seat of this industry is in Glasgow; but while the initiatory and concluding manipulations connected with it are almost wholly performed in that city and its neighborhood, the needle-work, although partly wrought in Scotland, is chiefly executed by the peasantry of Ireland. About 300,000 persons, principally females, are employed in this work in all the counties of Ulster and some localities of the other provinces, and the gross value of the manufactured goods amounts to about £1,400,000. Spirit distilleries were established in Ireland at an early period. The number of distilleries and rectifying establishments in 1871 was 65, against 93 in 1835; the number of gallons entered for home consumption 5,212,746, against 12,296,342 in 1838; the rate of duty is 10s. per proof gallon.—Among the fisheries of Ireland, those of salmon and herring are flourishing. The number of vessels and boats employed in fisheries in 1871 was 8,999, and the number of men and boys employed 38,629, against 19,883 vessels and boats and 113,073 persons in 1846. In the coasting trade of Ireland the entrances in 1871 were 18,676 sailing vessels, tonnage 1,598,343, and 5,947 steam vessels, tonnage 2,619,891; the clearances were 5,947 sailing vessels, tonnage 439,001, and 8,500 steam vessels, tonnage 2,660,027. The registered shipping in 1871 numbered 651 sailing vessels under 50 tons, tonnage 19,919; 923 sailing vessels above 50 tons, tonnage 148,555; 60 steam vessels under 50 tons, tonnage 1,555; and 142 steam vessels above 50 tons, tonnage 48,133. The commerce of Ireland consists of the provision trade and of the trade in the produce of the country with Great Britain and foreign nations. The exports are mainly sent to Liverpool, Bristol, and Glasgow, from Belfast, Dundalk, Drogheda, Newry, Waterford, and Limerick, and particularly from Cork and Dublin. The entrances of vessels engaged in the foreign trade in 1871 comprised 802 British and Irish, tonnage 282,752, and 920 foreign, tonnage 343,721; the entrances of vessels engaged in the colonial trade numbered 289 British and Irish, tonnage 125,679, and 34 foreign, tonnage 15,571. The principal ports of entry were Cork, Dublin, Belfast, Waterford, Limerick, Londonderry, and Newry. The importation of grain into Ireland in 1870 comprised 6,716,534 cwt. of wheat, 215,279 of barley, 9,670 of oats, 5,738,138 of Indian corn, and 193,707 of wheat meal or flour. By far the most extensive market for Irish products is Great Britain; but the abolition of duties on this cross-channel trade, which took place in 1825, has taken away the means of estimating the imports and exports. The total value of Irish and British products exported direct to foreign countries from Ireland in 1871 was estimated at £462,486. The direct trade between Ireland and the United States has of late decreased. The number of American vessels entering Irish ports in 1871 was only 38, tonnage 24,701. Marble, porter, ale, whiskey, and manufactured goods

from Dublin and Belfast are among the Irish exports to the United States, and tobacco, wheat, and corn among American imports into Ireland. In 1871 there were 17 lines of railway open in Ireland, of which the following were the most important: Belfast and Northern Counties; Dublin and Belfast junction; Dublin and Drogheda; Dublin, Wicklow, and Wexford; Great Southern and Western; Irish Northwestern; Midland Great Western; Ulster; Waterford and Limerick. The aggregate capital of the main lines (excluding that of lines leased or worked) is £27,028,580. In 1871 the number of miles open was 1,988 (in 1872, 2,091); of passengers carried, 15,547,934; gross receipts, £2,272,386; net receipts, £1,090,795. The lines of inland navigation are as follows: Grand canal with its branches, 165½ m.; Royal canal with its branches, 96½; Shannon navigation, river and canal, and two branches, 158; Lagan navigation, river and canal, 26½; Newry navigation, do., 35; Tyrone navigation, do., 4½; lower Boyne navigation, do., 19; Barrow navigation, do., 42½; Ulster canal, 24; Suir navigation, 16½.—Large amounts have been advanced by the government (according to statistics of 1872, £11,832,224) for the improvement of land by means of arterial and thorough drainage, post roads, farm buildings, &c. The encumbered estates court, established in 1849, has brought into market smaller holdings and estates overburdened by debt, and has proved of very great advantage to the prosperity of the country. The total amount expended in the purchase of property under control of the court from 1849 to 1858, when it was replaced by the landed estates court, was £22,000,000, of which £3,000,000 was invested by English and Scotch purchasers. The number of estates sold was 2,380, divided into more than 11,000 lots, and 8,235 conveyances have been executed by the commissioners. The total number of letters delivered in 1871 was 71,166,000, giving an average of 13 letters for each person. The number of newspapers published in 1873 was 154. Savings banks were introduced in 1810; in 1845 the amount deposited reached nearly £3,000,000, but owing to the famine it fell below £1,500,000 in 1849; a gradual increase has since taken place, bringing the deposits up again to £2,220,000 in 1871. Of loan societies there were 81, which advanced 115,095 loans, the amount circulated during the year being £542,295. The bank-note circulation in 1871 was about £7,500,000. There are 8 banks, all issuing their own notes excepting the Hibernian joint stock company and the Royal bank of Dublin. The most important is the bank of Ireland, which acts as banker to the government, and which is bound to make weekly returns similar to those of the bank of England. It has 42 branches; its capital is £3,000,000, its reserve fund about £1,000,000, and at the end of 1872 it circulated notes to the amount of about £3,392,000. The next most important establishments are the Pro-

vincial bank of Ireland, with a capital of £2,040,000 and 44 branches, and the National bank, with a capital of £2,500,000 and 73 branches.—The public institutions for religious, benevolent, and educational purposes are numerous. The Episcopal or Anglican was formerly the established church of Ireland, but by act of parliament it was disestablished on Jan. 1, 1871. (See IRELAND, CHURCH OF.) The dignitaries of the Roman Catholic church of Ireland are the four archbishops of Armagh, Dublin, Cashel, and Tuam, and 24 bishops. The number of priests in 1873 was upward of 3,200, nominated by the bishops, and supported altogether by voluntary contributions. The "Presbyterian church in Ireland" in 1872 had 627 ministers and 553 congregations. There are eight other small Presbyterian and three Methodist organizations, with a small number of Congregationalists, Baptists, Moravians, and others. According to the census of 1871, there were 4,141,933 Roman Catholics, 683,295 persons reporting themselves as belonging to "the church of Ireland" or as Protestant Episcopalians, 503,461 Presbyterians, 41,815 Methodists, 4,485 Independents, 4,643 Baptists, 3,834 Friends, 19,035 of other denominations, and 258 Jews.—The chief educational institution is the university of Trinity college, Dublin, founded in 1591, with an average attendance of nearly 1,200 students. Among the other principal seats of learning are the queen's colleges of Belfast (351 students in 1871-'2), Cork (253 students), and Galway (141 students), established by acts passed in 1845 and 1850. Maynooth college and All-Hallows college, Drumcondra, are the chief institutions for the education of Roman Catholics for the priesthood. The establishment of a Roman Catholic university was agreed upon by a synodical meeting in 1854, and the schools were opened in the same year. On July 20, 1862, the corner stone of a new university building was laid at Drumcondra. The Roman Catholics have also colleges affiliated with the Catholic university at Clonliffe, Tuam, Cloyne, Armagh, Carlow, Athlone, Tullamore, Thurles, Castleknock, Kilkenny, Fermoy, Longford, and Ellis. The Presbyterians have a theological college at Belfast, and Magee college (established in 1865) in Londonderry; the Methodists a college at Belfast (established in 1868). The college of St. Columba, at Rathfarnham, is an Episcopalian institution. The Alexandra college in Dublin was founded in 1866 for the higher education of females. The royal college of science for Ireland was established under the authority of the science and art department, London, in August, 1867, in place of the museum of Irish industry, which then ceased to exist. The church education society, instituted in 1839 for the education of its pupils in the principles of the church of England, had 52,166 pupils in 1870, of whom 3,757 were Catholics. Since 1837 the grants of public money for the education of the people have

been under the superintendence of commissioners, who were incorporated in 1835 under the name of the commissioners of national education in Ireland. Their report shows that on Dec. 31, 1872, there were 7,059 schools in operation, with 1,010,148 children on the rolls. There were 184 new schools, and 48 struck off, showing a net increase of 136. The commissioners had made grants for the erection of 98 additional schools to accommodate 13,045 children. The pupils were divided in reference to religious denominations as follows: Roman Catholic, 804,222; Presbyterian, 112,465; Episcopalian, 80,893. There were 125,347 Episcopalian pupils mixed with 27,312 Roman Catholics under exclusively Protestant teachers; 18,957 Protestant pupils mixed with 11,270 Roman Catholics under joint teachers of both creeds; and 26,172 Protestant children with 362,313 Roman Catholics under exclusively Roman Catholic teachers. These statistics are independent of the schools conducted by the Christian Brothers, which are numerous and largely attended; the teachers are experienced and well educated, and have the confidence of the people. The national schools are open during the entire year, five hours daily. The books used are the same in every school throughout the country, and the instruction embraces reading, writing, arithmetic, grammar, geography, geometry, trigonometry, algebra, bookkeeping, chemistry, hydrostatics, acoustics, electricity, mechanism, music, and drawing; and the girls in addition are taught plain and fancy sewing and knitting. The national system receives but small assistance from government; the entire amount paid out of the treasury in 1872 for teachers, tutors, and work-mistresses was \$322,000. The principal establishments for the promotion of literature, science, and art are situated in Dublin, among which are the royal Irish academy, the royal Hibernian academy of art, and the royal Dublin society; literary and mechanics' societies are scattered all over the country. The great industrial exhibition of 1853, called into existence by the exertions of William Dargan, produced increased interest in institutions calculated to diffuse a knowledge of useful sciences among the people. The foundation for a national gallery of art was laid in Dublin in 1859. Medicine, the various branches of natural history, archæology, and other departments of science as well as of the fine arts, are represented by numerous societies in Dublin, Belfast, and other towns.—Charitable institutions abound in Ireland. Infirmaries for counties and cities, supported by assessment and governed by corporations, afford annual relief to about 60,000 sufferers. Public hospitals for counties, districts, and poor-law unions are distributed over the country, besides various private establishments. The number of insane in 1871 was 18,327. There are houses for the relief of the poor in 163 unions of Ireland. The poor-law system is conducted with a view of assisting those who

cannot support themselves by their personal labor, but at the same time of discountenancing in able-bodied persons all dependence on eleemosynary relief. The poor rate is levied under the assessment of poundage rate on the net annual value of various kinds of ratable property. In 1871 the valuation of the assessable property was £13,239,394, and the average poundage 1s. The total amount expended on the relief of the indigent in that year was £685,668, chiefly for indoor maintenance. Out of 282,492 persons assisted during the year, 56,416 received outdoor relief.—The number of offenders tried at assizes and quarter sessions has materially decreased since 1849. The total number of persons committed or held to bail in 1872 was 4,476 (including 814 females), of whom 2,565 were convicted. From 1865 to 1871 there were 21 persons sentenced to death, and 13 were executed. The number of county prisons is 33, of city or town prisons 5, and of bridewells 106. A law for the promotion and regulation of reformatory schools for juvenile offenders was passed in 1858.—The government is administered by a lord lieutenant (in 1874, the duke of Abercorn), who is assisted by a privy council appointed by the crown, and by a chief secretary for Ireland, a cabinet minister (in 1874, Sir Michael Hicks-Beach). In the absence of the lord lieutenant, he is replaced by lords justices, usually the primate or archbishop of Dublin, the lord chancellor, and the commander of the forces. Each county is in charge of a lieutenant, generally a peer of the realm, assisted by deputy lieutenants and magistrates who officiate gratuitously, and one or more resident paid magistrates, all appointed by the crown during pleasure. The cities, towns, and boroughs are governed by local magistrates. Justice is administered by the lord chancellor, the master of the rolls, four judges in each of the courts of the queen's bench, common pleas, and exchequer, an assistant barrister for each county, a bankrupt court with two judges, and the judges of the prerogative court and of the admiralty. Assizes for criminal and civil pleas are held by two of the judges in each county in spring and summer of every year. The execution of the laws is intrusted to the constabulary in the counties and the police in Dublin. The total of the constabulary amounted, Sept. 30, 1871, to 12,274. The revenue police, organized for the suppression of illicit distillation, comprises about 400 officers and men. The Irish militia is composed of 12 regiments of artillery and 25 of infantry, numbering when embodied 31,972 men. Ireland is represented in the British parliament by 28 representative peers elected for life, and 105 commoners. Of the latter, 64 represent the counties, 2 the university, 12 the cities and towns of Dublin, Cork, Limerick, Waterford, Belfast, and Galway, and 27 the boroughs. The number of county electors in 1871 was 175,149; of city and borough electors, 48,358. No separate return of the reve-

nue and expenditure of Ireland has been given in the finance accounts since 1870; the gross amount of customs collected at the Irish ports in 1871 was £1,942,721, and the net amount of excise duties received in 1872 was £4,056,019.—The antiquities of Ireland are of various kinds: cromlechs, cairns (either simple mounds or to mark burial places), pillar stones, barrows, duns or defences of stone, lis or fortifications of earth, raths or villages, ancient stone-roofed buildings, round towers (of which there are 118, in height from 35 to 120 ft. with an internal diameter of 10 to 16 ft.), ecclesiastical architecture of all ages, with a vast number of castles and fortalices. The origin and use of the round towers have been much discussed. Of recent archæologists, Dr. Petrie believes them to be Christian ecclesiastical structures dating for the most part from the 9th and 10th centuries; Dr. O'Brien thinks they are phallic monuments of remote pagan antiquity; and the Rev. R. Smiddy in 1873 claims them as Christian baptisteries. Ancient weapons of bronze and ornaments of gold are frequently found in turning up the soil, the jewelry especially showing a high degree of artistic skill. The mediæval architecture of Ireland has been largely illustrated by the labors of Dr. Petrie and his school. The round or oval structures of rough stone and earth, popularly called beehive houses, which are still found in great numbers on the islands off the coast of Connemara, county Galway, are probably of the 6th or 7th century. Of Cyclopean architecture, the most remarkable examples are the Dun Aengus, on a high cliff on the great Isle of Arran; Knockfennell in Limerick, 360 ft. in circumference, with walls 10 ft. thick; and the Staigue fort near Kenmare bay, circular, 90 ft. in diameter, with walls 18 ft. high and 13 ft. thick. Several ancient oratories built of uncemented stones admirably fitted, and their side walls and to some extent also the end walls converging from the base to the summit in curved lines, exist in county Kerry. The most beautifully constructed and best preserved of these ancient relics is the oratory of Gallerus. A building unique in Ireland is Cormac's chapel, on the rock of Cashel, constructed in the 12th century, covered with ornaments of the richest Norman character, of the period and probably the work of Anglo-Norman masons and sculptors. The church or chapel of St. Doulough's, near Dublin, dating from the 14th century, presents a singular combination of church, house, and castle, all comprised in the space of 40 ft. long by 16 wide. Many parts of Ireland abound with ruins, especially of old manor houses, built in the form of towers for defence, and hence called castles, or the Irish towers. They are of all periods from the 12th to the 16th century. Besides these there are numerous real fortified castles, some of which furnish admirable specimens of the military architecture of the middle ages. Many smaller castles combining the military and do-

mestic character are provided with keeps and exterior walls like the baronial castles of Britain. Conspicuous among these is Bullock castle, at Dalkey, near Dublin, which protected the port of Dalkey, where the commerce of Dublin was carried on for centuries. Among the principal tower houses are Loughmore castle, county Tipperary, Athenry castle, Galway, Blarney castle, near Cork, and Augnure castle, county Galway, on the borders of Connemara. Many buildings of the Elizabethan period exist in Galway; the finest are the Lynch castle and Castle Banks. Few countries offer so fine a field for the archæologist.—According to the map of Ptolemy, the central portion of Ireland was inhabited in his day by the Scoti; the north by the Robogdii; the east by the Darnii, Voluntii, Eblani, Cauci, Menapii, and Coriundi; the south by the Brigantes, Vodii, and Ibernii; the west by the Luceni, Velaborii, Cangani, Auteri, Magnatæ, and Haudinii. In the *Argonautica* of Orpheus of Crotona (500 B. C.), the island is called Iernis. In the *De Mundo*, attributed to Aristotle, "Albion" and "Ierne" are mentioned. Diodorus Siculus alludes to the latter as Iris or Irisi, and Strabo names the island *Ιέρπη* (Ierne); Cæsar, Tacitus, and Pliny call it Hibernia; Mela and others, Juverna. The native name is Ir, Eri, and Erin. The name of Ogygia, "most ancient land," was also applied to it by Plutarch. A very remote antiquity is claimed and supported with much display of erudition by Irish writers. The researches of the last 50 years have exposed the fallacies and fictions of previous writers on Irish history and antiquities. "The Annals of the Four Masters," as translated by John O'Donovan and Owen Connellan, with the remarkable collections of erudition forming the notes to these volumes, together with the researches of the former and Eugene O'Curry into Gaelic annals, rare works, and unpublished records, appear to authenticate the following statements in reference to ancient Ireland. During the reign of Ollav Fola, about 900 B. C., it is said, a species of parliament was organized by a triennial assemblage at Teamor or Tara, of the chiefs, priests, and bards, who digested the laws into a record called the psalter of Tara. Ollav Fola also founded schools of philosophy, astronomy, poetry, medicine, and history, which were protected by his successors. Kimbath, who reigned about 460 B. C., like Ollav Fola, promoted the civil interests of his kingdom. Three reigns afterward Hugony the Great (300 B. C.) married a daughter of the king of Gaul, obliged the Picts to pay tribute, conquered the Western isles, and divided Ireland into 25 administrative provinces. The crown was declared hereditary in his family, in order to avoid the disorders caused by elections. To this period also is traced the division of Ireland into four provinces; and in the 1st century of the Christian era a portion was cut off from each to form a national district surrounding the cap-

ital. Crinatham, one of Hugony's successors, married the daughter of a Pictish chieftain, and joined the Picts in their forays against the Romans. Tacitus mentions that, about this time, an Irish prince who had been exiled from his country solicited Agricola to invade Ireland, assuring him that a single legion would be sufficient to conquer it; but there is no trace or record of Roman occupation. Tacitus also notes the commerce existing between Ireland and Chester in England, and says that the harbors of Ireland are better known than those of Britain. Of Crinatham's successors it will suffice to mention Feradach, surnamed the Just; Tuathal (A. D. 95), who erected temples for the sacred fire of the druids, and quelled "the revolt of the plebeians," which had lasted 25 years; Conn Keadcahagh, or Conn of the hundred battles, who was forced to give up half the kingdom to Modha Nuod, king of Munster, their respective shares being partitioned by a wall and ditch from Dublin to Galway, the country north being Leagh Cuin, or Conn's share, and south Leagh Modha, or Modha's share—names yet remembered, although the division lasted but a year. Subsequently Conn became sole monarch. In the reign of his grandson Cormac flourished the military brotherhood of the Fianna Eirionn, commanded by Finn McCool or Fingal, and cut to pieces at the battle of Gabra, in Meath, in the succeeding reign. Cormac was famous in peace and war. He enlarged the educational establishment originated at Tara by Ollav Fola, added to the number of military academies and law schools, and renewed the statutes concerning the psalter of Tara and the registration of individual histories. Nial of the nine hostages fought in Scotland, England, and France, and was killed by an arrow on the banks of the Loire. His successor Dathi, pushing his conquests through Britain into Gaul, was killed at the foot of the Alps. He was the last pagan king of Ireland. At this period the inhabitants were Scoto-Milesians, or Scots mixed with the descendants of an Iberian hero Mileagh.—From the 3d to the end of the 10th century the whole island took the name of Scotia, a term not then applied to the country now called Scotland. Usher and other historians mention four holy men who had preached the gospel in Ireland before St. Patrick. A fifth was sent by Pope Celestine I., in the person of Palladius, archdeacon of the Roman church. Arriving in the reign of Laogare II., he was expelled after a few months, and died in Britain. Patrick, a native of Gaul, and a relative of St. Martin of Tours, was sent to Rome by Germanus of Auxerre, and intrusted by the pope with the mission of converting the Irish people. He arrived in Ireland about the middle of the 5th century, and died in 493, leaving the island Christian. This event gave a considerable impulse to civilization. The churches and monasteries founded by Patrick became so many schools, a zeal for learning spread among clergy

and laity, and the favorite monastery of St. Patrick at Armagh became famous as a school all over Europe. For a time Ireland was so noted for the learning and piety of its ecclesiastics that it was called *insula sanctorum*, isle of saints. One of the most important events which happened about this time was the foundation of the Dalriadan or Scoto-Milesian kingdom of Albania, the first colonization of which from Ireland took place about A. D. 238. It had been established with the aid of the Nialls or O'Neills of the north of Ireland, and when Columba landed in Albania in 563 he found at the head of the colony Connal, one of his own blood relatives. Connal's successor Aidan was anointed king in Iona by Columba; and in 590 both went to Ireland, where, in the general assembly of Drumceat, Columba obtained a recognition of the new Scottish kingdom and the abolition of the colonial tribute paid to the Irish kings. According to Bede, in the year 646 many Anglo-Saxons settled in Ireland. In 684 it was invaded by Egfrid, king of Northumberland, who ravaged many churches and monasteries. More serious predatory incursions by the Scandinavians took place toward the close of the 8th century. Soon the idea of a permanent foothold seized the pirates, and they occupied good maritime positions, as Dublin, Drogheda, Waterford, Limerick, and Wexford. About the year 840 a powerful fleet arrived under Turgesius (Thjorg?), who for nearly seven years exercised authority over a large district, proscribed the Christians, dispersed the schools, burned the books, and issued his mandates from the high altar at Clonmacnoise. Turgesius was killed by Malachi, prince of Westmeath, and the Irish, rallying under the chief king Niall III., broke the supremacy of the Danes. Still they clung to the seaports, and by paying tribute when necessary and forming alliances with and against the Irish princes, retained occupation for more than two centuries, and were the source of great national decadence. In 1002 Brian Boru, or Boroimhe, king of Munster, expelled the Danes from his own kingdom, and, seizing the national authority, was crowned at Tara as king of Ireland. Ere long he expelled the Danes from the whole country. Having accomplished this result, he further effected great civil reforms, founded churches and schools, opened roads, built bridges, and fitted out a fleet. He also introduced the use of surnames, and made the marriage contract permanent. Another invasion by the Danes, incited by the king of Leinster, led to the decisive battle of Clontarf, Good Friday, April 23, 1014, in which the power of the Danes was finally broken. Brian was killed in his tent by a party of the flying enemy. His son and grandson perished on the same occasion. Malachi II., dethroned by Brian, now became king. His death in 1022 marks the decline of the Irish monarchy. The country in the 12th century presented a scene of almost ceaseless disorder, the five kingdoms of

Ulster, Leinster, Meath, Connaught, and Munster, besides a number of petty principalities, being continually at war with each other. The island had fallen into a state of degeneracy sadly at variance with its former title of isle of saints. St. Bernard of Clairvaux called the attention of Rome to this, and Pope Eugenius III. sent Cardinal Papiron to correct abuses and restore discipline. The synod of Kells, held under his auspices in March, 1152, acknowledged the supremacy of Rome, established the archbishoprics of Dublin and Tuam (Armagh and Cashel already existing), and condemned simony, usury, and concubinage. In 1155 a bull is said to have been issued by Pope Adrian IV., the existence of which is denied, conferring the sovereignty of Ireland upon Henry II. of England; but the latter did not avail himself of it for many years. The appeal of Dermot McMurrrough, king of Leinster, to be reinstated on the throne from which he had been justly driven, furnished a pretext for the invasion of Ireland by two bands of Norman adventurers, one under Robert Fitzstephen in 1169, and another under Richard de Clare, earl of Pembroke, commonly called Strongbow, in the same year. The success of McMurrrough's allies aroused the suspicions of Henry II., who issued a proclamation recalling Strongbow and all Englishmen, under pain of outlawry. This course gave him in the eyes of the Irish the aspect of a deliverer rather than that of an invader; and when in 1171 he arrived at Waterford, many native princes accepted him as liege lord, so that he might settle their existing difficulties, and guarantee them their own possessions and dignities. He was called away in the next year, and his lieutenants soon developed a system of spoliation. In 1177 the king's son John was made lord of Ireland, and in the same year Cardinal Vivian, the pope's legate, convening a synod at Dublin, published King Henry's title to Ireland with the papal ratification. In 1185 John arrived with a fleet of 60 ships, was defeated by Donal O'Brien, and soon returned with charges against Hugh de Lacy, chief of the English in Ireland. In 1210 King John arrived in Ireland, and was chiefly occupied in chastising the most powerful of the Anglo-Norman lords. He divided the country into counties, established courts in Dublin, appointed judges, circuits, and corporations, established a new coinage, and assimilated the currency of England and Ireland. In 1216 Magna Charta, or the great charter of liberties, was granted to the Irish by Henry III. Many years were passed in contentions among the rival English lords as well as the native chiefs. On May 25, 1315, at the invitation of several Irish princes, Edward Bruce landed in Antrim, where he was joined by Donal O'Neil, prince of Ulster. The natives flocked to his standard. The Anglo-Normans with O'Conor of Connaught opposed him. Bruce and O'Neil marched southward, overwhelmed the Anglo-Norman army, captured

all the great towns on their route, and went into winter quarters at Christmas "in the midst of the most considerable chiefs of Ulster, Meath, and Connaught." In the spring, having made a triumphant march south, they returned to Dundalk, when Bruce was elected and crowned king. Robert Bruce came to the aid of his brother, and, after a successful incursion as far as Limerick, returned to Ulster in May, 1317, the troops having been decimated by a famine of such severity as to compel a suspension of hostilities, after which Robert Bruce returned to Scotland. In August, 1318, the armies were moving. The English under John de Bermingham were in the field first, found Edward Bruce at a disadvantage, and defeated and dispersed his troops at Faugard, Oct. 14, Bruce himself perishing on the battle field. Unexpected dangers interfered with the subjection of Ireland. Notwithstanding incessant warfare between the Normans and the natives, the middle of the 14th century found the Irish language, laws, manners, and customs universally adopted by the former, while marriage and "fosterage" between the nobles of both races were making the Anglo-Normans "more Irish than the Irish." To avert this danger, many measures were adopted. By an ordinance of Edward III., 1341, all offices in Ireland held by Irish or English men who had estates or were married in Ireland were to be vacated, and filled by Englishmen who "had no personal interest whatever in Ireland." In 1367 a parliament at Kilkenny, under the auspices of the king's son Lionel, passed the memorable "statute of Kilkenny," directed against the English who adopted Irish customs or manners, and making intermarriage, fostering, or trading with the natives, treason. Near the end of the century Richard II. twice landed in Ireland with a large force, but he was completely baffled by Art McMurrrough, who in the succeeding reign defied and fought the duke of Lancaster under the walls of Dublin. In the reign of Edward IV. was passed the "head act," which made it lawful to kill "any persons going or coming, having no faithful man of good name and fame in their company in English apparel." Henry VII. undertook still further to reduce the country to a condition of complete dependence by ordaining that no parliament should meet without his permission, and no law be valid unless sanctioned by the English king and council. To meet his view Sir Edward Poynings, then lord deputy, assembled a parliament at Drogheda in 1495, at which was enacted the "Poynings law," which took away the independence of the Irish parliament, making all its acts subordinate to that of England. A parliament in Dublin, in 1537, passed the act of supremacy, declaring Henry VIII. supreme head of the church, prohibiting intercourse with the court of Rome under penalty of *præmunire*, and making it treason to refuse the oath of supremacy. Henry VIII. also took the title of king of Ireland, although in his day

only an inconsiderable portion of the country was practically subject to the English law. This reign was marked by the insurrection of Lord Thomas Fitzgerald, which ended in the total ruin of the powerful house of Kildare. Henry introduced the Protestant reformation into Ireland with as little difficulty as he had into England. A few partial disturbances happened, but nothing of national importance till the reign of Elizabeth, during which fierce and almost incessant wars were carried on with the Desmonds in Munster, and other Anglo-Irish families who resisted the reformation. During the last 15 years of her reign the contest raged with fury, particularly against the O'Neills, O'Donnells, and other Ulster princes and chiefs. It is estimated that this war of Elizabeth cost £3,000,000 and 200,000 lives, about equally divided between the English and the Irish. A great parliament summoned by the lord deputy Sir John Perrott, in 1585, was attended by nearly all of the great Irish chiefs and representatives of the Anglo-Irish families. James I. introduced into Ulster many Scotch and English Protestant settlers. The civil wars in England supplied the Irish and Anglo-Irish Catholics with a favorable opportunity to make an attempt to overthrow the new settlements and protect themselves. Accordingly, in 1641, an insurrection broke out in Ulster, which quickly spread to all parts of the island. Dublin narrowly escaped falling into their hands. Social and religious animosities alike served to embitter the contest, which was marked by great atrocities. As the abbé MacGeoghehan says, both sides were culpable, and the massacre "was one of the most cruel and barbarous that has been recorded among Christians, both on account of its duration and the fury of those who were the authors of it." In 1642 a national synod established the "Confederation of Kilkenny," issued a plan of provisional government, and called a general assembly of the whole kingdom, Oct. 23, at which a supreme council of 24 (comprising 3 archbishops, 2 bishops, 4 nobles, and 15 commoners) was elected. This power exercised the functions of a national government for several years, coined money, appointed judges, held assizes, commissioned officers, and sent ambassadors abroad. Charles I. negotiated publicly and privately with it. Its favorite general, Owen Roe O'Neill, gained a great victory over the English army at Benburb, June 5, 1646; but it was finally distracted and destroyed by intrigue. The country was a prey to anarchy till 1649, when Cromwell appeared on the scene. He took Drogheda by storm, and delivered it up to the license of his soldiery. One after another the Roman Catholic strongholds fell, till the whole country lay at his mercy, and for the first time English supremacy might be said to be established. Four fifths of the whole soil was confiscated. Once more, in 1688, the Catholics took up arms. James II., after his flight from England, presented himself in Ireland, and was

received with acclamation. An army was speedily organized under the Irish and French officers whom he had brought with him. But the superior genius of William of Orange, displayed at the battle of the Boyne in 1690, broke the current of the ex-king's success. The battle of Aghrim followed, July 12, 1691, where the Irish met with a disastrous defeat; the fugitives retired to Limerick, and after a final stand surrendered, Oct. 3, 1692, on terms which were violated by the victors. Renewed confiscations followed. A large number of Roman Catholics fled the country, and those who remained were barely permitted to exist. The next hundred years of Irish history record little else than relentless persecution of the Catholics. Even so late as toward the close of the 18th century the penal laws were tyrannous. Catholics were not eligible to offices of trust, were not allowed to serve in the army or navy, nor to possess arms, nor to exercise many other of the rights of citizenship. The gloom of the penal days was only broken by brave utterances from noble Protestant men in behalf of the general rights of the kingdom, such as Molyneux's "Case of Ireland stated," Dean Swift's "Drapier" letters, and Dr. Lucas's protests against the encroachments on constitutional rights. Molyneux's book was burned by the common hangman; a reward was offered for the Drapier, and his printer arrested; and Lucas had to find refuge in England from laws enacted by and for the English interest in Ireland. In 1782 Henry Grattan, backed by the arms of the volunteers who had organized to defend the country against an expected French invasion, achieved the independence of the Irish parliament by the repeal of the act 6 George I., the Poyning's, and other objectionable acts. Still the Catholics had cause to sue for "emancipation," meaning thereby a complete community of privileges. The Protestants, too, had their grievances on various matters connected with trade and revenue. War with the American colonies touched their interests in various ways, chiefly by closing the markets for their linens, and by putting a stop to the emigration which was even then beginning to be developed. Hence the universal emancipation of nations proclaimed by the French revolution appealed powerfully to the Irish of both creeds. Theobald Wolfe Tone had founded the first society of United Irishmen, Oct. 12, 1791. His avowed object was to break the connection by means of a union of Protestant, Catholic, and Dissenter. The British government, naturally jealous of the discontent everywhere manifest, increased its severities, suspended the *habeas corpus* act, dispersed meetings by force of arms, and distributed troops at free quarters upon the people. In defence the "United Irishmen" became a secret society, and besought French aid. The recourse to arms contemplated by the United Irishmen was forced to a premature culmination by the government, which through

the viceroy Lord Camden proclaimed all Ireland under martial law, March 30, 1798. This led to great excesses on the part of those in power, and localities in which the united Irish organizers had little hold, like Wexford county, were goaded into revolt. The active civil war lasted less than five months, during which many notable battles occurred, as at New Ross, Enniscorthy, and Vinegar Hill. England employed 137,000 men. Its cost is variously estimated at £30,000,000 and £50,000,000. The English lost 20,000 men, the Irish 50,000. Many of the leaders were executed, Lord Edward Fitzgerald died of his wounds in prison, and Tone, who was captured on board the *Hoche*, the admiral's ship accompanying the third expedition which he had projected from France and Hamburg, committed suicide in prison. Of the leaders of the United Irishmen fully two thirds were Protestants and Presbyterians. Lord Cornwallis was appointed lord lieutenant, with instructions to pursue a pacific policy. A bill of amnesty was passed in 1799, and the country settled into the appearance of quiet. Government took advantage of the rebellion to hasten the legislative union of the two countries, which, despite the eloquent opposition of Grattan and his party, went into effect Jan. 1, 1801. The articles of the act of union were: 1, that the two islands be called the United Kingdom of Great Britain and Ireland; 2, the succession to the throne to continue as existing, limited; 3, the kingdom to be represented by one parliament; 4, that Ireland be represented in the house of lords by 28 temporal peers elected for life from the Irish nobility, and in the house of commons by 100 representatives; 5, that the state churches of the two islands be united, their doctrines and discipline being one; 6, that the population of the two countries be on the same footing as regarded manufacturing, trading, and commercial privileges; 7, that the expenditure be in the proportion of Britain 15 to Ireland 2 for 20 years, afterward to be regulated by parliament; 8, that the existing laws and courts be continued, excepting that appeals from the Irish chancery be to the British house of lords. The extremes of both parties were dissatisfied. An insurrection broke out in Dublin, July 23, 1803, but was speedily suppressed. Robert Emmet, the young enthusiast who led it, died on the scaffold. The outbreak had little other result than to cause the revival of harsh measures and of agitation. For several years the question of Catholic emancipation was a standard subject of excitement; it was periodically mooted in parliament, and as regularly thrown out, for nearly 20 years. In 1821 George IV. paid a state visit to Ireland, where he was received with demonstrations of loyalty. In 1822 Ireland suffered from a famine, produced, says Alison, "by the contraction of the currency and consequent fall of the prices of agricultural produce 50 per cent." Cobbett says there was food enough, but no money to purchase it. In

1823 the question of Catholic emancipation assumed larger proportions. Daniel O'Connell was the most prominent public man from this period till his death in 1847. Various associations were organized in aid of the ends for which the Catholics, supported by the liberal of all parties, were striving. The chief of these was "the Catholic Association," of which the ostensible object was, in brief, the removal of all political and civil disabilities. Its ramifications extended throughout the country, and it derived from voluntary contributions a large revenue, known in the records of the time as "the rent." This organization exercised an important influence on the domestic political policy of the country, and may indeed be said to have effected its object, for, on April 13, 1829, the long-sought act of "Catholic emancipation" received the royal assent. Sir Robert Peel, in addressing parliament on the bill, made the admission that scarcely for one year since the union had Ireland been governed by the ordinary course of law, without the intervention of insurrection acts, suspension of the *habeas corpus*, or martial rule. O'Connell took his seat as member for Clare, and immediately proclaimed an agitation for repeal of the legislative union. The tactics that had carried the measure of emancipation were revived. The repeal association followed the Catholic. Combined with this primary object were complicated lesser issues, such as a movement against the payment of tithes. Of the 8,000,000 inhabitants of Ireland, only one tenth were members of the established Protestant church, yet tithes for its support were exacted indiscriminately from all. The "tithe war" was distinguished by many disgraceful and heart-rending transactions, notably the massacre at Newtownbarry and Carrickshock in 1831, and at Rathormack in 1834. At length, in 1838, the obnoxious features of the tax were concealed by the substitution of a fixed rent charge payable by the land owners. The parliamentary reform bill, in 1832, gave to Ireland five more members in the house of commons; and the municipal reform act, in 1840, removed many minor administrative grievances. In 1831 the national system of education was established by act of parliament. In 1833 the expenditure of the grants for public education was intrusted to the viceroy under the superintendence of "commissioners of national education;" and in 1835 these commissioners were incorporated, with power to hold lands. In 1838 the English poor-law system was introduced, and during the succeeding ten years received extension and adaptations as circumstances required. The organization of the police force kept pace with these ameliorations. In 1836 it was consolidated into the semi-military arm it now is. During the progress of these events the repeal agitation was increasing, until it culminated in "the repeal year," 1843. Monster meetings were held at various places. A final one, on a yet more gigantic scale, was proposed to be held at Clontarf, but

the government having forbidden it, it did not take place. In February, 1844, under the Peel administration, O'Connell and his fellow agitators were convicted and sentenced to a short term of imprisonment. An appeal to the house of lords set them at liberty. The agitation did not flourish afterward. In 1846 and the succeeding year a great famine fell upon the land, through the rotting of the potato crop, upon which most of the peasantry depended for sustenance, and thousands perished of hunger. Parliament made successive grants in aid, amounting in the aggregate to £10,000,000. Large sums were subscribed abroad; and among other donations, a cargo of food was sent from the United States. The crops of the two succeeding years were short, but gradually plenty came again. The young Ireland party, which had grown under the auspices of O'Connell, rejected his peace policy, and remonstrated against his affiliation with the English whigs. It received great accessions from the country, and on Jan. 13, 1847, formed the "Irish Confederation." Although it had upward of 150,000 enrolled men in its clubs, its organization was imperfect, and the amount of arms in its possession insignificant. Neither was its purpose distinctly defined or understood. John Mitchel, seeing nothing in the famine policy of the government but "a machinery deliberately devised and skilfully worked for the entire subjugation and slaughter or pauperization of the people," advised resistance and a general arming. William Smith O'Brien, C. Gavan Duffy, T. F. Meagher, and the "Nation" party thought this would be a virtual declaration of war. But the French revolution of February, 1848, gave a great impetus to Mitchel's views, and set all the confederate orators on the path of revolution. The confederation sent to France a deputation, with an address which declared that the heroism of the French republic "taught enslaved nations that emancipation ever awaits those who dare to achieve it by their own intrepidity." The parliament hurriedly passed a "treason-felony" act. Mitchel was arrested, tried, and banished for 14 years. The nationalists desired to wait for the harvest; but the government, as on former occasions, put forth all its power to force an immature rising. The "Nation," "Tribune," and "Felon," which had succeeded Mitchel's "United Irishman," were seized, and their writers thrown into prison. The "gagging act" prevented freedom of speech at the clubs; and the suspension of the *habeas corpus* act compelled those who were objects of suspicion to evade the authorities. Thus the leaders were thrown on the country, and rewards offered for them. Hunted with celerity, they strove to face the emergency in hurried councils and with undisciplined material, and having come in contact with the forces at the slate quarries, Mullinahone, Killenaule, Ballingarry, Abbeyfeale, and elsewhere, they were either captured or found safety in exile. O'Brien, Meagher, McManus,

and O'Donoghue were sentenced to death; Martin and O'Doherty were banished for a term of years to Australia; and Doheny, Dillon, Devin Reilly, and O'Gorman found their way to America. Later in the year (September) a more persistent effort was made by John O'Mahony and John Savage to rally the people in Tipperary, Waterford, and Kilkenny, but it was hopeless. The government had 40,000 troops in the country. None were executed, the sentence of death having been commuted to transportation, and in most instances pardons were extended in 1856. In 1849 came into operation the act establishing courts for the sale of encumbered estates. To May 25, 1857, property had been sold to 7,216 persons, 6,902 of whom were Irish, the rest English, Scotch, or foreigners. The amount realized for the same was over £20,000,000. In 1849 a serious collision took place between some Orangemen and unarmed Catholics at Dollysbrae, county Down, which necessitated the dismissal of Lord Roden and another Orange magistrate from the commission of the peace by the viceroy, Lord Clarendon. In the same year Queen Victoria paid her first visit to Ireland, and she again visited it in 1853 to witness the great exhibition of Irish industrial products, opened at Dublin, May 12. The year 1854 was signalized by the foundation of a Roman Catholic university. The political excitements of this period were an agitation by Protestants against the governmental grant to the college of Maynooth, and by the Catholic defence association in favor of perfect religious equality. "Tenant right," with other secular questions, under discussion at the same time, produced considerable effervescence. In 1857 the Phoenix society developed some active revolutionary spirit in the south of Ireland. This was followed up by the "Irish Revolutionary Brotherhood," the form under which Fenianism became known in the British islands. The rise and progress of the Fenian movement on both sides of the Atlantic is treated under FENIANS. It is only necessary here to allude to the measures passed by the British parliament growing out of the Irish efforts from 1857 to 1871. The government put forth its most vigilant and effective resources in Ireland, twice suspending the *habeas corpus* to strengthen the hands of the Irish executive. Mr. James Stephens was the controlling influence of the "Revolutionary Brotherhood" in Ireland, and the seizure of his organ, "The Irish People," in September, 1865, and of himself in November, created intense excitement, which was more widely extended by his escape on the 24th of the same month. The rising in March, 1867, gave a great number of active spirits into the hands of the government. Following the failure, the parliament passed a reform bill extending the franchise; this was supplemented by Mr. Gladstone's bill for the disestablishment of the Anglican church in Ireland, which was followed by a land-tenure bill for Ireland and a naturalization bill. Through-

out 1868-79 immense meetings were held in favor of amnesty for the political prisoners, in which the corporations of leading cities took part. This developed so much national spirit and concentration of feeling that it was taken advantage of by Mr. Isaac Butt, to direct its energy and fervor into a new national movement on a constitutional basis. Gentlemen of all classes and religions entered the "Home Rule League," and a great national convention or conference was held in Dublin, Nov. 18, 1873, at which the principles and objects of the organization were declared. The conference solemnly asserted the inalienable right of the Irish people to self-government, and adopted "the principle of a federal arrangement, which would secure to an Irish parliament the right of legislating for and regulating all matters relating to the internal affairs of Ireland, while leaving to the imperial parliament the power of dealing with all questions affecting the imperial crown and government, legislation regarding the colonies and other dependencies of the crown, the relations of the empire with foreign states, and all matters appertaining to the defence and stability of the empire at large, as well as the power of granting and providing the supplies necessary for imperial purposes." In the election following the dissolution of parliament in January, 1874, the success of the home rule candidates was very significant. In Ireland 60 noblemen and gentlemen elected were pledged to home rule, while England sent 23 also pledged. The new Disraeli administration initiated its Irish policy by warning, on April 17, through the lords justices, a national Dublin journal. The act having been brought before parliament, May 1, was defended by the secretary for Ireland on the ground that "a spirit of disaffection still existed there which might be easily fanned into a flame."—See Giraldus Cambrensis, *Topographia Hiberniæ et Expugnatio Hiberniæ* (Frankfort, 1602, and in Holinshed's collection); Lanigan's "Ecclesiastical History of Ireland to the 13th Century" (4 vols., Dublin, 1822); Betham's "Irish Antiquarian Researches" (2 vols., Dublin, 1826), and "The Gaël and the Cymbri" (1834); O'Connor's "Chronicles of Eri" (2 vols., Dublin, 1832); "The Annals of Ireland," by James Grace (Dublin, 1842); "The Annals of Ireland," by Friar John Glyn (Dublin, 1849); publications of the Irish archaeological society (Dublin, 1853 *et seq.*); publications of the Ossianic society (Dublin, 1853 *et seq.*); O'Brennan's "Ancient Ireland" (Dublin, 1855); "The Four Masters' Annals of the Kingdom of Ireland," edited by J. O'Donovan (7 vols., Dublin, 1856); Dr. Todd's "Wars of the Irish and Danes" (Dublin, 1858); MacGeoghegan's "History of Ireland, Ancient and Modern," continued up to present date by John Mitchel (New York, 1874); Gustave de Beaumont, *L'Irlande sociale et politique* (2 vols., Paris, 1839); and Abbé Perraud, *Études sur l'Irlande contemporaine* (Paris, 1862).

IRELAND, Church of, the name of the Irish branch of the Anglican Episcopal church. Until Jan. 1, 1871, this church was an integral part of the "Church of England and Ireland," which was the establishment in Ireland as well as in England. (See ENGLAND, CHURCH OF.) In 1868 the house of commons, on motion of Mr. Gladstone, resolved to disestablish the church in Ireland. The house of lords rejected the proposition, but under the pressure of public opinion, which strongly expressed itself against the continuance of the privileges of the Irish church, the "royal commissioners on the revenues and condition of the church of Ireland" recommended important reductions as to the benefices of the Irish church. Mr. Gladstone, having become prime minister toward the close of the year 1868, introduced in March, 1869, a new bill for the disestablishment and disendowment of the Irish church, which was passed by both houses of parliament, and on July 26 received the royal assent. By this act a body of commissioners of church temporalities in Ireland was appointed, in whom the whole property of the Irish church was to be vested from the day the measure received the royal assent. A distinction was made between public endowments (valued at £15,500,000), including everything in the nature of a state grant or revenue, which were to be resumed by the state, and private endowments (valued at £500,000), which were defined as money contributed from private sources since 1660, and which were to be restored to the disestablished church. Provision was made for compensation to vested interests (including Maynooth college and the *regium donum* of the Presbyterians), the largest of which in the aggregate were those of incumbents, to each of whom was secured during his life, provided he continued to discharge the duties of his benefice, the amount to which he was entitled, deducting the amount he might have paid for curates; or the interest might under certain circumstances be commuted upon his application for a life annuity. Other personal interests provided for were those of curates, permanent and temporary, and lay compensations, including claims of parish clerks and sextons. The aggregate of the payments would amount to about £8,000,000, leaving about £7,500,000, giving an annual income of about £30,000, at the disposal of parliament. When the affairs of the establishment should be wound up, the commissioners were to report to the queen that the objects immediately contemplated by the act had all been provided for, and to report the amount of surplus available for charitable purposes. The actual disestablishment provided for by the Irish church act took effect on Jan. 1, 1871, when all church property became vested in the church temporalities commissioners, and the right of the Irish bishops to sit in the house of lords ceased. Previously a general convention held in Dublin in 1870 adopted a constitution for the

church of Ireland. The church is governed by a general synod, meeting annually in Dublin, and consisting of a house of bishops and a house of clerical and lay delegates. The house of bishops have the right of veto, and their veto prevails also at the next synod. The bishops are elected by the diocesan convention, but whenever the latter fails to elect a candidate by a majority of two thirds of each order, the election devolves upon the house of bishops. The primate (archbishop of Armagh) is elected by the bench of bishops out of their own order. The property of the church is vested in a "representative church body," which is composed of all the archbishops and bishops, of one general and two lay representatives for each diocese, and 12 coöpted members. At the first general synod of the church several resolutions against the introduction of ritualistic practices were adopted. As late as 1833 the church of Ireland, notwithstanding its small membership, had four archbishoprics and 18 bishoprics; in that year the number of archbishoprics was reduced to two, Dublin and Armagh; and the number of bishoprics to ten, five for each archbishopric. The number of benefices in 1873 was 1,548; the number of curates 622. The population connected with the church of Ireland, according to the census of 1861, was 693,357, or 11·9 per cent. of the total population; in 1871, 683,295, or 10 per cent. of the total population. Immediately on the passing of the Irish church act, the church temporalities commissioners took charge of all the property formerly belonging to the established church, and issued forms of claims to be filled up by clergymen or other persons entitled to receive a continuance of clerical income or compensation. The total number of clergy and officers who had commuted under the provisions of the act to the end of 1873, when the time expired, was 6,162, of whom 1,459 were incumbents, 921 curates, 579 nonconformist ministers, and 3,203 church officers. The total number of non-commutants was 415, of whom 20 were incumbents, 15 curates, 30 nonconformist clergy, and 300 church officers. The total amount of commutation paid in respect of claims investigated up to February, 1873, was £8,259,673.

IRELAND. I. Samuel, an English engraver and author, born in London, died there in July, 1800. After learning engraving, he became a dealer in curiosities, scarce books, prints, &c., but ultimately turned tourist and author. He visited Holland, Brabant, France, and various parts of England, and published several illustrated works of travel and scenery, none of which have now much interest or reputation. He also published "Graphic Illustrations of Hogarth" (1794-'9). **II. William Henry**, son of the preceding, born in London in 1777, died there, April 17, 1835. He was educated in France, and at the age of 16 was apprenticed to a conveyancer in his native city. Having accompanied his father to Strat-

ford-upon-Avon, and noticing his enthusiasm for Shakespearian relics, he forged a deed or lease containing a pretended autograph of the poet, which he said he had found among some old law papers. The eagerness with which his father believed this tale induced him to manufacture other documents of the same description; and he finally produced a play called "Vortigern," purporting to be by Shakespeare. It deceived many literary men, and Sheridan purchased it for Drury Lane theatre, where it was produced with John Kemble in the leading part; but the total failure of the play, joined with the attacks of Malone and others, soon led to a general conviction of young Ireland's dishonesty. "Vortigern" and "Henry II.," a similar production, were printed in 1799, and the former was republished in 1832, with a facsimile of the original forgery. Being required to show the source from which he had derived the manuscripts, he confessed his deception, left his father's house, and abandoned his profession. He passed the rest of his life in literary pursuits, publishing several novels which never had much popularity, "Neglected Genius," a poem (1812), &c. A new edition of his "Confessions" (1805), containing a full account of his literary forgeries, was published in New York in 1874, with additional facsimiles, and an introduction by Richard Grant White.

IRENÆUS, Saint, one of the fathers of the church, supposed to have been born near Smyrna about 135, died in Lyons about 202. In a letter to the Valentinian Florinus, Irenæus reminds him of their having been both disciples of Polycarp; he also studied under Papias, according to Jerome. He probably accompanied Pothinus into Gaul, was ordained priest by him, and labored under him among the Greek colonists on the Rhône. In the beginning of 177 he was sent to Rome by the church of Lyons and Vienne, to consult with Pope Eleutherus about the spread of the Montanistic doctrines, and was while there elected and consecrated bishop of Lyons. In the controversy relating to the celebration of Easter, Irenæus acted as mediator between the eastern bishops and Pope Victor I. About 181 he published in five books his work *Adversus Hæreses*, which is considered the most valuable relic of early patristic literature. Of the original Greek, only the greater part of the first book has been preserved in the writings of Epiphanius and of Hippolytus, who was a pupil of Irenæus; but the existing Latin version, in five books, is very ancient, and perhaps contemporary with the author. Four Greek fragments of other compositions attributed to him were discovered by Pfaff at Turin in 1715. The first edition of his works is that of Erasmus (Basel, 1526, frequently republished); the best are those of Grabe (Oxford, 1702), Massuet (Paris, 1710, and Venice, 1734), Stieren (Leipsic, 1851-'3), Harvey (Cambridge, 1857), and in vol. vii. of Migne's *Patrologie grecque*.

IRENE, a Byzantine empress, born of obscure parentage in Athens about 752, died on the isle of Lesbos, Aug. 15, 803. She was an orphan, and 17 years old when her beauty and genius attracted the attention of the emperor Constantine V. Copronymus, who destined her to be the wife of his son and heir Leo. Their nuptials were celebrated with royal splendor at Constantinople in 769. Her husband compelled her to abandon the worship of images, but she gained his love and confidence, and was appointed in his testament (780) to administer the government during the minority of their son Constantine VI., then nine years old. In 786 she assembled at Constantinople a council to restore images in the churches; but it was interrupted by the garrison of the capital. In the following year she called another council at Nicæa, in which the veneration of images was declared agreeable to Scripture and reason, and to the fathers and councils of the church. Constantine was encouraged by his favorites to throw off the maternal yoke, and planned the perpetual banishment of Irene to Sicily. Her vigilance disconcerted the project, but, while the two factions divided the court, the Armenian guards refused to take the oath of fidelity which she exacted to herself alone, and Constantine became lawful emperor. Irene was dismissed to a life of solitude in one of the imperial palaces, but her intrigues led to several conspiracies for her restoration. On the return of Constantine from an expedition against the Arabs in 797, he was assailed in the hippodrome by assassins, but escaped, and fled to Phrygia. Irene joined her son and persuaded him to return to the capital. There he was surprised by her emissaries, and stabbed in the eyes, but, according to Gibbon, survived many years. Irene ruled the empire for five years with prudence and energy. Intercourse was renewed between the Byzantine court and that of Charlemagne, and she is said to have sent ambassadors (about 800) to negotiate a marriage between that emperor and herself, thus to unite the empires of the East and West; but there is reason to doubt that this was the object of the embassy. As her golden chariot moved through the streets of Constantinople, the reins of the four white steeds were held by as many patricians marching on foot. Most of these patricians were eunuchs; and one of them, the great treasurer Nicephorus, having been secretly invested with the purple, immediately caused her arrest, and, after treacherously obtaining possession of her treasures, banished her to the isle of Lesbos (802). There, deprived of all means of subsistence, she gained a scanty livelihood by spinning, and died of grief within a year. Her protection of image worship has caused her to be enrolled among the saints in the Greek calendar.

IRETON, Henry, an English soldier, son-in-law of Oliver Cromwell, born in Nottinghamshire in 1610, died in the camp before Limerick, Nov. 15, 1651. He graduated at Trinity col-

lege, Oxford, and commenced reading for the law; but his studies were interrupted by the civil war, and he joined the parliamentary army. At the battle of Naseby he was taken prisoner, but escaped. Having married Bridget Cromwell, Oliver's eldest daughter, in 1646, he was appointed captain of horse, and soon afterward colonel. Ireton was one of the most active in compassing the death of the king, and signed the death warrant. Under the protectorate Cromwell made him president of Munster and afterward lord deputy of Ireland, in which capacity he acted with much administrative vigor, and the greater part of the island submitted to him without resistance. He died of the plague. His body was carried to London, and buried in the chapel of Henry VII. in Westminster abbey. On the restoration his remains were exhumed, exposed on a gibbet, and burned by the hangman at Tyburn. The royalists admitted his ability, but denounced him as treacherous and hypocritical; his friends eulogized his sanctity and talents. From his skill in drawing up ordinances, petitions, and declarations, he was called "the scribe." A pension of £2,000 from the confiscated estates of the duke of Buckingham, refused by him, was settled on his family.

IRIARTE. See YRIARTE.

IRIDIUM (Lat. *iris*, rainbow), a metal so named from the colors exhibited by its solutions; symbol, Ir; chemical equivalent, 98.56. It was discovered by Descotils in 1803, and by Smithson Tennant in 1804. It occurs native and nearly pure, also associated with osmium, platinum, and rhodium, and in alloys of various proportions of these metals. An alloy of one fifth platinum and four fifths iridium has been met with in octahedral crystals whiter than platinum, and of specific gravity 22.66. When native platinum is dissolved in nitro-hydrochloric acid, black scales remain behind, which are composed of iridium and osmium. These metals may then be separated by one of the methods in use, and the iridium is obtained in a gray metallic powder, resembling spongy platinum. It is very hard, white, and brittle, and may be melted on lime by the oxyhydrogen blowpipe, or by the heat of the voltaic current. When thus fused it has the specific gravity of 21.15. None of the acids attack the pure metal, but when alloyed with platinum it is readily dissolved by aqua regia. Iridium black, similar to platinum black, may be obtained by decomposing a solution of its sulphate by alcohol. If heated in a finely divided state in the open air, iridium absorbs oxygen; it is also oxidized by nitre and caustic potash. Small grains of iridium containing a little platinum are picked out from the grains of the latter metal, and from their extreme hardness make excellent nibs for gold pens.

IRIS, in Greek mythology, a daughter of the sea god Thaumas and of the oceanide Electra, and sister of the Harpies. According to some writers she was a virgin; others make her the

wife of Zephyrus and mother of Eros. She was the personification of the rainbow, and messenger of the gods.

IRIS, in botany, the generic name of a number of beautiful plants belonging to the natural order *iridaceæ*. The plants of this order are endogenous, having a creeping rootstock (*rhizoma*), or else a flat tuber (*cormus*), equitant leaves, irregular flowers, three stamens, and an inferior ovary. They are represented equally in the temperate and hotter regions of the globe. The wild species of iris are generally called blue-flag, and the cultivated flower-de-luce, from the French *fleur de Louis*, it having been the device of Louis VII. of France. Our commonest blue-flag, *I. versicolor*, is a widely distributed plant, its violet-blue flowers, upon stems 1 to 3 ft. high, being conspicuous in wet places in early summer; the root of this possesses cathartic and diuretic properties, and is used by some practitioners. The slender blue-flag, *I. Virginica*, found in similar localities near the Atlantic coast, is smaller in all its parts. A yellowish or reddish brown species, resembling the first named in appearance, is *I. cuprea*, found in Illinois and southward. There are three native species which grow only about 6 in. high and have blue flowers: *I. verna* and *I. cristata*, in Virginia and southward, and *I. lacustris*, on the shores of the great lakes; these are sometimes seen as garden plants. The orris root of the shops is the

Iris Florentina.

produce of *I. Florentina*, *I. pallida*, and *I. Germanica*, which grow wild in the south of Europe; the rhizomes are pared and dried, and exported from Trieste and Leghorn, chiefly for the use of perfumers; they have the odor of violets. The garden species of iris are numerous, and these by hybridizing and crossing have produced a great many known only by garden names. The dwarf iris, *I. pumila*, from 3 to 6 in. high, flowers very early and

makes good edgings to borders; the common flower-de-luce of the gardens is *I. Germanica*; the elder-scented flower-de-luce is *I. sambucina*. There are several with yellow and brownish flowers, among which are *I. pseudacorus* and *I. flavescens*; the recently introduced *I. Iberica*

Mourning Iris (*Iris Susiana*).

presents a remarkable combination of colors. These and many others are hardy in our climate, and readily multiplied by division of their rootstocks. *I. Susiana*, the mourning or crape iris, is one of the finest of the genus, its flowers being very large, dotted and striped with purple on a gray ground. In the northern states it needs winter protection. There are several species of iris with bulbous roots, and highly ornamental, such as the Spanish iris (*I. riphoides*) and the Persian iris (*I. Persica*), with exquisitely scented blossoms of an elegant pearly whitish hue, admirably adapted to forcing in pots for the drawing room.

IRISH MOSS. See CARRAGEEN.

IRISH SEA, that part of the Atlantic ocean which lies between Scotland on the north, England on the east, Wales on the south, and Ireland on the west. It contains the isle of Man, Anglesea, Holyhead, and a few islets. Carnarvon and Morecambe bays, and the estuaries of the Dee, Mersey, and Ribble, are its inlets in England; Solway frith, Wigtown and Luce bays, in Scotland; and Dundrum, Carlingford, Dundalk, and Dublin bays, in Ireland. The principal rivers flowing into it from Great Britain are the Esk, Ribble, Mersey, and Dee; from Ireland, the Liffey and the Boyne.

IRKUTSK. **I.** A government of Asiatic Russia, in the S. part of E. Siberia, bordering on Mongolia; area, 271,875 sq. m.; pop. in 1870, 365,810. The continuations of the Altai mountains form its S. boundary. The surface is elevated, the general level in the north and east being from 2,500 to 3,000 ft., and that in the south 1,200 to 2,000 ft. It is watered by the Angara, Lena, and several smaller rivers, and

contains Lake Baikal. It is rich in minerals, among which are gold, silver, copper, and iron. Extensive forests, furnishing excellent timber, and abounding in all kinds of game, occupy a large portion of the country; and agriculture is prosperously conducted, barley and rye being the principal crops. The pastures support great numbers of cattle and sheep. The summers are short, but very warm and generally clear, while the winters are so cold that sometimes mercury freezes. A considerable portion of the inhabitants are descendants of Russian exiles, and the majority of the natives are Mongols, Tunguses, and Buriats. **H.** A city, capital of the government and of E. Siberia, on the right bank of the Lower Angara, about 35 m. from its source in Lake Baikal; pop. about 30,000. It lies on both sides of the mouth of the Ushakovka, a small tributary of the Angara, and opposite the confluence of the Irkut with the latter river. It is well built, paved, and lighted. The principal streets run parallel with the Angara, on the banks of which are the exchange, the admiralty offices and dockyards, the governor general's palace, and various government factories and workshops in which convicts are employed. In the centre of the city is a handsome public square, on which front the houses of many of the functionaries, and the guard house. The school of medicine, the gymnasium, and the former depot of the Russian American company are fine and spacious. There are many public schools, a high school for navigation, a female orphan school, a theatre, and a good bazaar. The city is fortified, and has a citadel. It contains 15 churches, and numerous convents and hospitals, and is the see of an archbishop. Nearly all the houses are of wood, neatly planked, and painted yellow or gray. The principal manufactures are woollens, linens, leather, glass, and soap. The trade of Irkutsk is important. It is the great commercial entrepot between the Chinese empire and European Russia, exporting to the latter tea, rhubarb, fruits, porcelain, paper, silk, &c., in exchange for furs, metals, and various European goods. It has a great fair in June.

IRON, one of the elementary substances, possessing when pure the following characters: specific gravity, 8·1393 (Percy); hardness, 4·5; crystalline form, isometric; color, silver-gray; lustre, metallic; atomic weight, 56 (O = 16); specific heat, 0·113795. Its symbol is Fe (*fer-rum*). Although seldom found native, and never pure, iron is the most universally and extensively distributed of metals. It occurs in large deposits in the form of oxide, and constitutes an ingredient of nearly all rocks, soils, and natural waters. So-called chalybeate mineral springs contain it in relatively large amounts. As a consequence of this wide distribution in the inorganic world, it is found also in vegetable and animal organisms, constituting 0·07 per cent. of the blood, or 5·5 to 8·5 per cent. of the ash of blood. Pure iron is un-

known in the arts; and, owing to the difficulty of procuring it on a large scale, its properties have been but slightly investigated. Peligot states that iron prepared by the reduction of its protochloride by hydrogen, is filamentous, compact, malleable, and almost as white as silver. Iron deposited by the galvanic battery is grayish white and susceptible of a high polish; it is scarcely attacked by sulphuric or muriatic acid at ordinary temperatures, but is dissolved on application of heat, evolving hydrogen free from fetid odor (in contradistinction from manufactured iron). Its malleability is not affected by rapid cooling after exposure to a high temperature. Iron may be rendered strongly magnetic by induction, but loses its magnetic power, when pure, as soon as the source of magnetism is removed. Throughout a wide range of temperature, from red heat to near its melting point, iron is more or less plastic. At red heat it is readily forged under the hammer, and at white heat two masses of iron can be firmly and intimately incorporated with each other (welded) by hammering or pressure. Welding, though not exclusively a property of iron, is possessed by no other metal to so great a degree. It is volatilized in the heat of the voltaic arch.—Iron is a metal of active chemical affinities, and enters into a large number of compounds. It combines with oxygen in four proportions, as follows:

COMPOUNDS WITH OXYGEN.	For- mula.	Iron, per c't.	Oxygen per c't.
Ferrous oxide (protoxide of iron).....	FeO	77·77	22·23
Ferric oxide (sesquioxide of iron).....	Fe ₂ O ₃	70·00	30·00
Ferroso-ferric oxide (protosessquioxide of iron; magnetic oxide).....	Fe ₃ O ₄	72·41	27·59
Ferric acid.....	FeO ₃	53·80	46·20

Metallic iron rusts when exposed to moist air, and is gradually and completely converted into oxide. Mr. Grace Calvert, investigating the conditions necessary or favorable to the rusting of iron, has found that it is not acted upon by pure, dry oxygen or carbonic acid, while it is feebly attacked by moist oxygen or carbonic acid, and most rapidly by moist oxygen containing traces of carbonic acid, which forms first oxide, then ferrous carbonate, and finally hydrated sesquioxide, with admixtures of ferrous oxide and carbonate. Carbonic acid and water likewise act with energy. Solutions of alkaline hydrates, carbonates, or bicarbonates prevent the rusting of iron, while a solution of sugar promotes it. The oxidation of iron may be hindered by attaching it to a more electro-positive metal, such as zinc, or promoted by the presence of a more electro-negative metal, such as copper. Under ordinary circumstances zinc will protect iron when it covers only $\frac{1}{15}$ of the surface of the latter, but in a solution of sugar the proportion of surface covered by zinc must be 1 to 15. The following analysis by Grace Calvert gives the composition of rust from Llangollen, Wales:

Ferric oxide.....	93.094	Silica.....	0.196
Ferrous oxide.....	5.810	Ammonia.....	trace.
Ferrous carbonate.....	0.605		
Calcic carbonate.....	0.295		100.000

Iron decomposes steam at a red heat and is converted into oxide, hydrogen being liberated. But hydrogen passed over oxide of iron at a red heat reduces it to metallic iron, water being formed. The character of the action is here determined by the relative amounts of free hydrogen and steam. If the former predominates, reduction takes place; if the latter, oxidation. Dilute mineral acids dissolve iron, converting it into a ferrous salt, hydrogen being evolved. Under certain circumstances iron becomes "passive," and is not attacked by strong acids. This condition is brought about in various ways, and seems to be connected with a superficial oxidation of the iron. Iron burns with brilliancy in oxygen gas. Reduced by hydrogen from finely pulverized oxide, it burns readily in the air, taking fire spontaneously when the temperature of reduction has not been too high, but otherwise requiring to be first ignited. Ferrous oxide possesses so strong an affinity for oxygen that it is isolated with difficulty. Its salts are permanent when crystallized, but rapidly absorb oxygen when exposed to the air in solution. Ferrous carbonate occurs abundantly in nature. The most important ferrous salt is the sulphate, commonly called green vitriol or copperas, obtained as an incidental product in many metallurgical operations, and applied to manifold uses in the arts. It forms a number of double salts with other sulphates. Ferric oxide occurs abundantly in nature. (See IRON ORES.) It may be prepared artificially by precipitating the hydrate from solution and subsequently igniting it, and also by simple ignition of the sulphate or nitrate; its powder is red. Ferric oxide and its salts are stable in the air, but part with a portion of oxygen when in contact with organic matter; a familiar instance is the rotting of fabrics of cotton or linen by "iron mould." On this property depends the disinfecting power of iron compounds. Ferric oxide acts also as a carrier of oxygen. Bischof has shown that spongy metallic iron is a powerful disinfectant, probably first becoming oxidized itself, and subsequently parting with its oxygen to the organic matter, then becoming again oxidized, and so on. Ferric oxide is largely used in the polishing of metals and glass. It forms salts which do not crystallize as readily as the ferrous salts. Ferroso-ferric oxide, generally called magnetic oxide, is abundant in nature, and may be regarded as a compound of the two oxides, and its salts as compounds of ferrous and ferric salts; it is perfectly stable; its powder is black. Ferric acid is formed by heating together ferric oxide with saltpetre; it forms salts which are very unstable.—Iron combines with sulphur in two proportions, forming a proto- and a bisulphide. The former is largely used in

the preparation of sulphuretted hydrogen for chemical purposes. The latter, known as pyrite or iron pyrites, occurs abundantly in nature, and is used largely as a source of sulphur in the preparation of sulphuric acid. Iron forms a definite compound with nitrogen, Fe_4N_2 ; but it is doubtful whether nitrogen plays any part in the manufacture of iron or steel. Compounds of carbon, phosphorus, and silicon with iron also exist; the effect of these substances on the properties of iron is discussed below. The compounds of iron with chlorine and cyanogen are of great importance in chemistry and in the arts. There are two chlorides, FeCl_2 and Fe_2Cl_6 , corresponding to the two oxides, and two double compounds with cyanogen, potassic ferrocyanide or yellow prussiate of potash, $\text{K}_4\text{FeC}_6\text{N}_6$, and potassic ferricyanide, or red prussiate of potash, $\text{K}_3\text{FeC}_6\text{N}_6$, which are valuable chemical reagents. The ferrocyanide of iron, or Prussian blue, $\text{Fe}_4\text{FeC}_6\text{N}_6$, is formed by precipitation of a solution of a ferric salt with yellow prussiate of potash.—Iron is used in medicine as a reconstructive tonic. It is an important constituent of the animal tissues, and under ordinary circumstances the supply normally present in the food is equal to the demand; but when the number of red blood corpuscles, which contain much iron and are the special carriers of oxygen, is diminished, then their re-formation may be promoted by the administration of iron preparations. This condition (anæmia) is the real indication for iron, most of the special diseases in which it is used being dependent upon or accompanied by this condition. Hence it is largely used not only in anæmia, but in neuralgic affections, dropsy, Bright's disease, scrofulous affections, incipient phthisis, hæmorrhages, the various diseases of females, in the convalescence from acute diseases, and in the protean forms of debility and weakness. A few of the salts are astringent, and a portion of their effect is probably due to their local action upon the stomach. These may be used not only as reconstructive agents, but to check discharges and arrest hæmorrhage. Iron is absorbed in small quantity, so that a considerable proportion of every dose passes through the bowels unappropriated. It may be detected in the urine, and the amount normally present has been found increased in the milk of animals to which iron has been administered. The bodily temperature is raised, the pulse quickened and strengthened, and the appetite and nutrition improved by its administration. Headache and constipation are the consequences of too large doses or too long continued use. The number of preparations in use is exceedingly and unnecessarily large, and constantly increasing. Among them are metallic iron, a grayish powder; the protocarbonate, in pills and mixture; the sulphate; hydrated oxide, usually called subcarbonate; tincture of the chloride; wine of iron; tartrate of iron and potassa; phosphate, lactate, and iodide; citrate

of iron and quinia; iron and strychnia, &c. The astringent preparations are the perchloride, subsulphate, and ferric alum. The freshly precipitated sesquioxide is the best antidote for arsenic. In cases of decided anæmia, the stronger preparations of iron are indicated, as the tincture of the chloride, the perchloride, and the sulphate. In other cases the milder salts are generally preferred. The iodide of iron is especially adapted to scrofulous affections. The addition to iron of nux vomica or strychnia, or of bitter tonics like gentian, often enhances its therapeutic action. The administration of iron is contra-indicated by gastric or gastro-enteric inflammation, by plethora, fever, and febrile conditions generally. The dose of iron varies with the preparation used. It is a sort of food, and is best given with or near meals. During its use, the faces are colored dark by it.—In the arts, iron occurs in three forms, as wrought iron, cast iron, and steel. Wrought iron is nearly pure, and highly malleable, ductile, and weldable. It is fused with difficulty, and its finished forms are therefore generally wrought at a welding heat. It contains invariably a small amount of chemically combined carbon, 0.25 per cent. or less, and intermingled cinder. Its specific gravity varies from 7.3 to 7.8. Its temperature of fusion is about 1800° C. or 3240° F. Cast or pig iron is in most respects the opposite of wrought iron. It is not in the slightest degree malleable, ductile, or weldable. It is readily fusible, and is therefore always cast in moulds. It is much harder than wrought iron, and is relatively rigid and brittle. There are many varieties of cast iron, exhibiting great diversity of properties. In color, the extremes are white and black, with a number of intermediate shades of gray. The hardness and brittleness vary through wide limits. White cast iron is the hardest, most rigid, and most brittle; it resists the action of the file and drill, while many of the dark varieties can be tooled with ease. The fusibility of the different varieties of cast iron likewise differs greatly. The dark irons generally require a high heat for fusion and become thinly liquid; they fill forms well, and, as they expand in cooling, make sharp castings, and are hence often called foundry irons. The lighter shades do not become so thinly liquid when fused, and as they contract on cooling are not adapted for castings; they usually contain a smaller amount of foreign matters, and hence, being adapted to conversion into wrought iron, are called forge irons. The specific gravity of cast iron varies from 6.9 to 7.7; its fusing point is about 1500° C. or 2700° F. The difference between gray and white iron is strongly marked in the molten condition, as they flow from the furnace. Dark cast iron flows quickly and sets without any movement of the surface; when hard, the upper surface is smooth and convex. White iron emits an abundance of brilliant sparks, and its surface is vigorously agitated by the formation of crys-

tals; the forms of the crystals are characteristic of the grade of the iron; when hard, the surface is honeycombed and depressed. There are two other varieties of cast iron: specular iron, or *Spiegeleisen*, and silvery or glazy iron. They are both white, but differ in character and composition from each other and from ordinary white iron. Chemically, cast iron is further removed than wrought iron from the pure metal; it always contains from 2 to 5 per cent. of carbon. The union of the carbon with the iron may be either chemical or mechanical, and usually both conditions are present in the same mass. The result of the chemical union of iron and carbon is white iron, while the mechanical mixture of iron with black scales of graphite is dark-colored; the preponderance of one or the other of these conditions gives the various shades from black to white. Sometimes cast iron is composed of a mixture of white and gray iron in patches; the iron is then called mottled. The different grades of pig iron are generally designated by numbers. No. 1 stands for highly graphitic open-grained iron, and Nos. 2, 3, and 4 for the lighter and more compact varieties, passing toward white. Mottled and white irons are generally designated by name. Malleable castings (see IRON MANUFACTURE) are cast iron which has been rendered partially malleable without alteration of form.—Steel holds, both in physical properties and in chemical composition, an intermediate position between cast and wrought iron. It may be considered as a compound of iron with 0.25 to 2 per cent. of carbon. The limits given for carbon in wrought iron, steel, and cast iron, viz., 0.25 per cent. or less in wrought iron, 0.25 to 2 per cent. in steel, and from 2 to 5 per cent. in cast iron, are to be regarded as approximate only. No sharp and accurate distinction, based on chemical composition, can be drawn between these three varieties of iron. Steel with the minimum of carbon (mild or soft steel) can scarcely be distinguished from wrought iron; it exhibits the properties of malleability, ductility, and weldability nearly to an equal degree with wrought iron; while steel with the maximum of carbon (strong or hard steel) approximates so nearly to cast iron that the above properties are almost entirely wanting. The fusing point of steel is intermediate between those of cast and wrought iron. The properties that preëminently characterize steel are connected with hardening and tempering. When heated to redness and suddenly cooled by plunging into water or other liquid, it becomes hard in proportion to the amount of carbon it contains, the temperature to which it has been raised, and the rate of cooling. Such hardened steel, being again heated and allowed to cool slowly in the air, loses its hardness to a degree proportional to the temperature to which it was reheated. This process is called tempering. Hardening and tempering are generally regarded as pe-

cular to steel; but, properly considered, they belong to all compounds of iron and carbon. Wrought iron contains too little carbon to show much hardening when rapidly cooled from a high temperature, but it is generally rendered more rigid by such treatment. Cast iron becomes very hard and brittle on sudden cooling, but, since it is much more complex in composition than steel, the circumstances controlling the hardening are not so well understood. Cast iron which has been hardened may by a process of tempering be rendered soft again. The precise nature of the hardening process is not understood. It has been supposed to result from a chemical union of the carbon with the iron, formed at high temperature, and maintained under rapid, but resolved by slow cooling. It has also been ascribed to a state of tension or polarity of the particles, which is relieved by tempering. In the case of cast iron a change in the condition of the carbon may be often observed; some dark graphitic irons become perfectly white (chill) on sudden cooling. As to the character of the union of iron and carbon in cast iron, a difference of opinion exists. Gurlt, Mayrhofer, Hahn, and others, have endeavored to establish the existence of definite combinations of iron and carbon, such as FeC , Fe_2C , Fe_3C , Fe_4C , and suppose the different varieties of cast iron to be compounds or mixtures of these definite carburets with iron. The formula of spiegeleisen, in which the carbon is all combined, was supposed by Karsten to be expressed by Fe_4C , which would require 5.8 per cent. carbon, but this amount is never found in reality. Gurlt proposed a lower carbide, Fe_6C , which he supposed to stand in the same relation to gray iron as Karsten's tetracarbide did to white iron. These formulas, although interesting and attractive in a theoretical point of view, must be regarded as purely imaginary. Isolated analyses may seem to indicate their existence, but extended investigations show that the variations of composition in cast iron are too great to admit of any definite formulas. In the molten condition all the carbon is most probably combined with the iron. The separation of carbon as graphite takes place on cooling, and the amount separated is, other things being equal, determined by the rate of cooling. When we consider the number of factors that enter into the case, it is not surprising that we fail to detect any regularity in the composition of cast iron. Durre proposes a classification of cast iron based on physical characters. He considers all pig irons to be mixtures of two different substances, namely, graphite and a white or light gray matrix or ground mass. He recognizes three types of iron, represented by spiegeleisen, in which the ground mass forms bold, brilliant, reed-like bundles of crystals; Swedish cannon iron, in which it appears as thin thread-like bundles; and Scotch iron, in which it presents short interlaced figures, almost obscured by the graph-

ite.—The manifold properties possessed by iron in its various forms constitute its great value in the arts. No other metal or metallic combination possesses such a wide range of properties. The hardness and rigidity of pig iron, and the facility with which it can be cast into any desired form, adapt it to use in construction for the resistance of a crushing weight, and also to an infinite variety of utensils. The purer kinds often possess moreover great toughness, and are available for ordnance. Wrought iron, having a high degree of tenacity and elasticity combined with malleability and ductility, is applicable to numberless uses in every-day life, particularly those which require not only strength, but the ability to resist shock. Steel is stronger than wrought or cast iron, but is intermediate between the two in rigidity. It replaces wrought iron advantageously in construction where strength is required in small bulk; but it is excluded, except in the softest varieties, where shocks are to be encountered. Its property of hardening, combined with malleability and ductility, adapts it for the manufacture of cutting tools. Until the comparatively recent introduction of the Bessemer process and the Siemens regenerative heating furnace (see FURNACE), it was impossible to melt wrought iron on the large scale; and the distinction between wrought iron and cast steel was therefore well marked in their physical characters, steel showing a homogeneous crystalline, and wrought iron a more or less fibrous structure, due to the intermingled cinder. This distinction in physical characters disappears when soft iron (that is, iron with 0.25 per cent. or less of carbon) is melted and cast in moulds; and the tendency of metallurgists at the present time is to call this product steel, without regard to its contents in carbon or its susceptibility to hardening. Bessemer and open-hearth (Martin) steels include products varying from hard steel to soft iron; they have, however, the common property of homogeneity, whence the name sometimes applied to them of "homogeneous metal." In both steel and wrought iron, therefore, the distinction is to be observed between welded and cast products. (See STEEL.)—Manufactured iron has thus far been considered in the present article merely as a compound of iron and carbon. It is generally, however, much more complex in composition, and we will now consider each kind separately in greater detail. I. CAST IRON. This is the product of the blast furnace (see IRON MANUFACTURE), and contains a number of elementary substances derived from the ore, flux, and fuel used in its production. The substances most commonly met with (besides carbon, which must be regarded as essential) are silicon, sulphur, phosphorus, manganese, and more rarely, or in smaller quantities, chromium, copper, nickel, cobalt, titanium, arsenic, antimony, aluminum, calcium, and magnesium. The following analyses will serve as examples:

The localities of the samples furnishing the above analyses, and their description as far as given, are as follows: White iron.—1. Mariazell, Styria; charcoal; sp. gr. 7.729. 2. Reschitz, Hungary; charcoal. 3. Cleveland, England; coke. 4. Medellin, Colombia, used for stamp heads; sp. gr. 7.45. 5. Primör, Tyrol; spiegeleisen. 6. Sava, Carniola, Austria. 7. Fröschnitz, Styria. 8. Bieber, Prussia. 9. Müsen, Prussia. Mottled iron.—10. Cleveland, England. 11. Styria: *a*, white portion, sp. gr. 7.069; *b*, gray portion, sp. gr. 6.928. Gray iron.—12. No locality; analysis by Fresenius. 13. Cleveland, England. 14, 15, 16. Bessemer iron: Reschitz in Hungary, Neuburg in Styria, and English (hematite). 17. American gun iron. 18. Austrian gun iron. 19. "Glazy" iron, English. The influence which each of these elementary substances exerts on the physical properties of pig iron cannot be stated with precision. The subject is one of great complexity, and has not been thoroughly investigated. The following comprises what is known about it. When iron is fused in the presence of carbon, in a reducing atmosphere—conditions which obtain in the blast furnace—it combines with a portion of carbon, forming a readily fusible compound. The condition of the carbon in the molten iron is not certainly known, but it is probably in chemical combination. When, however, this carburetted compound solidifies, the carbon may either remain in combination, giving the iron a white color; or it may assume the form of graphitic scales, mechanically disseminated throughout the mass, giving it a black color; or both conditions of the carbon may coexist, imparting to the iron a shade of gray. So far as is known, these conditions are determined by the rate of cooling of the iron. When the iron is quickly cooled, as on being cast in iron moulds or poured into water, the carbon will remain in combination; when the iron is cooled slowly, the carbon has time to separate, and a part at least will appear as graphite. Snelus ("Journal of the Iron and Steel Institute," vol. i., p. 28) has proved conclusively the separate existence of graphite in pig iron. Bell's experiments ("Chemical Phenomena of Iron Smelting") seem to show that there is no difference in the amount or condition of the carbon in gray and white pig iron made at the Clarence furnace in the Cleveland district, England; and he considers the difference of color to be due to the fact that in the white varieties the graphitic scales are so minute as to be no longer visible. His experiments contradict results obtained by investigators in other localities, and have not as yet been confirmed. The highly graphitic variety of pig iron is usually produced at a higher temperature than the white; and it has been noticed that when white iron is exposed to the temperature of a furnace making gray iron, it is changed into gray. This has led to the opinion that the temperature of production is the sole cause of the

difference in the two varieties. A more correct statement of the fact would perhaps be, that the color of the pig metal, or in other words the amount of graphite separated, is due, other things being equal, to the time or rate of cooling. White iron caused to solidify very slowly becomes gray; and gray iron cooled quickly becomes white. The cause of this difference is conceivable on one supposition only, viz.: that there is a limited range of temperature, probably near the point of solidification of the metal, within which the separation of the carbon from the iron takes place, and that the amount of carbon separated in any given instance is proportional to the time consumed by the cooling pig iron in passing through this range of temperature. It is evident that the time required for the metal to cool a given number of degrees, near its point of solidification, must depend partly upon the temperature of the surrounding moulds. The hotter the metal leaving the furnace, the more will it have heated the moulds as it approaches solidification, and consequently the slower will have become the rate of cooling, the longer will be the period during which carbon can separate, and the larger will be the amount of graphitic carbon in the final product. Carbon, as already remarked, increases the fusibility of iron. In chemical combination it renders iron brittle, the brittleness decreasing in proportion as the carbon separates as graphite.—Silicon is nearly always present in pig iron. White iron is occasionally almost free from it, but the darker sorts may contain as much as 8 per cent.; $\frac{1}{2}$ to 3 per cent. is usual. The conditions favoring the production of a highly siliconized pig iron are slow working, a high temperature in the furnace, and a cinder rich in silica. Silicon, like carbon, renders iron more fusible. The temperature of solidification of pig iron rich in silicon is therefore relatively low; and this fact, combined with the high temperature of production, affords ample opportunity for the carbon to separate as graphite. We consequently find such pig iron always highly graphitic, and very difficult to chill, or convert into white iron by sudden cooling. In many articles made of cast iron, such as rolls, car wheels, &c., it is desired to combine toughness of structure with a hard wearing surface. This is effected by casting the object in a suitable mould of iron, so that the molten iron shall be suddenly solidified on the outside, and rendered white to a moderate depth, while the mass of the casting remains gray. The casting is subsequently annealed, to relieve the tension caused by the unequal cooling. The irons most suitable for this purpose are produced with charcoal and with a cold or but moderately heated blast, and are of exceptional purity. Any considerable amount of silicon prevents the iron from chilling. Silicon renders iron brittle and weak. When present in very large quantity it makes the iron worthless both for castings and for conversion

into wrought iron. It plays an important part in the pig iron employed for making Bessemer steel, supplying by its oxidation the greater part of the heat required to retain the metal in a molten condition. The amount of silicon in Bessemer pig iron varies from 1 to 3 per cent. Silvery or glazy pig iron, occasionally produced when the furnace is working very hot with an excess of fuel, is white, but has none of the properties of white iron properly so called, and is weak and worthless for all purposes. It has not been thoroughly investigated. An analysis (No. 19) given above shows it to contain over 5 per cent. of silicon.—Sulphur is present in many ores of iron and in almost all mineral coals. The hotter the furnace and the more basic the cinder, the more sulphur will be removed in the cinder. Where the opposite conditions exist a large part of the sulphur in the charge will be found in the pig iron. The influence it exerts on pig iron has not been determined with precision. According to Egertz, 0·4 per cent. of sulphur renders pig iron stronger and more mottled. Swedish cannon iron contains from 0·07 to 0·1 per cent. of sulphur. It is the general impression among iron founders that sulphur renders pig iron harder, whiter, and more infusible; but experimental proof is wanting on this point. Phosphorus is almost always present in cast iron. Few iron ores or limestones are absolutely free from phosphorus; and almost the entire amount of this element present in the charge is absorbed by the iron, which it renders thinly liquid when fused, and crystalline and hard when solid. Such iron is well adapted to form ornamental and intricate castings, since it fills the mould well and brings out the fine outlines with sharpness. Less than 0·5 per cent. of phosphorus does not materially affect the physical properties of pig iron; and more than 5·5 per cent. renders it too weak and brittle to be used. The following table shows the amount of sulphur and phosphorus in some well known brands of English pig:

BRANDS.	Phosphorus, per cent.	Sulphur, per cent.
Whitehaven (hematite).....	0·144	0·056
South Wales.....	0·473	0·098
South Staffordshire.....	0·480	0·061
Yorkshire.....	0·540	0·052
Scotland.....	0·730	0·283
Derbyshire.....	0·865	0·045
North Staffordshire.....	1·070	0·040
Northamptonshire.....	1·143	0·267
Cleveland.....	1·320	0·085

In the conversion of pig into wrought iron by puddling, the phosphorus and sulphur are to a considerable extent eliminated. In the conversion into Bessemer steel, however, these elements remain with the iron, and therefore only the purest pig irons can be used in this process. The maximum amount of phosphorus (the most deleterious element) that Bessemer pig iron may contain is 0·1 per cent.—Manganese resembles iron in many of its chemical

properties, and generally accompanies it in its ores. The amount in spathic iron ores is often large, in other ores usually small. Manganese is reduced from its oxide with much more difficulty than iron. When the manganese forms an integral part of the iron ore, it is reduced to a large extent together with the iron; but when the oxide as such is present in the charge, it passes mainly into the slag, unreduced. The effect of manganese on cast iron is peculiar. Specular iron, generally known by its German name *Spiegeleisen*, made from spathic ores rich in manganese, contains from 4 to 12 (exceptionally as high as 20) per cent. of the latter metal, and also nearly 5 per cent. of carbon, all chemically combined, and but a fraction of 1 per cent. of silicon. On its freshly fractured surface it is white and resplendent, with large crystalline faces. It is very hard. Gray pig iron may contain as much as 6 per cent. of manganese without showing any tendency to whiteness; the effect of manganese may here be counteracted by the silicon. Pig iron containing manganese is preëminently adapted for conversion into wrought iron and steel. The part that manganese plays in these processes is not well understood. It replaces silicon as a heat producer in pig iron employed in the Bessemer process. *Spiegeleisen* is generally very pure, and is almost exclusively used in steel-making. The effect of the other substances mentioned above on the physical properties of pig iron is not known definitely. II. WROUGHT IRON. By far the largest amount of wrought iron in the arts is made from pig iron by the removal of the carbon, silicon, &c., through oxidation in a reverberatory furnace. (See IRON MANUFACTURE.) The iron is removed from the furnace in the form of a white-hot ball or bloom, composed of small particles of soft iron, intimately mingled with cinder. The cinder is expelled and the particles of iron are united by squeezing, hammering, or rolling. Slabs of iron thus made are welded by exposing them to a white heat and rolling them out together. The homogeneity of the product depends on the thoroughness of the working, and this in turn on the temperature and the fusibility of the cinder. The fibrous character of wrought iron is due to the elongation of the granules or crystals of iron by rolling with intermingled cinder. Fibre, however, is not a condition inherent in iron, nor is it necessarily characteristic of good or strong iron, as is often supposed. Iron from which the cinder has been removed by thorough working, or by fusion, exhibits the granular crystalline fracture proper to the metal itself; and such iron is, other things being equal, stronger than that showing well developed fibre. But fibrous structure is evidence of good quality in iron, in so far as it shows the absence of substances (notably phosphorus) which tend to make it crystalline and brittle. It is to be observed that all iron, even the most fibrous, shows a crystalline character when broken short off; and that some

varieties of crystalline iron may appear fibrous when bent and broken slowly. The specific gravity of wrought iron differs according to treatment. The following determinations are by Kirkaldy: rolled, 7·7626 to 7·2898; hammered, 7·8067 to 7·7206; angle iron, 7·7310 to 7·5297; sheet iron, 7·7419 to 7·5381. The physical properties of wrought iron are intimately connected with its chemical composition. Carbon is almost always present in minute quantity; without it, iron is liable to take up oxide of iron and become rotten or "burnt." In the analysis of wrought iron it is often difficult to determine whether a substance is present in the iron itself or in the cinder. This is especially the case with silicon. The amount of silicon in wrought iron is never large (disregarding cinder), as it is the element most readily removed by oxidation in the operation of puddling. It is supposed to render the iron weak and brittle. Sulphur and phosphorus are frequently met with in wrought iron, and their effects have been tolerably well determined. Sulphur makes iron "red short" or "hot short," that is, brittle at a red heat. Phosphorus, on the contrary, makes iron "cold short," that is, brittle when cold. A red short iron can be worked cold, and a cold short iron hot. According to Eggertz, iron with 0·04 per cent. of sulphur can still be punched hot. More than this amount renders iron perceptibly red short. The effect of phosphorus on wrought iron differs according to the treatment it has received. Its tendency, even in proportions as low as 0·1 per cent., is to make iron coarsely crystalline in texture; this tendency is increased by prolonged heating. The strength and extensibility are thereby decreased and the hardness increased. If however the phosphorus is in not too large quantity and the iron is drawn out to such an extent that on slow fracture it exhibits a fibrous structure, the metal becomes both strong and tenacious. The presence of cinder facilitates the formation of fibre; and iron with an abundance of cinder (2 to 3 per cent.) has been found by Knut Styffe to be tenacious with 0·25 to 0·35 per cent. of phosphorus. He considers that phosphorus, like carbon, raises the elasticity and strength within the crystalline particles of the iron (whence results its superior hardness), but that it does not increase the cohesion between the separate crystals. The general impression among iron workers is that phosphorus and sulphur neutralize each other in iron, so that a "neutral" iron can be made from a mixture of cold and hot short irons. Whether the effect produced by such a mixture is one of neutralization, strictly speaking, or merely of dilution, remains to be determined. Little is known of the effect of other elementary substances on wrought iron. Manganese, if present in pig iron, is almost entirely removed on conversion into wrought iron. Chromium, titanium, tungsten, manganese, and other substances are sometimes added to

steel in the process of manufacture, and appear to modify its properties materially.—Prof. Graham ("Chemical Journal," vol. v., 1867), in his investigations on the occlusion of gases in metals, found that wrought iron contained many times its own bulk of gas, notably carbonic oxide. Mr. John Parry, of the Ebbw Vale iron works, Wales, has studied the subject more closely, and found that all iron contains occluded gas. In his experiments the amount of gas evolved was not determined, but its composition is as follows:

KINDS.	Carb. oxide.	Carb. acid.	Hydrogen.	Nitrogen.
Pig iron:				
Spiegeleisen.....	17.570	0.942	81.105
White iron.....	2.320	6.800	84.000	6.880
Gray iron.....	5.200	1.600	89.700	3.250
Wrought iron.....	34.262	9.920	54.100	1.718
Soft steel.....	24.352	16.550	52.610	6.488

The amount of hydrogen that gray pig iron is capable of absorbing when heated in an atmosphere of this gas has been found by Parry to be 20 times its volume. By increasing the heat the gas thus absorbed is given off. Of the effect of gases on the physical properties of iron nothing is known, and the part they play in the various manufacturing processes is only beginning to be investigated. (See IRON MANUFACTURE.)—Compounds of iron with potassium, aluminum, manganese, nickel, lead, antimony, tin, and copper are known; but none of them have found important application in the arts, except ferro-manganese, which is often used instead of spiegeleisen in the Bessemer and Martin processes. It contains sometimes over 40 per cent of manganese, with a very small amount of carbon, is acknowledged to give better results than spiegeleisen, and would supersede the latter but for its cost.—*Strength of Iron.* The strength of cast and wrought iron varies through wide limits. Cast iron is inferior to wrought iron in strength when exposed to tensile, torsional, or transverse strain, but shows a very high resistance to compression. Owing to its rigidity, it stretches but slightly under stress, while wrought iron elongates considerably. In estimating tensile strength, therefore, regard must be had to the fractured as well as to the original area. The softest and purest irons elongate most, and consequently show a low tensile strength when referred to the original area, but a high degree of resistance when referred to the fractured section. A gradual increase in the amount of extension under strain is noticed from cast iron through steel to the softest wrought iron. The following tables, compiled from the experimental results of Hodgkinson, Fairbairn, Kirkaldy, Thalén, Rodman, and others, show the limits of strength of cast and wrought iron and steel under different conditions and treatment. (Steel is included here to facilitate comparison. For more detailed information with regard to this substance, see STEEL.)

The tensile strength of Austrian gun iron is from 30,000 to 38,000 lbs.; of Russian, about 27,000 lbs.; and of Swedish, about 34,000 lbs. Experiments made by Capt. Rodman of the United States ordnance corps, with Greenwood, Springfield, and Salisbury pig irons (charcoal), and mixtures of the same, showed in 16 determinations a minimum specific gravity of 7.099 and a maximum of 7.307; a minimum tensile strength of 22,179 lbs. and a maximum of 42,884 lbs. to the square inch. The following determinations of the strength of Richmond (Mass.) charcoal pig were made at the South Boston foundry. This iron is smelted from pure red hematite, with temperature of blast varying from 100° to 350° F., and is largely used for ordnance:

	Specific gravity.			Tensile strength, in lbs. per sq. in.		
	A	B	C	A	B	C
No. 1.	7.0920	7.0858	7.0909	14,379	16,693	15,518
" 2.	7.1320	7.1252	7.0797	16,398	19,731	18,471
" 3.	7.1390	7.1796	7.1750	16,344	23,119	19,837
" 4.	7.2549	7.2533	7.2125	25,138	29,066	24,726

Remelting in a reverberatory furnace raised the average specific gravity of this iron to 7.3135, and the average tensile strength to 40,022 lbs. per square inch. Fairbairn has determined the transverse strength of cast iron rectangular bars from nearly all the British iron works. In 51 experiments on all shades of gray pig iron, the minimum breaking weight for bars 4 ft. 6 in. between supports was 357 lbs. to the square inch, corresponding to a specific gravity of 6.916, and the maximum 581 lbs., corresponding to a specific gravity of 7.122. Irons intermediate in strength, however, often show a higher specific gravity. From experiments made by Fairbairn to determine the effect of hot blast on the strength of pig iron, he concluded that No. 1 irons had been deteriorated, No. 2 slightly injured by it, and No. 3 improved by the use of hot blast. According to experiments on the resistance to torsion in cast iron, the length of the bar submitted to torsion being about eight diameters, the ultimate strength of seven samples varied from 6,176 to 10,467 lbs. to the square

inch. The force requisite to give the bar a permanent set of half a degree is about nine tenths of that which will break it. The following table shows the effect of successive remeltings on the strength of cast iron, from determinations by Fairbairn; the iron used was Eglinton No. 3, hot blast:

NO. OF MELTINGS.	Sp. gravity.	Mean breaking w'ght in lbs. per sq. in. for bars 4 ft. 6 in. between supports.	Resistance to compression for cubes 1 in. square.

Melting *per se* cannot have any effect on the physical properties of iron, and any change consequent on melting must be referred to change in chemical composition, leaving out of consideration accidental imperfections of casting. Melting may be effected in three ways: in a crucible, in a cupola or shaft furnace, or in a reverberatory or air furnace. In a crucible, by exclusion of air, the iron should be unchanged; in a cupola the atmosphere is reducing, and an increase of carbon or silicon may result; while in the oxidizing atmosphere of an air furnace the silicon and carbon are gradually removed. The following tables give the strength of wrought iron of various manufacture, composition, &c., under varying strains; steel is added for comparison:

Results of Experiments on the Strength of Iron rolled cold. (Fairbairn.)

CONDITION OF BAR.	Br'king weight per sq. in., tons.	Strength (untouched=1'000).
Untouched (black).....	26.173	1.000
Rolled, cold.....	39.388	1.500
Turned.....	27.119	1.036

The resistance of cold rolled iron to tension, compression, and transverse strain, and also its hardness, are increased in nearly the same ratio as its breaking weight. The following table exhibits the results of experiments to determine the strength of the iron from two exploded boilers, compared with other brands of American iron and English Lowmoor boiler plate:

KINDS.	Average breaking weight per sq.in.,lbs.	Highest.	Lowest.	Later less than former per cent.
Exploded boiler, steamer Westfield, 33 experiments.....	41,653	50,182	29,012	42
Sligo boiler plate, 16 experiments.....	54,123	57,012	51,813	9.1

Exploded boiler, steamer Red Jacket, 2 experiments.....	55,954	64,000	55,300	14
English best Lowmoor boiler plate, 5 experiments.....				

The great variation in strength in the iron from the exploded boilers was supposed to be due to the wrenching and twisting accompanying the explosion. From the foregoing tables it will be seen that the physical properties of iron, strength, elasticity, &c., vary according to composition and treatment. The following are some of the conclusions of Knut Styffe ("The Elasticity, Extensibility, and Tensile Strength of Iron and Steel," translated by C. P. Sandberg, London, 1869): "The limit of elasticity, the absolute strength, and the extensibility are to a great extent dependent, in both iron and steel, on the mechanical treatment to which the material has been submitted, and on the temperature to which it has been exposed, either during working or subsequently. By cold-hammering, cold-rolling, and other forms of mechanical treatment applied at a low temperature, both the limit of elasticity and the absolute strength are increased; while by the same treatment the extensibility is diminished. In these respects heating produces an opposite effect. When the proportion of carbon in iron or steel is increased, while the other conditions remain the same, the limit of elasticity, as well as the absolute strength, is to a certain extent increased; but the extensibility, on the contrary, is diminished. The absolute strength, which in good soft iron may be estimated in round numbers at 48,034 lbs. or 21.44 tons per square inch, seems to attain its maximum in steel containing about 1.2 per cent. of carbon, and is then in good cast steel or Bessemer steel about

137,240 lbs. or 61.26 tons per square inch. A small proportion of phosphorus in iron generally raises the limit of elasticity and the absolute strength, and therefore also the hardness of the metal; but at the same time it diminishes its extensibility, provided that the iron during its manufacture, has been so much drawn out that on slow rupture it exhibits a fibrous fracture. By admixture, however, of slag (which always makes the iron unsound and difficult to be re-formed when heated, but which facilitates the development of a fibrous structure), an iron containing 0.25 per cent. of phosphorus seems capable of acquiring nearly the same extensibility as an iron which contains only traces of phosphorus. The presence of slag also seems to oppose the tendency of the iron to become when strongly heated crystalline, and therefore cold-short. By heating and sudden cooling (hardening), the limit of elasticity is raised, while the extensibility is diminished, not only in steel, but also in iron. The absolute strength likewise is increased by hardening, if this be performed in a manner adapted to the quality of the material. Hardening in water without subsequent moderate heating (tempering) generally diminishes the strength of hard steel to a very considerable extent; while hardening in oil does not occasion this inconvenience, provided the heat previous to hardening has not been too high." Styffe likewise gives the result of an elaborate series of experiments on the strength of iron and steel at different temperatures from -40° F.

to 418° F., from which he deduces the following conclusions: "The absolute strength of iron and steel is not diminished by cold, but even at the lowest temperature which ever occurs in Sweden, it is at least as great as at the ordinary temperature (about 60° F.). At temperatures between 212° and 392° F., the absolute strength of steel is nearly the same as at the ordinary temperature; but in soft iron it is always greater. In neither steel nor iron is the extensibility less in severe cold than at the ordinary temperature; but from 266° to 320° F. it is generally diminished, not to any great extent in steel, indeed, but considerably in iron. The limit of elasticity in both steel and iron lies higher in severe cold; but at about 284° F. it is lower, at least in iron, than at the ordinary temperature." In the experiments on which these conclusions are based, the strength was determined by a gradually increasing strain. The result is quite different if the strain is applied suddenly, that is, if the iron or steel is submitted to shock, as is shown in the following experiments made by C. P. Sandberg (appendix to the work of Knut Styffe):

Height of Fall of Ball (weighing 4 cwt.) required to break each Rail (Iron) at different temperatures. Distance between supports 4 ft.; length of rail 10 ft. 5 in.

Mr. Sandberg concludes from these experiments that for such iron as is usually employed for rails in Wales, France, and Belgium, the breaking strain, as tested by sudden blows or shocks, is considerably influenced by cold; such iron exhibiting at 10° F. only from one third to one fourth of the strength which it possesses at 80°. The ductility and flexibility of such iron he finds also much affected by cold; rails broken at 10° showing on an average a permanent deflection of less than one inch, while the other halves of the same rails, broken at 84°, showed a set of more than four inches before fracture. He says that at summer heat the strength of Aberdare rails was 20 per cent. greater than that of Creusot rails; but that in winter the latter were 30 per cent. stronger than the former. The confusion in the statements regarding the strength of iron and steel

at different temperatures has arisen from the fact that in the experimental determinations the difference between the effect of a gradually increased and a suddenly applied strain has been overlooked. The experiments of Mr. Sandberg are conclusive on this point, and confirm the universal experience that iron and steel tools and utensils are much more liable to break in cold than in warm weather. The breaking of rails in winter has also been referred to the hardness and rigidity of the road bed; no experiments have yet been made that confirm this view.—A very thorough investigation of the strength of wrought iron at different temperatures was made by a committee of the Franklin institute of the state of Pennsylvania, consisting of Prof. W. R. Johnson, Prof. A. D. Bache, and Benjamin Reeves, from 1832 to 1837. These experiments were 73 in number, at temperatures from 212° to 1317° F. A remarkable anomaly was discovered in the behavior of iron at a temperature between 500° and 600°. About 572° was found to be the temperature of the maximum strength of iron; and the best qualities then showed a tenacity 15-17 per cent. over that possessed by the same iron at ordinary temperatures. Sir William Fairbairn made a similar observation on South Staffordshire iron. It showed from 60° to 325° a regular increase of tenacity from 62,186 lbs. to 84,046 lbs. per square inch, or 30 per cent. Mr. Clay has determined the effect of repeated workings on the tensile strength of wrought iron as follows:

	Lbs. per sq. in.		Lbs. per sq. in.

2. Reheated.....	52,864	8. "	57,344
3. "	59,585	9. "	57,344
4. "	59,585	10. "	54,104
5. "	57,344	11. "	51,968
6. "	61,824	12. "	43,904

The increase of strength is doubtless due to the increase of homogeneity, and the subsequent decrease to an oxidation of the iron.—A. Wöhler (*Ueber die Festigkeitsversuche von Eisen und Stahl*) has investigated the effect of repeated strains on iron and steel, and has shown that the rupture of a material may be effected by frequently applied strains, none of which exceed the limit of rupture; that the destruction of cohesion depends on the differences of tensions which form the limits of the oscillations of the strain; and that the absolute amount of the extreme tensions is only of importance in so far as the differences of strain which effect rupture decrease with the increasing tension. When a fibre passes from a state of tension to a state of compression, or *vice versa*, we should consider the tensional strain as positive, and the compressive strain as negative, so that the variation will be equal to the sum of the tensional and compressive strains. This condition, often called the "fatigue" of metals, is shown in the following table:

KINDS.	Ultimate breaking strain in lbs. per sq. inch.		Elonga- tion per cent.	Strain applied in lbs. per sq. inch.		Difference in maximum and minimum.	No. of applications before fracture.

Piece of cast-iron cylinder, Stettin.

The effect of vibration on fibrous iron, it has been generally supposed, is to make it crystalline. Experimental evidence is however lacking on this point. Iron subjected to vibratory shocks may become weak and break from "fatigue," or by reason of poor material or bad working; but there are no facts to prove that weakening is the result of a passage from the fibrous to the crystalline condition.—Prof. Robert H. Thurston has investigated the effect of unintermitted static stress on wrought iron and steel strained beyond the limit of elasticity, and has found that they do not lose their power of resistance or yield in the slightest degree. He has further determined that iron and steel, if strained beyond the limit of elasticity, and left under the action of the distorting force which has been found just capable of equilibrating their power of resistance, gain resisting power to a degree which has a limit in amount approximating closely, if not coinciding with, the ultimate resistance of the material, and which had a limit as to time in experiments hitherto made of three or four days. Releasing the piece entirely and again submitting it to the same force immediately does not produce this strengthening effect.—The production of iron and steel in the United States in 1872 was as follows, in tons of 2,000 lbs.:

Iron and steel rails.....	941,992
Other rolled and hammered iron.....	1,000,000
Forges and bloomeries.....	58,000
Cast steel.....	32,000
Bessemer steel.....	110,500
Martin steel.....	3,000
Pig iron.....	2,580,070

The following is the production of England, Prussia, and Sweden for 1871, and France for 1872:

COUNTRIES.	Pig iron.	Wrought iron.	Steel.
England.....	6,027,179	5,566,175	
Prussia.....	1,327,934	897,273	211,967

Sweden.....	292,850	183,989	84,588

IRON. I. A S. E. county of Missouri, drained by affluents of the St. François and Big Black rivers; area, about 500 sq. m.; pop. in 1870, 6,278, of whom 352 were colored. Iron mountain and Pilot Knob are on the N. E. border. The surface is hilly and mountainous. There are large forests of oak, hickory, pine, and cedar. Iron ore is abundant, and other metals

are found. The St. Louis and Iron Mountain railroad crosses the county. The chief productions in 1870 were 12,221 bushels of wheat, 90,385 of Indian corn, and 28,141 of oats. There were 690 horses, 919 milch cows, 1,703 other cattle, 3,178 sheep, and 4,714 swine; 5 manufactories of carriages, 1 of charcoal, 1 of pig iron, and 5 saw mills. Capital, Ironton.

II. A S. county of Utah, extending from Colorado on the E. to Nevada on the W.; area, 9,200 sq. m.; pop. in 1870, 2,277. It is intersected in the E. by the Colorado river, and crossed in the W. by the Wasatch mountains. Iron ore is found in this range, and at its base is some land suitable for agriculture, but much of the county is unavailable. The chief productions in 1870 were 8,917 bushels of wheat, 2,857 of Indian corn, 21,276 of potatoes, 17,968 lbs. of wool, 21,355 of butter, and 736 tons of hay. There were 732 horses, 2,114 cattle, 4,502 sheep, and 3 saw mills. Capital, Parowan.

IRON-CLAD SHIPS, or Armored Ships, vessels covered or plated with iron for the purpose of rendering them impenetrable to the fire of artillery. The idea of strengthening the sides of ships so as to enable them to resist attack is nearly as old as the art of navigation itself. From the time of the Norman freebooters, who protected themselves by ranging their bucklers along the sides of their vessels, down to the battle between the Kearsarge and the Alabama in 1864, in which the sides of the former were protected by hanging chains over the bulwarks, and from the time of the Romans, who built their triremes with castellated prows, to the English, who have covered their frigates with plates of solid iron, all nations have sought by means more or less perfect to make their ships impenetrable, and to render them invincible in battle. The first attempts at making iron-clad vessels were made by the Normans in the 12th century, who put an armature or belt of iron around their vessels, just above the water line; this belt terminated in front by a spur. In some instances this armature was converted into a curtain of iron or brass reaching above the bulwarks for the protection of the combatants. The crusaders of the 12th and 13th centuries protected their ships in a similar manner. Pedro of Aragon in 1354 ordered the sides of his ships to be covered with leather or raw hide to protect them against incendiary compounds. Andrea Doria, who commanded in the expedition

against Tunis in 1535, had one vessel plated with lead in his fleet, furnished by the knights of St. John of Jerusalem; and at the battle of Lepanto (1571) many of the Genoese ships were strengthened by blindages or bulwarks composed of heavy beams, old sails, cordage, &c. In 1782 the chevalier d'Arçon, on the suggestion of M. de Verdun, at the unsuccessful siege of Gibraltar, constructed and used 10 floating batteries having their tops bomb-proof, and the sides protected by parapets 6 ft. thick, composed of hard wood reinforced by cork wood, leather, and bars of iron. These floating batteries carried 214 guns of large calibre, of which 72 were reserves, and for several hours at close range withstood the heavy fire of artillery concentrated upon them. They yielded finally only to red-hot shot, and all but one were burnt or blown up. In 1814, toward the end of the war with England and after the success of the first steamboats, Robert Fulton proposed to construct a floating battery for the United States government, capable of steaming five or six miles per hour, and having walls proof against the heaviest artillery. The hope of breaking the blockade of the Hudson and Chesapeake caused this proposition to be received with enthusiasm. The vessel was be-

FIG. 1.—Demologos (elevation).

gun in June and launched in October of the same year; but owing to delays in completing her machinery, she was not ready for service till June, 1815, after the declaration of peace. This battery, called the Demologos, was 150 ft. long, and was composed of two hulls coupled together, but separated by an open space 13 ft. wide. The wheel was placed between the two hulls. The battery and machinery were protected by a wooden wall about 6 ft. thick and extending 3 ft. below the water line. The armament consisted of 30 32-pdr. guns. The

FIG. 2.—Demologos (section).

speed of the vessel reached nearly six knots per hour. Her name was changed to the Fulton after the death of that distinguished engineer. This vessel seems to have been far ahead

of her time, and, although never used in warfare, was doubtless superior to anything of the kind ever built up to that day. She was destroyed by the explosion of her magazine in 1829. In 1838 the Fulton II. was constructed, but with improved engines and greater speed. She was a true side-wheel steamer, and her wooden walls are said to have been covered with a thin plating of iron.—In 1826 an anonymous writer in Paris proposed the construction of iron or iron-clad frigates, the walls of which should have a thickness sufficient to resist cannon shot, asserting that when the enemy should have adapted the Paixhans system of horizontal shell firing wooden ships would no longer serve for the purposes of war. This was a correct idea, but only an idea at that time; and it is nearly impossible to find the real inventor of iron-plated ships, or ironclads, as they are now commonly called. The idea was public property and the natural outgrowth of the improvements made in artillery; the inventors were those of all nations who gave the idea form and feasibility. The remarkable results obtained by the employment of Paixhans's system of artillery called the attention of all nations to the means of defending both ships and land batteries from the destructive effect of horizontal shell firing. Some experiments were made in 1834 at Metz and Gavres for the purpose of determining the power of different materials to resist penetration, in consequence of which Gen. Paixhans recommended that the French vessels of war should be strengthened by plating them with iron; but this was rejected by the board of naval construction in 1841. In 1835 Mr. John Podd Drake proposed to the English naval department the protection of the machinery of steam men-of-war by iron plating $4\frac{1}{2}$ in. thick, and in 1841 he promulgated the idea of iron-clad blockading ships.—In 1842 Robert L. Stevens of Hoboken, N. J., proposed to the United States government the construction of iron-clad steam batteries for the purpose of defending the commercial ports from the chances of bombardment by hostile fleets. After recognizing the importance of this idea, the government decided to make a series of experiments with the view of determining the best arrangement for the walls of such batteries. These experiments demonstrated that an iron wall $4\frac{1}{2}$ in. thick was sufficient to resist the largest projectiles then in use. The construction of one battery was decided upon, but it was not commenced till 1854. From the best information which can be obtained, her length over all is 420 ft., her breadth 52 ft., depth from fighting deck 28 ft., draught of water with coal and stores on board 20 ft. 6 in., fighting draught 22 ft. 6 in. The vessel is an iron screw steamer, secured by longitudinal bulkheads, by a heavy box keelson running from stem to stern, and by shot-proof decks and continuous side armor. She has two screw propellers working independently, each being

driven by four compact beam engines working entirely below the water line. Cylinders are 3 ft. 9 in., with 3 ft. 6 in. stroke, driven by 10 boilers and capable of developing 8,600 horse power. The leading principles of this vessel's construction are as follows: 1. When ready for action the ship is to be settled 2 ft. lower in the water, by letting water into compartments which can again be emptied rapidly by powerful steam pumps provided for that purpose; this is done in order to save the weight and cost of the additional armor which would otherwise be necessary; to allow a flatter slope and secure greater resistance of the armor; to employ the resistance of the water; to give the vessel a greater speed by expelling the water from her compartments, and to enable her when thus lightened to enter harbors into which she could otherwise not go. 2. The use of inclined instead of vertical plating, for the purpose of changing the direction and throwing off instead of stopping the enemy's projectiles. The side plating consists of the best iron slabs $3\frac{1}{2}$ in. thick, laid upon a triangular backing of locust timber extending outside the shell of the vessel from stem to stern, and to a depth of 4 ft. below the water line when the vessel is ready for action. From the outer edge of this side protection the shot-proof casemate or main armor proceeds, upward and inward, at an angle of one vertical to two horizontal, to a height of 28 ft. from the bottom of the ship, and $5\frac{1}{2}$ ft. from the fighting line, where it is covered by a flat shot-proof deck. The main armor extends only over the engine's boilers, blowing and pumping machinery, that is, 107 ft. forward and 74 ft. aft the centre. Its ends slope upward and inward at a similar angle, from the 21-foot deck, which is shot-proof, and which extends forward and aft the armor to the extreme bow and stern. The inclined armor, or casemate, is composed of $6\frac{3}{4}$ in. of iron plates, backed by 14 in. of locust timber, in which are imbedded six-inch wrought-iron girders 2 ft. apart. The whole is lined with half-inch plate iron. It is supported by the engine frames, by heavy braces and girders between the boilers, and by the frames and sides of the ship. The horizontal shot-proof decks are composed of $1\frac{1}{2}$ in. of iron plates, resting on six-inch wrought-iron girders, filled in with locust timber and backed with half-inch iron plate. The guns will be loaded by being pivoted to a hole in the deck protected by a shot-proof hood, below which is a steam cylinder of which the piston rod is the ramrod of the gun. All the machinery and men for working the guns are thus within the shot-proof armor. The guns are protected by a covering of wrought-iron armor in addition to their own immense thickness, and will be trained by steam power. The shot-proof deck fore and aft the central casemate affords ample accommodation for men and officers. Above this deck, and flush with the 28-foot gun deck, which forms the top of the

casemate, is a light deck, extending at the sides of the casemate, and forward and aft from stem to stern. The entire 28-foot or gun deck is thus level (excepting the usual camber), and unencumbered over the whole vessel. Only the part of it that forms the top of the casemate is shot-proof. Above the 28-foot deck are flying bulwarks to be turned down in time of action. The height of the bulwarks from the water at the load line will be $13\frac{1}{2}$ ft. The 14-foot deck affords ample space for stores, and for the salt-water tanks designed for settling the vessel to the fighting line. Below the 14-foot deck, forward of the boilers, are the blowers and pumping engines and coal bunkers. Aft the engines are coal bunkers also. Capacity for coal, 1,000 tons. The vessel will have two light masts for emergencies, but will not ordinarily carry sails. Her projector claimed that her iron casemate, $6\frac{3}{4}$ in. thick backed by 14 in. of hard timber, and standing at the acute angle of one base to two perpendicular, is a stronger protection than has ever been applied, and that at the same time it is comparatively light, as its extent is reduced by confining it to the central part of the vessel, and by immersing the vessel to a deeper fighting draught. The parts of the vessel fore and aft the central casemate are also thoroughly protected by a horizontal deck, which is not only shot-proof but one foot below the fighting water line. The water protection, as far as it can be judiciously employed, is at once the most perfect and cheapest armor. 3. The side protection, extending from stem to stern, is intended to answer these four important purposes: 1, protection from projectiles; 2, from disaster by collision; 3, increasing the immersed beam, and the consequent stability of the ship when fighting; 4, adding in a very great degree to the horizontal and vertical strength and stiffness of the vessel. 4. The immense power of the engines and the fine lines are intended to give a much higher speed than has been attained by any sea-going war or commercial steamer. The sharpness of her lines is unprecedented in any government practice, and in any except the latest and most successful commercial practice. 5. The ability of the vessel to turn rapidly round on her own centre, without making headway, by means of two screws, instead of occupying the time and making the circuit required by all other war vessels, it is thought, will give her remarkable and important facilities for manœuvring when in action. 6. The employment of barbette guns, or on the top of the casemate instead of within it, gives the free range of the entire horizon. Three guns can be fired at a time in line with the keel, forward or aft. 7. As there is no casemate over the guns, the enemy cannot pour shot and shell into port holes at close quarters; for the same reason the guns will not be limited to the few degrees of range permitted by the ports, but can sweep the horizon. The cost and weight of the casemates over the guns

are dispensed with, and the seven guns thus arranged will be as formidable as a whole broadside arranged in the ordinary way. This vessel was still incomplete when it was announced to be sold by auction on Oct. 2, 1874, by the state of New Jersey, to which it was bequeathed by Mr. E. A. Stevens.—The experiments of the American government to test the theories of Mr. Stevens were repeated by the English admiralty at Woolwich. A target was constructed of 14 thicknesses of sheet iron, or about 2½ in., riveted together and backed by 2 ft. of oak. It was fired at with 64- and 32-pdr. guns, at a distance of 375 yards; 32 projectiles were used, 8 of which broke the plating, but none of which succeeded in piercing the target. A new series of experiments was made in France in 1843 and 1844, at the request of the prince de Joinville; and in 1845 M. Dupuy de Lôme published a memoir urging the construction of iron-plated frigates, having thinner plating than it was generally thought experiment had shown to be necessary, but carrying fewer guns of heavier calibre. The experiments up to that time had not indicated clearly enough the manner of constructing the walls of ships, and as Dupuy de Lôme's memoir demanded still further experiments, the construction of ironclads was not yet undertaken. In 1846 the English admiralty made further experiments with 32-pdr. guns at 200 yards, against targets composed of iron plates riveted together. The results were thought to be unfavorable, and no further steps were taken at that time toward the employment of iron in the construction of ships of war. In 1847 M. Gervaise proposed a screw ship composed entirely of iron, and, basing his opinions on the experiments undertaken at Gavres in 1843-'5, he asserted that the impenetrability of iron walls is as much greater than that of wood, as the penetrating power of solid shot is greater than that of shell, and that consequently the true machine for naval warfare is the iron ship. He also claimed the possibility of using such vessels as rams, owing to their superior swiftness and solidity. These ideas were also put aside for the time being, and further experiments were undertaken, without any notable results till active operations in the war of England and France against Russia had taken place in 1854. It was then found that the English and French war ships drew too much water to get within close range of the forts in the Baltic, and hence it became necessary to construct vessels of lighter draught and greater force. The emperor of the French authorized M. Guieysse to make such further experiments as might be found necessary in deciding upon the plan. These were made at Vincennes, and resulted in a determination to lay the iron plates on an elastic backing of wood, and to have the plates rolled to the required thickness rather than composed of thin plates united together. The plans of Guieysse were adopted, and five floating batteries, the Dé-

vastation, Tonnante, Lave, Foudroyante, and Congrève, were begun. They were 160 ft. long at the water line, 42 ft. wide, and 8 ft. draught. Their armament consisted of 16 50-pdr. guns under the cuirasse and 2 12-pdrs. on the forecastle; the plating was composed

FIG. 3.—The Dévastation.

of 4½ in. of iron backed by 8 in. of oak. The engines were of 225 horse power, with boilers designed to act under a pressure of 75 lbs. to the square inch. The first of these vessels was launched in March, 1855, and the rest soon after. At the same time that the order for these vessels was given the French minister of marine, M. Ducos, sent the plans to the English government; but Sir James Graham, the first lord of the admiralty, hesitated much before deciding to build any of this new class of ships. As a preliminary measure the experiments made at Vincennes were tested at Portsmouth in September, 1854, in the presence of Garnier and Guieysse. The results were satisfactory, and on Oct. 3 the admiralty ordered the construction of five batteries of the new type. Although they were sea-going vessels, they were without claims as ships, being designed simply for strong floating batteries. The French vessels of this class were towed to the Baltic by the screw frigates. On Oct. 17 the Lave, Tonnante, and Dévastation attacked the fortress of Kinburn at close range, and, although they were hit many times, succeeded after five hours and a quarter in silencing the enemy's guns. The performances of these vessels left no doubt as to the utility or soundness of the idea on which they had been constructed, and at once attracted the attention of naval constructors throughout the world to the necessity not only of vessels of this class for harbor defence and attack, but also of having iron-clad cruisers and rams of high speed and fine sea-going qualities. The French themselves were the first to profit by their own experience, and at Toulon on March 4, 1858, under the orders of Napoleon III., began the construction of the Gloire, an iron-plated screw frigate of the first class. Her form does not essentially differ from that of the ordinary

FIG. 4.—The Gloire.

wooden frigates of the French navy, although, as she is also intended to act as a ram, her bows have a peculiar form specially designed for crushing the sides of her opponents. Her length over all is 250 ft., breadth of beam 55 ft.; her armament consists of 36 guns of 6·3 in. calibre. Her armor, which covers only her

sides amidships, consists of solid plates $4\frac{1}{2}$ in. thick, backed by 2 ft. of timber. The completion of this ship marks an epoch of the greatest importance in naval warfare and architecture. From that day wooden ships gave way to a new class practically impenetrable to the projectiles of artillery, and endowed with speed and sea-going qualities equal to those of the vessels they were destined to replace. The science of ordnance and gunnery also received a new impulse, as guns of larger calibre and greater penetrating power became necessary. Every subsequent improvement in the construction of iron-clad ships has been followed if not preceded by a corresponding improvement in artillery, and in no branch of human industry have greater ingenuity or more persistent efforts been displayed. Shortly after the *Gloire* was begun, the French laid the keels of the *Normandie* and the *Invincible* on the same plans, and the *Couronne* on the plans suggested by M. Audinet. The construction of these ships was looked upon by all maritime nations as betraying an intention on the part of Napoleon III. to make France the principal naval power of the world, and was regarded by the English as a direct challenge which could only be properly met by the construction of a fleet of still more formidable vessels. Accordingly the admiralty ordered the building of the *Warrior*, and shortly afterward of the *Black Prince*, *Defence*, and *Queen*. These vessels were the forerunners of a new fleet composed entirely of ironclads, built at an enormous cost, but making good her position as the first naval power of the world. The plating of the *Warrior*, like that of the *Gloire*, is only $4\frac{1}{2}$ in. thick, and is applied amidships only. It is backed by 18 in. of teak, and is of uniform thickness, designed to resist 68-pdr. shot and shell. She is a long, handsome frigate, masted and rigged as usual, and sails faster than the *Gloire*, but owing to her greater length is not so handy at sea. The *Defence* and the *Resistance*, constructed upon the same plan, but smaller, soon followed. About the same time the French built the *Magenta* and the *Solferino*, admirable vessels, but as war ships in some respects less effective than the *Gloire*. The example of France and England was soon followed by the second-class naval powers. Austria undertook the construction of two frigates and Italy of two corvettes in 1860.—Up to this time all the efforts of constructors had been directed to the building of vessels after the old patterns, simply using iron

instead of wood, or in order to strengthen the wooden walls of old ships, without any essential modification of form or change of model. The outbreak of the civil war in the United States gave a great impulse to invention in this direc-

FIG. 5.—The *St. Louis*.

tion. The seizure of the important points on the Mississippi river below Cairo enabled the confederates to erect batteries and to stop navigation, and rendered it necessary for the Union fleets to be accompanied by ironclads. The first of these were constructed by James B. Eads, a civil engineer residing in St. Louis. He built the *St. Louis*, *Carondelet*, *Cairo*, *Mound City*, *Louisville*, *Cincinnati*, and *Pittsburgh* in 1861, and later the *Benton* upon the model known subsequently as the "turtle-back." They were plated with iron slabs $2\frac{1}{2}$ in. thick and 11 in. wide, rabbeted together and laid on a 4-inch backing of oak inclined at an angle of about 45° , and each armed with 13 9- and 10-inch guns. These vessels were built under the orders of the war department, and were the first ironclads actually employed in warfare by the United States. While they were not impenetrable to the fire of heavy rifles, or even to the 8- and 10-inch columbiads used by the confederates, they did excellent service till the end of the war. Mr. Eads designed and constructed the *Osage* and the *Neosho* after the model of the *Monitor*, each having a turret carrying two 11-inch guns. The turret plating was 6 in. thick, the hull plating $2\frac{1}{2}$ in., the deck plating 1 in., while the draught of water was only 4 ft. They were 145 ft. long and 45 ft. wide. He also designed the *Winnebago*, the *Milwaukee*, the *Chickasaw*, and the *Kickapoo*, each carrying two turrets, the sides of which were 8 in. thick, with hull plating 3 in. thick, and deck plating $1\frac{1}{2}$ in. They were each 226 ft. long, 56 ft. wide, and drew only 6 ft. Each turret carried two 11-inch guns.—The confederates, shortly after the commencement of hostilities, seized the navy yard at Norfolk, in the harbor of which the wooden frigate *Merrimack* had been scuttled and sunk. They

tion. The seizure of the important points on the Mississippi river below Cairo enabled the confederates to erect batteries and to stop navigation, and rendered it necessary for the Union fleets to be accompanied by ironclads. The first of these were constructed by James B. Eads, a civil engineer residing in St. Louis. He built the *St. Louis*, *Carondelet*, *Cairo*, *Mound City*, *Louisville*, *Cincinnati*, and *Pittsburgh* in 1861, and later the *Benton* upon the model known subsequently as the "turtle-back." They were plated with iron slabs $2\frac{1}{2}$ in. thick and 11 in. wide, rabbeted together and laid on a 4-inch backing of oak inclined at an angle of about 45° , and each armed with 13 9- and 10-inch guns. These vessels were built under the orders of the war department, and were the first ironclads actually employed in warfare by the United States. While they were not impenetrable to the fire of heavy rifles, or even to the 8- and 10-inch columbiads used by the confederates, they did excellent service till the end of the war. Mr. Eads designed and constructed the *Osage* and the *Neosho* after the model of the *Monitor*, each having a turret carrying two 11-inch guns. The turret plating was 6 in. thick, the hull plating $2\frac{1}{2}$ in., the deck plating 1 in., while the draught of water was only 4 ft. They were 145 ft. long and 45 ft. wide. He also designed the *Winnebago*, the *Milwaukee*, the *Chickasaw*, and the *Kickapoo*, each carrying two turrets, the sides of which were 8 in. thick, with hull plating 3 in. thick, and deck plating $1\frac{1}{2}$ in. They were each 226 ft. long, 56 ft. wide, and drew only 6 ft. Each turret carried two 11-inch guns.—The confederates, shortly after the commencement of hostilities, seized the navy yard at Norfolk, in the harbor of which the wooden frigate *Merrimack* had been scuttled and sunk. They

raised her, cut down her sides, and converted her into an iron-clad ram, which they called the Virginia. She was covered with railroad iron, laid on in an oak backing inclined at about 45° to the water surface. She was armed with 10 9- and 10-inch guns, and on March 8, 1862, sallied out upon the shipping in Hampton Roads, sinking the frigate Cumberland by ramming, and subsequently destroying the Congress. On the 9th she resumed operations, and after a contest with the frigate Minnesota was met by the Monitor, a novel ship constructed by John Ericsson of New York, which after a brief but remarkable combat disabled and drove the Virginia back to Norfolk. This combat marks one of the most notable epochs in naval warfare, and changed the course of naval construction throughout the world. The essential feature of this vessel was a revolving turret, composed of wrought-iron plates an inch thick, bolted together till a thickness of 8 in. had been obtained. The turret was 20 ft. in diameter and 9 ft. high; it contained two 11-inch Dahlgren guns, trained side by side and revolving with the turret, and throwing solid shot weighing 166 lbs., with a charge of 15 lbs. of powder. The hull of the vessel itself was of iron, 127 ft. long, 36 ft. 2 in. wide, and 12 ft. depth of hold. Her extreme length over all was 173 ft., extreme

FIG. 6.—The Monitor (elevation).

width 41 ft. 6 in. She had a very low freeboard, and sat so deep in the water that she seemed submerged. She was built at Greenpoint (Brooklyn), N. Y., in 100 days, and cost \$275,000. The plan upon which she was built is known as the turreted or monitor system, and was invented by Theodore R. Timby of Dutchess co., N. Y. The essential part of the plan was conceived when he was a boy, and the germ of the whole invention was embodied in a model which he completed in 1841. On Jan. 18, 1843, he filed his first caveat for the invention in the United States patent office. His specifications were "for a revolving metallic tower, and for a revolving tower for a floating battery to be propelled by steam." In the same year he completed and exhibited an iron model showing all the essential parts of the system as subsequently adopted, and still later another, which he presented to the emperor of China through Mr. Caleb Cushing, the American minister. In 1848 a committee of congress made a favorable report to the secretary of war upon the system. This was several years previous to the time when Capt. Coles of the English navy claimed to have invented the turret. When the civil war broke out Mr. Timby constructed a fifth model of his invention, embodying all the improvements which he had made. His patents covered the broad claim "for a re-

volving tower for offensive and defensive warfare, whether used on land or water." When therefore the monitors were to be built, the constructors at once recognized the validity of his claim, and paid him a liberal sum for the right to use his invention. Fig. 7 presents the sec-

FIG. 7.—Timby's Revolving Turret.

tion of a naval tower designed by Mr. Timby. It is supposed to be 40 ft. in diameter, with space for six guns. Revolving once a minute, its capacity would be one shot aimed at any given point every ten seconds. Thus it seems to be clear that the idea upon which the monitor system is based was invented and first presented to public notice by Mr. Timby; but it remained for Ericsson to give it practical application in this country, and Capt. Coles in England, although the latter did not at first propose to use revolving turrets.—The results of the combat in Hampton Roads were far-reaching in effect; they demonstrated not only the destructive power and practical invulnerability of ironclads, but the utter inability of wooden frigates, no matter how armed or commanded, to contend with them. It was the first contest between the new and the old systems, and left no uncertainty as to their relative merits. All maritime nations addressed themselves actively to the transformation of their old wooden steamships, wherever they were sound, by cutting down and plating their sides, and by supplying themselves with ships built according to the new system. The English displayed extraordinary activity in this direction; public opinion forced the government to build monitors as well as iron-clad frigates; also to employ the best talents the country afforded in improving her system of artillery, as well as in experimenting upon the best combinations, whether of iron or of wood, for constructing impenetrable armor. Mr. E. J. Reed, secretary of the society of naval architects, was called to the post of chief constructor, and began at once a radical modification of the English naval marine. In 1863 the Bellerophon, representing the ideas which Mr. Reed had carried into the English admiralty, was put upon the stocks. The Warrior and

the earlier English ironclads were constructed with deep frames running in a longitudinal direction through the greater part of the ship's hull, combined with numerous strong transverse frames, formed of plates and angle irons. In fact, up to the height of the armor, the longitudinal framing of the older ironclads closely resembles that of the roadway of a common English girder bridge of iron, in which the principal or longitudinal strength is contributed by the continuous girders that stretch from pier to pier, and the transverse framing consists of short girders fitted between and fastened to the continuous girders. If such a structure be conceived to be curved transversely to a ship's shape, and the under side to be covered with iron plating, a fair idea will be had of the construction of the hull of the Warrior. If instead of this arrangement the continuous longitudinal girders be considerably deepened and the transverse girders be replaced by "bracket frames," and, after curving these to the ship's form, both the upper and lower side thereof be iron-plated, a correspondingly good idea will be had of the construction of the hull of the Bellerophon. In other words, the construction of the latter is identical with the cellular system of the Menai and other tubular bridges, which best combines lightness and strength in wrought-iron structures of tubular cross section. This double-skinned or tubular system, in addition to giving greater strength and safety than the single-skinned system, is also better adapted to resist the explosive effect of torpedoes, which are fast becoming one of the most important adjuncts to naval warfare. No ship's bottom can be made strong enough to resist the shock of a torpedo's explosion, and consequently Mr. Reed provided as far as possible against the danger of sinking by dividing his ships into water-tight compartments. Notwithstanding the superior strength and safety thus given to the Bellerophon, the weight of her hull was considerably less than it would have been if built of wood, and was very much less than the total weight of armor, armament, and equipment. In the wood-built ironclads the weight of hull was generally about equal to that of the total weight carried, and in the earlier built ironclads the hull was heavier than the cargo. In the Black Prince the weight of hull was 4,969 tons, and the total weight carried 4,281 tons. In the Bellerophon the hull, with thick skin plating and extra girders, was 3,652 tons, while the total weight carried was 3,798 tons. In the case of the Monarch, a turret ship built after this system, the weight of the hull is 3,674 tons, while the weight carried is 4,632 tons. In all the later ships constructed by Mr. Reed the carrying power is much greater than the weight of the hull, and is due mainly to the improved structural arrangements introduced by him. This system is known among naval constructors as the "bracket-plate system," and is now generally

employed even by the private ship builders of England who build ships of war.—Iron-clad ships are substantially of two forms or types: those in which the batteries are protected by armor laid upon the walls of the ships, such as the New Ironsides, Warrior, Hercules, and Bellerophon, and those carrying their batteries in turrets, such as the Miantonomoh, Monitor, Glatton, Thunderer, and Devastation; and they are divided into classes according to their uses for cruising, defending harbors, guarding coasts, or operating upon rivers and lakes. While there is a certain similarity in all the vessels of each class, there are also many differences in details, according to the intended use. The Warrior is armed only at the middle, with 4½-inch plates, while both bow and stern, including the steering gear, are exposed to shot and shell. In all the more recent English ships this central battery or "box" has been enlarged by a continuous belt of armor extending from stem to stern, and protecting the region of the water line and steering gear. The Warrior's armor is of uniform thickness; but in recent ships the most vital parts, such as the region of the water line and over the machinery, have been further protected by thick armor, additional backing, and iron bulkheads fitted inside. The Warrior possesses only broadside fire; all the later vessels have their fighting capacity increased by bow and stern fire of greater or less extent. The Warrior has only her main-deck battery armor-plated; recent ships have a protected upper-deck battery. The Warrior has her guns well spread out; later ships carry their battery concentrated, and composed of much heavier guns. The Warrior was made extremely long with a view to speed; recent ships are much shorter in proportion, and are handled more easily. The Warrior has a single-skinned hull and comparatively light and weak framing; later ships are double-skinned, with deep, strong framing and water-tight compartments. The armor of the Warrior, as before stated, is only 4½ in. thick; that of the Bellerophon is 6 in., of the Hercules 9 in., of the Hotspur 11 in., and that on the sides of the monitors Glatton, Thunderer, and Devastation is 12 in., while their turrets are 14 in. Presuming that the resistance offered by armor plates to penetration varies as the square of the thickness, which is approximately correct, the armor of the Bellerophon is nearly twice as strong as that of the Warrior, of the Hercules about seven times, of the Hotspur six times, of the Glatton seven times, and of the turrets of the latter nearly ten times. The guns (rifled) used by the Warrior weigh 4½ tons, those of the Bellerophon 12 tons, of the Hercules 18 tons, of the Glatton 25 tons; while those of the Thunderer and Devastation weigh 30 tons. The necessity of carrying such armor and guns, and of firing ahead and astern, as well as from the broadside, has rendered essential many changes in the sizes, forms, and arrangements of the sides, decks, and batteries

of armored ships. The introduction of twin screws, and the necessity of having light-draught vessels for coast and harbor defence, have also led to further differences. When the first English ironclads were constructed, the most powerful guns used by their ships of war were 68-pdrs. or 8-inch smooth-bore guns. The Americans then used 9- and 10-inch guns, and 4½-inch armor plating was deemed sufficient when properly backed and supported. This thickness of armor backed in various ways forms the protection of a large number of the English and French ironclads. In the first iron ships, the Warrior, Black Prince, Achilles, Defence, Resistance, Hector, and Valiant, the 4½-inch armor was backed by 18 in. of teak fitted outside the hulls; and in the wooden ships the armor was bolted on the outside of the planking. In the Minotaur class the plating was increased to 5½ in., but the backing was reduced to 9 in., so that practically the sides of the latter class are of the same strength as those of the Warrior class. In the Belleophon the armor plating is 6 in. and the backing 10 in., but it is still further strengthened by having the skin plating 1½ in. thick, or nearly an inch thicker than in the older iron-built vessels. The armor of sea-going broadside ships has, according to some English authorities, reached its greatest thickness in the Hercules, which has 9-inch armor at the water line, 8-inch on the most important parts of the broadside, and 6-inch on the remainder, with teak backing 10 and 12 in. thick outside the 1½-inch skin plating. Below the lower deck, and down to the lower edge of the armor, the spaces known as the "wing passages" are filled in with solid teak backing, inside of which there is an iron skin ¾ in. thick, supported by vertical frames 7 in. deep. The total protection in the region of the water line therefore consists of 11½ in. of iron, of which 9 in. are in one thickness, and 40 in. teak backing. The trial of a target at Shoeburyness, constructed to represent this part of the ship's side, proved that it was virtually impenetrable to the 600-pdr. rifle gun. But the maximum thickness of armor carried must not be considered to have been yet attained. Coast-defence vessels and rams have been built to carry 11- and 12-inch armor, and ships have been designed and will doubtless be built for sea-going purposes to carry 15, 18, and 20 in. of armor, either in turrets or broadsides. There can be little doubt that as improvements are made in the manufacture and working of heavy guns, corresponding additions will be made to the thickness of armor. It is hardly possible to foresee in what way the competition between guns and ships will terminate. Grouping the iron-clad ships of the English navy according to the thickness of their armor and backing, without regard to the greater or less extent of the surface protected, but dividing them into iron-built and wood-built, and remembering that turret armor is generally a little stronger than the side

armor, the preceding facts may be summarized as follows:

IRON-BUILT.				Remarks.	
VESSELS.	Armor.	Back- ing.	Skin plating.		
	Inches.	In.	Inches.		
Scorpion	4½	9	½	The weakest of English ironclads. But very slightly stronger than the above.	
Wivern					
Viper.....	4½	10	½		
Vixen.....					
Waterwitch	4½	18	¾		All of equal strength to resist shot.
Warrior					
Black Prince.....					
Achilles

* These two ships have an inner skin of 1½-inch iron, and a strake of 5½-inch armor at the water line, and the frame is filled in solid behind the armor; so that in addition to the outer and inner armor, the whole thickness of the side is available to resist penetration. In all the other wooden ships water can enter when the outside planking, which is only 8 or 10 in. thick, is penetrated.

The information contained in the preceding summary of the English ironclads is illustrated in the accompanying engravings, showing specimen blocks cut from the sides of the ships which may be taken as fair representatives of the various classes. The section from the side of the Kalamazoo may be regarded as fairly representing the strongest class of American monitors. The latest publication concerning the English iron-clad navy (April, 1874) gives a list of 55 vessels, of which 41 are sea-going ships and 14 are available for harbor and coast defence. Of the sea-going ships 5 are in the course of construction, and 9 are not fit to go to sea, or worth making fit; and 9 more which are not

yet available for service should also be deducted, leaving 18 now about ready. Of the 14 coast-defence ironclads, only 9 are fit for service; the other 5 are on foreign stations and said to be not worth taking home. The French ironclads Gloire, Magenta, and Solferino have armor a little over $4\frac{1}{2}$ in. thick, worked upon ordinary wooden hulls. The iron-built frigate Couronne and the small wooden floating batteries of the Palestro class carry about the same thickness of armor. All the other floating batteries are iron-built and have $5\frac{1}{2}$ -inch armor. The frigates of the Flandre class and the ram Taureau have armor a little less than 6 in. thick laid upon wooden

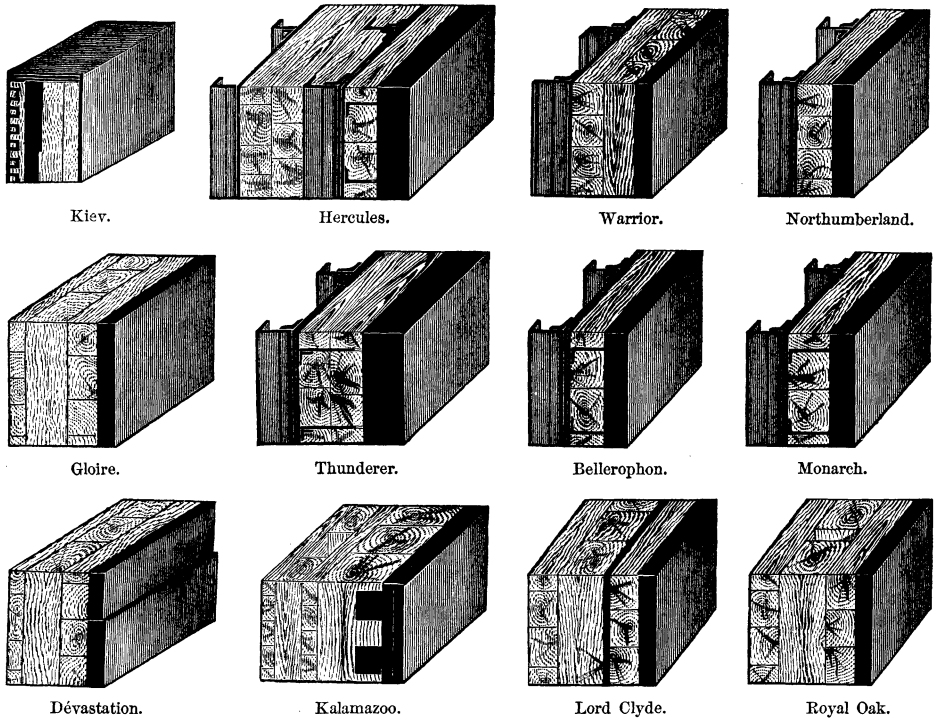

FIG. 8.—Sections of the Sides of Iron-clad Ships of the Various Classes.

hulls, while the corvettes and second-class frigates of the Alma class have armor $5\frac{8}{10}$ in. thick at the water line, and 4 and $4\frac{8}{10}$ in. on the other parts. The vessels of the Marengo class, corresponding very nearly to the English Invincible class, have $7\frac{8}{10}$ -inch armor at the water line, and from 4 to $6\frac{1}{2}$ in. on other parts. The rams of the Béliar class have 7- and $8\frac{1}{2}$ -inch armor. By far the greater number of the French ironclads are wood-built, the armor being simply laid upon the outside planking, without inner skin plating or longitudinal girders to give greater strength. They are therefore weaker than the English ships even when the armor and backing are equal.—In the American sea-going ironclads, what is

known as laminated armor has been largely if not almost exclusively used. This was rendered necessary at first by the fact that thick armor plates could not be produced by the rolling mills in anything like sufficient quantities; but a few ships like the Roanoke and New Ironsides have been made with solid armor, the former having plates $5\frac{1}{2}$ in. thick and the latter $4\frac{1}{2}$ in. With this exception, the armor of our ironclads is made up of consecutive plates averaging 1 in. thick, but backed, as in some of the monitors, by armor stringers or plank armor of small breadth and moderate thickness. Experiments made by the English admiralty at Shoeburyness prove this laminated armor to be far inferior to solid armor in power

of resistance, and that no amount of strengthening can compensate for the defects of the laminated system. The resistance of single armor plates, shown by direct experiment for all thicknesses up to 5½ in. to vary as the square of the thickness, does not obtain in laminated armor. For example, a 4-inch solid plate would be 16 times as strong as a 1-inch plate, but would not be four times as strong as four 1-inch plates riveted together, although it would be much stronger than the laminated structure. Excluding the Roanoke and New Ironsides and the river ironclads, which leaves only the Monitor class, the armor of the American ironclads may be briefly summarized as follows: The original Monitor had her hull protected by five layers of 1-inch plate, diminishing first to 4 in.

Fig. 9 shows a section of the Dictator's armor, with one of the English turreted ship Thunderer. Though generally unfit for cruisers, the monitors are well adapted to coast and harbor

Fig. 9.—Sections of the Armor of the Thunderer and Dictator.

and then to 3 in. in thickness below the water line; her turret, as previously stated, was built of eight layers of 1-inch iron. The wood backing of the hull armor was 27 in. thick, bolted to 5/8-inch iron skin plating. The Passaic class have armor of the same thickness as the first Monitor, but have 39 in. of wood backing. The Canonicus class have five layers of 1-inch plates, supported by two armor stringers let into 27 in. of wood backing; their turrets have 11 layers of 1-inch plates. The Miantonomoh and the Monadnock, which are wood-built, are protected much like the Canonicus. The Puritan and the Dictator have six layers of 1-inch plates on their sides, with 42 in. of wood backing; their turrets are 15 in. thick, made up of two drums, with segments of wrought-iron hoops 5 in. thick placed between the drums, which are composed of layers of 1-inch plates. In the Kalamazoo class the total thickness of hull armor is 6 in., made up of two layers of 3-inch plates, backed by 30 in. of oak, still further strengthened near the water line with three armor stringers, 8 in. square, let into the backing, and only a few inches apart. This is by far the most formidable armor carried by any of the American monitors; and while there are in some places 14 in. of iron, there is no part of it nearly so strong as it would be with that thickness in solid plates. The turrets of the Kalamazoo are 15 in. thick, like those of the Dictator, but none of them have any backing or wood about them. The rapid diminution in thickness of armor on these vessels is a serious defect, leaving no ground for comparison with corresponding English ships. The Dictator, for instance, 2½ ft. below the water line, has but two 1-inch plates, and at 3 ft. only one.

defence. The present strength of the United States iron-clad navy is as follows:

—In the earlier English ironclads the armor extended over a portion of the broadside only, as in the case of the Warrior, whose length is 380 ft., and the armored portion only 213 ft.,

FIG. 10.—Warrior.

leaving the extremities of the ship entirely unprotected. At the ends of the armored portion iron-plated bulkheads are built across the ship, making with the side armor a central or "box" battery extending to a little more than 6 ft. below the water line. This box battery, or partial protection, is also adopted on the Black Prince, Defence, and Resistance, but has been modified by the addition of a belt of plating extending from the upper to the main decks, before and abaft the broadside armor, on the Hector and Valiant. The main deck on

FIG. 11.—Hector.

which the guns are fought is thus protected throughout its entire length, but the extremities between wind and water are quite unprotected. Both these plans of disposing the armor were considered unsatisfactory, and in the Minotaur and converted ships of the Caledonian class, the "complete protection system," in which the armor extends from stem to stern, and 6 ft. below the water line, was adopted. This system is followed in nearly all the monitors, both English and American, and in nearly all the French ships. The great development in the power of ordnance has led not only to increased thickness of armor, but to different modes of disposing it. In the Bellerophon and Hercules, and in oth-

FIG. 12.—Hercules.

er large English ships, an arrangement of the armor consisting of a middle course between the Warrior and Minotaur has been adopted.

FIG. 13.—Achilles.

The Achilles, a ship of the Warrior class, had the water-line belt added. This plan of plating is known as the central battery and armor belt system. In this arrangement the great weight of the armor and battery is amidships, and the

FIG. 14.—Invincible.

ends of the ship are not overloaded as in the complete protection system. An important modification of the method of applying the armor is shown in the engraving of the Invincible,

by which the plating is continued up to such a height above the upper deck, amidships, as to protect four heavy guns

mounted at the angles of an octagonal battery, of which the ends are closed by transverse iron-plated bulkheads. Previously to the design of this arrangement the Lord Clyde

FIG. 15.—Lord Clyde.

and Lord Warden were supplied with powerful armored bow batteries on the upper deck, but the arrangement of the Invincible has many advantages. In their recent ships the French have abandoned the complete protection system, and adopted the central battery and armor belt system, and generally follow the varieties of English practice. The American practice, as shown in the New Ironsides and Roanoke, is essentially the same as the central box or partial protection system. In the monitor system the practice has been sufficiently indicated. With the low freeboards of these vessels, the armor that would otherwise go upon the sides has to be spread upon the deck to prevent penetration by plunging and vertical fire, to which they are peculiarly liable. The English admiralty have designed an arrangement of armor which they apply to what they call "breastwork monitors." They resemble American monitors, in having their upper decks at comparatively small height above water; but instead of having these decks flush, except where the turrets, funnels, air shafts,

and hatchway casings rise above the deck, they have a space amidships surrounded by an armored breastwork, which rises several feet above the deck, and encloses

the parts just mentioned. By this means the height of the freeboard is materially increased for a great part of the ship's length; the

height of the turret parts above water is made much greater than is usual in American monitors; and the liability to serious injury, resulting from the

FIG. 16.—Cerberus.

perforation of the deck and funnels, and from heavy blows upon the base of the turrets, is much reduced. The Cerberus is a fair representation of the breastwork monitors.—The monitor or turret

system possesses many advantages, but also under some circumstances so many disadvantages that its introduction has occasioned much diversity of opinion among naval officers and constructors throughout the world. The advantages are as follows: the facility with which large guns may be smoothly and easily trained, and with which the same guns may be used in all directions; the small size of the ports, and the difficulty of hitting them; the low freeboard, and consequently small target offered to the enemy's fire; the great thickness which may be given to the armor, and the great size and penetrating power which may be given to the few guns protected by it. As fighting ships, there is no reason why the monitors may not be made superior to any other form of ironclad yet invented. The only serious defect which has been developed in their fighting power is the liability of the turret as originally constructed to become jammed by being struck at

sea-going vessel. On the other hand, with such improvements as have been or may hereafter be made, this class of ships are and will probably remain unrivalled for harbor and coast defence, and for use against land batteries and fortifications, and may ultimately be made to serve successfully as cruisers. Two circular monitors, the Kiev and Novgorod, designed by Admiral Popoff, have been constructed by the Russian government, for use in the

FIG. 18.—Russian Circular Monitor, Elevation and Deck.

North and Black seas. These batteries are called Popoffka, and are about 100 ft. in diameter, bordered with wood and lined with copper, after the system followed in the construction of the Raleigh in England. Their draught is about 12 ft., height of upper deck above water about 2 ft., and displacement about 2,530 tons. Their stability in the water is secured by 12 keels. The middle of the vessels is surmounted by a turret 30 ft. in diameter and 7 ft. high, carrying two steel 11-ton 8-inch breech-loading rifles. The lower part of the hull is double-skinned, the outer skin being about $\frac{1}{2}$ in. thick, and the inner one $\frac{1}{4}$ in. The space between is about 3 ft. and divided into water-tight compartments. They are propelled by six separate engines and screws, each working up to 80 horse power. Their speed is about 9 knots per hour; complements of

FIG. 17.—Eads's Revolving Battery.

or near the junction with the deck, so that it will not revolve. This defect has been partially remedied by the use of a massive ring of iron, surrounding the base of the turret, and by the breastwork system. A still better remedy has been introduced by James B. Eads, C. E., of St. Louis, who constructed stationary turrets and arranged the guns so that they might be traversed in pairs, as shown in fig. 17. The greatest defect in this system is that ships constructed after the original Monitor model are poorly adapted for sea-going purposes, and hence cannot be made first-class cruisers. This opinion is not controverted by the fact that the Miantonomoh and similar ships have crossed the ocean in various directions. It is now generally admitted that no monitor, with turrets standing upon the low deck, unprotected by breastworks, with hatchways, air shafts, and low turret tops opening through her deck only two or three feet above the water line, can be considered as a satisfactory

FIG. 19.—Deck of Russian Circular Monitor.

officers 11, men 85 to 90. The hull armor is composed of two strakes of plates each $2\frac{1}{2}$ ft. wide, the upper one about 9 in. thick and the lower about 7 in., backed by 7 and 9 in. of teak respectively. The turrets are constructed

in the same manner, but the plates are 9 in. thick throughout. This system seems to be capable of great expansion as affording the means of constructing batteries practically indestructible, and capable of carrying any weight of armor or armament.—The offensive powers of ironclads, in common with those of other ships of war, are measured by the number and power of their guns, the rapidity with which they may be loaded and fired, and the facility with which they may command all points within range. The wooden frigates of the English navy in use before the construction of ironclads carried 32-pdrs. and 68-pdrs.; while the Americans used 42s, 64s, and 9- and 10-inch Dahlgren smooth-bore shell guns, which at the outbreak of the civil war they increased to 11-inch guns. Subsequently they adopted 13- and 15-inch iron guns of the Dahlgren model, cast after the Rodman process, the 15-inch guns throwing solid shot weighing 450 lbs., with a charge of 60 lbs. It is now proposed to make and use on the monitors 20-inch guns throwing shot weighing 1,080 lbs., with a charge of powder weighing from 120 to 250 lbs. It is thought to be practicable to construct and use even 25- or 30-inch guns of this model. This system is based upon the idea of a heavy projectile of large size moving at comparatively low velocity, instead of an elongated projectile moving at a high velocity, and is termed the "racking or battering" system, in contradistinction to the English "punching system," based upon the use of rifle guns throwing large elongated shot at higher velocities. The latter, instead of using the 68-pdr. (8-inch) gun, which failed to penetrate the Warrior's armor at 200 yards, now use 6½-ton rifle guns, which would pierce it at 500 yards, 12- and 18-ton guns, which would do the same at 2,000 and 3,000 yards, and 25-ton guns, which would probably penetrate any ironclad afloat, except perhaps the Hercules, at 4,000 yards. They have made and will use on the Thunderer and Devastation 30-ton rifles, throwing shot weighing 600 lbs. They contemplate the construction and use at an early day of 70- and 80-ton rifles, and ultimately will doubtless construct them of still greater weights and power. The projectile of the 6½-ton guns is 7 in. in diameter and weighs 115 lbs., taking a charge of 22 lbs.; that of the 12-ton gun is 9 in. in diameter, weighs 250 lbs., and is fired with 43 lbs. of powder; that of the 18-ton gun is 10 in. in diameter, weighs 400 lbs., and is fired with 60 lbs. of powder; while those for the 25- and 30-ton guns are 12 in. in diameter, weigh 600 lbs., and are fired with 70 lbs. and 100 lbs. of powder respectively. Great differences of opinion prevail with reference to the merits of these two systems, but experiments made by the English seem to fairly indicate the superiority of the punching system. They show, for instance, that the 15-inch smooth-bore gun, throwing a spherical solid shot weighing 484 lbs., with a

charge of 50 lbs. of English powder (said to be equal to 60 lbs. of American powder), would fail to penetrate the Lord Warden's side (see fig. 8) at any range, while the English 9-inch 12-ton gun, with an elongated shot weighing 250 lbs. and a 43-lb. charge, would penetrate her at 1,000 yards. They also show that the 15-inch smooth-bore gun would not penetrate the Warrior at a greater range than 500 yards, while the 7-inch 6½-ton rifle, weighing only about one third as much, would penetrate her at the same distance with a charge of 22 lbs. and a shot weighing 115 lbs. As a matter of course, the rifles of 12, 18, 25, and 30 tons would penetrate at correspondingly increased distances. On the other hand, there seems to be but little doubt that the American guns have greater battering power; the real question at issue is as to the relative merits of penetration and battering or racking. The English and the French prefer the former, and for apparently sound reasons, while the Americans as yet prefer the latter and point to the experience of the civil war in vindication of their opinion. But it must not be forgotten that the ironclads disabled or captured by them from the confederates were hastily constructed and poorly armored, and carried light guns in comparison with those of the well built and strongly armored ships of the European navies. The advocates of the racking system lay particular stress upon the "smashing" of the sides of the casemated ship Atlanta by the 15-inch shot of the monitor Weehawken, at a range of 300 yards; but the Atlanta was not a first-class ship in any respect. There is now but little doubt that the United States government will be forced to abandon the racking system in its future vessels, or better still, to combine it with the punching system.—*Iron-clad Rams.* The introduction of steam men-of-war gave rise to numerous proposals for reviving the ancient method of naval warfare, that of disabling or sinking an enemy by ramming; and when the Gloire and the Warrior were built, their bows were designed, strengthened, and projected with this object in view. In all succeeding ironclads more or less efficient provisions have been made to adapt the bows to the same purpose. In the American navy a special class of small swift river steamers were fitted up specially for this purpose during the civil war. The confederates built several extraordinary crafts of this class, designed specially for harbor defence, among the most notable of which was the Merrimack already mentioned. Most if not all of the monitors were also strengthened for ramming, and several of the engagements, particularly those on the Mississippi, were greatly influenced if not decided by ramming. The French and English followed the example of the Americans, and at the end of the war they had generally adopted the opinion of our naval officers that "every ironclad should be an unexceptionable ram; in other words, susceptible herself of being used

as a projectile." The victory of the Austrian over the Italian fleet at Lissa in 1866 was in a great measure due to the excellent services of the Austrian ship Ferdinand Max, which rammed and sunk the American-built frigate *Re d'Italia* and damaged other ships severely. It afforded conclusive evidence of the great results which may be achieved by the proper use of this method of attack, and attracted renewed attention to the construction and manœuvring of iron-clad rams. In order that a ship may be efficient as a ram, it is obvious that she should be swift and handy under steam, so as to enable her not only to overtake her enemy, but to hit her directly and squarely in the side. These qualities are incompatible with either great size or great length. Hence the ram should have moderate dimensions and proportions, in combination with powerful machinery, twin screws, and improved means of steering. As to the proper form of ram bows, there are some differences of opinion among naval constructors. Some favor stems reaching forward above water, others prefer upright or nearly upright stems; but the majority are decidedly in favor of the under-water prow, spur, or *éperon*, which has been generally adopted in European navies. The advocates of the forward-reaching stem, like that shown in the *Warrior*, think that there is an advantage in delivering the blow above water rather than under, particularly in ramming low-decked monitors or ships with low sides, on the ground that there is a probability of overrunning the enemy and making the weight of the ramming ship aid in sinking her. The advocates of the upright stem, like that shown in the *Achilles* and *Invincible*, assert that the blow delivered thereby is not so local in its effect, and that this form of bow can be more readily disengaged after ramming; while the advocates of the spur bow (shown in the *Lord Clyde*) believe that it is specially adapted to sink an enemy by penetrating the weak side below the armor, and particularly about the rudder, and that it possesses greater penetrating power than any other bow. Mr. Reed, late English naval constructor, holds that this form possesses special advantages against American monitors, the armor of which generally terminates at comparatively slight depth below water.—The following table shows the strength of the iron-clad navies of the world in 1873:

COUNTRIES.	Number of ships.	Aggregate number of guns.	COUNTRIES.	Number of ships.	Aggregate number of guns.

IRON MANUFACTURE. Since the reduction of iron from its ores is an operation of simple character, requiring merely that the ore shall be in contact with burning fuel in an enclosed space, or in the midst of the fire, it is not surprising that the process was employed in remote antiquity. The Greeks attributed the discovery of iron to the burning of the forest on the mountain of Ida in Crete about 1500 B. C. The rapidity with which iron rusts on exposure is no doubt the reason why so few ancient articles of this material are preserved. Pliny quaintly says: "Nature, in conformity with her usual benevolence, has limited the power of iron, by inflicting upon it the punishment of rust; and has thus displayed her usual foresight in rendering nothing in existence more perishable than the substance which brings the greatest dangers upon perishable mortality." Copper and bronze are not so liable to oxidation, and are consequently better preserved. Iron is occasionally found in the metallic state in meteorites, but its amount is too small to be of importance to any nation. There is abundant historic testimony to the great antiquity of iron. The Bible contains a great number of references to it. Wilkinson says: "Iron and copper mines are found in the Egyptian desert, which were worked in old times; and the monuments of Thebes and even the tombs about Memphis, dating more than 4,000 years ago, represent butchers sharpening their knives on a round bar of metal attached to their aprons, which from its blue color can only be steel; and the distinction between the bronzed and iron weapons in the tomb of Rameses III., one painted red, the other blue, leaves no doubt of both having been used (as in Rome) at the same period. In Ethiopia iron was much more abundant than in Egypt." According to Diodorus, the Egyptians assigned the art of working iron to their great national divinity Osiris, thus implying that it was known from time immemorial. Herodotus and Pausanias mention that the Lydian king Alyattes, the father of Cræsus, who died about 570 B. C., presented as an offering at Delphi a curiously inlaid iron saucer made by Glaucus, an inhabitant of Chios. Both Diodorus and Herodotus mention the island of Elba as abounding in ironstone,

and describe the method of melting it. In the time of Æschylus (born in 525 B. C.) the Chalybes were famous workers in iron, and Chalybia was called the mother of iron. Strabo, writing about the beginning of the present era, speaks of the iron mines of Chalcis in Eubœa as almost exhausted by the extensive mining operations of the Athenians. He also mentions iron brought from Britannia, and speaks of the mines of Elba, famous to this day, then called by the Greeks, from the blazing fire of its iron works, Æthalia. Pliny the Elder devotes two chapters of his "Natural History" (xxxiv. 14, 15) to an account of iron, its uses and manufacture. He speaks of an iron statue of Hercules by Alcon at Thebes, and bowls of iron in the temple of Mars at Rome; of different qualities suited to different purposes, some being adapted for hardening into steel, or else prepared in another manner for making thick anvils or heads of hammers; and of the Serican, Parthian, and Norican irons. He was aware of the magnetic property of iron, and speaks of an iron statue of Arsinoë, sister of Ptolemy Philadelphus, which it was proposed to suspend in air, in a temple, by means of a vaulted roof of loadstone. Iron of great antiquity has been found in eastern countries. Belzoni describes the discovery, under the feet of one of the sphinxes unearthed by him at Karnak, of an iron sickle, which he considers to be at least as old as the age of the Ptolemies. It was of the same form as those depicted in the tombs at Memphis. At Memphis iron has been found in the ancient structures, and two pieces have been taken from the great pyramid of Gizeh. Layard discovered at Nimrud a large number of articles showing great knowledge and skill in working this metal possessed by the Assyrians. Most of them, having been wholly converted into oxide, fell to pieces when touched. Among the objects found were armor scales, daggers, shields, heads of spears and arrows, a pick, a double-handed saw, articles of combined bronze and iron (the former having been cast around the latter), part of a stand consisting of an iron ring with three feet of bronze, &c. Iron ornaments of the ancient Chaldeans have been discovered, but no implements, showing that with them iron was still a precious metal. The most remarkable evidences of the progress made by the ancients in iron metallurgy are found in India, although, strangely enough, the art as practised in that country at the present day is extremely rude and simple. In the remains of temples are found iron beams, one of which measures 24 ft. in length and 8 in. in section. The famous Delhi wrought-iron pillar, called Cuttub Minar, at the mosque of the Cuttub Shaw, is upward of 48 ft. long. Its lower diameter is about 16½ in., its upper diameter 12 in. It contains upward of 80 cubic feet of metal, and weighs 17 tons. It is supposed to have been erected A. D. 319. How such a forging could have been effected is a mystery.

The only probable suggestion hitherto brought forward is, that it was made by welding each bloom directly to the previously made bloom, and that as the column grew in height the furnace was elevated by throwing up a mound of earth, so that the top of the pillar formed the bottom of the furnace, and the blooms as soon as formed were directly welded to the top of the still glowing pillar.—From some obscure remarks by ancient writers it has been inferred that cast as well as wrought iron is of great antiquity; and it has been suggested that the ancients practised the art of steel making described by Vanoccio Bizinguoco in 1540 and by Agricola shortly after, which consisted in immersing pieces of soft iron in a bath of molten iron. This we can only conceive possible by supposing the metal bath was well carbonized. The evidence for this is however very slight. Aristotle writes: "Iron may be cast so as to be made liquid and to harden again; and thus it is they work to make steel." Pliny in describing the process of iron smelting says: "It is a remarkable fact that when the ore is fused, the metal becomes liquefied like water, and afterward acquires a spongy brittle texture." This may refer, however, to the liquefaction of the cinder. Diodorus gives a clearer and more comprehensible account of the smelting process on the island of Elba, and says nothing about molten metal: "The workmen employed first cut the stone in pieces, and then melt them in furnaces built and prepared for the purpose. In these furnaces the stones, by the violent heat of the fire, are melted into several pieces in form like great sponges." This description might equally apply to the bloomary practice of the present day.—Though so little is known of the methods employed by the ancients for the reduction of iron from its ores, it is not improbable that they were similar to those still in use in eastern countries, which have been practised from time immemorial. A low stack, either built of clay or excavated on the hillside, with openings at the bottom for draught of air or for an artificial blast, is all the apparatus required for the successful manufacture of iron. The furnaces of India are usually from 3 to 6 ft. high and from 10 to 18 in. in diameter. The blast, supplied by bellows made of skins, is forced into the furnace through clay tuyeres. The furnace is charged with ore and charcoal alternately, until the requisite amount of ore has been added. After a blast, varying from 3 to 4 up to 18 hours, a mass of soft malleable iron mingled with cinder is removed from the furnace, either by breaking away the lower part of the stack, or by lifting the bloom out of the top with tongs. The weight of the iron bloom varies from 4 or 5 up to 200 lbs. It is hammered while still hot, reheated and again hammered, until the greater part of the cinder is expelled.—The knowledge of the method of reducing iron was probably introduced into Europe from the East, but when and by whom is unknown. Traces of early workings

in Styria and England are abundant. The method employed differed from that in use at present in India. Charcoal and ore were placed in a furnace consisting of a small hearth, generally rectangular, provided with a tuyere in the rear wall, and resembling a blacksmith's forge. This form of furnace has descended to the present day, and is still in use in many places. The Catalan forge, used mainly in the Pyrenees, and the American (a modified German) forge, now chiefly confined to Canada and northern New York, are the most prominent examples of this ancient method. (See BLOOMARY.) The nature of the process in low furnaces or hearths is extremely simple. The iron in the ore is reduced by the carbon and carbonic oxide, and, not being fusible at the temperature of the furnace, agglutinates or welds together to a pasty mass, which gradually sinks and accumulates in the bottom of the furnace. The completeness of the reduction depends on the time of exposure and the amount of charcoal used. When reduction is incomplete, the unreduced ore fuses and mingles with the iron. When silica is present in the ore, as is almost always the case, it unites with a portion of ferrous oxide and forms a basic ferrous silicate or fusible cinder, part of which flows off, while part remains incorporated with the iron and is largely expelled in the subsequent working. Complete reduction is therefore never attainable in low furnaces, and the loss of iron is greater the more silicious the ore. Rich ores consequently are the only ones adapted to the process. The iron produced in low furnaces is generally of superior quality, because the impurities of the ore, not being reduced at the comparatively low temperature which prevails, pass off in the cinder. But the iron is apt to lack uniformity both in structure and in composition. The tendency to increase the height of the furnace, in order to increase the yield and thereby diminish the cost, was thwarted by the production of a fluid iron, which was probably for ages a waste product, since no method of utilizing it was known. The absorption of carbon by iron and its conversion into steel or cast iron which is readily fusible depend mainly on the heat of the furnace, and this in turn on the amount and pressure of blast. Increasing the height of a furnace necessitated a stronger blast to overcome the resistance of a higher column of material; and carburization of the iron necessarily follows. The progress of development from the low furnaces and hearths to the modern high furnaces was therefore slow; and it was not until the art of making castings and the method of converting cast into wrought iron were discovered, that modern iron metallurgy took its rise. According to Verlit, cast iron was known in Holland in the 13th century, and stove plates were made from it in Alsace in 1400. Ancient ornamental castings have been found in Sussex, England, which have been referred by Lower to the

14th century; but Karsten says that the systematic production of iron for foundry purposes cannot be traced with certainty to an earlier period than the end of the 15th century. According to Lower, the first cast-iron cannon made in England were cast by Ralph Hogge in 1543. Up to the year 1595 Thomas Johnson had made for the earl of Cumberland 42 cannon weighing three tons apiece. The method of converting cast into wrought iron, by exposing the fluid iron to a blast of air, was discovered very early. It is mentioned distinctly by Agricola, who died in 1555; but the regular manufacture of wrought iron by this method began some time later. In Styria, where the pure spathic ores have been regularly smelted since the year 712, there were in 1625 19 *Stücköfen* or *Wolföfen* (shaft furnaces 10 to 16 ft. high), producing mainly malleable iron, which was taken from the furnace in a mass (*Stück* or *Wolf*). The process lasted about 18 hours, and the weight of the mass often reached 1,300 to 1,400 lbs. There was also produced at the same time more or less fluid carburized iron. The form of the furnace resembled two truncated cones placed base to base, a construction which has been retained to a great extent to the present day. In 1760 so-called *Flossöfen*, 25 ft. high, were introduced, and white pig iron was regularly and continuously made. This iron was subsequently decarburized and converted into wrought iron in charcoal hearths. From this time the *Stücköfen* gradually disappeared. They lingered in some localities for a long time owing to the demand which still continued for *Stücköfen* iron, than which nothing could be purer; but finally, during the early part of the present century, they had entirely ceased to exist. The *Flossöfen* gradually enlarged into the *Blauöfen* or *Blaseöfen*, of which there were 34 in Styria in 1864. These furnaces are from 28 to 46 ft. high, and differ from the modern blast furnace mainly in having a closed breast with tapping openings for iron and cinder, while the blast furnace has an open fore hearth, originally designed doubtless to permit the dipping out of fluid iron for castings, and now generally retained on account of the facility of access it gives to the interior of the hearth of the furnace, in case obstructions or deposits have to be removed. Of late years the closed front has been adopted in many large blast furnaces with success; but the fore-hearth construction is still the prevalent one. Increasing the height of the furnace and the strength of the blast had for its immediate effect the more perfect extraction of the iron and a decided economy of fuel. The addition of lime as a flux to silicious ores likewise facilitated the complete extraction of the iron. The cinder thus produced, instead of being rich in iron, as was previously the case, contained only the earthy ingredients of the ore with but a trace of iron. The cinders produced in low furnaces were for a long time successfully smelted in the *Blauöfen*.—In

England the birth of the iron manufacture dates back to the days of the early Britons, and relics of the iron smelting of the Romans are abundant. In the 16th century the iron manufacture had increased to such an extent that, in order to check the rapid destruction of the forests, restrictions were laid on the cutting of wood for charcoal, by laws enacted in 1558, 1581, and 1584. As a consequence the iron manufacture declined, until in the early part of the 18th century there were but 59 iron works in the country. The supply of iron at this time was mainly from Russia, Sweden, and Spain. Numerous attempts were made to use mineral or pit coal for smelting iron, and patents for alleged discoveries were freely granted; but no manufacture based on mineral coal was established till 1619, when Dud Dudley obtained his patents. He successfully carried on the manufacture for many years, making iron cheaply and of good quality; but, being much persecuted by envious rivals, he finally succumbed to his misfortunes, and dying left no record of his invention behind. It was not till 1735 that the next successful attempt was made to use mineral coal. At that time the difficulties of the case were again conquered by Abraham Darby, who, before using the coal in the furnace, submitted it to the same process as wood undergoes in its conversion into charcoal; in other words, he converted the coal into coke. From this time the progress of the English iron industry was rapid. In the century following Darby's discovery, bellows gave way to blowing cylinders, and water power to steam, which greatly increased the efficiency and yield of the furnace; while the application of the hot blast by Neilson in Scotland, and the utilization of the waste gases by Aubertot in France, added vastly to its economy of working. —The blast furnace consists of a vertical shaft of circular section lined with fire brick. The lowest part is ordinarily in the form of a cylinder, and is known as the hearth. In the masonry of the hearth are built the tuyeres (two to eight in number), which are hollow truncated cones of metal supplied with a constant current of cold water. Into these tuyeres project the nozzles of the pipes that supply the blast. The part of the hearth below the tuyeres is called the crucible; in it the iron and slag accumulate until tapped off. The hearth is prolonged toward the front of the furnace (fore hearth), and is closed by the dam and covered in by the tump arch. At the bottom of the dam is a channel communicating with the bottom of the crucible through which the iron is tapped off, and on the upper edge of the dam is a notch (cinder notch) over which the cinder flows. The tump arch is covered by the tump, a long hollow casting through which water circulates. The sloping walls connecting the hearth with the widest part (belly) of the furnace are called the boshes, the angle which they form with the horizontal line being called the angle of the boshes. In many furnaces the

hearth expands into and is continuous with the boshes. From the widest part of the furnace the walls usually slope inward toward the mouth, which may be either permanently open, or provided with a mechanical arrangement by which it is kept closed except during charging. There are openings in the walls of the furnace, close to the top of the stack where it is closed, and some distance down where it is open, to conduct off the escaping gas. Until comparatively recently furnaces were built entirely of masonry, the outer walls consisting of massive stone work. At the present day this heavy construction has been almost entirely superseded by slender stacks encased in brick work and surrounded by sheet iron. In building a blast furnace, the main body of the shaft is supported on pillars, usually of cast iron, and is entirely independent of the boshes and hearth, which are put in subsequently, and can be removed and repaired without interfering with the upper portion of the furnace. In the Büttgenbach system of construction the main shaft consists of one layer only of fire brick 18 in. thick, without outer casing of any kind. The charging floor on the top of the furnace is supported by hollow cast-iron columns, which serve also to conduct down the gas to the stoves. This construction is mainly recommended by its cheapness. The dimensions of blast furnaces vary greatly. The height ranges from 30 to 100 ft., the greatest diameter from 6 to 30 ft., and the capacity from 500 to 40,000 cubic feet. The relative dimensions of hearth, boshes, and throat likewise vary greatly. The cause of this great variation in dimensions is partly due to differences in ores and fuels, and partly to the fact that there are no fixed principles of blast-furnace construction that have found general acceptance. The more refractory the ore and the more dense the fuel, the larger, as a rule, is the furnace; but as to the proper outline of the interior there is great difference of opinion. Most metallurgists are so far agreed as to have abandoned the flat boshes, narrow mouths, and abrupt changes of outline of the older furnaces; but further than this there is no uniformity in modern blast-furnace construction. The following are some of the considerations which should determine the dimensions and outlines of blast furnaces. The temperature attained in the hearth, upon which the nature and quality of the iron depend, is the result of a number of factors, such as pressure or penetration of blast, character and amount of fuel, and diameter of hearth. The last is readily fixed when the others are known. The regular working of the furnace depends in a great measure on the regular descent of the charges. Now, as the charge diminishes in bulk in descending, owing to the reduction of the iron and the combustion of the fuel, the capacity of the furnace should diminish correspondingly; that is, the walls should taper downward. The amount of this tapering, or in other words the angle of the boshes, should

correspond to the rate of the shrinkage, which is more rapid as the charge approaches the tuyeres. This principle is generally recognized; but it is applied in practice to the lower part of the furnace only. It seems rational to suppose that advantage would result by applying it to the whole length of the furnace, and making the greatest diameter correspond to that part where the charge occupies the greatest bulk, namely, at the mouth. The difficulty of properly distributing the charges over a wide mouth is however at present a practical objection; and it may be also that the reactions in the upper zone of the furnace, by which carbon is deposited, would be unfavorably affected by such a construction. The height

FIG. 1.

of the furnace depends primarily on the nature of the charge. If this is disposed to crumble, or is composed of fine particles that might pack and impede the passage of the blast, a high furnace would be inadmissible; but, other things being equal, the higher the furnace the greater is its yield and economy of working, as the reducing gases are more thoroughly intercepted and utilized. Fig. 1 is a vertical section through the fore hearth of a German blast furnace built entirely of masonry. Its height is 48 ft. and greatest diameter 14 ft. Fig. 2 is a vertical section of a blast furnace at Chicago. It is 66 ft. high and 17 ft. in greatest diameter. The top is closed by a "bell and hopper." The upright column at the side is the gas conductor. Fig. 3 is an elevation of the same furnace show-

FIG. 3.

ing the sheet-iron casing.—The essential accessories of the blast furnace are the blowing engines, hot-blast ovens, and hoist. The blowing engines are of three kinds, the vertical beam, the horizontal, and the upright engine. The latter has been generally introduced of late years, owing to its compactness and efficiency. One of the largest blowing engines ever erected is a beam engine at Dowlais in Wales. The blowing cylinder is 12 ft. diameter with 12 ft. stroke. With 19 strokes per minute it discharges 51,528 cub. ft. per minute at a pressure of 3 lbs. to the square inch, capable of supplying six large furnaces and four fineries. From the blowing cylinders the air passes to the hot-blast ovens. These consist of a series of cast-iron pipes, arranged in a fire-brick chamber, and

gases. While one is heating, the blast passes through the other, and the currents of air and gas are changed at intervals of about half an hour. The temperature of the blast ordinarily employed varies greatly. A few furnaces are still blown with cold blast, where it is desired to produce an iron of superior quality; but usually the blast is heated from 500° to 1000° F. The hotter the blast, the sooner the pipes in the ovens burn out, and therefore the temperature rarely reaches 1000° with iron pipes. In Whitwell's stoves a temperature of 1550° may be obtained; but it does not generally rise above 1200° or 1400°. The pressure of blast varies from 1 lb. per inch to 5 or 6 lbs. Charcoal furnaces are usually blown with the lowest pressure, anthracite furnaces with the

FIG. 4.

heated by the combustion of the gases drawn from the top of the furnace. The gases are generally burnt in a special combustion chamber, and the products of combustion only pass into the chamber containing the pipes. Equable heating without danger of injury to the pipes is thus effected. This arrangement is shown in fig. 4. Recently Siemens's system of regenerative heating (see FURNACE) has been applied to hot-blast stoves, and a much higher temperature of blast attained than could be produced by the simple combustion of the gas. Whitwell's and Cowper's stoves are both constructed on this system. The former are being extensively adopted. They consist of two "regenerators" of fire brick, which are heated alternately by the combustion of the furnace

highest, and coke furnaces with a pressure of 3 or 4 lbs. Occasionally furnaces are situated on a hillside, and the stock of ore and fuel is on a level with the mouth of the furnace; but ordinarily lifts or hoists are required to raise the materials of the charge from the ground to the top of the furnace. There is a great variety of lifts, embracing among others the hydraulic, the pneumatic, and the steam lift.—The blast-furnace process, expressed in its simplest form, is as follows: The furnace is charged with ore, fuel, and limestone, which gradually descend the shaft as the smelting proceeds. The air of the blast, on coming in contact with the incandescent fuel, is converted into carbonic acid gas, but, speedily taking up another atom of carbon, is reduced to carbonic oxide, which, together with the inert nitrogen of the air, rises through the descending charge, abstracts the oxygen of the ore, and passes out of the mouth as carbonic acid. When the reduced iron reaches the vicinity of the tuyeres, it takes up carbon, melts, and drops down into the crucible of the furnace, while the earthy ingredients of the ore, flux, and fuel unite and form a fluid cinder, which likewise drops into the crucible and floats on the top of the molten iron. At regular intervals the iron is tapped off into moulds of sand or iron, where it cools in "pigs." The foregoing expresses merely the general progress and final results of the blast-furnace process. In practice it has been found that the changes which take place are very complicated and involved, and depend on a great number of conditions. The phenomena of iron smelting have recently been the subject of searching investigation; and we are mainly indebted for our present knowledge

to the studies of Bell in England, Tunner in Austria, Akerman in Sweden, and Gruner in France. What follows contains the principal results of these investigations, especially those of I. Lowthian Bell, which have been the most extensive and the most fruitful of valuable conclusions. The mutual reactions of carbon, carbonic acid, carbonic oxide, metallic iron, and oxide of iron are expressed in the following formulas:

These reactions show that carbonic oxide not only abstracts oxygen from oxide of iron, but also imparts oxygen both to metallic iron and to its lower oxide; that carbonic acid, which results from the reduction of iron by carbon or carbonic oxide, may also oxidize metallic iron; and that carbonic acid is capable of taking up a second atom of carbon. The nature of the reaction in any given instance is dependent mainly on the temperature, and also on the relative proportions of the gases. The breaking up of carbonic oxide and the deposition of its carbon was discovered by Bell. The conditions governing this remarkable reaction have been studied by him and by Gruner. The following are the results of Gruner's experiments on this point: On passing carbonic oxide over a fragment of iron ore at a temperature of 300° to 400° C. (572° to 752° F.), the latter is gradually reduced, the reduction progressing from the surface to the interior of the mass. When metallic iron is formed on the surface, the ore cracks and expands, and becomes covered with a fine deposit of carbon. This carbon deposition diminishes as the reduction of the ore proceeds; and were it possible to effect complete reduction in this way, it would finally entirely cease. Pure carbonic oxide is not decomposed by metallic iron at 300-400° C.; but when the carbonic oxide is mixed with carbonic acid, deposition of carbon takes place. The amount of the CO₂ must not, however, exceed 1 volume to 2 volumes of CO. This deposited carbon is not pure, but contains 5 to 7 per cent. of metallic iron, and also some oxide of iron, mainly magnetic. The formation of this deposit of ferruginous carbon is the result of the mutual reaction of two molecules of carbonic oxide, whereby 2CO = CO₂ + C; but it is absolutely necessary that there should be present simultaneously metallic iron and ferrous oxide, the former to fix the carbon and the latter to hold for an instant the oxygen, losing it again by the action of carbonic oxide. The following formulas express the reactions: 3FeO + CO = Fe₃O₄ + C, and Fe₃O₄ + CO = 3FeO + CO₂; and so on indefinitely, provided that the reducing action of carbonic oxide is tempered by a certain amount of carbonic acid.

If the temperature is raised to a red heat the deposition ceases, and the carbon already deposited unites with the remaining oxide of the ore. It is probable that the deposited carbon plays an important part in the final reduction of the ore in the blast furnace. The dissociation of carbonic oxide (2CO = CO₂ + C) is accompanied with a development of heat, every unit of carbon deposited corresponding to an evolution of 3,134 heat units.—The temperature at which the iron ore begins to lose oxygen in the blast furnace depends on the molecular constitution of the ore and the relative amount of carbonic oxide in the gas. Bell has found that the temperature of incipient reduction of oxide of iron by pure carbonic oxide varies from 141° C. (285° F.) to 208° C. (407° F.), according to the nature of the oxide or ore. The temperature at which carbonic acid begins to oxidize metallic spongy iron was found by him to be about the temperature of melting zinc, 417° C. (782° F.). In both cases the energy of the action is promoted by increasing the temperature, but the oxidizing action of the carbonic acid increases in a greater ratio than the reducing action of the carbonic oxide. The point of equilibrium of the two gases toward metallic spongy iron at different temperatures was found to be:

Low red heat.....	150 vols. of CO ₂ for each 100 vols. of CO.
Full ".....	47 " " " "
Approaching whiteness.....	11 " " " "

The point of equilibrium of a mixture of carbonic oxide and carbonic acid toward oxide of iron depends likewise on the temperature, and also on the molecular structure of the oxide. At a red heat a mixture of 100 volumes of carbonic oxide and 600 of carbonic acid is nearly neutral to calcined Cleveland ore, while at 417° C. the point of equilibrium is found in a mixture containing 100 volumes of carbonic oxide to 50 of carbonic acid. Again, a mixture of equal volumes of carbonic acid and carbonic oxide at a temperature of 417° C. is found to reduce *Eisenerz* spathic ore actively. The temperature at which carbon (coke) begins to decompose carbonic acid is, according to Bell, 410° C. (770° F.).—The composition of blast-furnace gases at different levels of the furnace has been investigated by a number of observers. The following analyses are by Bell and Tunner:

Wear Furnace, 80 ft. high. Capacity, 17,500 cub. ft. Consumption per ton of iron, 23.5 cwts. of coke and 12.8 cwts. limestone. Ore, roasted carbonate. (Bell.)

The hydrogen in the gases from the Wear furnace was not determined; it is never present in large quantity, and plays no important part in the blast-furnace process. Hydrocarbons and cyanogen are also sometimes present in small quantity. The former are abundant in the upper part of the furnace, when raw bituminous coal is used. It will be noticed in the above analyses that the escaping gases still contain a considerable amount of carbonic oxide. An ideal furnace process would be one in which the carbonic oxide was completely utilized, and only carbonic acid escaped from the furnace. From the experiments of Bell, quoted above, it is evident that such a condition is practically impossible; yet the relative amount of carbonic oxide is a measure of the economy of working. Formerly the gases were allowed to burn at the mouth of the furnace; now they are invariably utilized, either wholly or in part, to heat the blast, raise steam for the blowing engines, or roast ores. The gases likewise possess a certain amount of sensible heat, from which also the economy of working may be judged. The ultimate practical economy of fuel that can be attained in the furnace is reached when the gases contain such a relatively small amount of carbonic oxide that they are no longer capable of reducing the ore at the temperature at which they leave the furnace.—In the year 1829 there were used in Scotland about eight tons of coal in the form of coke to produce one ton of pig iron; at the present time in Cleveland the consumption of coal is but 33 cwts. per ton of iron. This great economy of fuel has been reached by increasing the dimensions of the furnace, by complete utilization of the carbonic oxide in the escaping gases, and by the use of heated blast. Increasing the height and diameter of the furnace prolongs the contact of the charge with the hot reducing gases, whereby the sensible heat of the latter is more completely transferred to the descending materials, and the reducing power of the carbonic oxide is more thoroughly utilized. Widening the throat and mouth of the furnace has the same effect, by decreasing the rapidity of the gaseous current. It would at first sight appear that the dimensions of the furnace could be so far increased as to intercept the total amount of sensible heat. This is found not to be the case in practice. Bell has shown by experiment that the temperature of the gases at the mouth of a

furnace having a height of 80 ft. and a capacity of 12,000 cub. ft. is not materially higher than that of gases from furnaces 103½ ft. high with a capacity of 33,000 cub. ft. The cause of this has been shown by Bell to be, that there is a constant source of heat production in the upper part of the furnace, caused by the reduction of the ore and the deposition of carbon; and increasing the height of the furnace merely serves to raise this zone of reduction. From the reduction of the ore by carbonic oxide, the heat development is very small, as a given weight of oxygen uniting with iron or carbonic oxide produces in either case nearly the same amount of heat. According to Dulong, one litre of oxygen gas gives 6,216 units of heat when it combines with iron, and 6,260 when it combines with carbonic oxide. But the heat development by the dissociation of carbonic oxide, as described above, is 3,134 heat units for each unit of carbon deposited. The utilization of the carbonic oxide in the gases for heating blast or boilers directly effects a saving of a corresponding amount of coal. The saving of fuel consequent on heating the blast is very marked. The cause of this saving was for a long time sought in vain. On the first introduction of the hot blast in Scotland it was found that by burning 5 cwts. of coal to heat the blast to 450° F. there was effected a saving of 47 cwts. of coal in the furnace; and by burning 8 cwts. of coal, to heat the blast to 612° F., the saving was 83 cwts. or 69 per cent. Experience has shown that the economy of fuel attained by the use of hot blast depends on the height of the furnace and on the reducibility of the ore. The higher the furnace and the more susceptible the ore to the reducing action of carbonic oxide, the smaller is the saving of fuel effected. The enormous saving shown in the Scotch furnaces was due to the fact that both conditions were favorable to the use of hot blast, viz.: the furnace was low and the ores were refractory. The economy of fuel by hot blast in modern high blast furnaces does not often exceed 10 to 12 cwts. of coke per ton of pig iron. The ideal working of the blast furnace is as follows: A certain amount of fuel is burned before the tuyeres, and generates enough heat to melt the reduced iron and the cinder. The carbonic oxide, which is the end result of this combustion, ascends through the ore, which it reduces to metallic iron, and passes out of the furnace as carbonic acid. It is found, however, that the minimum amount of fuel that will melt the iron and cinder does not, under the conditions that obtain in the blast furnace, supply sufficient carbonic oxide to do the work of reduction. It has further been found that the rapidity of the reduction of the ore depends on its molecular constitution, or the proportion that carbonic oxide bears to carbonic acid in the gases, and on the temperature. Let it be supposed that in a blast furnace working with a given quantity of fuel, a certain ore requires

seven hours for complete reduction, while another ore requires fourteen hours. If it is now desired to smelt the refractory ore so as to have a production equal to that afforded by the first ore, it is necessary either to give it fourteen hours' exposure or to increase the rapidity of reduction. The first of these conditions is accomplished by doubling the height of the furnace, and the second by increasing the temperature through the use of more fuel. In the latter case there is no more heat utilized, in spite of the greater amount of fuel, than when smelting the easily reducible ores, presuming that they have approximately the same composition. It is merely the rate of reduction that is increased; and the excess of heat passes off in the escaping gases. Of these two methods of smelting refractory ores, the latter was the one adopted until a comparatively recent period, when increased height of furnace was found to give the same result. As an instance may be given a Scotch furnace 53 ft. high and using 40 cwts. of coke per ton of iron produced from black-band. By adding 18 ft. to the height the amount of fuel was reduced to 28 cwts. Akerman in Sweden was the first to suggest what is probably the principal cause of the economy in using hot blast. The heat which is produced by the combustion of the fuel in the furnace is contained in the carbonic oxide formed and in the accompanying nitrogen, while the heat that is conveyed by the blast is not attended with the development of any gaseous products, and does not therefore increase the bulk of the gases in the furnace. Now, as the temperature of the gases is inversely as their bulk, it follows that the temperature of the furnace must be higher when using hot blast, and the rate of reduction correspondingly rapid. Further, the rapidity of the upward current will be diminished, and the more thorough will be the reducing action of the carbonic oxide. It has been shown that increasing the height of the furnace beyond a certain limit only serves to raise the zone of reduction, and does not cause further saving of fuel. The theoretical limit of temperature of the blast is attained when the amount of fuel consumed in the furnace is so far replaced by the heat in the blast, that the carbonic oxide formed is just sufficient to do the work of reduction. This point has never been reached in practice; but the significant circumstance has been noted, that the rate of saving for a given number of degrees decreases as the temperature of the blast is raised.—From the above it will be evident that the ultimate practical economy of fuel attainable in blast furnaces depends on a number of conditions. In the Cleveland district, England, where the furnaces have attained colossal dimensions and the blast is heated to over 1000° F., the lowest consumption of coke per ton of No. 3 pig (see IRON) is about 21 cwts.; while at the Wröbna furnace in Austria, which is but 36 ft. high, and where the temperature of blast is 752° F., the consump-

tion of charcoal is but 13.20 cwts. per ton of iron. The daily production of furnaces is dependent on the same conditions as determine the consumption of fuel, and also on the rate of driving of the furnace, *i. e.*, the amount of blast in a given time. The extremes are small charcoal furnaces yielding but 4 to 5 tons per day, and large furnaces yielding 80 tons per day. The absolute amount of heat produced in the blast furnace, the amount absorbed in work done, and the amount lost by radiation and in the gases, have been calculated by a number of authorities. The following is Bell's estimate expressed in cwt. heat units per ton of iron produced:

HEAT PRODUCTION.

Oxidation of carbon.....	81,536 units.

—Occasionally ores occur which contain the proper proportion of earthy matters to form a fusible slag (self-fluxing ores). When this is not the case, the substances in deficiency must be added; and this may often be advantageously accomplished by mixing ores of different characters. In the large majority of cases, limestone is added as flux, since most ores contain silica and alumina, which with the lime form a fusible slag. It is a matter of great importance that the composition of the ores and fluxes should be accurately determined, in order that a slag (cinder) may be formed of the desired fusibility. Blast-furnace slags are usually double silicates of alumina and lime, in which the latter is often partially replaced by magnesia, oxide of manganese, and (when the reduction is incomplete) by protoxide of iron. The fusibility increases with the amount of silica, up to about 60 per cent. of the latter, and decreases with the amount of lime. Basic slags are white and stony in character, and require a very high temperature for fusion. The conditions in the furnace producing such a slag are therefore favorable to the complete reduction of the ore and the formation of a highly carburetted siliconized iron. Basic slags also take up sulphur in considerable quantities. White iron is generally accompanied with a more acid cinder, which sometimes contains

considerable oxide of iron. When this is the case, it is called a scouring cinder. The following analyses show the composition of several varieties of blast-furnace slags:

ELEMENTS.	1	2	3	4	5
Silica.....	38.48	43.07	27.65	42.17	61.06

Nos. 1 and 2 are from raw coal, used at Dowlais, Wales, the first making gray, the second white iron; 3, coke, at Clarence, England, making gray iron from Cleveland ores; 4, anthracite, at Boonton, N. J., making gray forge iron; 5, charcoal iron, at Gosberg, Sweden. Slags are classified, according to the ratio which the oxygen of the silica bears to the oxygen of the bases, as tri-, bi-, mono-, and subsilicates. According to Bodemann, the most fusible silicate of lime and alumina is a bisilicate of the following composition: silica 56 per cent., lime 30, alumina 14. Blast-furnace slag is almost entirely a waste product, and one that is very difficult to dispose of. Acres of valuable land are often sacrificed as a dumping ground for it. Many attempts have been made to utilize it, and with considerable success. Building brick, paving stone, hydraulic cement, sand for mortar, &c., have been successfully made; but no regular manufacture has yet been introduced that can work up even a minute fraction of the ever-increasing slag production of the world.—WROUGHT IRON is either made directly from the ore or from pig iron. In the former case the process is one of reduction of the iron from its oxide; in the latter it is one of oxidation of the carbon, silicon, &c., of the pig iron. Although the iron produced in low furnaces and bloomeries is usually of great purity, yet owing to the small production and the waste of iron, and the necessity of rich ores and charcoal, the direct process has almost entirely disappeared from civilized countries, as it is not able to compete commercially with the indirect production of wrought iron from pig. (See BLOOMARY.) The conversion of pig into wrought iron is effected either in a hearth similar to a bloomery or in a reverberatory furnace. The nature of the process is the same in both cases, and consists in the oxidation of the silicon, manganese, carbon, phosphorus, sulphur, &c., in the pig iron, by the oxygen of the air, and also by that of oxide of iron. The latter is generally added as such, but is always formed in the process itself. The oxygen in the solid form is the most active, since it can be intimately incorporated with the iron, while the oxygen of the air merely acts on the surface of contact.

The order in which the foreign substances in the pig iron are removed is that in which they are named above; or, more especially, all these substances are oxidized coincidentally, but the rate of oxidation is in the order given. The iron is also promptly oxidized, and forms with the silica resulting from the oxidation of the silicon a basic iron silicate, or cinder, which reacts on the carbon and silicon remaining, converting them into oxides, while an equivalent amount of metallic iron is reduced. Iron thus serves as a carrier of oxygen to the non-metallic elements. This interchange of elements continues until the iron is nearly or quite decarburized. Manganese, if present in the pig iron, may replace the iron in the cinder, but it does not act in the same manner as a carrier of oxygen. The hearth process, now almost exclusively confined to the mountainous region of southern Europe, Sweden, and South Wales, was previous to the latter part of the last century the method universally employed for the conversion of pig iron. The process is a very simple one. The iron is melted with charcoal and exposed while molten to the direct action of a blast of air from one or two inclined tuyeres in the side of the hearth. The iron gradually loses carbon, silicon, phosphorus, &c., and is converted into a pasty lump or bloom which is hammered into slabs. The process in its essential features is the same everywhere, but owing to slight variations in construction of hearth or in the details of manipulations it has received a great variety of names. In Sweden there are three methods employed, the Walloon, the Franche-Comté, and the Lancashire. The latter, which is the one most generally used and most economical of fuel, will be briefly described. The hearth is quadrangular, and formed of cast-iron plates. The tuyere side is slightly inclined inward, the opposite side and the back are inclined outward, and the front is vertical. The bottom plate is cooled by running water. The blast is supplied by one or two tuyeres at a temperature of 210° to 390° F., and at a pressure of 1 to 1½ lb. per square inch. The waste heat from the hearth is used to heat the blast and also the pig iron previous to charging. The manipulation consists in piling up the already heated pig iron to the amount of 200 to 250 lbs. on the burning charcoal, and melting down. As the molten metal drops past the blast it is partially oxidized, and the oxide thus formed, together with the rich basic cinder remaining from the previous operations, act with the blast in decarburizing the iron. The imperfectly refined iron, which sinks to the bottom, is broken up with an iron bar and brought repeatedly before the tuyere, until the iron is rendered thoroughly soft and malleable. Finally, a high heat is given, and the iron is collected in a mass or bloom in the bottom of the hearth. It is then taken out and forged under a trip-hammer to a prismatic shape. The process lasts about 1½ to

1½ hour. The yield of blooms is about 87 per cent. of the pig iron, and the consumption of charcoal one ton to a ton of blooms. The iron is subsequently heated in a gas furnace and forged out into bars. All the Swedish bar iron used in Sheffield for conversion into steel is made by this process, except that from Dannemora, which is made by the more expensive Walloon process. The latter consumes three tons of charcoal to a ton of blooms, with a yield of but 80 per cent. Formerly the process of refining pig iron previous to its conversion into wrought iron was extensively employed, but at present this practice is falling into disuse. It consists in exposing the molten pig iron in an elongated rectangular hearth to blasts of air from two or three tuyeres on each side. The operation is in all respects similar to that already described, but is interrupted before all the carbon is removed, and while the metal is still molten. The metal is then run out on an iron plate, where it solidifies in plates about 3 in. thick. Gray pig is used in the refining or running-out fire; and the change that is effected consists mainly in the removal of the greater part of the silicon and a little of the carbon, the resulting refined or "fine" metal being white and more easily and quickly converted into wrought iron than the original gray pig.—Puddling consists in melting down pig iron on the bed of a reverberatory furnace heated by flame, and stirring it actively in an oxidizing atmosphere, until it has become malleable. This process was first successfully introduced by Henry Cort in England in 1784. Although others, notably the brothers Oranage in 1766 and Peter Onions in 1783, had plainly indicated in patent specifications the essential operations in puddling, yet to Cort belongs the credit of having made the process a practical success. For some time puddling was performed on a sand bottom, which made the operation tedious, and caused great waste of iron by the formation of an excessive amount of cinder. In 1818 Samuel B. Rogers introduced iron bottoms, by the use of which the production of the furnace was greatly increased, and the waste of iron lessened. Before the puddling furnace is used, the iron bottom is covered with a thick layer of cinders or scrap wrought iron, and exposed for a long time to an oxidizing atmosphere, so as to form a refractory lining. The essential parts of a puddling furnace are the fireplace, hearth, and flue. The fireplace is from one third to two thirds the size of the hearth. The draught of the fire is effected by a high chimney, and often there is a blast under the grate. Either bituminous coal or anthracite may be used as fuel. The hearth is generally rectangular or oval. It is formed of a bottom plate and sides of cast iron, and ends of fire brick, called the fire and the flue bridges. The

side castings are hollow, as are also the bridges, to allow of a circulation of air for cooling. There are recesses in the side castings, in which is put the fix or fettling, which is either rich iron ore or roasted cinder. The waste heat passing off in the flue is usually utilized to heat steam boilers. Fig. 5 shows a vertical and horizontal section of a puddling furnace with steam boiler. Sometimes puddling furnaces are built of double the usual size, with a working door on each side. In these the charge is twice the usual amount, and two puddlers work together. There is a great variety of puddling furnaces, built mainly with a view to economize fuel or to better regulate the combustion. Gas furnaces have never come into very general use for puddling. The pig iron used for puddling is mostly the lighter gray

FIG. 5.

iron and white iron. The highly graphitic varieties are apt to be rich in silicon, which makes a large amount of fluid cinder, prolongs the operation, and causes great loss of iron. Gray iron requires a high temperature for fusion, but becomes thinly fluid, while white iron is sluggish when melted. The former therefore generally yields an iron of better quality, as it can be more thoroughly worked. The puddling process may be divided into four stages: 1, melting down the charge; 2, incorporation of the fettling; 3, boiling; and 4, uniting the soft iron to balls. When the charge is completely melted, it is stirred to render it uniform. The temperature is then somewhat lowered in order to allow the cinder which has formed on the surface and the oxide of iron of the fettling to be thoroughly incorporated with the iron. The temperature is then raised again,

and the mass of metal begins to "boil" from the escape of carbonic oxide, which burns with a blue flame on the surface. Finally the ebullition becomes less rapid, and little bright points of soft iron appear. The iron is then said to "come to nature." The stirring or rabbling is continued incessantly, to prevent the formation of lumps of imperfectly decarburized iron. When the operation is complete, the puddler forms a number of balls of the pasty iron, of about 60 to 80 lbs. each. As soon as the balls are formed, the damper is lowered in order to prevent the waste of iron by burning. During the whole course of the puddling the working door remains closed, and the rabbling tools are introduced through a small notch in the lower side of the door. When the balls are ready for removal, the door is opened and the balls are taken singly to the hammer or squeezer. The duration of the process is from $1\frac{1}{2}$ to $1\frac{3}{4}$ hour, the loss of iron 10 to 15 per cent., and the consumption of fuel from 16 to 30 cwts., according to character of fuel, size of charge, &c. Sometimes the term puddling is restricted to the working of white or nearly white iron in a furnace without fettling, and the term boiling is applied to the process described above. Such boiled iron is, other things being equal, superior to puddled iron. As the oxidation of the carbon and silicon is mainly effected by the oxide of iron of the fettling, there should be a gain of malleable iron over the pig iron charged, instead of a loss; since for every 18 parts of carbon removed from the pig iron 56 parts of iron are reduced from the oxide, and for every 42 parts of silicon removed there are also 56 parts of iron reduced. In the ordinary puddling furnace, however, with the strongly oxidizing atmosphere, the loss of iron more than compensates for this gain. Siemens has succeeded, in his gas furnaces, in obtaining a yield of wrought iron equal to the weight of pig charged; but Danks, in his rotary puddler, described below, has obtained nearly the theoretical amount of gain.—The quality of the wrought iron produced by puddling depends on the composition of the pig iron used, and on the care and thoroughness of working. The removal of silicon and carbon is easily effected by good working; but phosphorus and sulphur are never completely removed. According to Parry, 75 to 80 per cent. of phosphorus and 80 per cent. of sulphur is ordinarily eliminated. The manner of removal of phosphorus is somewhat doubtful. Percy thinks it is mainly in the form of phosphide of iron, which is more fusible than the iron, and is hence carried off with the cinder. It has, however, been noticed that the more basic the cinder, the more phosphorus it contains; which renders it probable that phosphorus is present in the cinder in the form of phosphoric acid. Sulphur is said to be principally removed in the latter part of the process, which is consequently prolonged when highly sulphur-

ous pig iron is puddled. This prolongation of the operation tends to make a highly fibrous iron, probably owing to the fact (see Iron) that the cinder becomes very basic and more infusible, and is hence not so readily expelled by rolling or hammering. The purer the pig iron treated, that is, the less sulphur and phosphorus it contains, the shorter may the operation be, and the more granular and crystalline the product. Puddled steel is made in the same way as wrought iron, but from pure pig iron, containing not too much silicon. The operation is stopped before all the carbon is oxidized, and a steely product is obtained. The presence of manganese is here an advantage; since, as has been before mentioned, oxide of manganese in the cinder does not oxidize the carbon of the pig iron. Tap or puddling cinder is composed mainly of silica and oxides of iron; it may be considered as a tribasic silicate of ferrous oxide, containing also, at times, ferric and magnetic oxide. Phosphoric acid and sulphur are also generally present. Such cinder is used either raw or roasted in the blast furnace, yielding when in large quantity an inferior quality of iron, known as cinder pig; or it is used after roasting as fettling for the puddling furnace. The following analysis is of tap cinder made from common white iron: silica, 7.71; ferrous oxide, 66.32; ferric oxide, 8.27; manganese oxide, 1.29; alumina, 1.63; lime, 3.91; magnesia, 0.34; sulphur, 1.78; phosphoric acid, 8.07; total, 99.32.—There have been proposed from time to time a great number of fluxes and purifying agents for use in the puddling process; they are mainly directed against sulphur and phosphorus, particularly the latter. The following are a few of the substances proposed: oxide of manganese, common salt, iodide of potassium, nitre, litharge, copperas, chloride of calcium, lime, and fluoride of calcium. Manganese generally exerts a favorable influence in all iron and steel processes. Its action is not well understood, except so far as it hinders the decarburization of pig iron when it replaces iron in cinder. It is not probable that it affects either sulphur or phosphorus in the puddling. The volatilization of sulphur and phosphorus as chlorides has long been a favorite theory; but there is no proof that chloride of sodium or any other chloride acts in this way. The oxidation of phosphorus in pig iron takes place readily; and, if the cinder present is sufficiently basic, the phosphoric acid will remain combined; if not, the phosphorus will recombine with the iron. (See Bessemer process, under STEEL.) A highly basic iron cinder, as above mentioned, retains a large amount of phosphoric acid, but if instead of oxide of iron a stronger base is substituted, the phosphoric acid will be still more firmly held in combination. The alkalies and alkaline earths have proved to be valuable dephosphorizers; and it is probable that salt, nitre, and chloride of calcium act, in this respect, solely by virtue of their respective bases.

Henderson used a mixture of fluoride of calcium or fluor spar and titaniferous iron ore for the purification of pig iron, with good effect. It is impossible to say whether the fluorine exerts any direct action on the phosphorus, or whether the effect is due simply to the lime present in a highly fusible compound.—When the balls of soft iron are ready in the puddling furnace, they are taken directly to the hammer or squeezer. The trip hammers formerly employed are now generally replaced by steam hammers, which are more efficient and manageable. Squeezers are now very generally used for the first treatment of the puddled ball. The form generally used in the United States is Burden's rotary squeezer. Fig. 6 shows a horizontal section, different in construction, but on the same principle as the Burden squeezer. The revolving corrugated cylinder is excentric to the frame in which it turns, and the ball in

Fig. 6.

its passage is considerably condensed, while a large part of its cinder is expelled. From the hammer or squeezer, the bloom is taken while still hot to the rolls, where it is passed through a number of grooves, and formed into a slab or bar, called puddled or muck bar. This is still rough, and must be reheated and again rolled before it is ready for the market. The muck bar is generally broken up in lengths of two or three feet, made into a pile, and raised to a welding heat in a reverberatory or gas furnace. This white-hot pile is put through another set of rolls and gradually reduced in size until it forms merchant bar iron. The more iron is worked in this way within certain limits, the more homogeneous it becomes. Fig. 7 shows a merchant train of three high rolls with grooves of different shapes and sizes. The most varied forms of iron are made by means of rolls or with appropriately shaped grooves. By piling iron of different qualities a finished product may be

obtained which will combine the properties of all the varieties used. Thus it is customary, in making piles for rails, to put a granular iron on the top and a fibrous iron in the body, so that the finished rail shall have a hard wearing surface and a tough web and flange. Smooth

Fig. 7.

rolls are used for making plates and sheet iron. These rolls are provided with a mechanism by which they can be approximated after each pass of the metal. The limits of dimensions within which iron may be worked are very great. Sheet iron has been rolled out to the thinness of the finest paper, and armor plates have been made over a foot in thickness and weighing 33 tons.—The operation of puddling is extremely laborious, requiring great muscular strength and endurance. Many attempts have been made to substitute machine for hand labor in this process, with but partial success. The mechanical puddlers, so called, are mostly contrivances by which the rabble can be moved about in the furnace with merely the guidance of the workman. These machines, although they have worked well, have never come into general use. Another similar contrivance is the revolving rabble. This is extremely simple and requires no expensive machinery; it is said to give good results. Richardson's process consisted in blowing air through a hollow rabble, which was moved about the hearth. The process of oxidation here, as in the Bessemer process, proceeded rapidly; the iron soon came to nature, and the manual labor was confined to the operation of balling. Notwithstanding its apparent success, this process is nowhere in use at present. Attention was early directed to the construction of rotary or oscillating puddling furnaces; but the insuperable difficulty encountered was the formation of a lining that would stand the scouring effect of the metal. This difficulty has been overcome by Mr. Samuel Danks of Cincinnati, who has constructed and introduced the first practical and efficient rotary puddler. It consists of a revolving chamber, fire grate, and movable head piece communicating with the flue. The puddling chamber, 5 to 6 ft. in diameter and 3 to 4 ft. long, is made of two end pieces banded with wrought iron, and provided with detachable rings on the part most exposed to the fire. They rest on carrying rollers, permitting free rotation. The two ends are con-

ected by a series of stave plates to form a cylinder. These have hollow ribs running longitudinally, which serve the double purpose of holding the fettling and keeping it cool. The cylinder is open at both ends; one butts against the ring that is fastened to the bridge plate, and the other, which serves as a doorway, against the movable head piece. The chamber is made to revolve by a special engine attached to it by means of a toothed wheel. The fireplace is large, and is provided with blast under the grate and over the fire, by means of which the heat and character of the flame are easily regulated. Fig. 8 shows a vertical section through the fireplace chamber and head piece. The chamber is lined in the following manner: The initial lining is composed of a mixture of pulverized ore and pure lime, worked with water to the consistency of a thick paste. The inner surface of the chamber is completely covered with this mortar in a layer projecting about one inch over the hollow ribs. After

is added with each charge, as is usual in puddling. When the iron is thoroughly melted, the furnace is made to revolve once or twice a minute for the first five or ten minutes. A stream of water is then injected through the stopper hole along and just above the line of contact between the floating cinder and the inner surface of the vessel, on the descending side. The cinder is thus partially solidified, and carried down with the molten iron and intimately mixed with it. When the iron begins to thicken under this treatment, the rotation is stopped and the heat raised until the cinder melts thoroughly and floats on top of the iron, when it is tapped off. The furnace is again put into motion at the rate of six to eight revolutions a minute, which causes the charge to be dashed about violently in the furnace. When the iron begins to come to nature, the velocity of the apparatus is reduced to two or three revolutions per minute, when the ball speedily forms. The movable head

FIG. 8.

this has become hard, the furnace is ready for the fettling. About one fifth of the whole quantity of iron ore required is thrown into the furnace in the form of powder. The furnace is then heated up and made to revolve slowly until the ore is completely melted. The apparatus is then stopped, and that part of the ore which has not been consumed in glazing the initial lining forms a pool in the bottom of the chamber, into which are put a number of lumps of ore of such a size that they project 2 to 6 in. above the surface. This is allowed to set, and then another lot of pulverized ore is put in, which is melted in the same way, and a pool collected on another part of the surface, into which lumps are put as before. About 2 to 2½ tons of ore are required to fettle a 700-lb. rotary furnace. The iron may be either charged in the solid form or run in molten from a cupola. When in the solid form, it has been found advantageous to have it granulated or otherwise finely divided, in order to hasten the melting. A quantity of hammer or roll cinder

piece is pushed to one side and the ball is removed in one mass. Special machinery is needed to work these large blooms, which in the furnaces hitherto constructed weigh 700 lbs. The yield of puddled bar is usually about 10 per cent. more than the weight of the pig charged, which is due to the reduction of the iron of the fettling. Owing to the thorough working of the iron, and the intimate contact of every particle of the pig iron with the fettling, the product is much more uniform and pure than that made by hand puddling. Since the successful introduction of Danks's furnace, a number of rotary puddlers have been invented, which, though they may differ in mechanism from Danks's puddler, are yet lined and fettled in the same manner. In Sellers's rotary puddler the chamber is egg-shaped, and the flame from the fire, instead of passing through, returns and goes out at the end through which it came.—Pig iron may be completely decarburized by heating in an oxidizing atmosphere, at a temperature below that of fusion. The removal of the carbon is effected gradually and slowly from the surface to the centre. This process is used extensively for making the so-called "malleable castings" (see IRON), also often malleable iron. Only articles of less than an inch in thickness are generally so treated, on account of the length of time required for conversion. White iron, which is best adapted for the purpose, is cast in moulds, and the articles thus formed are packed in oxide of iron and exposed to a red heat for five or six days. When cold they are taken out, and are found to be tough and malleable if the iron from which they were made was of

suitable quality, and the conversion has been uniformly effected. The following analyses by Dr. R. W. Davenport show the progress of decarburization :

ELEMENTS.	Original casting.	After annealing.	After second annealing.
Silicon	0·445	0·438	0·449
Phosphorus.....	0·315	0·327	0·315
Manganese.....	0·529	0·585	0·525
Sulphur.....	0·059	0·067	0·081
Carbon	3·430	1·510	0·100

These analyses likewise show that the process is simply one of decarburization, and that the other elements present are not materially affected. Dr. Davenport noticed in a casting $\frac{1}{4}$ in. thick, which had been converted to the depth of $\frac{1}{8}$ in., that the remaining $\frac{1}{8}$ in. was darker in color than the original iron used, and analysis showed that it contained graphitic carbon. The separation of carbon from combination may therefore possibly be the first step in the process of conversion.—Within the last 30 years there have been a great number of attempts to make wrought iron and steel direct from the ore without the use of the blast furnace. These direct processes differ from the bloomery process, in which the same result is accomplished, by the reduction of the ore at a temperature below fusion, and the formation of iron sponge. The sponge thus formed contains nearly all the iron in the metallic state besides the earthy ingredients of the ore unaltered. To remove the earthy matters and consolidate the iron, it is worked up to a bloom in a reverberatory or gas furnace, or in a bloomery hearth, and then hammered or rolled in the usual way. The process of reduction or sponge making is very simple. The ore is either mixed with the fuel (preferably charcoal) in a cylinder or cupola furnace and heated to redness, or is exposed to a current of hot carbonic oxide gas. When reduction is ended, the sponge, which oxidizes readily owing to its porous condition, should be cooled in a reducing atmosphere before removal. If the process of reduction has been sufficiently prolonged, and the sponge fully cooled before removal, the product should contain at least 95 per cent. of iron in the metallic state. A great loss of iron has hitherto been experienced in working up this sponge, especially when made from poor ores containing considerable silica. In balling the iron in a puddling furnace, the loss of iron is excessive, owing to its porous condition. This has been the principal cause of the failure of nearly all the modern direct methods for making wrought iron. Chenot's process, which 20 years ago seemed to be successfully established as a metallurgical and economical process, and which furnished a large amount of iron and steel of excellent quality, is now abandoned. The same fate has befallen Yates's, Renton's, Gurlt's, and other processes which promised

success. A new application of iron sponge has been found in steel making in the open-hearth regenerative furnace; and it is now probable that iron sponge will find an economic application. In the Martin process for making steel or homogeneous iron (see STEEL), wrought-iron scrap is added to a bath of molten pig iron until the percentage of carbon remaining, in consequence of this addition, is very low, or, with the aid of an oxidizing flame, even perfectly removed. Iron sponge added in this way to a pig-iron bath loses iron to the extent merely of saturating the silica it contains in the formation of a cinder. In very pure ores this loss is consequently very small. It is in this way that Mr. Thomas S. Blair of Pittsburgh successfully utilizes the sponge made by his process, which is one of great simplicity, on the principle of Chenot's, with certain improvements in apparatus. His reduction cylinders are 40 ft. high and 3 ft. in internal diameter. The upper half is exposed to a bright red heat from burning gas on the outside, and the lower half is provided with a water jacket for cooling the reduced product. Into the top of the cylinder is inserted a thimble of cast iron 6 ft. long and 28 in. in diameter, leaving an annular space of 4 in. between it and the cylinder. Into this space are charged charcoal in small fragments and powder, and ore in pieces not larger than an egg. The carbonic oxide resulting from the reduction of the ore burns inside the thimble, and the gas from the producers outside the cylinder. The charge thus becomes rapidly heated through in this narrow space, and when it spreads over the whole diameter of the stack, 6 ft. from the top, it is all red hot. At the bottom of the stack there is a sleeve which when raised allows the already thoroughly cooled sponge and the charcoal charged in excess to run out. The sponge is drawn at regular intervals, and in the mean time the sleeve is luted with clay. No air gains access to the stack while drawing, as the column of finely divided iron and coal forms an effectual packing. The sponge is separated as far as practicable from the charcoal and compressed by hydraulic pressure into ingots, which are added directly or after previous heating to the bath of metal in a Siemens or other form of regenerative furnace. Owing to the great simplicity of the process, iron sponge is a much cheaper product than pig iron. Siemens has invented a number of sponge processes, which are all connected with the use of his regenerative furnace. None of them have ever come into general use. Since the introduction of Danks's puddler he has employed a rotary cylinder similar to this for the direct production of iron. The chamber is lined with a refractory material and heated on the regenerative principle. The ore is first melted, then the charcoal or coke is added, and the vessel rotated. Reduction takes place energetically, and a ball of soft iron is speedily formed. Siemens

claims small waste of iron and a great economy of fuel for this process. It may be regarded as a perfected form of the bloomery process.

IRON MASK, Man in the, a state prisoner of France in the reign of Louis XIV., who died in the Bastille, Nov. 19, 1703. Some critics have denied the existence of such a person, but late investigations have established it beyond question. The register kept by Dujunca, chief turnkey of the Bastille, proves that the prisoner was committed on Thursday, Sept. 18, 1698, having been brought thither from the island of Ste. Marguerite by Saint-Mars, who exchanged in that year the governorship of the state prison there for that of the Bastille. The removal was made with extraordinary precaution and secrecy. The prisoner was carried in a close litter, which preceded that of Saint-Mars, and was accompanied by a mounted guard. His face was covered with a black velvet mask, fastened with steel springs, which he was forbidden to remove on pain of instant death. He was not allowed to speak to any one except his governor, who watched him with jealous care and always kept a pair of pistols at hand to destroy him in case he made an effort to reveal himself. When in the Bastille he was attended at meals and at his toilet by Saint-Mars himself, who removed personally and examined or destroyed the linen which he had worn, lest he might make known his secret by means of some mark on it. At mass he was forbidden to speak or to show himself, and the invalides who stood by with loaded muskets had orders to shoot him if he made the attempt. After his death everything which had been used or worn by him was burned. He was buried in the cemetery of St. Paul.—Since the time of Voltaire, who first gave shape to the story of the mask, numerous attempts have been made to establish his identity. Writers have advanced various theories regarding him, some of which are: that he was the fruit of an intrigue between Anne of Austria, queen of Louis XIII., and the duke of Buckingham, born in 1626; the illegitimate son of the same queen by an unknown father, born in 1631; and a twin brother of Louis XIV., born a few hours after the king, and disposed of thus to avoid a disputed succession. But there is little evidence that any of these ever existed. Theories have also been put forth in regard to a number of real persons, among whom are the English duke of Monmouth, the reputed son of Charles II. and Lucy Walters; the count of Vermandois, an illegitimate son of Mlle. de la Vallière by Louis XIV.; the duke of Beaufort, prominent in the insurrection of the Fronde; Henry, son of Oliver Cromwell; Avedick, the Armenian patriarch, who was treacherously seized by De Ferriol, French ambassador at the Porte; Fouquet, marquis of Belle-Isle, minister of finance, and reputed rival of the king in the affections of Mlle. de la Vallière; and Ercole Mattioli, a secret agent of the duke of Mantua, who was arrested in 1679 for divulging one of the intrigues by which

Louis XIV. sought to obtain possession of Calais. The claim of Mattioli to the distinction, first advanced by M. Delort, and again by Lord Dover in 1826, is ably upheld by Marius Topin in "The Man with the Iron Mask" (Paris and London, 1869); but a late book by T. Jung, a staff officer of the French army, entitled *La vérité sur la masque de fer* (Paris, 1873), makes it appear probable that Mattioli was never in the Bastille, but died at Ste. Marguerite in 1694. M. Jung, who has investigated the subject with minute care, shows that in 1691 the mask was spoken of as a prisoner of 20 years' standing, and then proves the following: that in October, 1681, Saint-Mars was transferred from Pignerol, a fortress on the borders of Savoy, of the donjon of which he had had command for nearly 16 years, to Exiles, a fort on the frontier of Piedmont, and that he then took with him, in a litter strictly guarded, two prisoners; that on or previous to Jan. 5, 1687, one of these prisoners died, and that in April following Saint-Mars was transferred to Ste. Marguerite, and took with him a single prisoner, who was carefully guarded and watched. By a chain of strong circumstantial evidence he connects the mask with the latter prisoner, and with the survivor of the two removed in 1681 from Pignerol to Exiles. He endeavors next to prove his identity with the chevalier de Kiffenbach, or d'Harmoises, who was arrested with others in March, 1673, at Péronne, charged with complicity in a plot to murder the king, and sent to the Bastille. In 1674 a prisoner was transferred from the Bastille to Pignerol, but the evidence is scarcely strong enough to establish his identity with the prisoner of 1673, and it is still less certain that the one of 1674 was of the pair transferred to Exiles. But if M. Jung has not fully proved his case, he has confined future research to very narrow limits.

IRON MOUNTAIN, a remarkable deposit of specular iron ore on the S. E. border of Washington co., Missouri, about 40 m. S. W. of St. Genevieve, the nearest point on the Mississippi. The locality is connected with St. Louis by rail. It is described by Dr. Litton in the second annual report of the geological survey of Missouri (1855), and by Prof. Raphael Pumpelly and Dr. Adolf Schmidt in the volume on "Iron Ores and Coal Fields" of the new geological survey (1873). The later account, being based on more extensive and minute examinations, with the advantage of exposures made by continued mining operations, is the more accurate. The iron mountain deposit occurs in the azoic rocks, which reach their most extensive surface development in the region forming the northern part of Madison, Iron, and Reynolds, and the southern part of St. Francis and Washington counties, constituting the exposed portions of the skeleton of the eastern part of the Ozark range, and appearing as knobs 1,400 to 1,800 ft. above sea level, and 300 to 700 ft. above the valleys at their bases. These knobs form an archipelago of granitic and por-

phyritic islands in the lower Silurian strata of dolomite and gritstone, which surround and separate them. These azoic crystalline rocks, having been apparently above the level of the sea since before the upper Silurian period, at least, have been exposed to the action of atmospheric agency for enormous periods, and under this long-continued influence have undergone remarkable changes. The gradual removal of the soluble constituents has left important residuary deposits in the Silurian strata of clay, flint, crystalline quartz, iron sulphuret, galena, &c., and in the pre-Silurian rocks of iron ore. The destructive action of atmospheric agencies is developed both in the disintegration and decomposition of large bodies of rocks *en masse*, and in the formation and subsequent gradual disintegration of polygonal blocks on the surface. In Iron mountain the former is characteristically the case, the porphyry of which the hill (now 250 ft. high, and covering about 500 acres) largely consisted, having been entirely changed to clay. The accumulation of insoluble residuum from this decomposition and denudation has left a remarkable surface deposit of iron ore, covering the whole of the hill in a mantle of ore detritus, associated with clay. The internal structure of the hill is indicated by the mining excavations at and near the summit, and on the spur called Little Iron mountain. It appears to consist of deposits of most irregular form, lying, as magnetic observation has seemed to show, in zones extending N. N. E., being nearly the course of the ridge of porphyry of the spur of which Iron mountain is the southwestern termination. At the summit an immense mass of solid ore is exposed; and the decomposed porphyry adjoining it is traversed in all directions by veins of various sizes and irregular shape, forming a network of ore and rock. Little Iron mountain, a western continuation of the main hill, contains similar irregular veins and masses of ore, the smaller of which frequently show crystals of apatite. At or near the surface the apatite has been removed, leaving the impressions only of the crystals, frequently lined with delicate drusy quartz: hence, in such seams, the surface ore shows least phosphorus. All the ores of this region are characterized by great purity. Those of Iron mountain are in general very rich and very uniform, nearly free from sulphur both on the surface and in depth, and carrying a variable proportion of phosphorus, which rarely exceeds 0.12 per cent. The ore is specular, containing over 90 per cent. (sometimes 97 per cent.) of peroxide of iron. Porphyry is enclosed in it in large masses which can be easily separated, apatite occasionally in small crystals, and quartz in drusy aggregations resulting from infiltration into small cavities or fissures. All Iron mountain ore is magnetic, some of it strongly so, with distinct polarity, though the greater part of it acts but slightly on the needle. The amount of ore in this deposit is

beyond calculation. The main body has a thickness of at least 50 ft., and continues indefinitely in depth. Some distance beyond the base of the mountain an artesian well, sunk to the depth of 152 ft., passed through iron ore and clay 16 ft., sandstone 34 ft., dolomite $7\frac{1}{2}$ in., gray sandstone $7\frac{1}{2}$ in., "hard blue rock" 37 ft., "pure iron ore" 5 ft., porphyry 7 ft., iron ore 50 ft.—Pilot Knob, in Iron co., 6 m. S. of Iron mountain, is a conical hill nearly circular, about 600 ft. high and a mile in diameter at the base, composed chiefly of porphyry, porphyry conglomerates, and beds of hard specular iron ore. The top is conglomerate 140 ft. thick, consisting of more or less angular pebbles of porphyry cemented with iron ore, and containing frequent layers and bodies of ore. The lowest layer of the conglomerate is in some places workable as iron ore, the matrix consisting mainly of finely divided specular oxide, with clay. Below this lies the ore bed proper, 46 ft. thick, and divided into two beds, about 31 ft. above the lower foot wall, by a persistent slate seam 10 in. to 13 ft. thick. The upper bed is distinctly stratified flag ore, and considerably leaner than the lower, which presents a very compact and hard stratified peroxide. Under this ore bed is a series of porphyries. The maximum superficial extent of the ore bed appears to be about 200,000 square yards. It dips S. W. about 13° . The ore differs in quality from most of the other specular ores in the state. It is steely gray with a tint of sky-blue, very faint lustre, crystalline to granular structure, lamellar and jointed, and very brittle. The streak is uniformly dark red. The fine ore from the conglomerate has polaric magnetism, and all the Pilot Knob ores are slightly attracted by a magnet, when they are ground fine. Those from the beds immediately above and below the slate seam, however, do not disturb an ordinary compass needle.—At Cedar hill, Shepherd mountain, and other localities, similar deposits of magnetic specular iron ore occur. Dr. Schmidt holds that these specular ore deposits have been formed by infiltration from chalybeate waters. At Iron mountain he believes such waters to have deposited oxide of iron in numerous large and small fissures in the porphyries. At Pilot Knob he believes the iron ore beds to have been formed by gradual replacement of the constituents of the porphyry with ore, effected by solutions similar to those which caused Iron mountain and other deposits. This view is supported by chemical as well as geological considerations.—The Iron mountain company in 1871 shipped 262,477 tons of ore; in 1872, 371,474 tons, of which 143,431 tons were consumed in Missouri. In 1873 there were 16 furnaces employing the ores of this region, 7 using charcoal and 9 stone coal, able to produce in a year of ten months about 176,000 tons of iron. The production of 1872 was 126,652 tons, from 211,177 tons of ore, indicating a yield of about 60 per cent. of iron

from the ore. These specular oxides of the azoic rocks of Missouri are proving immensely important, not only to the western states, but also to the general iron industry of the country. The demand for the ores is large, on account of their richness and purity, which render them suitable for admixture with magnetites, &c., of other localities, and adapt them especially for the manufacture of pig iron for use in the Bessemer process, and of wrought iron by the direct process.

IRON ORES. The term iron ore is limited to oxides of iron, either as such or in combination with water or carbonic acid. Other compounds of iron, as for example the sulphide,

are not adapted for iron making. The term is further limited to deposits of sufficient purity and richness to render smelting profitable. These factors differ in different localities. Both the ferric and magnetic oxides occur in nature, sometimes nearly pure; they are called respectively hematite (red or anhydrous hematite) and magnetite. Ferric oxide also occurs in combination with water in various definite proportions; these compounds are called hydrous or brown hematites. Ferrous oxide is a component of many minerals, but only the ferrous carbonate is important as an ore of iron; it is known as spathic ore. Mineralogically iron ores may be grouped as follows:

ORES.	Formula.	Crystalline form.	Hardness.	Specific gravity.	Color of powder.	Per ct. metallic iron.	Water.	Carbonic acid.
<i>Ferric Oxide—Red Hematite.</i>								
HEMATITE	Fe ₂ O ₃	Hexagonal.....	5·5-6·5	4·5-5·3	Cherry red to reddish brown...	70·00
<i>Ferric Oxide Hydrated—Brown Hematite.</i>								
Limonite.....	Fe ₂ O ₃ ·3H ₂ O	Massive.....	5-5·5	3·6-4	Yellowish brown to rusty yellow	52·34	25·28
Xanthosiderite.	Fe ₂ O ₃ ·2H ₂ O	Massive or fibrous	2·5	Ochre yellow.....	57·14	18·37
LMONITE.....	2Fe ₂ O ₃ ·3H ₂ O	Massive or earthy	5-5·5	3·6-4	Yellowish brown.....	59·90	14·43
Göthite.....	Fe ₂ O ₃ ·H ₂ O	Orthorhombic....	5-5·5	4·4-4	Brownish to ochre yellow.....	63·08	10·11
Turgite.....	2Fe ₂ O ₃ ·H ₂ O	Massive.....	5-6	3·5-3·7	Reddish.....	66·28	5·33
<i>Ferrous Carbonate—Spathic Ore.</i>								
SIDERITE.....	FeO·CO ₂	Hexagonal.....	3·5-4·5	3·7-3·9	White.....	48·27	37·63
<i>Magnetic Oxide—Magnetite.</i>								
MAGNETITE....	Fe ₃ O ₄	Isometric.....	5·5-6·5	4·9-5·2	Black.....	72·41

Iron ores rarely occur in masses of mineralogical purity. The hydrous hematites are so closely related in their formation, occurrence, and physical appearance, that their distinction is sometimes impossible without chemical analysis, but generally the groups are readily distinguishable. The color of the powder, or streak, is very characteristic. Turgite here forms an exception to the rule; but it is easily recognized on heating, since it decrepitates and gives off water. Nearly all the iron ores contain earthy substances. These are commonly silica, alumina, lime, magnesia, &c.; silica usually predominating. These substances are removed in the cinder on smelting. Manganese accompanies iron in nearly all its ores, but for the most part in small quantities; the spathic ores contain the largest proportion. Under favorable conditions the manganese is reduced in the furnace and unites with the iron; usually, however, the greater part goes into the cinder. Sulphur is found in many ores, either in the form of sulphuric acid or as iron pyrites. According to the conditions of the smelting, the sulphur may enter either the iron or the cinder. Phosphorus, in the form of phosphoric acid, is present in most iron ores, either combined with the oxide of iron, or mechanically disseminated as apatite (calcic phosphate). It is the most dreaded of all the impurities of iron ores, since no method has been discovered of eliminating it in the blast furnace; nearly the total amount

of phosphorus in the ore goes into the iron. Titanium, as titanate, is present in many ores, especially magnetites. It renders the ores very difficult to smelt in the blast furnace; it is generally mainly removed in the cinder, but occasionally some of it unites with the pig iron. Chromium in small amount is not an unusual ingredient of iron ores; on smelting it probably passes mainly into the pig iron. Zinc is very commonly present in minute amounts; it is completely volatilized, and forms incrustations of white oxide around the furnaces. A brief description of the leading varieties of iron ore deposits, and their distribution, particularly in the United States, is all that will be attempted in this article.—1. *Hematite*. The term hematite (Gr. *αἷμα*, blood) is properly applied to the sesquioxide only, since this has a red powder; but Theophrastus speaks of *ἀματίνης ξανθῆς*, or yellow hematite—probably an ochreous limonite. The ferric or sesquioxide occurs in several varieties. The specular ore has a crystalline structure, often forming beautiful splendid rhombohedral crystals. The famous mines on the island of Elba, worked before the beginning of the Christian era, furnish this variety in great purity. Sometimes the structure is foliated or micaceous, giving the ore a greasy appearance and feel; it is then called micaceous hematite. The more common varieties are the compact, columnar, and fibrous. It occurs also in concretions or botryoidal masses. Its color

is brownish red to iron black (red hematite). Occasionally it is earthy in character (red ochre). An argillaceous variety is known as clay ironstone, or argillaceous hematite. It is also often oölitic in character. All the varieties have the red streak in common. Hematite is found with the iron partially replaced by titanium, giving rise to various mineral species, such as menacannite and ilmenite. They have the general formula $(\text{Ti, Fe, Mn, Mg})_2\text{O}_3$, and contain from 3.5 to 59 per cent. of titanitic acid. The hematite ores are as a rule of great purity, and from them is made a large proportion of the finer varieties of iron and steel. Nearly all the Bessemer pig iron in England and America is made from red hematite. "It occurs in rocks of all ages. The specular variety is mostly confined to crystalline or metamorphic rocks, but is also a result of igneous action about some volcanoes, as at Vesuvius. Many of the geological formations contain the argillaceous variety or clay ironstone, which is mostly a marsh formation, or the deposit over the bottom of shallow, stagnant water; but this kind of clay ironstone (that giving a red powder) is less common than the corresponding variety of limonite or siderite. The beds that occur in metamorphic rocks are sometimes of very great thickness, and, like those of magnetite in the same situation, have resulted from the alteration of stratified beds of ore, originally of marsh origin, which were formed at the same time with the enclosing rocks, and underwent metamorphism, or a change to the crystalline condition, at the same time." (Dana.) The hematite ores are widely distributed. Immense beds occur in Chili, and it is said in other South American states. The mines of Norway, Sweden, Lorraine, Switzerland, Saxony, Bohemia, and the Hartz also contain this ore. Unusually pure varieties are found in the mountain limestone of the carboniferous system in Cumberland and North Lancashire, England; and remarkably fine fibrous hematite is mined in Wales. At Bona, Algeria, there are extensive deposits of pure hematite, which is exported to France, England, and the United States for the manufacture of Bessemer steel. In the United States there are immense deposits of specular ore in the azoic rocks of the Marquette region, south of Lake Superior. These deposits probably consist chiefly of martite, which is sesquioxide of iron crystallizing in isometric forms, and supposed to be pseudomorphous after magnetite. According to this hypothesis, the Marquette ore beds were once all magnetite in composition, and have been changed to sesquioxide by the addition of oxygen. Some of these deposits present masses of absolutely pure ferric oxide; the majority, however, are more or less silicious, containing streaks and masses of jasper. The amount of sulphur and phosphorus is small, and the ores are consequently well adapted for the manufacture of steel. They furnish a large proportion of the Bessemer pig iron of the

United States. Missouri, which is one of the richest states in iron ores on the North American continent, contains specular ore in porphyry and in sandstone, as well as in disturbed and drifted deposits, and also strata and drifted deposits of compact and earthy red hematites, supposed to be in many cases the product of an alteration of the specular ores. The most famous deposits are those of Iron Mountain and Pilot Knob. At Iron Mountain, which is the largest ore deposit in Missouri, a hill of decomposed porphyry 250 ft. high is traversed by numerous ore seams, and cut in two by an enormous vein of specular ore from 40 to 60 ft. thick, besides being covered with surface ore in rounded boulders and fragments of variable size, in a stratum usually from 1 to 5 ft. thick. At Pilot Knob the ore is not in veins, but forms a regular bed in the porphyry of blue conglomerate. Shepherd Mountain, Cedar Hill, and other localities show similar deposits. The Missouri specular deposits in sandstone belong to the lower Silurian formation, and seem to have been originally formed in lenticular shape. The red hematites of the carboniferous formation of Missouri extend over large areas, as beds impregnating or replacing the ferruginous sandstone. All the Missouri specular iron is more or less magnetic, and in some cases it possesses polarity. Specular ores and massive or earthy or oölitic red hematites occur in the great azoic region of northern New York, in St. Lawrence, Clinton, and other counties. The Sterling, Parish, and other mines are famous. The Rossie hematites are now brought in considerable quantity to the Hudson river, for smelting with the magnetites of Lake Champlain. It is said that these hematites are so nearly pure as to permit the use of a considerable portion of them in the manufacture of Bessemer pig. In North and South Carolina a micaceous ferric oxide in schistose rocks, called itabirite or specular schist, occurs. It is found also in great beds in Canada. In some parts it is a rich ore of iron, and in others passes into ordinary chloritic schists. The Laurentian system in Canada contains beds of hematites, or oligist iron ore, in large irregular masses, as on Lake Nipissing, arranged in the planes of stratification. Similar ore occurs in small beds in the Potsdam sandstone. Specular ores occur in Maryland, Virginia, and other southern states, but do not yet constitute so important a source of iron production as the brown hematites, magnetites, and argillaceous carbonates. Maine and New Hampshire also present red hematite deposits, the largest of which is on the Aroostook river in the former state. The finest iron ore of this variety yet discovered west of the Missouri river is the deposit of red hematite near Rawlins, Wyoming territory. It is massive and very pure, and has been mined to a considerable extent and shipped to Salt Lake, where it has been charged in the lead-smelting furnaces, as a flux for the production of

an iron slag.—2. *Hydrous or Brown Hematite* (brown ore, bog ore, ochre, lake ore, marsh ore). The brown hematites belong to the most recent iron formations, and occur in great abundance. They constitute a series, in which the physical characters vary as the proportion of water diminishes, passing from earthy varieties having a yellowish streak to compact masses, with brown streak inclining to red. Turgite, which has the lowest amount of water, and is therefore nearest to red hematite, has already a red streak. The usual condition of hydration is that of limonite, which may be regarded as the typical brown hematite. The other varieties enumerated are exceptional. This ore occurs in a great variety of conditions, as earthy or ochreous masses, or in concretionary, stalactitic, or hard, compact, mammillary, and botryoidal aggregations. It has often a distinct fossiliferous character, and is associated with vegetable and animal remains. All the varieties yield water when heated, and all except turgite give a yellowish or brownish streak. Brown hematites differ widely as regards purity. Usually they contain considerable silica and phosphoric and sometimes sulphuric acid, and are consequently rarely employed exclusively for the finer varieties of iron and steel. They however supply a large proportion of the iron that is used for castings. "Limonite occurs in secondary or more recent deposits, in beds associated at times with barite, siderite, calcite, aragonite, and quartz, and often with ores of manganese; also as a modern marsh deposit. It is in all cases a result of the alteration of other ores, through exposure to moisture, air, and carbonic or organic acids, and is derived largely from the change of pyrite, siderite, magnetite, and various mineral species (such as mica, hornblende, and augite), which contain iron in the protoxide state. It consequently occupies, as a bog ore, marshy places over most countries of the globe, into which it has been borne by streamlets from the hills around; and in the more compact form it occurs in stalactites as well as in tuberoses and other concretionary forms, frequently making beds in the rocks which contain the minerals that have been altered into it. In moist places, where a sluggish streamlet flows into a marsh or pool, a rust-yellow or brownish yellow deposit often covers the bottom, and an iridescent film the surface of the water; the deposit is a growing bed of bog ore. The iron is transported in solution as a protoxide carbonate in carbonated waters, a sulphate, or as a salt of an organic acid. The limonite beds of the Green mountain region were shown by Percival to be altered beds of pyritiferous micaceous and argillaceous schist; and the same is held by Lesley as true also of the other beds of the Atlantic border, from New England and New York, through Pennsylvania (Mt. Alto region and others), to Tennessee and Alabama." (Dana.) Brown hematite is the most universally dif-

fused of all the ores of iron, and furnishes a large proportion of the iron of the world. In the United States it is distributed very widely and abundantly. Large deposits occur in New England, particularly in the neighborhood of Salisbury and Kent, Conn., and in Columbia and Dutchess counties, N. Y. The ores of these deposits are highly prized. Similar deposits of limonite are traced in a zone extending from the Hudson river to Alabama, along the line of the north flank of the South mountain, Blue Ridge, and Smoky mountain range, and also in the lower Silurian limestone valleys of Pennsylvania and Virginia, Nittany valley, Kishicoquillis, &c.; and again, under similar geological conditions, in East Tennessee, where the deposits near Embreeville are estimated by Lesley, Maynard, and others to contain many millions of tons of excellent ore. Western North Carolina and northwestern Georgia contain portions of the same zone, which ends in the magnificent deposits of Alabama. The siderite clay ironstones of the carboniferous and other rocks frequently furnish by oxidation deposits of brown hematite. This is the case particularly near the outcrop, but sometimes also throughout large deposits. The lignites of New Mexico, Colorado, and Montana are accompanied by ores of this character. The same is the case in the Appalachian region, for instance at Brady's Bend, Pennsylvania, in West Virginia, and elsewhere, and among the carboniferous iron ore deposits of Ohio, Indiana, Kentucky, &c. Large deposits of limonite occur in dolomite, associated with zinc ores, in Arkansas. Texas is also abundantly supplied with this ore. Brown hematite (bog ore and ochre) is found in large quantities in Canada, particularly in the St. Lawrence valley, where it overlies superficial deposits of clay and sand. The distribution of brown iron ores in other countries is so nearly universal that the localities need not be named. It may be remarked that the extensive deposits of Styria and Carinthia in Austria, and of Nassau on the Rhine, are celebrated for their purity and freedom from phosphorus—an element which, by reason of the usual organic origin of such deposits, is most likely to be found in them. The universality of this ore naturally follows from the fact that it is the ultimate result of the chemical metamorphosis of all other kinds of iron ore; so that wherever any ore of iron is exposed to oxidizing agencies and moisture, some form of limonite or hydrated ferric oxide of iron is certain to occur. The term limonite is derived from the Greek *λειμών*, moist grassy land, and refers to that variety which is known as bog ore or marsh ore. Famous ochreous deposits occur at Brandon, Vt. At Pointe du Lac and St. Ann, Montmorenci, Canada, are remarkable localities of the ochre, and at the latter place it is seen in the process of formation. The deposit varies from 4 to 17 ft. in thickness, and covers an area of four acres.—

3. *Spathic Ore, or Siderite.* This ore is never found as pure ferrous carbonate, part of the iron being invariably replaced by manganese, lime, or magnesia. The percentage of iron given in the table above is therefore theoretical, and is never perfectly attained. The ore is found crystallized, massive, and concretionary; in the latter form it is called sphaerosiderite. It is for many purposes the most valuable ore of iron, owing to its general freedom from injurious ingredients, its easy reducibility, and the presence of manganese (from 1 to 10 per cent. of oxide, exceptionally as high as 25 per cent.), which always enhances its value. It is not very extensively distributed in nature, but a few localities contain it in large deposits. It is almost the only material used in the preparation of spiegeleisen. (See IRON.) Ferrous carbonate also forms the basis of the carboniferous blackband ores, and of most of the clay ironstones, which are very extensively distributed. The ferrous carbonate is in these ores intimately associated with argillaceous, silicious, and often carbonaceous matter. It frequently contains also sulphur as iron pyrites, and phosphorus as calcic phosphate. These ores are therefore much less pure than the spathic ore properly so called, and yield irons of a much inferior character. The carbonated ores, when heated, lose their carbonic acid, and their ferrous oxide is converted into magnetic oxide. They are always calcined before smelting. The carboniferous blackbands contain usually from 15 to 20 per cent. of carbon, and may be roasted without the addition of fuel. On roasting they lose half their weight. Spathic ore becomes brown or brownish black on exposure, owing to a peroxidation of the iron and its passing into limonite; and by a subsequent loss of water it may pass into red hematite. The occurrence of spathic ore is limited principally to the crystalline slates and the older sedimentary rocks, the most extensive and characteristic deposits being in the Devonian formation. The most noted localities are Siegen, Rhenish Prussia; Kamsdorf and Stahlberg in Thuringia; Osnabrück in Westphalia; the Erzberg near Eisenerz in Styria, in the Devonian; and the Erzberg near Hüttenberg in Carinthia. England has also deposits in the Brendon hills in Somersetshire, and at Exmoor, South Moulton, and Walscott in Devonshire; also at Weardale, Durham. A remarkable series of deposits of impure or earthy carbonate is found in the different members of the lias formation in the Cleveland hills, North riding of Yorkshire, England. The main deposit is in the middle lias, showing a workable seam from 8 to 13 ft. thick; it is believed to extend throughout the whole of Cleveland proper. In this region of England the manufacture of iron has reached a higher stage of development than in any other part of the world. The principal deposit of siderite in the United States is at Roxbury, Conn., in a vein of quartz, traversing gneiss.

The clay ironstones are met with in both the carboniferous and tertiary (brown coal) formations. In England, Scotland, Westphalia, and other regions, the blackband ore (carbonaceous carbonate) forms the basis of an extensive industry. This ore, as found in Westphalia, contains an extraordinary amount of phosphoric acid, in some layers as much as 30 to 60 per cent., and in others 20 to 25 per cent. The blackband ores are of subordinate importance in the United States, though they have been found in the coal regions of western Pennsylvania. Earthy carbonates occur extensively in Pennsylvania, West Virginia, Ohio, &c.—4. *Magnetite.* Magnetic iron ore occurs generally in large masses, but with distinctly crystalline structure. It also occurs in the form of sand, concentrated by fluvial or tidal action from the débris of rocks containing it. It is readily recognized by its black color and streak, and by its being attracted by the magnet. It derives its name from the Thessalian district of Magnesia, bordering on Macedonia, or, according to Pliny, from Magnes, who first discovered it. There is a magnesian variety in which part of the ferrous oxide is replaced by magnesia, and a titaniferous variety in which a part of the iron is replaced by titanium. This variety bears the same relation to magnetite as iserine to hematite. The amount of titanitic acid varies through wide limits. Magnetic ore is often found in a state of almost absolute purity; more generally it is associated with apatite (calcic phosphate), iron pyrites and other sulphides, quartz, and earthy ingredients. It supplies a large amount of the finest iron and steel of commerce. The iron industry of Sweden is based almost entirely on magnetic ores. "Magnetite is mostly confined to crystalline rocks, and is most abundant in metamorphic rocks, though found also in grains in eruptive rocks. In the azoic system, the beds are of immense extent, and occur under the same conditions as those of hematite. It is an ingredient of most of the massive variety of corundum called emery. By deoxidation through organic matter it is changed to protoxide, which may become a carbonate; by oxidation it becomes hematite." (Dana.) The principal European occurrences of magnetic ore are at Arendal in Norway; Dalarne, Westmanland, Wermland, Dannemora, Utö, and Smaland in Sweden; in Finland, and in the Ural. In the United States there are vast beds in the azoic of the Adirondack region, Warren, Essex, and Clinton counties, in northern New York; also in northern New Jersey, in Morris, Sussex, Warren, and Passaic counties, where it is found in beds conformable with the azoic gneiss, and also intimately disseminated in the gneissic strata. In eastern Pennsylvania there are several localities, the most noted being Cornwall in Lebanon co. In Canada it is found at Hull, Grenville, Madoc, &c. In North Carolina, at Greensboro, there is an extensive titaniferous belt of magnetites. Large deposits are known in Sierra co., Cali-

fornia, and in Oregon.—5. *Franklinite*. This is an ore analogous in composition to magnetite, but part of the iron is replaced by manganese and zinc. Its formula is (Fe, Mn, Zn)O, (Fe, Mn)₂O₃. It crystallizes in the isometric system; specific gravity about 5; hardness 5.5 to 6.5; streak dark reddish brown. It contains about 46 per cent. of iron, 17 of manganese, and 13.5 of zinc. It occurs at Franklin furnace and Stirling Hill, N. J. It is first treated to extract the zinc, and the residues are then smelted for spiegeleisen.—The reducibility of iron ores depends more on their molecular structure than their chemical composition. While the natural magnetites are classed with the more refractory ores, owing to their dense structure, the magnetic oxide resulting from the roasting of spathic ore is reduced with ease. The same contrast is noticed between the anhydrous and hydrous hematites.—The distribution of the iron ores of the United States, with relation to the resources of the country in mineral fuel, has been well stated in the "Report on Iron and Steel" of Mr. Abram S. Hewitt, United States commissioner to the Paris exposition of 1867, as follows: "The position of the coal measures of the United States suggests the idea of a gigantic bowl filled with treasure, the outer rim of which skirts along the Atlantic to the gulf of Mexico, and thence returning by the plains which lie at the eastern base of the Rocky mountains, passes by the great lakes to the place of beginning, on the borders of Pennsylvania and New York. The rim of this basin is filled with exhaustless stores of iron ore of every variety, and of the best quality. In seeking the natural channels of water communication, whether on the north, east, south, or west, the coal must cut this metalliferous rim, and in turn the iron ores may be carried back to the coal, to be used in conjunction with the carboniferous ores, which are quite as abundant in the United States as they are in England, but hitherto have been left unwrought, in consequence of the cheaper rate of procuring the richer ores from the rim of the basin. Along the Atlantic slope, in the highland range from the borders of the Hudson river to the state of Georgia, a distance of 1,000 miles, is found the great magnetic range, traversing seven entire states in its length and course. Parallel with this, in the great limestone valley, which lies along the margin of the coal field, are the brown hematites, in such quantities at some points, especially in Virginia, Tennessee, and Alabama, as fairly to stagger the imagination. And finally, in the coal basin is a stratum of fossiliferous ore, beginning in a comparatively thin seam in the state of New York, and terminating in the state of Alabama, in a bed of 15 feet in thickness, over which the horseman may ride for more than 100 miles. Beneath this bed, but still above water level, are to be found the coal seams, exposed upon mountain sides, whose flanks are covered with magnificent timber,

available either for mining purposes or the manufacture of charcoal iron. Passing westward, in Arkansas and Missouri is reached that wonderful range of red oxide of iron, which, in mountains rising hundreds of feet above the surface, or in beds beneath the soil, culminates at Lake Superior in deposits of ore which excite the wonder of all beholders; and returning thence to the Atlantic slope, in the Adirondacks of New York, is a vast undeveloped region, watered by rivers whose beds are of iron, and traversed by mountains whose foundations are laid upon the same material; while in and among the coal beds themselves are found scattered deposits of hematite and fossiliferous ores, which, by their close proximity to the coal, have inaugurated the iron industry of our day. From these vast treasures the world may draw its supply for centuries to come, and with these the inquirer may rest contented, without further question; for all the coal of the rest of the world might be deposited within this iron rim, and its square miles would not occupy one quarter of the coal area of the United States."—The table on the preceding page gives analyses of various ores from different localities, indicated by numbers as follows: A. *Hematites*. 1. Whitehaven, Cumberland, England. 2. Iron mountain, Missouri; specular ore from vein. (The phosphoric acid is the average of four determinations in as many samples, varying from 0.252 to 0.081 per cent.) 3. Pilot Knob, Missouri; specular ore from main ore bed. B. *Hydrous Hematites*. 4. Lake ore, Sweden. (Phosphoric acid varies from 0.051 to 1.213 per cent.) 5. Katahdin furnace, Piscataquis co., Me., resulting from the decomposition of iron pyrites. 6. Silicious ore, York co., Pa. 7. Pennsylvania furnace ore-bank, Centre co., Pa. C. *Carbonates*. I. Spathic ore. 8. Müsner Stahlberg, Prussia. 9. Calcined spathic ore from Altenberg, Styria, used for Bessemer process at Neuberg. 10. Brendon hill, Somersetshire, England. II. Earthy carbonates. 11. Gubbin ironstone, Dudley, S. Staffordshire, England. 12. Sphaerosiderite from Ahaus, Prussia. 13. Eston, Cleveland, England; main seam. 14. Carbonate ore from Fayette co., Pa. III. Blackband. 15. Shelton, N. Staffordshire, England. 16. Westphalian blackband, low grade. 17. Best Westphalian, roasted. D. *Magnetites*. 18. Dannemora ore, Sweden. 19. Granrot ore, Sweden. 20. Lake Champlain, "new bed" ore, unusually free from apatite. 21. A sample from New Hope mine, Morris co., N. J. (The ores in northern New Jersey are very variable in regard to silica and phosphoric acid. The former varies from 2 to 40 per cent., the latter from 0 to 3 per cent. Low percentages of both silica and phosphoric acid, and freedom from sulphur, are usual.) 22. Titaniferous, from Greensboro, N. C. The following table shows the amount of sulphur and phosphorus contained in most of the Swedish and in some of the Prussian ores:

—*Treatment of Ores.* Iron ores are generally used in the blast furnace in the condition in which they are mined, but sometimes they are submitted to a preliminary treatment. The carbonate ores are invariably roasted before smelting. This drives off the carbonic acid; the ferrous is converted into magnetic oxide; and the ore is rendered not only richer but much more porous, and thereby more readily reduced. Ores containing much sulphur are also roasted with access of air, and the greater part of the sulphur is driven off as sulphurous acid. Heavy compact ores are occasionally roasted to render them friable. Roasting may be effected in open heaps or within brick walls by piling the ore and fuel (wood or brush) in layers, and allowing it to burn out. This method is far less thorough and efficient than roasting in shaft furnaces. In the latter case the fuel (small coal) and ore may be charged alternately, or gas (from the blast furnace or suitable generators) may be used. The operation is continuous. Brown hematites often occur mixed largely with clay and other earthy matters; they are then submitted to a dressing or concentrating process by washing, in which the lighter clay is washed off and the heavier ore remains.—Forge and mill cinders, produced in puddling and heating iron, are very rich in iron, containing from 40 to 75 per cent. Although, strictly speaking, they are not ores of iron, yet they are used for reduction in the blast furnace. Their use in large quantity is attended with disadvantage, owing to the facility with which they melt and escape reduction. Puddling cinder, moreover, contains the greater part of the impurities of the iron from which it is made, and yields therefore inferior iron. Roasting renders the cinder more infusible, and also effects a partial purification.

IRONS, William Josiah, an English clergyman and author, born at Hoddesden, Hertfordshire, Sept. 12, 1812. He graduated at Queen's college, Oxford, in 1833, was some time a curate in the suburbs of London, afterward vicar of Barkway, Hertfordshire, and of Brompton, Middlesex, and in 1860 was made prebendary of St.

Paul's, London. In 1870 he was chosen Bampton lecturer, and the same year became rector of Wadingham, Lincolnshire, and rural dean. Dr. Irons has published a number of works, the most important of which are: "The Whole Doctrine of Final Causes" (1836); "Parochial Lectures" (three series, 1837-'47); "The Theory of Development examined" (1846); "Sermons for the People" (2 vols., 1859); "The Bible and its Interpreters, its Miracles and Prophecies;" "The Idea of the National Church" (1861), in the volume of "Replies to Essays and Reviews;" and "Christianity as taught by St. Paul" (Bampton lectures, 1870).

IRONTON, a city and the county seat of Lawrence co., Ohio, on the Ohio river, 142 m. above Cincinnati, and 100 m. S. by E. of Columbus; pop. in 1860, 3,691; in 1870, 5,686. It is built above the highest floods, at the foot of lofty hills, in the centre of the "Hanging Rock" iron region, embracing a portion of S. Ohio and N. E. Kentucky, of which it is the principal business point. Its iron trade amounts to about \$7,000,000 a year, and is rapidly increasing. The Iron railroad, 13 m. long, connects it with the N. part of the county. It is lighted with gas, supplied with water by the Holly system, and contains four blast furnaces, two rolling mills, a nail factory, a machine shop, a stove and hollow ware foundery, two boiler works, a hoe factory, two saw and planing mills, a boat-building establishment, a tannery, two breweries, two national banks, several graded public schools including a high school, a tri-weekly, a semi-weekly, and three weekly (one German) newspapers, and 15 churches. Ironton was laid out in 1849 by the Ohio iron and coal company, and was incorporated as a city in 1865.

IROQUOIS, or **Six Nations**, a confederation of Indians formerly occupying central New York, and exercising controlling influence over all surrounding tribes. They consisted when first known to the French of five nations: the Agnégue (called Maquas or Mohawks by their Algonquin neighbors), the Oneidas, Onondagas, Cayugas, and Senecas. Lakes or rivers bearing these names still mark the places of their residence. As a league they called themselves Hudenosaunee or Hotinonsionni, meaning "they form a cabin." Of this cabin the fire was in the centre at Onondaga, and the Mohawk was the door. Each tribe had its name as a collection of individuals, and a symbolical name as a body corporate; thus the Mohawk tribe was the She Bear. According to their own tradition, they resided on the St. Lawrence as far down as Gaspé, but were driven back south of Lake Ontario by the Algonquin tribes. From this it may be inferred that those found by Cartier at Montreal in 1534 were really Iroquois. Soon afterward the Susquehannas, a kindred tribe, nearly exterminated the Mohawks. When Champlain began to settle Canada he found the Iroquois at war with all the Canada Indians, from the Hurons on Lake Huron to the Miemac

in the gulf of St. Lawrence. In May, 1609, Champlain with some Hurons and Montagnais defeated an Iroquois force on Lake Champlain. In 1615 he joined the Hurons in an expedition against a town not far from Onondaga. But the Iroquois made a firm peace with the Dutch, and, obtaining firearms, invaded Canada in 1621. They also made war on the Mohegans, and killed the Dutch commander at Albany, who had joined their enemies. When the French recovered Canada in 1632 they found the Iroquois dominant. In 1639 they destroyed a town of the Dinondadies; in 1642 they cut off all communication between the Hurons and the French, defeated a large party, and captured a Jesuit missionary. They made peace in 1645, but renewed the war in 1646, killing Father Jogues and Piskaret, a great Montagnais chief. They then beset the French and their allies with large forces, compelling the Hurons to abandon some towns. Others were taken by storm in 1648-'9, and numbers of the Hurons perished with their missionaries. One whole division of the Hurons submitted and were incorporated among the Senecas. The Iroquois then subdued the Dinondadies and the Neutral nation. In 1651 they nearly annihilated the Attikamegues and besieged Three Rivers, killing the French governor of the town. They then absorbed many of the fugitive Hurons who had taken refuge with the French; but being pressed by the Eries and Susquehannas, they made peace with the French, who began a settlement at Onondaga in 1655. They also renewed their alliance with the Dutch. While French missionaries were laboring to convert them, they crushed the Eries, Tiogas, and other tribes, and carried their operations from the Abenakis on the east to the Illinois on the west and the Susquehannas on the south. They soon made war on the French and defied New England. Garakonthie, the Onondaga chief, restored peace with the French in 1665, although the Mohawks and Oneidas kept up the war till 1666, when the French twice invaded the Mohawk country. Then for a time French missions were renewed in their country. They subdued the Susquehannas in 1675 after a long war, and attacked the Shawnees and Mohegans. The English as masters of New York began to use the Iroquois to carry out their designs; they sent them against the Illinois, Miamis, and Ottawas, in order to subdue those tribes and control the fur trade. The French under De la Barre and Denonville invaded the Iroquois cantons in 1684 and 1687. Though peace was made in 1688, the Iroquois the next year attacked and destroyed Lachine in Canada, killing 200, which led the French to retaliate by destroying Schenectady in 1690. The Iroquois took part in English operations against Canada in 1690 and 1691, but the French in 1693 and 1696 ravaged the Mohawk and Onondaga territory. This war was very destructive to the league, which lost 1,500 out of 2,800 fighting men, and became averse to further

hostilities. Their next operations were against southern tribes, the Conoys, Tuteloës, Choc-taws, and Catawbas; but they took in the kindred Tuscaroras as a sixth nation, though without sachems. The French gave up all claim to the Iroquois in 1713, gathering their converts in villages on the St. Lawrence, where they still exist at Caughnawaga, Lake of the Two Mountains, and St. Regis. In the wars between England and France, which deprived the latter of Canada, the Iroquois were generally neutral, although, influenced by Sir William Johnson, they joined in the campaign against Dieskau, in which the Mohawks lost their chief Hendrick, and also served against Niagara. Alarmed at the progress made by the English, the Iroquois joined Pontiac and slaughtered many of them at Beaver Creek, Venango, Fort Pitt, and on the Niagara. Johnson finally renewed treaties with them in 1764 and 1766, and in 1768 by the treaty of Fort Stanwix obtained, for £10,460 7s. 3d., a grant of all lands not within a line which whites were not to pass, running from the mouth of the Tennessee to the Delaware. English authority being now supreme, vigorous attempts were made to convert them to Christianity, the previous efforts having met with little success. The Episcopal church made an enduring conquest in the Mohawk tribe. Yet the Iroquois were not all peaceful. A part of the western Iroquois were in arms in 1774, and fought against the whites at the battle of Point Pleasant, one of the fiercest in border history. When the American revolution began, the Iroquois led by the Johnsons adhered to the crown, while the French Iroquois in Canada inclined to the cause of the United States. Led by Brant, the Iroquois defeated several parties of troops and massacred the people at Wyoming and Cherry Valley. Col. Butler retaliated by destroying Unadilla and Oghkwaga, and Gen. Sullivan in 1779 ravaged their western cantons; but Brant in turn scourged the frontiers and punished the Oneidas, who were friendly to the Americans. The close of the war left the Iroquois at the mercy of the exasperated Americans, and nearly all emigrated except the Oneidas and Tuscaroras, settling on Grand river, Canada. By the treaty of Fort Stanwix, Oct. 23, 1784, the United States confirmed the Oneidas and Tuscaroras in their lands, and guaranteed to the other tribes the lands in their actual possession, on their ceding to the general government all W. of a line beginning on Lake Ontario at the mouth of Oyonwayea creek, running S. to the mouth of Buffalo creek, and thence to the N. line of Pennsylvania, which it followed W. and S. to the Ohio. This was confirmed by the treaties of 1789, 1790, and 1794. New York in 1785 and 1788 purchased the lands of the Oneidas, Tuscaroras, Onondagas, and Cayugas, except a reservation for each. The Mohawks had removed to Canada; the Cayugas broke up in 1795, some joining the Senecas, some going to Canada, and some

to the west. In 1826 and 1839 all the Seneca land except the Tonawanda reservation was sold, it is asserted, by persons holding no power in the tribe. In 1840, 430 Oneidas and 500 Senecas emigrated to Canada. In 1820 some Oneidas settled at Green bay, where they purchased lands. A party of several tribes was lured beyond the Missouri in 1846, but nearly all perished. Some Senecas who had joined the Shawnees were more fortunate. The war of 1812 arrayed the English and American Iroquois against each other; but they have since been at peace.—While the league subsisted, each tribe was divided into families, those of the Bear, Wolf, and Tortoise in all the tribes, and others in some only. Each family had certain sachemships hereditary in the female line. These sachems formed the ruling body of the league, Onondaga being the central point or council fire, and the Atotarho or Sagochiendagueté, the head Onondaga sachem, being the chief of the league. No one could marry in his own tribe; the children belonged to the mother's tribe. Their cosmogony was that of the Hurons, and they worshipped Agreskoi by offerings of flesh, tobacco, and human sacrifice. They honored genii or spirits, especially those of maize, pumpkins, and beans. After the labors of the French missionaries, God, under the name Niio (*Dieu*) or Hawenniio (He is the master), seems to have been the object of worship among the so-called pagan party. They interred the dead temporarily, and every tenth year collected all the remains in one long grave lined with furs, adding kettles, arms, &c. Prisoners were either adopted or tortured and put to death at the stake. The men wore a breech cloth, the women a short petticoat, and both wore moccasins, leggins, and in colder weather a fur mantle. The houses were of bark laid over an arched arbor-like frame. In their greatest prosperity they numbered not more than 15,000, and they are now, according to the official American and Canadian reports of 1873, 13,660, distributed as follows: 7,034 in Canada, viz., 759 Mohawks on Quinté bay, 2,992 of the Six Nations on Grand river, 633 Oneidas on the Thames, 1,491 Caughnawagas at Sault St. Louis, 911 at St. Regis, and about 250 at the lake of the Two Mountains; 6,626 in the United States, viz., 5,141 Senecas, Onondagas, Oneidas, Cayugas, Tuscaroras, and St. Regis in New York, 1,279 Oneidas at Green bay, and 206 Senecas in the Quapaw agency. The most eminent men of the nation were Garakonthié, the friend of the French, Dekanisora, Tawerahe, Kryn or the Great Mohawk, Hendrick, Cornplanter, Farmer's Brother, Brant, Red Jacket, Ganeodiyo, the prophet and reformer of the heathen band, Dr. Wilson, Col. Ely S. Parker, who served on Grant's staff and became commissioner of Indian affairs, and Cusick, a Tuscarora, who wrote a curious account of early Iroquois traditional history. The missions of various bodies have made most of the Iroquois Christians; the Mohawks and Oneidas

are Episcopalians; the villages near Montreal are Catholics; Baptists, Congregationalists, and Methodists have also made converts. The language of the tribes was first reduced to grammatical form by the Jesuit Bruyas, who also made a dictionary of the "Radical Words of the Mohawk Language" (New York, 1862); an Onondaga dictionary by an unknown French author was printed in New York in 1860; and a sketch of Iroquois grammar by the Rev. Mr. Cuoq in his *Études philologiques sur quelques langues sauvages* (Montreal, 1866). A very full grammar and dictionary by the Rev. Mr. Marcoux remains unpublished. "The Book of Common Prayer" has been several times printed in Mohawk, and prayer books and devotional treatises in the Caughnawaga dialect; and some portions of the Bible in Mohawk and Seneca.—The special works on the tribe are Cusick's "Sketches of Ancient History of the Six Nations" (Tuscarora, 1826); Colden's "History of the Five Nations" (New York, 1727; reprinted, 1866; London, 1747, 1755); Morgan's "League of the Iroquois" (Rochester, 1851); Schoolcraft's "Notes on the Iroquois" (New York, 1846); "The Iroquois, or the Bright Side of Indian Character," by Minnie Myrtle (Anna C. Johnson) (New York, 1855); Stone's "Life of Brant" (2 vols. 8vo, 1838, 1864) and "Life of Red Jacket" (1841, 1866); and Williams, "Life of Tehoraganegen, alias Thomas Williams" (1859).

IROQUOIS, an E. county of Illinois, bordering on Indiana and drained by the Kankakee river; area, 750 sq. m.; pop. in 1870, 25,782. It has a level surface, much of which is prairie, and the soil is generally fertile. The county is traversed by the Chicago branch of the Illinois Central railroad, and by the Toledo, Peoria, and Warsaw, the Gilman, Clinton, and Springfield, and the Chicago, Danville, and Vincennes lines. The chief productions in 1870 were 67,640 bushels of wheat, 23,250 of rye, 799,810 of Indian corn, 430,746 of oats, 27,293 of flax seed, 87,127 of potatoes, 54,495 lbs. of wool, 30,194 of flax, 358,672 of butter, and 63,947 tons of hay. There were 12,716 horses, 10,345 milch cows, 21,135 other cattle, 14,986 sheep, and 21,764 swine; 7 manufactories of saddlery and harness, 1 of cooperage, 1 distillery, and 6 flour mills. Capital, Middleport.

IRRAWADDY, *Irawadi*, or *Airavati* ("great river," or "elephantine river"); the principal stream in India E. of the Brahmapootra. It rises on the confines of Thibet and Burmah, at the E. extremity of the Snowy range of the Himalaya, about lat. 28° N., lon. 98° E., flows S. across the territory of Burmah, which it divides into two nearly equal parts, and traverses the state of Pegu in British Burmah, entering the bay of Bengal and the gulf of Martaban by several mouths which form an extensive delta. Its whole length is 1,060 m. It separates 140 m. below the S. frontier of Burmah into two branches, the eastern of which is named the Rangoon or Siriam from

the principal cities on its banks, and falls into the gulf of Martaban, while the western, called the Bassein, enters the bay of Bengal near Cape Negrais. The delta is formed by numerous offsets from both these branches. The Irrawaddy has two striking deviations from its general southerly course: one just below the mouth of the Tapan, about lat. 24° 15', where it makes a bold curve in the shape of the letter S; and the other at Amarpura, where it turns sharply W., and, after receiving the waters of its largest tributary, the Khyen-Dwen, flows successively S., S. W., and again S. The principal cities and towns on its banks are Bhamo (a trading town having a considerable traffic with China), Amarpura and Ava, former capitals, Mandalay, the present capital of Burmah, Pagan, Maloon, Prome, Bassein, and Rangoon. From above the junction of the Khyen-Dwen to Maloon the Irrawaddy spreads itself over a channel reaching during the inundation from June to September to a width of 4 or 5 m. It is then restricted between steep and hilly banks, and does not expand again considerably until it has passed Prome. It is navigable to Ava at all seasons by boats drawing 3 ft. of water, and during the rains vessels of 200 tons can ascend to Bhamo, a distance of 800 m. from the sea. Two steam navigation companies run steamers on the Irrawaddy, making 60 trips a year. Klapproth and the Chinese geographers consider the Irrawaddy a continuation of the Sanpo of Thibet; but the latter river is now generally admitted, though not positively ascertained, to be identical with the Brahmapootra.

IRRIGATION, the watering of lands by currents distributed over or near the surface, and also by temporarily flooding them. It is one of the oldest of arts, was practised by the ancient Egyptians, Arabians, Assyrians, Babylonians, and Chinese, and has always formed a part of the agriculture of the countries bordering on the Mediterranean. The valley of Mareb in Yemen, Arabia, was irrigated by waters distributed from a vast reservoir made by a dam 2 m. long and 120 ft. high, constructed by an Adite monarch of Saba, probably long before the times of Solomon. This dam was built of enormous blocks of hewn stone, and must have been a work of no mean engineering skill, as it stood and restrained the current of a large stream of 70 tributaries for about 2,000 years, when it burst with desolating effect. The canal of the Pharaohs, connecting ancient Pelusium with the Red sea, was constructed for purposes of irrigation. The plains of Oman in Arabia are watered by subterranean canals supplied by reservoirs in the mountains, and a vegetation of rare luxuriance, consisting of most of the fruits and grains of Persia and India, is produced in consequence. The plains of Assyria and Babylonia were covered with an immense system of canals, some of them hundreds of miles in length, intended partly for irrigation and part-

ly for navigation; and their ruins are among the interesting antiquities of those countries. Into some of these canals the water was raised by machines which consisted of rude buckets worked by oxen, in much the same manner still practised on the banks of the Tigris and Euphrates. Among the ancient Egyptians irrigation was performed with water flowing directly from the Nile, or raised out of it, or, as was often the case, from wells. The most ancient machine was the sweep, or bucket suspended from a balanced pole, such as was generally used many years ago in this country, and is still in some parts at the present time. Afterward the chain of pots, or *sakiyeh*, was used, as it also was by the Assyrians and Babylonians. At present water is raised from the Nile by means of Persian wheels, which differ from the chain of pots by the vessels being hung upon the periphery of a large wheel, and so adjusted as to tip over and empty their contents into a trough when they arrive at a certain height, instead of being placed upon an endless chain or rope.—In the agriculture of Italy, France, and Spain great attention is paid to irrigation. The Romans during several centuries constructed extensive works, which are still in use. The water is carried not only over the grass lands and the rice fields, but between the ridges in the grain fields and through the vineyards round the roots of the vines. The distribution of it is controlled by a regular system. The state itself claims the waters of all the rivers of Lombardy; and in the Venetian territories all the springs and collections of rain water belong to the government. The use of the waters of the rivers is rented out at a certain price by the hour or half hour, or for so many days at certain seasons of the year. Persons are entitled to make canals through the lands of others lying between them and the river, on paying for the damage thus caused. The channels for leading the water into the lands and the parallel channels alternating with them, placed at about 6 in. lower elevation for conveying the water away, are laid out with great regularity, at distances usually of about 22 ft. between them. In summer the water is allowed to flow through them for several hours about once a week, but the flow is steadily kept up from October to April, except at the time of cutting the grass. In northern Italy lands that can be irrigated rent for one third more than the same class of lands not thus improved. On the American continent, the ancient inhabitants of Peru were found by their Spanish conquerors in the use of the most costly works constructed for irrigating their lands. Prescott says: "Canals and aqueducts were seen crossing the low lands in all directions, and spreading over the country like a vast network, diffusing fertility and beauty around them." In the article *AQUEDUCT* the wonderful magnitude of some of these works has been noticed. The Aztecs of Mexico also made use of similar means to counteract the

natural dryness of their atmosphere; and in the beautiful gardens of Iztapalapan, watered by canals and aqueducts, and moistened by the spray of fountains, was exhibited to the astonished Spaniards a perfection of horticulture at that time unknown in their own country.—Irrigation on a large scale and by the Italian method was attempted in England in the 16th century, on the estate of Babraham in Cambridgeshire; but the system was not fairly established as an important branch of agriculture until the commencement of the present century. Of late years what are called water meadows have become a common feature in some of the best cultivated counties, especially in Wilts, Devon, Somerset, and Gloucester, and also in the southern part of Scotland. Some peculiar methods have been introduced, as that of irrigating with currents of liquid manure; and the sewerage of Edinburgh is distributed on the same principle with the most beneficial results over the meadows that lie below the level of the city. The grass grown upon the meadows thus watered has to be cut about once a month from April to November, and it is described as remarkably tender and succulent, admirably adapted as a milk-producing food for cows. With some exceptions the general practice is not to leave the water standing upon the lands; but taking it from a running stream (which should be tapped if practicable far enough above the meadow for the water to flow in from the bottom of the current, where it is most charged with sediment), it is conveyed in a main channel around the further margin of the meadow, and numerous side branches lead off in nearly parallel lines into its central portions, each tapering to a point. These are commonly interlocked by others proceeding in the opposite direction from the main channel, on the lower side of its circuit, as it passes back to the river. The second set, being at a lower level than the first, serve as drains, conveying the water that overflows from the first to the main channel, which in the latter part of its course is no longer a feeder but a drain. The water is allowed to flow through this system as often as may be desirable, care being taken that it shall not lie at rest at any time, the effect of which is found to be a tendency to cause the growth of a coarse grass. This method is called *bed-work irrigation*, from the ground being laid out in nearly regular beds by the channels. It is applicable only to tolerably level land. By another method, called *catch work*, irrigation is conveniently applied to uneven ground. One set of channels follow the contour lines of the ground, each retaining its own level. These are crossed nearly at right angles by numerous other small channels, which are fed at their upper ends by the main gutter, and the water is directed by stops of clods of earth into the level side channels, which are filled as may be desired. The laying out of the work and management of the operation, so as to distribute the water uniform-

ly, in the proper quantities, and at the right times, require good judgment, close attention, and much experience. The irrigating season in England is the colder portion of the year, commencing in October or November, and terminating in March or April. The letting the water on or off during frosty weather is to be avoided, as a crust of ice may root out the grass as it thaws. As nearly as may be, with reference to this danger, the water is allowed to flow through the channels for two or three weeks at a time, and is then drawn completely off, so that the ground may become as thoroughly dry as possible. In this condition it is left for five or six days, when if there is no fear of freezing the operation is repeated; and so on through the winter. When the grass begins to vegetate, the periods of irrigation should be shortened, and cease entirely when it is sufficiently forward to make good pasture. The effect of this practice is often very striking; the grass is brought forward very early in the spring. After feeding off one crop or mowing the grass, the land is sometimes again irrigated for a short time to great advantage. A second crop is ready to be cut by the time the first has ripened on the dry meadows. Three or four crops of grass are thus obtained in each season.—But the perfection of irrigation is when it is combined with thorough under-draining. The water flowing in brings with it in solution and suspension various mineral and organic substances suitable for the food of plants. By evaporation and by various chemical reactions the soluble ingredients may be set free, when they become entangled with the other foreign matters in the grass and in the soil beneath, both of which act as filters. Thus the finely comminuted sediments and the soluble salts are equally distributed among the rootlets, and these are refreshed by the new supplies furnished by each repetition of the process. By the drains the excess of moisture is soon removed, stagnation, so injurious to vegetation, is prevented, and the elements that feed the plants below the surface are kept in a similar condition of healthy renewal with those of the air circulating among the branches and adding to the vegetable growth by assimilation going on through the leaves. The benefits derived from the process vary of course with the quality of the ingredients brought in by the water, according as these are more or less suited to the requirements of the soil and of the crop. The hard water, charged with carbonate of lime, which it has gathered in flowing through a limestone region, brings a valuable fertilizing ingredient to silicious soils deficient in lime; and the clayey sediment washed out of alluvial bottoms is spread with the most beneficial effect over loose sandy soils. Sometimes organic liquid manures, such as the drainage of farmyards and leachings of compost heaps, are supplied to the soil by being mingled with the water used in irrigating; but the principal object of irrigation is to supply mois-

ture, as it is always easy to add manure in a solid form.—Much attention is now given to the subject of irrigation in that portion of the United States lying between the Mississippi river and the Rocky mountains; so that a vast region, some of which was long known as the Great American desert, bids fair in time to be for the most part brought under fair cultivation. The Mormons in Utah by means of irrigation render their barren country fertile. The general plan with them, and also in California, is to lead the water in canals from the rivers or the mountains, and allow it to flow over the fields, either through small channels made in the soil, or over the even surface.

IRVINE, a parliamentary borough and seaport of Ayrshire, Scotland, on both banks of the river of the same name, 1 m. above its entrance into the Firth of Clyde, 20 m. S. W. of Glasgow; pop. in 1871, 6,866. It has a female academy, ship yards, and some manufactories of book muslins, jaconets, and checks. The harbor, having become shallow from sand bars, now admits only vessels of about 100 tons.

IRVINE, William, an American soldier, born near Enniskillen, Ireland, about 1742, died in Philadelphia, July 30, 1804. He graduated at Dublin university, studied medicine and surgery, and was appointed surgeon on board a ship of war, serving during a part of the war of 1756-'63 between Great Britain and France. On the declaration of peace he emigrated to America, and in 1764 settled in Carlisle, Pa. At the opening of the revolution he took part with the colonies. He was a member of the provincial convention assembled July 15, 1774, until he was appointed by congress, Jan. 10, 1776, colonel of the 6th battalion of the Pennsylvania line, and was ordered to join the army in Canada. He was made prisoner at the battle of Three Rivers in June of the same year, and was released on parole, Aug. 3, but was not exchanged until April, 1778. In July, 1778, he was a member of the court martial which tried Gen. Charles Lee. On May 12, 1779, he was promoted to the rank of brigadier general, and was assigned to the command of the 2d brigade of the Pennsylvania line. In the unsuccessful attack of Gen. Wayne at Bull's Ferry, July 21 and 22, 1780, he commanded his brigade. In the autumn of 1781 he was ordered to Fort Pitt, to take command of the troops on the western frontier, where he remained till Oct. 1, 1783. In 1785 he was appointed agent for the state under an "act for directing the mode of distributing the donation lands promised to the troops of the commonwealth." He became a member of congress in 1787, and was selected, with Messrs. Gilman and Kain, one of the commissioners for settling the accounts of the United States with the several states. He was a member of the convention for revising the constitution of Pennsylvania, and again from 1793 to 1795 a member of congress. In 1794 he was assigned to the command of the Pennsylva-

nia troops for quelling the "whiskey insurrection," and took an active part in all the most important movements. In March, 1801, he was appointed superintendent of military stores at Philadelphia. He was president of the state society of the Cincinnati at his death.

IRVING, Edward, a Scottish preacher, born at Annan, Dumfriesshire, Aug. 4, 1792, died in Glasgow, Dec. 8, 1834. He graduated at the university of Edinburgh in 1809, in his 19th year was appointed mathematical teacher in an academy at Haddington, and in 1812 rector of an academy at Kirkcaldy, where he remained seven years, pursuing at the same time the studies required of a candidate for the ministry of the church of Scotland. He was licensed to preach by the presbytery of Annan in 1815, but received no invitation to settle as a pastor, and continued to teach till 1818, when he went to Edinburgh. In 1819 he became Dr. Chalmers's assistant in Glasgow, where he continued three years, when he resigned, having been called to the charge of the Caledonian church, Hatton Garden, London, a small remnant of a congregation in connection with the church of Scotland. He was ordained by the presbytery of Annan, and entered upon his ministry in 1822. Within a few months of his settlement there crowds pressed to his weekly services. The nobility, members of parliament, judges and barristers, physicians, clergymen, dissenters, and noted beauties besieged the doors, attracted no less by the eloquence and power than by the plain-spoken originality of the preacher. With a view to break up the routine habit of mind, which he conceived destroyed the effect of preaching generally, he adopted a style of discourse different from the usual form of sermon, which he called "orations." A series of these, entitled "Orations for the Oracles of God," which were preached in 1823, he published in the same year in a volume with another series entitled "An Argument for Judgment to Come, in Nine Parts." This was the first of his published writings. In 1824 the foundations of a new church in Regent square were laid, which was intended to more fully accommodate his thronging audiences. In this year he was called upon to deliver a missionary discourse, the sentiments of which were so contrary to the views of the London missionary society for which he preached, as to occasion much dissatisfaction. This discourse was published about a year after its delivery, much enlarged, under the title "For Missionaries after the Apostolic School, a Series of Orations, in Four Parts: Part I, the Doctrine." The other three parts never appeared. In 1825 he delivered a course of lectures, afterward published, entitled "Babylon and Infidelity Foredoomed." On Christmas day of the same year he first began to make known his convictions in relation to the second and personal advent of the Lord Jesus Christ, and the nearness of that great event.

In 1826 he fell in with a Spanish work entitled "The Coming of Messiah in Majesty and Glory, by Juan Josafat ben Ezra," which purported to be written by a Christian Jew, but was in reality the work of Lacunza, a South American Jesuit. He undertook the translation of this work, which confirmed his attention to the subject of Messianic prophecy, and from this time it became a leading thought with him. He wrote an introduction, which occupies half of an octavo volume, and which is regarded as one of his best works. The book appeared in 1827. About the same time his attention was called by the death of one of his children to the subject of infant baptism, which resulted in a series of "Homilies on the Sacraments," of which only the first volume, on baptism, was published (12mo, 1828). From this he was led to enter more fully into the great doctrine of the incarnation, to the exposition of which he devoted much labor, both in preaching and in controversial writings; affirming the perfect oneness of Christ with us in all the attributes of manhood, including its infirmities and liability to temptation. On this account he was charged with asserting the sinfulness of Christ's human nature. What he really taught was, that Jesus Christ took from his mother human nature, such as it was in Adam after the fall, though in him without actual sin. It is asserted that his teaching on this subject was the origin of a revival of a similar strain of teaching in a portion of the English church. In 1828 he visited Scotland, and preached to thronging congregations in the principal places. At Kirkcaldy, his old home, the crowded galleries of the old church fell, and about 35 persons were killed. At this time he opposed the abolition of the test act, advocated by Chalmers, and in 1829 published a book entitled "Church and State," arguing for an organic connection between the two. In 1830 he was tried by the London presbytery for heretical views of the incarnation. He resisted the authority of the presbytery, on the ground of irregularity in the trial, and left them, appealing to the church of Scotland. In this he was sustained by his own church with great unanimity. All this time the interest in the study of prophecy was kept alive by Irving and his friends, and took practical form in a series of conferences of those interested which were held at Albury park, Surrey, under the patronage of Henry Drummond, Esq., and by the publication of a quarterly periodical entitled "The Morning Watch," to which Irving was a copious contributor. In the spring of 1830 reports came to London of some remarkable phenomena in the neighborhood of Port Glasgow in Scotland, consisting of what appeared to be supernatural utterances, *i. e.*, words spoken under the impulse of a supernatural power, partly in the vernacular and partly in forms of language that were not known, and in connection with them the healing of the sick. When this report was

received, some of the persons associated with Mr. Irving in the study of prophecy, and in the hope of the second coming of Christ, deemed it proper to investigate the matter. Accordingly, several gentlemen residing in London made a journey to Glasgow to inquire into the nature of these phenomena. After a careful scrutiny these persons were satisfied that it was in reality a revival of the "spiritual gifts" common in the first ages of the church, and specially referred to in St. Paul's epistle to the Corinthians. Soon after the same phenomena appeared in London, at first in private meetings of members of the established church, and afterward in Irving's congregation. A full account of these "spiritual gifts" was given by Irving himself in "Fraser's Magazine" in 1830. The consequence of his course in this matter was the loss of his great popularity, and an opposition in his own congregation. His writings were censured by the general assembly of 1831, and in 1832 this opposition resulted in his expulsion by the trustees from the building which had been erected for his use, after a hearing before the London presbytery. His adherents, numbering about 800 communicants, met at first in a hall in Gray's Inn road. They resolved to build, and money was collected for the purpose, but were forbidden by utterances which they regarded as divine; and after some months they hired a house in Newman street, with a hall which had been used by West the artist as a picture gallery, the house being taken for a parsonage. Irving was now (March, 1833) arraigned before the presbytery of Annan in Scotland upon a charge of heresy and irregularity, and deposed. His defences are among his best oratorical efforts. The portion of the congregation that adhered to him retained at first the Presbyterian order of worship and constitution of membership; but this was early modified through the agency of the prophetic utterances which abounded among them. Attention had been directed to the restoration of apostles and prophets as the most fundamental constituent of the church; and some time in 1832, at a meeting for prayer held in a private house, it is asserted, one of those present was declared in the word of prophecy to be an apostle, and exhorted to the exercise of his office, in conveying "the Holy Ghost by the laying on of hands." When Mr. Irving had been deposed in Scotland he ceased, in obedience to what he believed to be a spiritual utterance, from fulfilling priestly functions, confining himself to the work of a preacher or deacon until he should receive a new ordination from the spirit. On April 5, 1833, he believed that this supernatural ordination was conferred, when by the hands of the apostle he was constituted "angel," or chief pastor or bishop of the church. Wilks says ("Life of Edward Irving," London, 1854): "It seems to be generally supposed that Irving appointed the apostles, not that he was appointed by

them." The facts are the reverse of this. The movement did not begin in his church, nor as the result of his teaching, although he at an early period gave his adhesion to it. That he held a prominent position in the movement is manifest, but the form which it took was not the result of any plan or theory of his, nor was it fully and finally developed until some years after his death. Not long after these events his health failed. In the autumn of 1834 he set out, in obedience as he supposed to the word of the Holy Spirit, on a journey to Scotland, where he died. His personal characteristics were striking. He was at least six feet high; his limbs were well proportioned; black hair clustered in profusion over his lofty forehead, and descended in curls upon his massive shoulders; his eyes were dark and piercing, though affected by a squint; on his lips sat the firmness of a ruler and trembled the sensibility of a poet. He associated and lived in the world without restraint, joining in the forms and fashions of a mixed society, and was remarkable at the same time for blamelessness of life. His morals were untainted, his conscientiousness exact. A collection of his "Sermons, Lectures, and Occasional Discourses" was published in 1828 (3 vols. 8vo, London). Since his decease two series of his works have been published under the editorship of his nephew, the Rev. G. Carlyle; the one entitled "The Collected Writings of Edward Irving" (5 vols., London, 1864-'5); the other, "The Prophetic Works of Edward Irving" (2 vols., London, 1867-'70). Mrs. Oliphant's memoir of him (1862) is very complete, and in the main accurate; and a review of it in the "New Englander" for July and October, 1863, supplements it in a very satisfactory manner.—The church in Newman street became the centre of a widely extended community, which began very rapidly to spread throughout the British isles. In the next two years after Irving's death additional persons were called to be apostles, until the number of twelve had been completed, when they were as a whole set apart, or separated to the work to which they had been called, and gradually the organization of the church was perfected. The constitution of this body claims to be the perfect development of that which was established in the beginning of the Christian church. Its characteristic feature is the fourfold ministry of "apostles, prophets, evangelists, and pastors and teachers," referred to by St. Paul in chapter iv. of his Epistle to the Ephesians. Within this fourfold classification are comprehended the three orders of the church catholic, bishops, priests, and deacons. The collective apostolate is the head of the episcopate, and holds the relation of centre of unity to the whole church. The body declines any name but that of the "Catholic Apostolic Church," holding this not exclusively of all other churches, but as the only name by which the church should consent to be known. The

church disclaims all sectarian aims. It assumes this movement to be the work of the Holy Spirit for the blessing of the entire Christian church throughout the world. It does not seek to proselyte, but is content with bearing a witness to the truth and strengthening all who desire to maintain the truth. It recognizes all the baptized as members of the one church, and each several Christian community according to the measure of the truth it holds. The whole system of teaching, worship, and discipline is founded upon the doctrine of the incarnation, or the true and real manhood of the Lord Jesus Christ, and its application to man by means of sacraments and ordinances. Jesus is the Lord, and all ministries on earth are but forms by which his presence is made effective in the church. The worship is conducted by means of a ritual which embodies portions of the rituals in use in all different sections of the church, Greek, Roman, and Protestant. It makes use of material emblems and signs as far as they are significant of spiritual truths. Architecture, music, and painting, vestments of divers colors, incense, lights, all are employed as symbols of spiritual truths. When the numbers and means admit, the worship is conducted with all the magnificence that its importance justifies, while it is also capable of adaptation to very narrow circumstances. The eucharist is celebrated every Lord's day. Daily morning and evening worship is maintained. All the members pay tithes of their increase, which are applied to the support of the priesthood, besides offerings for other purposes. The great object of interest to all the believers is the hope of the speedy coming of the Lord Jesus Christ, when the dead in Christ shall be raised, and they who are looking for him shall undergo the change of their bodies which is spoken of by St. Paul in 1 Cor. xv. About the year 1846 the movement began to spread into other parts of Europe, especially Germany. There are in London seven churches, which collectively represent the unity of the whole church. The number of churches and congregations in the British isles (1874), including these, is between 80 and 90. In north Germany there are nearly as many, in Switzerland six or eight; and there are scattering congregations in other countries of Europe. There are no published statistics from which the number of ministers or people can be obtained; they amount to several thousands. In the United States there is only one fully organized church; this is in New York, and there are four smaller congregations connected with it in Connecticut and Boston. In Canada there are four churches.—Mr. Irving's works throw but little light on the principles of the church as such. Some of the works relating to it are: "The Liturgy and other Divine Offices of the Church;" "Readings on the Liturgy" (1 vol. and 2 parts of another, London, 1851); "Chronicle of Certain Events which have taken place in the

Church of Christ, principally in England, between the Years 1826 and 1852" (London, 1852); "Defence of John Canfield Sterling, Presbyterian," &c. (New York, 1852); "A Letter from David Morris Fackler to the Right Rev. G. W. Doane, Bishop of New Jersey" (New York, 1852); "The Permanency of the Apostolic Office as distinct from that of Bishops, with Reasons for believing that it is now revived in the Church, by a Presbyterian of the Protestant Episcopal Church" (New York, 1852); "The True Constitution of the Church and its Restoration," by the Rev. William Watson Andrews (New York, 1854); "The True Apostolic Succession, a Letter to Rev. Francis Vinton," by John S. Davenport (New York, 1858); "Edward Irving and the Catholic Apostolic Church," by the same (1863); "The Purpose of God in Creation and Redemption," the most complete exposition of the principles of the movement (Edinburgh, 1865); and "Christian Unity and its Recovery," by John S. Davenport (1866).

IRVING, Theodore, an American clergyman, nephew of Washington Irving, born in New York, May 9, 1809. At the age of 19 he joined his uncle in Spain, and resided for three years in Madrid, Paris, and London, attending lectures, and devoting himself to the study of modern languages. He was appointed professor of history and belles-lettres in Geneva (now Hobart) college, New York, in 1836, which post he occupied for 12 years. In 1848 he was chosen to be professor in the same department in the free academy (now college of the city) of New York, but resigned in May, 1852. Two years later he entered the ministry of the Episcopal church, and became rector of Christ's church, Bay Ridge, L. I.; was for many years rector of St. Andrew's and afterward of Ascension parish, Staten Island; and is now (1874) rector of St. John's school for young ladies, New York city. He has published "Conquest of Florida by Hernando de Soto" (1835; new ed., 1857), and devotional works entitled "The Fountain of Living Waters" (1854; 4th ed., 1855), "Tiny Footfall" (1869), and "More than Conqueror" (1873).

IRVING, Washington, an American author, born in New York, April 3, 1783, died at Sunnyside, near Tarrytown, N. Y., Nov. 28, 1859. He was the youngest son of William Irving, who was descended from an ancient family in the Orkneys; his mother was English. Washington Irving left school in his 16th year, and began the study of law. But his passion was for literature, and in 1802 he commenced in the "Morning Chronicle" a series of papers on dramatic and social subjects and local occurrences, under the signature of "Jonathan Oldstyle." In 1804, being threatened with consumption, he visited Europe, spending several months in the south of France and Italy. At Rome in 1805 he became intimate with Washington Allston, and under his tuition made a serious attempt to become a painter, but was

satisfied at the end of three days that his talent was not for art. He next visited Switzerland, the Netherlands, Paris, and London, and returned home in March, 1806, to resume his law studies; but he never practised. With his brother William and James K. Paulding he started a serial entitled "Salmagundi, or the Whim-Whams and Opinions of Launcelot Langstaff, Esq., and others," which appeared at irregular intervals in small 18mo, published by an eccentric bookseller named David Longworth. The first number was issued on Jan. 24, 1807. Its local allusions, personal hits, and constant vein of humor gave it immediate success, and it reached the 20th number. It is understood that the poetical epistles were contributed by William Irving, and the prose papers about equally by himself and his two associates. "Salmagundi" found favor also on the other side of the Atlantic. In 1809 appeared "A History of New York, from the Beginning of the World to the End of the Dutch Dynasty, &c., by Diedrich Knickerbocker." This was begun by Peter and Washington Irving as a burlesque on a hand-book of the city of New York which had just been published; but Peter soon sailed for Europe, and Washington elaborated the work and extended it to two volumes. Previous to its appearance an advertisement was inserted in the "Evening Post" inquiring for "a small elderly gentleman dressed in an old black coat and cocked hat, by the name of Knickerbocker," who was said to have disappeared from the Columbian hotel in Mulberry street, and left behind "a very curious kind of a written book." The work was accepted by many respectable but somewhat stupid readers as a veritable history, and Gölter, a German editor, gravely cites it in illustration of a historical passage. Some of the descendants of the old Dutch families were seriously offended by its burlesque of their ancestors, and Irving finally found it necessary to insert an apologetic preface. In 1810 he wrote a sketch of Thomas Campbell for a Philadelphia edition of his poems, and in 1813-'14 edited the "Analectic Magazine" in Philadelphia, to which he contributed several biographies of American naval commanders. In 1814 he became aide-de-camp and military secretary to Gov. Tompkins, and in 1815 sailed for Europe, having meanwhile become a silent partner in the mercantile business of two of his brothers. In London he was intimate with many of the literary men of the day, especially Procter and Campbell, and by the latter was introduced to Scott at Abbotsford. Irving's house soon became bankrupt, and he was compelled to write for a living. His rambles about England and Scotland had given him much of the material for the "Sketch Book," which was sent home in fragments and published in pamphlet numbers during 1818. Several of the sketches were copied in the London "Literary Gazette," and Irving offered the work for republication to Murray and Constable, by each of whom it

was declined, in spite of Scott's warm recommendation. He then put the first volume to press at his own expense (1820), but the failure of the publisher stopped its issue. In this crisis Scott arrived in London and prevailed upon Murray to purchase the manuscript for £200, which price he doubled when the book proved successful. The "Sketch Book" contained "Rip Van Winkle" and the "Legend of Sleepy Hollow," which are perhaps the most widely celebrated, and are certainly the most strikingly original, of all his creations. He spent the winter of 1820 in Paris, and in 1821 wrote "Bracebridge Hall, or the Humorists" (2 vols., London, 1822), producing 120 pages of it in ten days. Murray paid 1,000 guineas for the copyright, without seeing the manuscript. Irving passed the next winter in Dresden, returned to Paris in 1823, and in 1824 published his "Tales of a Traveller" (2 vols., London), for which Murray paid £1,500. This work met with severe criticism on both sides of the Atlantic. In 1826 Alexander H. Everett, United States minister to Spain, commissioned Irving to translate the documents relative to Columbus which had just been collected by Navarrete. With this material at command he wrote his "History of the Life and Voyages of Christopher Columbus" (4 vols., London, 1828), for which he received 3,000 guineas from the publisher and one of the 50-guinea gold medals offered by George IV. for historical composition. This history gained immediate popularity, and was highly praised by the reviewers, more than restoring the favor which its author seemed to have lost by his preceding work. After a tour in the south of Spain he published his "Chronicles of the Conquest of Granada" (2 vols., London, 1829), for which Murray paid £2,000, losing money by it. The "Voyages of the Companions of Columbus" appeared in 1831, and in 1832 the "Alhambra" (2 vols., London), a portion of which was written in the old Moorish palace, where Irving spent three months. In July, 1829, he had returned to London, having been appointed secretary of the American legation there. In 1831 the university of Oxford conferred upon him the degree of LL.D. The recall of the minister deprived him of his office, and in May, 1832, he returned to New York, where a public dinner, at which Chancellor Kent presided, was given in his honor. In the summer of the same year he accompanied Commissioner Ellsworth in the removal of the Indian tribes across the Mississippi, and the result was his "Tour on the Prairies" (1835), which, together with "Abbotsford and Newstead Abbey" (1835) and "Legends of the Conquest of Spain" (1835), forms the "Crayon Miscellany." "Astoria" (2 vols., Philadelphia, 1836), which professes to give the early history of the fur station of that name in Oregon, was written from the author's remembrance of visits in his youth to the station of the northwest fur company at Montreal, and from documents fur-

nished by John Jacob Astor. The "Adventures of Captain Bonneville, U. S. A., in the Rocky Mountains and the Far West," was published in 1837 (2 vols., Philadelphia), and in 1839-'41 Irving contributed to the "Knickerbocker Magazine" a series of articles which with others were collected in a volume entitled "Wolfert's Roost" (New York, 1855). In 1841 he wrote a life of Margaret Miller Davidson, to accompany her posthumous works. He was United States minister to Spain from 1842 to 1846, and on his return prepared for publication in separate form his biography of Oliver Goldsmith (New York, 1849), which was originally prefixed to a Paris edition of Goldsmith's works, and also published "Mahomet and his Successors" (2 vols., New York, 1850), composed partly from materials collected in Madrid. In 1848-'50, at the suggestion of Mr. G. P. Putnam, he revised his entire works, which were issued by that publisher in 15 uniform volumes, and met with a large sale. Irving's last, longest, and most elaborate work, "The Life of George Washington" (5 vols., New York, 1855-'9), occupied the remainder of his life, the final volume appearing only three months before his death.—From the time when the "Sketch Book" was published Irving had a wide circle of appreciative readers, which has never diminished. In the department of pure literature he was the earliest classic writer of America, and in the opinion of many he remains the first. The remarkable clearness and purity of his English, the freshness of many of his themes, and the genial spirit in which he handles all, seem to have secured for his works a permanent active circulation. During his lifetime 600,000 volumes were sold in America, and since his death the sale has averaged more than 30,000 a year. On account of the early death of a young lady to whom he was attached, Matilda Hoffman, he never married. For several years before his death he resided on the east bank of the Hudson, near Tarrytown, in an old Dutch mansion which he christened "Sunnyside." This place is the scene of the "Legend of Sleepy Hollow," and Irving's house was the original of the castle of Baltus van Tassel. In private life Irving was very even-tempered, hospitable, genial, and generous, with an almost feminine delicacy of manners and conversation. He was a communicant of the Episcopal church. He died suddenly from disease of the heart, and was buried in the graveyard at Tarrytown, the funeral procession passing through the famous "Sleepy Hollow." His "Life and Letters" (5 vols., New York, 1861-'7) was edited by his nephew Pierre M. Irving, who also collected and edited his "Spanish Papers, and other Miscellanies" (3 vols., 1866).

IRWIN, a S. county of Georgia, bounded N. E. by Ocmulgee river, and traversed by the Allapaha; area, about 1,000 sq. m.; pop. in 1870, 1,837, of whom 296 were colored. It has a level surface and a sandy soil, which is not

very fertile except in the S. E. part. Pine forests occupy a large portion of the land. The Brunswick and Albany railroad touches the S. W. corner. The chief productions in 1870 were 27,875 bushels of Indian corn, 15,165 of oats, 23,220 of sweet potatoes, 16,510 lbs. of wool, and 153 bales of cotton. There were 257 horses, 9,021 cattle, 7,372 sheep, and 7,458 swine. Capital, Irwinville.

ISAAC (Heb. *Yitz'hak*, will laugh, whose birth caused laughter), the second patriarch of the Hebrews, son of Abraham and Sarah, younger brother of Ishmael, and father of Jacob and Esau by Rebekah. The narrative of his life is contained in Genesis, according to which he was born when his father was 100 years old, was circumcised on the 8th day of his life, was about to be sacrificed by his father on Mt. Moriah, but was saved by divine interposition, lived partly as a nomad, partly as an agriculturist, in the southern region of Canaan and in Philistia, and died blind at the age of 180, after bestowing his chief blessing on his younger son Jacob, who, by the advice of his mother, had disguised himself to resemble Esau.

ISAAC I., Comnenus, a Byzantine emperor, died in 1061. He was the son of Manuel Comnenus, prefect of the East, but early lost his father, and was brought up by the emperor Basil II. He married the daughter of the captive king of Bulgaria, and was living privately in Paphlagonia when in 1057 a conspiracy raised him to the throne in the place of Michael VI. He repulsed the Hungarians in 1059, but was a weak and incompetent ruler, and the same year abdicated and retired to a monastery, where he remained till his death. He left no son, but the family of Comneni, after an interval of 20 years, occupied the Byzantine throne for a century.

ISAAC II., Angelus, a Byzantine emperor, born in 1154, put to death in 1204. A descendant of the Comneni through his grandmother, he held various offices under the emperor Manuel I. He fell under the displeasure of Andronicus Comnenus, who ordered him to be put to death; but a popular revolution delivered him and placed him upon the throne in 1185. He made himself detested by his vices and incapacity, and was dethroned by his brother Alexis III. in 1195, and deprived of his sight. When the crusaders took Constantinople in 1203, they restored Isaac to the throne; but he was again dethroned and put to death by Alexis Ducas in the following year.

ISABELLA, a central county of the southern peninsula of Michigan, intersected by Chippewa river; area, 576 sq. m.; pop. in 1870, 4,113. The surface is nearly level, and mostly covered with forests, principally of pine and sugar maple. The Flint and Père Marquette railroad crosses the N. E. corner. The chief productions in 1870 were 27,786 bushels of wheat, 18,984 of Indian corn, 21,382 of oats, 39,001 of potatoes, 87,854 lbs. of butter, and 4,268 tons of hay. There were 568 horses, 867 milch

cows, 1,532 other cattle, 1,911 sheep, and 1,375 swine. Capital, Mt. Pleasant.

ISABELLA I., the Catholic, queen of Castile and Leon, born in Madrigal, Old Castile, April 23, 1451, died Nov. 26, 1504. She was the daughter of John II. of Castile by his second wife, Isabella of Portugal, and was therefore descended through both parents from the famous John of Gaunt, duke of Lancaster. She was little more than three years old when her father died, leaving his crown to Henry, the offspring of his first marriage with Maria of Aragon. Until her 12th year Isabella lived with her mother in retirement in the small town of Arevalo. On the birth of the princess Juana, Henry removed his sister to court, the better to prevent the formation of a party for securing the succession to her instead of Juana. Remote as seemed her chances of a crown, with her elder brother on the throne, an heir to his body, and another brother living, Isabella was yet thought a fit match for the first princes of Europe. "Her hand was first solicited," says Prescott, "for that very Ferdinand who was destined to be her future husband, though not till after the intervention of many inauspicious circumstances." She was next, at the age of 11, betrothed to his brother Carlos, aged 40. This unequal union was prevented by the death of Carlos by poison, and in 1464 Henry promised her hand to Alfonso of Portugal. Isabella opposed this summary disposition of her person, saying that "the infantas of Castile could not be given in marriage without the consent of the nobles of the realm." An insurrection, headed by the marquis of Villena and his uncle, the archbishop of Toledo, had been stirred up partly by the belief of many nobles that the princess Juana (often known as *la Beltraneja*), to whom the king had caused the oath of fealty to be taken, was the offspring of an amour between the queen and the royal favorite Beltran de la Cueva. The confederates proclaimed the transfer of the sceptre from Henry to his brother Alfonso, and collected an army to support their cause. Henry sought to detach the chief conspirators by marrying Isabella to the brother of the marquis of Villena, the profligate Don Pedro Giron, grand master of the order of Calatrava. The princess vowed to plunge a dagger into Don Pedro's heart rather than submit to such dishonor, but the grand master died suddenly on his journey to the nuptials. Two years later (1468) Alfonso died, and the insurgents offered the crown to Isabella. She refused it, but expressed her willingness to succeed her brother; and an accommodation was soon effected with Henry, by the terms of which the queen was to be divorced, and Isabella was recognized as heir to Castile and Leon, with the right to choose her own husband, subject to the king's approval. Isabella's claim to the succession was soon afterward solemnly ratified by the cortes. Henry paid little regard to the terms of this agreement,

and made another effort to force her to marry the king of Portugal. Policy and affection inclined her to the suit of Ferdinand, prince of Aragon, and, incensed at her brother's threats of imprisonment, she resolved to take matters into her own hands, and returned the Aragonese envoy a favorable answer. Ferdinand signed the marriage contract at Cervera, Jan. 7, 1469, guaranteeing to his consort all the essential rights of sovereignty in Castile and Leon. Henry at once despatched a force to seize his sister's person, but Isabella escaped to Valladolid, and sent word to Ferdinand to hasten the marriage. The young prince, unable to procure an escort, as his father was then at war with the insurgent Catalans and utterly bankrupt, travelled in the disguise of a servant with six companions to Osma, escaping the troops of Henry posted to cut off his progress, and thence journeyed in more fitting state to Valladolid, where the marriage ceremony took place, Oct. 19, 1469. Henry now declared Isabella to have forfeited all the advantages guaranteed by the previous treaty, and proclaimed Juana his lawful successor. The kingdom became divided by two hostile factions, Henry receiving the countenance of France, but Isabella gradually winning the affections and allegiance of the Castilians by her virtues and sagacity. At length, on Dec. 11, 1474, the king died, and two days later Isabella was proclaimed queen at Segovia. Most of the nobles swore allegiance, but the party of Juana was still powerful, and it was not until after a war with Alfonso of Portugal, who had been affianced to Juana, that the queen's authority was fully recognized. From this time her career was brilliant. She applied herself to reform the laws and internal administration of the realm, to encourage literature and the arts, and to modify the stern and crafty measures of her husband. Though the life and soul of the war against the Moors, in which she personally took part, even wearing armor, which is still preserved at Madrid, she was opposed to the cruelty which was then the established policy toward that people; and if she decreed the expulsion of the Jews from Castile, and gave a reluctant consent to the introduction of the inquisition, it was from a conviction that the safety of the Catholic faith demanded this sacrifice of her private feelings. The encouragement of Christopher Columbus is the deed by which she is best known to posterity; the squadron with which he discovered America was equipped at her expense. She opposed the reduction of the Indians to slavery, and when a cargo of these captives was sent by Columbus to Spain, she ordered them to be transported back to their own country. With the aid of Cardinal Ximenes she reformed the religious orders, establishing thereby as firm a discipline in the church as she had already introduced into the state. Neither wealth nor station ever shielded criminals from her displeasure, and the sword of justice fell with

equal certainty upon the nobility, the clergy, and the common offender. The masculine intellect, the feminine charms, and the rare virtues of Isabella have been a favorite theme for historians of all subsequent times, and the affection in which all her subjects held her person is still cherished throughout Spain for her memory. The sudden deaths of Don Carlos, Don Pedro Giron, and her brother Alfonso, so opportunely for her interests, left no stain of suspicion upon her. For Ferdinand she always entertained the warmest affection, which was not always faithfully returned. Her genuine piety colored every action of her life. In person she was equally beautiful as in character. She had a clear complexion, light blue eyes, and auburn hair. She had five children: Isabella, married to Emanuel of Portugal; Juan, a virtuous prince, who died in 1497, aged 20; Juana, who married Philip, archduke of Austria, and was the mother of the emperor Charles V.; Maria, who espoused Emanuel after the death of her sister; and Catharine, the wife of Henry VIII. of England. (See FERDINAND V.)

ISABELLA II. (MARIA ISABEL LUISA), ex-queen of Spain, born in Madrid, Oct. 10, 1830. She is the eldest daughter of Ferdinand VII. and his fourth wife, Maria Christina. The question of her succession to the throne caused in Spain a bloody civil war. Her father, having no son, repealed (March 29, 1830) the Salic law, introduced into Spain by Philip V., and named the expected offspring of his fourth marriage to succeed him, thus excluding his brother Don Carlos, who was then heir presumptive by virtue of that law. Ferdinand dying Sept. 29, 1833, Isabella, then only three years old, was proclaimed queen. Don Carlos took up arms, supported by a large body of adherents, known as Carlists. The contest gradually assumed the worst form of civil war, the clergy taking sides with Don Carlos, while the queen's party was identified with that of the *exaltados*, liberals, or constitutionalists; the queen mother, who had taken the title of regent, having guaranteed a constitution to Spain. The young queen was supported by the majority of the people, and in 1834 it was almost unanimously agreed by the legislative cortes that Don Carlos and his descendants should be forever excluded from the Spanish throne; a decree which was confirmed by the constituent cortes in 1836. Peace was virtually concluded at the end of August, 1839, at Vergara, by the convention between the Carlist general Maroto and Gen. Espartero, the most successful of the constitutionalist commanders, and Don Carlos fled to France. During the course of the struggle the queen regent vacillated between the two parties of *moderados*, or conservatives, and *exaltados*, or liberals. The ministry of Mendizabal modified the constitution, enlarged the electoral law, and introduced other reforms; but the juntas, still dissatisfied, demanded the constitution of 1812, which was

finally extorted by the insurrection of Madrid, June 18, 1837. The great insurrections of Barcelona and of Madrid in 1839 caused the flight of the queen mother into France (October, 1840). Espartero now became head of the government, and on May 8, 1841, was declared regent, but was finally compelled by an insurrection of the friends of Christina and the radicals to abdicate; the cortes, by advancing the majority of the queen 11 months, placed her on the throne, Nov. 10, 1843. Gen. Narvaez, who had placed himself at the head of the insurrection, became chief of the cabinet in 1844, and in the following year the constitution was modified in a reactionary sense. On Oct. 10, 1846, under the influence of Louis Philippe, she was married to her cousin, Don Francisco de Asis, and at the same time her sister Maria Ferdinanda Luisa was married to the duke of Montpensier. This alliance gave rise to sinister comments, and resulted in domestic unhappiness and in injurious reports in regard to the conjugal fitness of the king and the conjugal fidelity of the queen. Isabella established alliances with Austria and Prussia, and in 1849 sent an army to aid the pope. An attempted assassination of the queen in 1852 was turned to account by the conservatives, who procured the dissolution of the cortes and the adoption of repressive measures. Several liberal generals having been banished, on June 28, 1854, Gens. O'Donnell and Dulce headed a military and civil insurrection in Madrid, and succeeded in reestablishing a liberal government. The queen mother fled again to France, and the queen proclaimed an amnesty, opened a new cortes, and legalized the sale of church property. In 1856 an attempted *coup d'état* by O'Donnell, and the suppression of revolts in the south of Spain, gave the queen more power, and reestablished the constitution of 1845. This induced the most reactionary measures, which in turn brought about a year later the fall of the Narvaez cabinet and the formation of a more liberal ministry (October, 1857). A war with Morocco, undertaken by O'Donnell, was successfully terminated in April, 1860. The intervention in Mexican affairs jointly with the French, and under the lead of Prim, in 1861-'2, was speedily cut short by that general. Wasteful enterprises in Santo Domingo and against Peru and Chili proved entirely fruitless. In 1865 Isabella was compelled by the resignation of her ministers to give her sanction to the bill repealing the law of 1861, by which the republic of Dominica was incorporated with the monarchy; and in the same year she ordered the sale of all the crown property, with the exception of the royal residences and entailed estates, for the benefit of the nation. In 1866, under the influence of the priests and a new Narvaez cabinet, she abolished freedom of the press and placed public instruction in the hands of the clergy. Insurrections, instigated and partly led by Prim, broke out in that and the

following year in various parts of the country, but failed for want of organization. Gonzalez Bravo, the successor of Narvaez at the head of the cabinet, carried reaction still further, until in September, 1868, a revolt began at Cadiz which speedily spread over all Spain, and resulted in the queen's flight to France, with her children, her lover Marfori, and her chaplain Claret. (See PRIM, and SERRANO.) Napoleon III. put at her disposal the castle at Pau, whence she issued a proclamation to the Spanish people, protesting against the revolution. On Sept. 29, 1868, her deposition was declared at Madrid, and on Nov. 6 she took up her residence in Paris, where she has since remained, with the exception of an interval spent at Geneva during the Franco-German war. On June 25, 1870, she abdicated her claim to the throne of Spain in favor of her son, Alfonso Francisco de Asis Fernando, &c. (born Nov. 28, 1857), prince of Asturias, who assumed the title of Alfonso XII.

ISABELLA OF ENGLAND. See EDWARD II. and III.

ISABELLA OF VALOIS. See ELIZABETH OF VALOIS.

ISABEY. I. Jean Baptiste, a French miniature painter, born in Nancy, April 11, 1767, died April 18, 1855. He studied historical painting under David, but commenced his career by making portraits in crayons. About 1800 he determined to apply the principles of high art to miniature painting, and in 1802 his reputation was established by an extensive work, representing the first consul reviewing his troops in the court of the Tuileries; and thenceforth he remained at the very head of this branch of his art. Napoleon I., with whom he had been intimate in his youth, appointed him his miniature painter in ordinary, and the members of the Bonaparte family and the marshals and great dignitaries of the empire sat to him, besides many sovereigns and statesmen of Europe, of whom he painted a greater number than any contemporary. His *Table des maréchaux*, on a large slab of porcelain, representing Napoleon surrounded by his most famous generals, is a good specimen of his large portrait pieces. His picture of one of the conferences at Vienna, whither he had followed Maria Louisa on the abdication of Napoleon in 1814, is valuable from the number of historic portraits it embraces. **II. Eugène Louis Gabriel**, a French marine and landscape painter, son of the preceding, born in Paris, July 22, 1804. He studied art under his father. His "Battle of the Texel" (1839) is in Versailles, and his "Embarking of Ruyter" (1851) in the Luxembourg. His later works include "The Alchemist" (1865) and "The Temptation of St. Anthony" (1869).

ISÆUS, one of the ten Attic orators, born at Chalcis, flourished in the first half of the 4th century B. C. He went at an early age to Athens, was instructed in oratory by Lysias and Isocrates, composed judicial orations for others, and founded a school of rhetoric in

which Demosthenes is said to have studied. In antiquity 64 orations were ascribed to him, of which 11 are extant, all relating to disputed inheritances. The best separate edition is that by Schömann (8vo, Greifswald, 1831). There is an English translation by Sir William Jones (London, 1794).

ISAIAH, the first of the great Hebrew prophets, son of Amoz, flourished under Kings Uziah, Jotham, Ahaz, and Hezekiah, from about 760 to 700 B. C. Ahaz was consoled by his prophecies when King Rezin of Damascus and Pekah of Israel warred against Judah. But his chief activity falls in the reign of Hezekiah, during the invasion of Sennacherib, king of Assyria. (See HEBREWS, vol. viii., p. 589.) The leading themes of his prophecies are denunciations of vice and oppression, announcements of impending ruin, and the promise of regeneration and a universal reign of justice. The eloquent style and sublimity of thought of the main portions of the book of Isaiah give him the highest rank among the prophets. The last 27 chapters, which differ in diction and topics, treating of the victories of Cyrus, the fall of Babylon, and the return of the Jews to Jerusalem, are generally considered by critics to be by some author of the time of the captivity, whose name is unknown, and who is often designated as the second Isaiah. Some other chapters (xiii., xxxiv., xxxv., &c.) are also regarded as productions of unknown authorship. Among the best commentators are Lowth (London, 1775), Gesenius (3 vols., Leipsic, 1820-'21), Hitzig (2 vols., Heidelberg, 1833), J. A. Alexander (2 vols., New York, 1846-'7), Barnes (2 vols., 1848), Drechsler (3 vols., completed by Delitzsch and Hahn, 1857), Knobel (3d ed., 1861), Delitzsch (1866), and Ewald (2d ed., 1867).

ISANTI, an E. county of Minnesota, intersected by St. Francis or Rum river; area, 450 sq. m.; pop. in 1870, 2,035. The surface is somewhat diversified. Timber is found along the river banks. The chief productions in 1870 were 16,025 bushels of wheat, 2,523 of rye, 8,699 of Indian corn, 11,860 of oats, 11,544 of potatoes, 58,331 lbs. of butter, and 5,432 tons of hay. There were 225 horses, 660 milch cows, 1,149 other cattle, 975 sheep, and 395 swine. Capital, Cambridge.

ISAR (anc. *Isarus*), a river of Germany, a tributary of the S. or right bank of the Danube, about 200 m. long. It rises in Tyrol about 6 m. N. E. of Innsbruck, passes for about 80 m. through a wild and partly uninhabited Alpine region, until it reaches with torrent-like velocity the Bavarian town of Tölz, 25 m. S. of Munich; it falls into the Danube 2 m. below Deggendorf. Besides Munich, the Isar waters Landshut, Landau, and other towns, but is not navigable excepting downward from Tölz, and then only for rafts. It contains many large bogs and forms numerous islands; has many affluents from the Ammer, Würm, and other lakes; and is said to have once been a mountain lake extending far beyond Tölz.

The circle of Upper Bavaria was formerly known as that of the Isar.

ISAURE, Clémence, a French patroness of poetry, born in Toulouse about 1450, died there about 1500. She belonged to a distinguished family, according to some authorities to that of the counts of Toulouse. She was never married, and devoted her wealth to the promotion of poetry by restoring the floral games at the academy of Toulouse. She annually devoted large amounts to the endowment of prizes for the best poetical contributions, and the academy continues to derive from her legacy an annual income of over 10,000 francs for the still existing floral games.

ISAURIA, in ancient geography, a district of Asia Minor, bounded by Phrygia, Lycaonia, Cilicia, and Pisidia, containing few towns, and known to the ancients chiefly by the marauding excursions of the Isauri, who dwelt in its mountain fastnesses. The Romans sent an army against them in 78 B. C. under Servilius, who reduced them to submission and gained the surname of Isauricus. As they continued their depredations, the Romans tried with little success to check them by confining them within a circle of fortresses. In the 3d century the Isaurians and Cilicians united themselves into one nation, and one of their chiefs, Trebellianus, assumed the title of Roman emperor (264), but was conquered and put to death. They were formidable to the Byzantine emperors, and two of their race, Zeno (474-'91) and Leo III. (718-'41), rose to the Byzantine throne. The capital of Isauria was Isaura, at the foot of Mt. Taurus, a strong and rich city, whose inhabitants destroyed it and themselves by fire when they could no longer resist the siege of Perdiccas, shortly after the death of Alexander the Great. It was rebuilt, and again destroyed by Servilius.

ISCHIA (anc. *Ænaria* and *Inarime*), an island of Italy, in the Mediterranean, at the N. entrance

of the bay of Naples; area, 26 sq. m.; pop. about 25,000. Its coasts are steep and rocky. Near its centre is the volcano of Epomeo, 2,500 ft. above the sea; its last eruption was in 1301. There are also 12 smaller volcanoes. The intervening valleys are of extraordinary fertility, producing corn, wine, and fruits in abundance. Its warm baths, the most celebrated of which are those of Casamicciola and Lacco, are much frequented, and, with its salubrious climate and luxuriant vegetation, make it a favorite resort in every season of the year. The chief town, Ischia, has about 6,300 inhabitants, and is the seat of a Catholic bishop. Its castle, a picturesque structure, stands on a high isolated rock of volcanic tufa and ashes, which rises out of the sea opposite the island of Vivara, and is connected with the mainland by a mole. It was built by Alfonso I. of Arragon in the 12th century.

ISCHL, or *Ischil*, a fashionable watering place in Upper Austria, on the river Traun, in the centre of five or six valleys, surrounded by picturesque mountains, 27 m. E. S. E. of Salzburg; pop. in 1869, 7,126. In the vicinity are extensive salt works, established in 1822. It contains several churches and schools, and sulphur, mud, and saline vapor baths. A suspension bridge crosses the Traun, at the junction of the Ischl. It is a favorite resort of the Austrian nobility and of the present emperor.

ISEGHEM, a town of Belgium, in the province of West Flanders, 7 m. N. N. W. of Courtray; pop. in 1867, 7,955. It has important manufactories of cotton, linen, hats, thread, ribbon, and soap, breweries, and tanneries, and a large trade in cattle.

ISELIN, Henri Frédéric, a French sculptor, born at Clairegoutte, Haute-Saône, about 1825. He exhibited various works in 1849, and has since produced busts of Murat and others for the museum of Versailles, "Observation," an allegorical bust, "The Genius of Fire," and "Eury-

pylus" for the new Louvre, and other busts and statues.

ISÈRE, a S. E. department of France, in Dauphiny, bounded W. and N. by the Rhône, which separates it from the departments of Loire, Rhône, and Ain, and on the E. and S. bordering on Savoie, Hautes-Alpes, and Drôme; area, 3,200 sq. m.; pop. in 1872, 575,784. It is named from the river Isère (anc. *Isara*), which flows through it generally S. W. from Savoie, passes Grenoble, and falls into the

Castle of Ischia.

Rhône near Valence, Drôme, after a course of 180 m., for more than 80 of which it is navigable. The surface of the department in the south is very mountainous, but in the centre and north it frequently expands into extensive plains. There are at least 20 mountain peaks, the lowest over 6,000 ft. high, and the most elevated, belonging to the Pelvoux group, on the border of Hautes-Alpes, over 13,000 ft. The soil of the lowlands is in general very fertile. Agriculture is in an advanced state. The quantity of wine made annually averages over 5,000,000 gallons; that made in the valley of the Rhône has been long celebrated. The production of silk is an important branch of industry. There are mines of iron, copper, lead, and coal; and gold, silver, platinum, zinc, and antimony are found. The staple manufactures are hardware, linens, and cotton yarn. The department is divided into the arrondissements of Grenoble, Saint-Marcellin, La Tour-du-Pin, and Vienne. Capital, Grenoble.

ISERLOHN, a town of Prussia, in the province of Westphalia, 15 m. W. of Arnsberg; pop. in 1871, 15,763. It is remarkable for its manufactures of iron, steel, bronze, needles, &c. The manufacture of iron was in operation there in the middle ages. That of brass dates from the 18th century. The other manufactures are silks, velvet, broadcloth, ribbons, leather, and paper. The country around Iserlohn is diversified with picturesque ruins, rocks, glens, and valleys. In the vicinity of the town is the celebrated Felsenmeer (sea of rocks), and a remarkable sounding cave containing fossil bones.

ISERNIA (anc. *Æsernia*), a town of southern Italy, in the province and 24 m. W. of the city of Campobasso, at the foot of the Apennines, and near the source of the Volturno; pop. about 7,500. It is surrounded by a modern wall, founded on the massive remains of an ancient one. In the middle is a fine fountain, with six rows of arches supported on columns of white marble; this, as well as the manufactures of the town, is fed by an ancient aqueduct hewn in the rock for a long distance and at a great depth. Isernia is the seat of a bishop, has cloth and earthenware manufactures and paper mills, and an extensive trade. Until 1780 it was crowded during the September fair with pilgrims to the shrine of Sts. Cosma and Damiano, who were supposed to have extraordinary healing powers, and to whom offerings were made of red wax models of the parts of the body affected by disease; these finally became so scandalous that the government suppressed the practice. In 1805 the town suffered severely from an earthquake.

ISHMAEL, son of Abraham and Hagar, born in Mamre. After the birth of a son to Sarah, she persuaded Abraham to banish Hagar and Ishmael, and from that time Ishmael dwelt as a hunter in the wilderness of Paran. His 12 sons became the heads of 12 tribes dwelling in the Arabian desert between Egypt and the Eu-

phrates, under the name of Ishmaelites or Hagarites.—In the 10th century A. D. the name of Ishmaelites or Ismaëlians was assumed by a Mohammedan secret society in Syria and Persia. (See ASSASSINS.)

ISIDORE MERCATOR, also called PECCATOR and PSEUDO-ISIDORE, the supposed author of the false decretals. (See CANON LAW, and DECRETALS.)

ISIDORUS. I. Of Charax, a geographer in the early part of the 1st century. He was the author of a work in which the Greek and Roman world and the Parthian empire were described. There are several quotations in Pliny from this treatise, the extant fragments of which have been repeatedly published in modern times among the remains of the *Geographici Minores*. The best edition is that of Miller (Paris, 1839). **II. Of Seville**, a saint of the Latin church, born in Cartagena, Spain, died April 4, 636. He succeeded to the see of Seville about 600, and was esteemed the most eloquent orator, the profoundest scholar, and the ablest prelate of his age. In 619 he presided at the second council of Seville, and in 633 at the great council of Toledo. He wrote on science, art, history, and theology; the most curious and important of his works is *Originum sive Etymologiarum Libri XX.*, an encyclopædia of all the arts and sciences then known. The best complete edition of his works is that of F. Arevali (Rome, 1797–1803). The fragments of his treatise *De Fide Catholica contra Judæos*, after the Paris and Vienna MSS., are given by Karl Weinhold in vol. vi. of the *Bibliothek der ältesten deutschen Literaturdenkmäler* (Paderborn, 1874).

ISINGLASS (perhaps from *icing glass*; Ger. *Hausenblase*, sturgeon's bladder, isinglass), a kind of edible gelatine, which consists of the dried air bags, sounds, or swimming bladders of fishes. It was known to the ancients by the name of *ichthyocollo* or fish glue, and is often alluded to by Dioscorides and Pliny. In different parts of the world it is obtained from different fishes, and the isinglass of commerce is consequently of various qualities. The best is found among the varieties imported from Russia, particularly that which is brought to St. Petersburg from Astrakhan, and said to be obtained from the sturgeon called the beluga (*acipenser huso*) of the Caspian sea and the rivers which flow into it, a species which attains a length of 25 ft. According to some authorities, the sound is cut open, washed, and then exposed to the air, the inner silvery membrane outward. This membrane is then stripped off, placed in damp cloths, and kneaded in the hands. Taken out and dried, it forms the leaf isinglass; folded like sheets of paper, it is the book isinglass; wound in the form of a horse shoe or lyre around three pegs, it forms the varieties known as long or short staple. According to Martin, the inner membrane is removed by beating and rubbing, and the thicker membrane is preserved. The isinglass

called Samovey is brought from Taganrog. The leaf, book, and short staple from this place are all of inferior quality. The varieties from the Ural and Siberia are better. The Brazilian isinglass, imported from Pará and Maranhão, is obtained in various forms distinguished as pipe, lump, and honeycomb. It appears to be the product of different kinds of fish, and to be prepared with little care. It is largely used in brewing establishments for fining the liquors; and though it is too impure for domestic uses, it is largely employed to adulterate the better kinds. Its presence may be detected by the isinglass failing to dissolve readily and completely in hot water, and by its forming with this an opalescent and milky jelly in which may be observed the insoluble shreds common to the Brazilian article. Its smell also is often disagreeable, while that of the pure Russian isinglass is as inoffensive as the odor of seaweed, which it somewhat resembles. The isinglass of New York and New England is obtained from the sounds of the codfish (*morrhua vulgaris*) and of the common hake (*phycis Americanus*). They are macerated in water, and afterward rolled out in long strips a few inches wide. The quality of this isinglass is poor, its solution not readily obtained, and its color dark. It is used for the same purposes as the Brazilian. Other varieties are produced in other maritime countries.—All isinglass has to undergo a process of refining before it is fit for making jellies, blanc-mange, &c. The best beluga leaf is imported in circular sheets, the most perfect of which are sometimes 2 ft. in circumference, and weigh from 8 to 16 oz., in some instances reaching even 4 lbs. These are carefully picked over, and all the discolored parts are cut away and put aside for uses of less importance. The assorted leaf is then passed through successive pairs of iron rollers, until it is converted into thin ribbons of uniform width, which are afterward by other machinery slit into fine shreds. Inferior sheet gelatine is sometimes introduced between two sheets of isinglass before rolling, and thus incorporated with it. Isinglass, being a nearly pure gelatine, should have little or no color; and being commonly prepared without exposure to high degrees of heat, it should be tougher and more elastic than the other forms of this substance. It therefore makes a most adhesive cement. For this purpose it is swollen with cold water and then placed in diluted alcohol. The vessel containing it is then put into cold water, which is to be heated to boiling. The jelly forms the cement, which may be kept from mouldiness and other change by the addition of a few drops of any essential oil. It is known as the "diamond cement," and is also the adhesive substance of court plaster. Gum ammoniac is sometimes introduced, especially by the Turks, who use the cement for fastening precious stones, mending broken porcelain, glass, &c. Isinglass has also been used for the window lights of vessels, being

covered with a transparent varnish which is not affected by moist air. Hence, sheets of mica prepared for similar uses, as in the doors of stoves, are popularly called isinglass. (See MICA.)—Besides the methods already stated of detecting fraudulent mixtures with isinglass, the microscope may be used to render the different textures apparent. The ash of isinglass seldom exceeds $\frac{1}{2}$ of 1 per cent., and is red; that of gelatine is white, and in quantity not less than 3 per cent.

ISIS, the principal goddess of the Egyptians, the wife of Osiris, and the mother of Horus, with whom she formed the most popular triad in Egyptian mythology. (See OSIRIS.) She was adored as the great benefactress of Egypt, who had instructed her people in the art of cultivating wheat and barley, which were always carried in her festal processions. In Greece, where her worship was introduced at a very early period, she was occasionally addressed as Pelagia, the queen of the sea. From Greece her worship passed into Italy, and was established in the first century B. C. at Rome, where it became popular. In 43 B. C. the triumvirs, in order to ingratiate themselves with the people, commanded a temple of Isis and Serapis to be founded, and publicly sanctioned their worship. The principal Roman temple of Isis stood in the Campus Martius, and hence the goddess was often called Isis Campensis. The Romans identified with her a native goddess of the Gauls, Sicilians, and Germans. The priests of Isis wore linen garments, and her votaries in the public processions wore masks representing the heads of dogs. In works of art she usually appears with the figure and face of Juno, arrayed in a long tunic, wearing a wreath of lotus flowers, and in her right hand a *sistrum*.

ISLA, José Francisco de, a Spanish author, born in Segovia in 1703, died in Bologna in 1781. He early became famous as a Jesuit preacher and a satirical poet. His first works were directed against an extravagant religious festival at Salamanca in 1727, and a royal pageant at Pampeluna in 1746; but he managed his sarcasm so adroitly that the authorities of the latter city at first regarded his effusion as complimentary, though subsequently he left the city, and probably was expelled. His published sermons (1729-'54) show a marked improvement upon the prevailing tone of the itinerant friars, and he reformed this effectively by his celebrated romance *Historia del famoso predador Fray Gerundio de Campazas*. The first volume, printed without his knowledge in 1758, was eagerly bought up; the derisive epithet of *Fray Gerundio*, henceforward applied to vulgar preachers, put an end to their vocation; but the government was obliged to withdraw the license for its publication in obedience to the clamors of the clergy. The inquisition condemned the book in 1760, but did not molest the author, who was protected by his increasing popularity. The violent ex-

pulsion of his order in 1767, requiring his sudden departure, gave a shock to his health from which he never recovered, and he spent the rest of his life in Bologna. The manuscript of his second volume having reached London, Baretta published it in English (1772); and complete Spanish editions soon appeared at Bayonne and elsewhere, Isla's friend Francisco Lobon de Salazar, a priest at Villagarcia, in whose house he had written the work, appearing as the author in the earliest and in some of the later editions to elude the censorship. In 1813 the work was published in Madrid in 4 vols.; and though again interdicted next year, it continued to have a large circulation. Ticknor finds in its plan some resemblance to "Don Quixote," and in its execution he compares it to Rabelais. Isla's works also include *Cicero*, a satirical poem in 16 cantos. Permission to print it was denied, and the manuscript was presented in 1844 to the library of the Athenæum of Boston, Mass., together with some of Isla's autograph letters. His letters to his sisters and brother-in-law, *Cartas familiares*, were published posthumously in 6 vols., 1785-'6.—See *Vida de J. F. de Isla*, by J. I. de Salas (Madrid, 1803).

ISLAM, an Arabic word, signifying full submission to God. It is used by Mohammedans to designate their religion, and also the whole body of believers, or those who accept the formula of faith: "There is no God but Allah, and Mohammed is his prophet." This formula or profession of faith is understood to include five essential articles of religion: 1, the acknowledgment of the divine unity and of the mission of Mohammed; 2, observance of prayer; 3, almsgiving; 4, keeping the fast of Ramadan; 5, the pilgrimage to Mecca. The Shiahs, or adherents of Ali, who are dominant in Persia, add to the declaration of faith, "Ali is the vicar of God." But the Sunnis, or orthodox Mohammedans, who form the majority of the church of Islam, reject this.

ISLAND, a N. W. county of Washington territory, bounded S. and S. W. by Admiralty inlet, and W. by Rosario strait; area, 200 sq. m.; pop. in 1870, 626. It comprises Hat, Camano, and Whitby islands, the last being 60 m. long, of irregular width, and noted for its fertile soil and salubrious climate. The chief productions in 1870 were 3,271 bushels of wheat, 4,856 of oats, 13,069 of barley, 15,043 of potatoes, 9,297 lbs. of wool, 11,395 of butter, and 1,942 tons of hay. There were 214 horses, 433 milch cows, 579 other cattle, 3,099 sheep, and 1,108 swine; 1 flour mill, 1 saw mill, and 3 establishments for building and repairing ships. Capital, Coupeville.

ISLAY, or *Isla*, an island of Scotland, the southernmost of the Hebrides, 15 m. from the coast of Argyleshire, to which it belongs; length 24 m., breadth 17 m.; area, 154,000 acres, of which 20,000 are cultivated; pop. in 1871, 8,143. The surface of the E. part is

hilly and mostly wooded, but the remainder is generally level. Some of its summits are 1,500 ft. high. It contains several small lakes and rivers, which abound with salmon and trout. Loch Finlaggan, near its centre, is about 3 m. in circumference. In this lake is an islet where the Macdonalds, the "lords of the isles," once resided, and where the ruins of their castle still are. The climate is moist, but tolerably healthy. The soil of the lowlands is very fertile and well cultivated. The staple manufacture is whiskey, which is of superior quality, and of which over 400,000 gallons are made yearly. Lead and copper mines have been opened. In 1843 the island was purchased as an investment by the late Mr. Morison of London for \$2,225,000. Chief town, Bowmore.

ISLE OF FRANCE. See MAURITIUS.

ISLE OF MAN. See MAN.

ISLE OF PINES. See PINES.

ISLE OF WIGHT, England. See WIGHT.

ISLE OF WIGHT, a S. E. county of Virginia, bounded N. E. by the estuary of James river, and S. W. by the Blackwater; area, 400 sq. m.; pop. in 1870, 8,320, of whom 3,446 were colored. The surface is generally level and divided between swamps, pine forests, and farminglands. The soil is thin and sandy. The Norfolk and Petersburg and Seaboard and Roanoke railroads cross the county. The chief productions in 1870 were 160,733 bushels of Indian corn, 17,823 of oats, 17,957 of Irish and 30,411 of sweet potatoes, and 1,312 tons of hay. There were 829 horses, 1,226 milch cows, 2,237 other cattle, 1,510 sheep, 11,423 swine, and 6 saw mills. Capital, Smithfield.

ISLE ROYALE, an island in Lake Superior, forming part of Keweenaw co., Michigan, 55 m. N. W. of Keweenaw point, 15 m. from the Canada shore, intersected by the 48th parallel and the 89th meridian; length from N. E. to S. W. about 45 m., greatest breadth 9 m.; area, 225 sq. m. It has no permanent population. The shores are generally rocky and broken, with several deep inlets. A large number of rocky islets are clustered about it, especially off the N. E. and S. W. extremities. Much of the island is covered with trees, and a longitudinal ridge rises at some points more than 700 ft. above the lake. Extensive veins of native copper have recently been discovered on this island, many of which have been worked by some ancient people, whose stone hammers and copper knives and other tools are found in great numbers in the pits. Some of the excavations on the N. side extend continuously more than two miles, and are connected by underground drains, one of which was cut through rock for a distance of 60 ft., and had been covered throughout with large timbers, now broken and decayed. The stone hammers weigh from 10 to 30 lbs., some of them having a groove for a handle, and the copper tools have been hardened by fire. The miners exhibited great skill in tracing the veins, and followed the deposits of sheet-like copper, re-

jecting the nuggets. Some copper arrow-heads have been found on the island, and a rude wooden bowl 3 ft. in diameter. At an indentation which forms a good harbor on the S. side, where a stream 40 ft. wide has cut a passage through the rocks and forms a considerable cataract, the apparent site of an ancient town has been discovered. It was on an elevated slope overlooking the lake. No human remains have been found. At least one generation of immense forest trees has grown over all the mines. One is now worked by a New York company. A few deer frequent the island, and it is overrun with rabbits.

ISLES OF SHOALS, a group of islets in the Atlantic ocean, 10 m. S. E. of Portsmouth, N. H.; pop. in 1850, 131; in 1860, 152; in 1870, 94. Their names are Appledore or Hog island, Haley's or Smutty Nose, Malaga, Cedar, Duck, Gosport or Star, White, Seavey's, and Londoner's. Malaga is permanently connected with Haley's by a breakwater, and at low water Cedar is also connected with Haley's, and Seavey's with White. Star, White, Seavey's, and Londoner's islands form part of Rockingham co., N. H., and constitute the town of Gosport; the others belong to York co., Me. The three largest are Appledore, containing about 400 acres; Star, 150 acres; and Haley's, which with Cedar and Malaga comprises 100 acres. On White island, the westernmost except Londoner's, is a lighthouse (lat. $42^{\circ} 58' N.$, lon. $70^{\circ} 37' 20'' W.$), with a revolving light 87 ft. above sea level, and visible 15 m. The islands consist of rugged ledges, and contain little vegetation. A steamer runs daily from Portsmouth in summer, accommodating the numerous visitors who resort hither to enjoy the sea air and the facilities for boating and fishing. On Appledore there is a large hotel, with the private residence of the proprietors. Star island contained nearly all the inhabitants, and had a church, a school, a monument to Capt. John Smith, erected in 1864, and the ruins of an old fort; but in 1872 a company bought out the inhabitants, and have built a large hotel for the accommodation of summer visitors. Haley's island has a wharf, a public house, and a few buildings.—The islands are believed to have been discovered by Champlain in 1605. They were visited by Capt. John Smith in 1614, who called them Smith's islands, but the name was not retained. They were early visited by fishermen, and the fish-

eries have been the chief support of the inhabitants. During the revolution most of the inhabitants, who for more than a century had numbered from 300 to 400, removed to the mainland.—Mrs. Celia Thaxter, who resides on Appledore, and whose father was for six years keeper of the lighthouse on White island, has published a volume descriptive of the islands ("Among the Isles of Shoals," Boston, 1873), and a number of poems illustrative of them.

ISLINGTON. See LONDON.

ISMAËLIANS. See ASSASSINS.

ISMAIL, or **Ismail-Tutehkov**, a town of Roumania, in Moldavia, situated on the Kilia, the N. arm of the Danube, 86 m. E. by S. of Galatz and 135 m. S. S. E. of Jassy; pop. in 1866, 20,869. It contains the remains of a fine Turkish palace, and many Greek and Armenian churches, and is an important seat of trade between Russia and Turkey. The new town of Tutehkov was added to it about 1830. Its commerce has been checked by the increasing business of Galatz, Braila, and Sulina, though the exports of grain, wool, tallow, and hides continue to be of some importance.—Ismail enjoyed great military and commercial prominence under the Turks, and contained 20 mosques and many khans, bazaars, and fine houses. The Russians took it in 1770, and stormed it again in 1790 under Suvaroff, when they lost 20,000 men, and put the Turkish garrison of 30,000 to the sword and nearly reduced the place to ashes. Having been partially rebuilt, the Russians again captured it in 1809. In 1812 it was formally ceded to Russia by the treaty of peace of Bucharest, and it was the strongest fortress of the Russian province of Bessarabia till 1856, when by the terms of the treaty of Paris the fortifications were razed and Ismail was restored to Turkey together with other parts of S. Bessarabia. It became a free port (tobacco and war material excepted) Jan. 1, 1873.

Ismailia.

ISMAILIA, a town of Lower Egypt, on the N. shore of Lake Timsah, on the Suez canal, and on the railroads leading from Alexandria

and Cairo to Suez; pop. in 1870, about 4,000. It was founded in 1863, to serve as a central seat for the administration of the work on the Suez canal, which had been simultaneously begun at Suez and Port Said. It was named after the khedive. In consequence of its favorable situation it seems destined to become a place of great commercial importance.

ISMAIL PASHA, or **Ismail I.**, khedive of Egypt, born in Cairo in 1830. He is a son of Ibrahim Pasha, and his mother was a Circassian woman. He was educated in Paris, and returning to Egypt soon after his father's death, Nov. 9, 1848, he became a determined opponent of the new viceroy Abbas Pasha. The latter accused him in 1853 of complicity in the assassination of one of his favorites, but the charge was not substantiated. Abbas suddenly died next year, and was succeeded by Said Pasha, who employed his nephew Ismail abroad and at home, placed him at the head of the administration during his visit to Europe in 1862, and made him general-in-chief of the army, in which capacity he distinguished himself by restoring tranquillity in the territory of Soodan. On the death of Said, Jan. 18, 1863, he succeeded him as fifth viceroy of Egypt, and acquired an enormous fortune through the production of cotton during the American civil war. The difficulties with M. de Lesseps in regard to the Suez canal were settled in 1864, and Ismail became thenceforward the most active promoter of the enterprise. While residing occasionally in his superb palace at Ermighian on the Bosphorus, he lived, as in Cairo, in a truly oriental style of magnificence, lavished large sums of money upon Turkish officials, and so ingratiated himself with the sultan and his court that he secured in 1866 the long coveted privilege of a direct line of succession for his dynasty, which makes the eldest of his three sons, Hussein, his heir apparent. In the same year he voluntarily increased his tribute to the sultan, with whom he cooperated at the same time, with 30,000 Egyptian troops, against the Cretans. New and important prerogatives were consequently granted to him in 1867, together with the titles of highness and khedive; but Ismail was not satisfied with these, and put forward the most extraordinary pretensions, threatening to withdraw his army from Crete, and even to seize that island, in case of non-compliance. The intervention of foreign powers caused him to abate his pretensions, and for a time appeased the exasperated sultan. But the viceroy, not content to extend his sway over the upper Nile (1868) and over the White Nile through Sir Samuel Baker (1869), continued to make foreign loans for the increase of his army and navy, proposed the denaturalization of the Suez canal, invited the potentates of Europe to attend its opening (Nov. 17, 1869), and acted as a completely independent sovereign to such an extent that after the closing of these festivities the sultan's long cherished design of curbing his vassal's

ambition was immediately carried out. Ismail was commanded to reduce his army to 30,000 men, to recall his order for the construction of ironclads and breech-loaders in Europe, and to discontinue the contraction of loans in foreign markets; and he was threatened with instant deposition in case of disobedience. Disappointed in the hope of support from Russia and other powers, the khedive reluctantly postponed his schemes and submitted to the sultan's will (Dec. 9). When, despite this agreement, he made another attempt to conclude a foreign loan in 1870, Abdul Aziz put an end to it by publicly denouncing the illegality of the proceeding. Within the next few years their relations were apparently smoother, owing to the altered condition of the balance of power in Europe consequent upon the Franco-German war and other events, and also to the khedive's increasing wealth and judicious manner of dispensing it in Constantinople. He obtained not only a confirmation of all previous prerogatives (June 9, 1873), but new concessions which give him absolute control over the organization and extension of his army, and the right of making loans and commercial treaties. He is still restricted in the acquisition of ironclads, in the intercourse with foreign powers, and in some other respects, but otherwise is an absolute sovereign; and he is acting as such in extending his authority in various parts of Abyssinia and on all the borders of the Nile. Early in 1874 he achieved an important victory over the sultan of Darfour, and sent in the same year another expedition up the Nile under Capt. Gordon, ostensibly for the suppression of the slave trade. At the same time he is bringing the rude tribes in his outlying dominions under the influence of civilization by drawing military cordons round those ill-defined regions, and by building public roads and promoting agriculture. His successful aggressive policy became however in 1874 a fresh source of uneasiness for the sultan, though he had the latter's sanction for taking military possession of the Suez canal, which compelled M. de Lesseps, with whom differences had arisen, to submit to the decision of the international tonnage commission. Like nearly all rulers of Egypt from time immemorial, the khedive holds the whole land in fee simple, as it were, and his subjects work it on his account and on his own terms. Through his enterprise and activity immense progress has been made in industrial development and the execution of public works of all kinds; and the whole business of the country being under his control, his wealth is incalculable, while the mass of his subjects, and particularly the fellahs or peasantry, remain in a condition of serfdom and pauperism. He has embellished Cairo and Alexandria, and introduced the gay fashionable life of Paris; employs many foreigners in the army, navy, and other branches of service; is a munificent patron of archaeological, geographical, and ethnological research-

es; has established a library in the ministry of education, rich in oriental works; and has enabled Rohlf to explore the Libyan desert. The clear complexion which he has inherited from his Circassian mother gives Ismail rather the appearance of an Englishman than of an oriental. He is of medium stature, inclined to the obesity of his family, with small gray eyes and a shrewd expression of countenance.

ISMID, or **Iskimid** (anc. *Nicomedia*), a town of Turkey in Asia, in the vilayet of Khodavendighiar, at the bottom of the gulf of Ismid, 50 m. S. E. of Scutari; pop. about 8,000. It is beautifully situated, but the interior of the town is wretched, and but few relics remain of Nicomedia. Greek and Armenian prelates and a Turkish pasha reside here, and there is a small community of Armenians converted to Protestantism. The port is accessible to the largest ships. Silk and pottery are manufactured. Tökölyi, the leader of the Hungarian Protestants against Leopold I., died in Ismid, and is buried there. (See *NICOMEDIA*.)

ISNARD, Maximin, a French revolutionist, born in Grasse, Provence, Feb. 16, 1751, died there in 1830. In the legislative assembly in 1791 he gained notoriety for his eloquence and boldness, contributed to the insurrection of Aug. 10, 1792, and was reelected to the convention. He then joined the Girondists, voted for the death of Louis XVI., was instrumental in establishing the committee of public safety, opposed the Montagnards, and was prosecuted. His Herculean strength enabled him to escape the officers who came to arrest him in June, 1793, and he took refuge with a friend. He reappeared in the assembly after the fall of Robespierre, and subsequently became a member of the council of 500, to which he belonged for one year. Thenceforth he devoted himself to literary and philosophical pursuits, and gradually became religious. Among his publications is a lyric poem of some merit, *Dithyrambe sur l'immortalité de l'âme*, dedicated to Pope Pius VII.

ISOCRATES, an Athenian orator, born in 436 B. C., died in 338. His father, Theodorus, was a rich musical instrument maker of Athens, and gave his son the best education attainable in the city. Tisias, Gorgias, Theramenes, and Socrates were his teachers. His natural timidity and weak voice precluded public speaking, and he devoted himself to lecturing on rhetoric. He first taught in the island of Chios; but his success there was not very great, and he was chiefly engaged in regulating the political constitution of the island. He then returned to Athens, where he soon had 100 pupils at a charge of 1,000 drachmæ each. He also derived a considerable revenue from writing orations. Plutarch says that Nicocles, king of Cyprus, gave him 20 talents for his oration *Πρός Νικοκλέα*. He was never willing to take part in public affairs, and, when appointed trierarch in 355, excused himself on account of illness. This refusal, considering

his ample means, occasioned much ill will against him. In 362, from policy, he accepted the office, and although it was the most expensive which a private citizen could undertake, he filled it with great liberality and splendor. Isocrates taught principally political oratory. The most eminent statesmen, orators, philosophers, and historians of the time were educated in his school, and he always selected practical subjects, proposing to them chiefly the political events of his own time as a study. His orations, though written to be delivered in his school, were copied and recited in all the countries inhabited by Greeks. In his *Areopagiticus* he urges Athens to adopt, as her only safeguard, the ancient democracy of Solon. In his *Panegyricus* he is equally warm in his exhortations to all the Greeks to unite against the barbarians. In his "Philip," an oration addressed to the king of Macedon, he entreats the king to unite with the Greeks, and lead them against the Persians. But Isocrates was not a practical statesman, and he was unconsciously urging Philip to become the ruler of the Grecian states, an object which the king was then secretly planning. His *Panathenæicus*, a eulogy on Athens, was written when he was 94 years of age. After the victory of the Macedonians over his countrymen at Chæronea, he was unwilling to survive the destruction of their liberties, and destroyed himself. The writings of Isocrates were all carefully studied and elaborated; he is said to have taken over ten years to write his *Panegyricus*. They are remarkable for their flow of elegance and melody, the precisely turned sentences and periods making the style almost monotonous. Of 28 genuine orations of his, 21 have come down to us, 8 of which were written for judicial cases, and were intended to serve as models for forensic writing. Besides these, there are titles and fragments of 27 others, and also 10 letters, some of which are undoubtedly spurious. His works have been translated into English by Sadlier, Dinsdale, and Gillies, and also into French, but unsuccessfully. The best text is Bekker's.

ISOMERISM (Gr. *ἴσος*, equal, and *μέρος*, part), a term used in chemistry to express the relation existing between those substances which, while they possess the same ultimate composition, exhibit essentially different chemical and physical properties. The term isomeric is often applied indiscriminately to several classes of bodies which will here be separately considered. Strictly speaking, it ought perhaps now to be confined to those cases in which the elements composing the dissimilar substances are both quantitatively and qualitatively the same. Difference of properties can here be readily explained by admitting that the elements of the different bodies are arranged or grouped in different ways. Thus both formiate of ethyle and acetate of methyle—very different substances—have the ultimate composition expressed by the formula $C_2H_4O_2$, sometimes

written $C_6H_{12}O_4$. They are however proximately composed of

That such compounds really contain different proximate constituents is proved by the fact that they afford different products when decomposed under similar conditions. Hence they are regarded as distinct chemical substances, and not as modifications of one and the same body. The different grouping of the elements of these compounds has been compared to that of letters in words like *ate, eat, tea, &c.*, on the arrangement of which the meaning of the word is entirely dependent. All bodies which are thus isomeric with each other, all that have absolutely the same ultimate composition, must of course possess identical equivalent weights. Such substances are often called *metameric* (Gr. *μετά*, indicating change or alteration), in contradistinction to polymeric substances (Gr. *πολύς*, many), which are composed of similar elements united in the same relative proportion in each case, but in different absolute quantities; the equivalent weights in which these substances combine with other bodies being unlike. This distinguishes them from members of the preceding class, in which both the relative and absolute number of equivalents are the same. Very many polymeric substances are known, whole series of organic compounds being formed of them. As an example, olefiant gas and cetene both contain 85·7 per cent. of carbon and 14·3 per cent. of hydrogen. If nothing were known of their chemical compartment, the empirical formula CH_2 would be applicable to both; but by studying their properties it has been found that 2C and 4H have united to form olefiant gas, the rational formula of which is therefore C_2H_4 , and its combining equivalent 28; while 16C and 32H have united to form cetene, which has consequently the rational formula $C_{16}H_{32}$, and the equivalent number 224. Between these two bodies there are 14 others polymeric with them and with each other. Differences like this have been compared to those between words like *ma, mamma, tar, tartar, &c.*, which contain the same letters arranged in the same way, but in different quantities. The arrangement of the elements in polymeric substances is not however of necessity the same; thus, the ether of wood spirit is polymeric with common alcohol; yet the rational formula of the former is CH_4O ; of the latter, C_2H_6O .—Until a comparatively recent period it was the prevalent opinion among chemists that bodies of similar composition must of necessity possess similar properties. Any observations tending to throw doubt upon the correctness of this belief were considered erroneous. Even the discovery, by Wöhler and Liebig, that cyanic and fulminic acids are of like percentage composition although they pos-

sess very different properties, was attributed to errors of observation, and generally discredited. Faraday's investigation of several isomeric hydrocarbons in 1825 first proved the fallacy of this supposed law. Its exceptions, being now more carefully observed, were found to be very numerous. In 1830 Berzelius proposed that they should be classified as isomeric substances. It was however soon perceived that the doctrine of isomerism could not with propriety be employed to explain the cause of all the differences which had been observed; least of all, to explain those which occur among the elements themselves—bodies which, from his inability to decompose them, the chemist is forced to regard as simple. In 1840 Berzelius suggested that these peculiarities might depend upon some absolute difference of quality in the different varieties of a substance, and not upon any dissimilarity in the arrangement or number of its molecules. He proposed the term *allotropism* (Gr. *ἀλλότροπος*, of a different nature) to express this idea, which has ever since steadily gained favor, although directly opposed to the doctrine of the immutability of matter, one of the principal tenets on which the chemistry of the first half of the present century was based. Allotropism is of special interest from the fact that several of the most common and best known elements may occur in two or more allotropic states. Thus, pure charcoal (lamp-black), graphite, and the diamond are essentially identical chemical substances. The element phosphorus, as it commonly occurs, is as soft, waxy, yellowish white, exceedingly inflammable, and very poisonous substance, with a strong odor and taste, luminous in the dark, and readily soluble in bisulphide of carbon. It may easily be transformed, however, into another allotropic state, in which it is of a dark red, nearly black, color; is hard, brittle, and devoid of taste or smell, and, so far as is known, of poisonous properties; is not luminous, and is completely insoluble in bisulphide of carbon. It differs moreover from ordinary phosphorus in specific gravity, and entirely in its affinity for other substances. Indeed, it is not known that it is itself combustible; for it may be heated without undergoing change to about 500° F., at which temperature it is reconverted into ordinary phosphorus. These two conditions of phosphorus are so utterly unlike in all their properties, excepting the weight of their equivalent, that were it not in the power of chemists to prove their identity by converting them one into the other, they would without hesitation be considered distinct elements. Similar instances occur among gases. For example, ordinary oxygen gas may be converted into an allotropic modification called ozone, which possesses properties entirely different from those of the original oxygen. Chlorine gas also, according to Prof. J. W. Draper of New York, after exposure to strong sunlight, possesses the power of combining with hydrogen even in the dark, and exhibits other properties unlike those

of chlorine which has been kept from the light. Several other elements are known to be capable of existing in two or more allotropic states; and a considerable number of compound bodies occur under different modifications, which, it is not unlikely, may yet be found to depend upon the allotropism of one or more of their elements. Indeed, these instances are so common that some chemists have been led to believe that most if not all of the elements may exist in distinct allotropic states. It has not as yet, however, been well ascertained to how great an extent the peculiar state of an element can influence the properties of the compounds it may form by uniting with other bodies. Schönbein, the discoverer of ozone, was confident that it exists, as such, chemically combined in several oxides. Other chemists have referred the dissimilar varieties of certain compounds of phosphorus, arsenic, &c., to the allotropism of their elements. Berzelius long ago pointed out that the different states of sulphide of mercury, iodide of mercury, &c., were probably to be attributed to a similar cause. Berthelot has advanced the opinion that the allotropic modifications of sulphur are intimately connected with, if not directly dependent upon, the electrical relation which this substance bears to the elements with which it is or has been united. When separated, by agents which are without action upon it, from those compounds in which it acts as an electro-positive body, as in sulphurous acid, it is amorphous and insoluble in bisulphide of carbon and other neutral solvents. On the contrary, when obtained from compounds in which it plays the part of an electro-negative element, as in sulphuretted hydrogen, it is susceptible of crystallization, and is soluble in bisulphide of carbon, &c. Berthelot also states that the modifications of selenium exhibit a similar comportment, and has suggested that the different states of phosphorus may in like manner represent respectively electro-negative (ordinary phosphorus) and electro-positive (red phosphorus) conditions. It is worthy of remark that these views, which are of prime importance in their bearing upon the theory of substitutions, are almost identically the same with those concerning chlorine published some years since by Prof. Draper. Although the correctness of the observations of both these chemists has been called in question by other observers, it cannot as yet be admitted that their views have been disproved; they still deserve the most careful consideration. The apparent relation between some of the phenomena of allotropism and those exhibited by substances when in the so-called nascent state (a phrase used in reference to the well established fact that many bodies can be made to combine with other substances with much greater facility at the instant when they escape from some of their combinations than at any other time) has been remarked by several chemists. Intimately connected with this view is the theory

of chemical polarity advanced by Brodie ("Philosophical Transactions," 1850, p. 759), who assumes that under certain conditions, as at the moment when a body enters into combination, a chemical difference exists between the particles of which the body is composed; so that these particles are to one another in a peculiar relation which is expressed by the terms positive and negative (+ and -). Several of the phenomena of allotropism may be explained by this theory. Thus, ozone may be regarded as polarized (active) oxygen, while ordinary oxygen is that in which the positive and negative particles are combined, and in the quiescent state. In like manner ordinary white and red phosphorus represent respectively polarized and indifferent conditions. It is customary to speak of the different allotropic states of a substance as if each were something absolute, and not liable to any variation. But there are numerous facts which go to prove that this is not always the case, and that the peculiar characteristics of the allotropic conditions of several bodies are themselves subject to certain variations. In support of this view may be instanced the great diversity of properties exhibited by different specimens of graphite and the various kinds of coke allied to it, or by the different sorts of sulphur.—In addition to the several classes of phenomena already alluded to, the peculiarities of which are strongly marked, there is another class of analogous facts which deserves mention. Many well known substances exhibit differences in hardness, color, specific gravity, solubility, &c., according to the circumstances in which they have been produced. Thus, carbonate of lime, when precipitated from a cold solution of a salt of lime, is readily soluble in an aqueous solution of chloride of ammonium; on the other hand, when in the form of marble it is scarcely at all soluble in this menstruum. Red oxide of mercury, which has been prepared by precipitation in the wet way, is decomposed with much greater facility when heated than that obtained by exposing nitrate of mercury to a high temperature. These differences, though subject to considerable variations, are rarely strongly marked. Since they do not affect to any great extent the chemical behavior of the substance, they are not classed as allotropic conditions, but are supposed to depend upon different states of aggregation of the substance. Some of these variations are probably more intimately connected with allotropism than has heretofore been admitted; thus, the dissimilar properties exhibited by different specimens of silicic acid would now be attributed by most chemists to the known allotropism of its components. But most differences of this sort are so slight that they cannot be regarded as being dependent upon allotropism; they seem rather to be allied to those variations to which, as already stated, even the allotropic conditions of substances are themselves liable. It would appear indeed as if every substance, in each of

its allotropic conditions, must have a point of maximum activity, at which point its properties are normal, subject however, like everything else in nature, to perturbations by which its peculiar properties may be somewhat changed. In compound bodies it is not always easy to distinguish between allotropism and isomerism properly so called; indeed, both may occur at once, *i. e.*, both the arrangement and quality of the elements of two or more substances of the same ultimate composition may be unlike. There is also a large class of bodies to which the general term isomeric is still applied, some of which may be allotropic, while many are probably polymeric. As examples may be mentioned the numerous metallic oxides which undergo changes when heated. The very remarkable circumstance noticed in this connection, that these bodies while undergoing change give off a quantity of heat which they must have previously possessed in a combined or latent form, has led some chemists to seek for an explanation of all the phenomena of allotropism by assuming that heat is a material constituent of substances, capable of modifying their properties according as it is combined with them in greater or less quantity. This is however entirely matter of conjecture, and, in view of our limited knowledge respecting the true nature of heat, can hardly be admitted. Nor has the direct influence of heat been proved in all the cases of allotropism which have been studied. That it is nevertheless intimately connected in some way with these phenomena is evident. This is of special interest in view of the changes which heat is known to effect in the ordinary conditions of matter; the solid, liquid, and gaseous forms, which all substances are supposed to be capable of assuming, being unquestionably dependent upon the temperature to which they are exposed. These conditions must not however become confounded with those dependent on allotropism, which are essentially different. Other chemists have regarded allotropic modifications as dependent upon different states of aggregation of the hypothetical atoms of which, as they suppose, all bodies are formed. In their eyes, the chemical peculiarities of charcoal depend upon its amorphous state; those of the diamond are different because it is crystalline, and those of graphite unlike those of the diamond because its crystals belong to another system. They would call the ordinary state of phosphorus crystalline, the other condition amorphous, and refer all difference of properties to this difference of form. Diversity of crystalline structure, or its entire absence, is however evidently only one of the many differences of properties incidental to allotropism; in many cases it must be regarded as a consequence of the latter, by no means as its cause. At all events, the cases of allotropism which occur among gases cannot be explained by this theory. Others, without paying special attention to crystalline form, have supposed that all cases of isomerism, taken

in its widest meaning, depend upon variations in the grouping of the molecules of bodies. They even refer the instances which have here been classed under allotropism to differences in the arrangement of the particles of matter of which the elements themselves are composed. But few, however, now hold this opinion, the doctrine of allotropism being generally admitted. Although the mere term allotropism conveys no definite idea of the different conditions of matter which it indicates, and is, strictly speaking, nothing more than a convenient name for a class of phenomena as yet inexplicable, the fact which it denotes, that an element can exhibit the properties of two different substances, is of preëminent importance. Important contributions to our knowledge of isomerism have been made in modern times by Butlerow, Kekulé, Erlenmeyer, and Gibbs. (See ALLOTROPISM.)

ISOMETRIC PROJECTION (Gr. *ἴσος*, equal, and *μέτρον*, measure), a species of drawing, used chiefly by engineers, in which the perspective plane of the paper must be imagined as making equal angles with the three principal dimensions of the figure, and the eye at an infinite distance. Thus lines in the three principal directions will be drawn on the same scale, and that scale the same for all parts of each line.

ISOMORPHISM (Gr. *ἴσος*, equal, and *μορφή*, form), in chemistry, the property possessed by certain bodies of replacing each other in compounds without causing in these an essential change of crystalline form. The bodies that thus replace each other possess themselves similar forms, and are said to be isomorphous. Familiar examples of this mutual replacement in minerals are of the protoxides of iron and manganese, and of lime and magnesia. Chlorine, bromine, and iodine possess this relation toward each other; also arsenic and phosphorus, and the acids of these elements. The term, as proposed by Mitscherlich, strictly signifies similarity of form; it is now applied to substances which are not only similar in their crystalline form, but are analogous in their chemical composition. The study of isomorphism has greatly facilitated the classification of compounds and the determination of atomic weights.

ISOPODS, a group of 14-footed crustaceans, so called because their thoracic feet, the three anterior in one series and the four posterior in another, are nearly equal; the branchiæ are six pairs and abdominal. Some inhabit the sea, where they are generally parasitic on other animals; others are terrestrial, living in dark and damp places, like the wood lice and sow bug. The eyes are sessile or not placed upon stalks, and the head is distinct from the segment bearing the first pair of feet.

ISOTHERMAL LINES. See CLIMATE.

ISPAHAN, or *Isfahan* (anc. *Aspadana*), a city of Persia, of which it was formerly the capital, in the province of Irak-Ajemi, 210 m. S. of Teheran, in lat. 32° 39' N., lon. 51° 44' E.; pop. probably not more than 60,000. It stands in

the midst of a broad plain watered by the river Zeinderud, which rises in the hill districts W. of the city, and flows eastward, finally disappearing in the desert. For miles around the city stretch groves, orchards, corn fields, vineyards, and shady avenues, interspersed with the ruins of deserted towns and palaces. On approaching the city from the south, travellers cross the river by three beautiful and massive bridges, which lead into spacious gardens watered by canals, and surrounded by numerous pleasure houses. A broad shaded avenue leads from one of these bridges to the great bazaar of Shah Abbas, an enormous length of building vaulted above to exclude heat but admit air and light. Hundreds of unoccupied shops line the sides of this once crowded mart of commerce, after traversing which for nearly two miles the traveller enters the great square of Ispahan, the magnificent Maidan Shah, an oblong open space of upward of 40 acres. In

paintings by native artists, representing the achievements of Nadir Shah and other Persian conquerors. The college of Hussein, a brilliantly colored tile-covered structure, the shah's mosque, and the three-storied Ali gate, which is the highest edifice in the city, are among the finest buildings. Ispahan was formerly distinguished for the excellence of its manufactures, which consisted of all kinds of woven fabrics, from the most costly gold brocade to the most ordinary calico or coarse cotton; of gold and silver trinkets, paper, pen cases, ornamental book covers, firearms, swords, glass, and earthenware. These goods were sent to nearly all parts of Asia, Ispahan being a central emporium on the great line of traffic between Afghanistan, India, and China on the east, and Turkey, Egypt, and the Mediterranean on the west. The trade of the city, however, has greatly diminished, and its manufactures are now comparatively inconsiderable. The wine

of Ispahan is thought not much inferior to that of Shiraz. The inhabitants are generally educated, so that almost every one can read and write, and even the shopkeepers and artisans are familiar with the works of the principal Persian poets. The merchants, who form a distinct class, are shrewd and enterprising. — On the S. side of the Zeinderud, which at Ispahan is said to resemble the Seine at Paris in magnitude, is the Armenian suburb of Julfa. This place was founded about 1603 by Shah

Court of the Grand Mosque, Ispahan.

the centre of two sides of this square are superb mosques, and in the centre of the other sides are great gates leading to the bazaars and to the royal mosque. Around the rest of the square are stately edifices of uniform architecture, once used as apartments for the nobility and officers of the Persian court, but now ruinous and desolate. In the S. part of the city is an extensive pleasure ground, called the Tchahar Bagh, consisting of eight gardens or "paradises," watered by canals, basins, and fountains, adorned with palaces, and enclosed by lofty walls. The most sumptuous of these palaces is the Tchehel Situn, or "Forty Columns." The columns from which the name is derived are in the principal hall, and are inlaid with mirrors so as to resemble pillars of glass. The walls and roof are decorated with the same fragile material, interspersed with flowers of gold. Behind this hall are many fine apartments, one of which is embellished with large

ed to it all the inhabitants of the Armenian town of Julfa on the Araxes, and gave them full toleration for their religion, and valuable privileges as merchants. This colony prospered for more than a century, and once contained 30,000 people and 24 churches. It has now greatly decayed, and has not more than 3,000 inhabitants, and the Armenians are forbidden any of the outward observances of their faith.—Ispahan is mentioned by historians as early as the 3d century. By the caliphs of Bagdad it was made the capital of their Persian provinces. Tamerlane captured it in 1387, massacred 70,000 of the inhabitants, and nearly ruined the city. It recovered at the beginning of the 17th century, and was the favorite abode of the monarchs of the Sufi dynasty. It was visited in 1673 by the French traveller Chardin, who resided there four years, and who describes it as a great city 24 m. in circuit, with 160 mosques, 48 colleges, 1,800 caravansaries,

273 public baths, and a population of 600,000. Other authors state the population at upward of 1,000,000. There are said to have been 1,400 villages in the vicinity of the city at the height of its prosperity. But in 1722 it was taken by the Afghans after a siege of eight months, and its buildings were defaced and people massacred in frightful numbers. This catastrophe nearly destroyed the city. The seat of government was removed first to Shiraz, and afterward to Teheran. Although the traveller rides for miles through deserted streets, ruined buildings, and silent squares, Ispahan is still the most stately and beautiful city of Persia; but the traces of its original splendor are fast disappearing.

ISRAEL. See JACOB.

ISRAELITES. See HEBREWS.

ISRAELS, Josef, a Dutch painter, born in Groningen in 1824. He studied in Amsterdam and Paris, and resides at the Hague. His best known works are "The Tranquil House," in a private collection in Brussels; "The Shipwrecked," "The Cradle," and "The Mother," all in London; "The True Support," in possession of the count of Flanders, brother of Leopold II.; and "The Children of the Sea," in the gallery of the queen of Holland. One of his genre pictures brought 7,150 florins at the public sale of Baron van Reede van Oudtshorn's collection at Amsterdam in 1874.

ISSAQUENA, a W. county of Mississippi, bounded W. by the Mississippi river and S. E. by the Yazoo, which is navigable by steamboats; area, 720 sq. m.; pop. in 1870, 6,887, of whom 6,146 were colored. It is drained by Big Sunflower river, Deer creek, and Steel's bayou, and has a low and level surface, portions of which are often inundated. The soil is rich. The chief productions in 1870 were 82,825 bushels of Indian corn, 5,105 of sweet potatoes, and 15,821 bales of cotton. There were 562 horses, 931 mules and asses, 619 milch cows, 1,559 other cattle, and 1,675 swine. Capital, Tallulah.

ISSOIRE, a town of Auvergne, France, in the department of Puy de-Dôme, at the confluence of the Crouze and the Allier, 81 m. W. S. W. of Lyons; pop. in 1866, 6,294. It has a fine church of the 11th century, a college, copper works, and an active trade.

ISSOUDUN, a town of Berry, France, in the department of Indre, on the river Théols and on the railway from Orleans to Limoges, 22 m. S. W. of Bourges; pop. in 1866, 14,261. It contains the ruins of a castle built in the 12th century, and has four churches, a theatre, manufactories of cloth and faience, and an important trade in corn and wine.

ISSUE. I. In law, used in deeds and wills to signify descendants. When employed in a deed, the term has a definite meaning. It is always construed to be a word of purchase, designating persons in being, and vesting in each of them an original interest. It cannot be a word of limitation, for that would confer on issue, whether in being or not, derivative interests

devolved upon them through descent from the original taker; and such estates of inheritance can be created in deeds only by the word heirs. We have used the word purchase in its technical sense. In law, all estates are acquired either by purchase or by descent; and it therefore follows that all estates not acquired by descent or by inheritance are acquired by purchase.—The construction of the word issue in wills has involved much uncertainty and difficulty; for it is a term of the most extensive import. It may embrace all descendants to the remotest degree, or may be limited to immediate descendants, or confined to some particular class of descendants living at a given time. Of the rules of construction established by the discussion of this perhaps most vexed question in the whole range of legal learning, it must suffice to state only the most general. In a will, issue may be regarded as a word either of limitation or of purchase. If real estate be devised either directly to, or by way of executed trust for, a "person and his issue," the word is here taken to be one of limitation; and it confers on the devisee an estate tail. Yet if it clearly appear from any expressions in the will that the testator did not intend to give such an estate, or that by issue he meant children, or any particular class of descendants, then the word will be construed as a word of purchase; and it will then comprise all who can claim as descendants from him to whose issue the bequest is made.—The different phrases which express default of issue have been the subjects of frequent and very nice construction. The failure of issue may be what is called a definite failure, when the will fixes a definite time for such failure, as if the devisee die "without issue living at the time of his death;" or it may be indefinite, when no period is fixed, but the contingency continues so long as the devisee has any descendants. A limitation over after a definite failure of issue is good; but not upon an indefinite failure, for the contingency is too remote. In the case therefore of a devise to A in fee, with remainder to another upon A's death without issue, the limitation over is void, and A's estate in fee is reduced to an estate tail. This is the general rule of the common law, though in the United States the courts seek to evade its authority, and often avail themselves of slight circumstances to support the executory devise. They have done so when the limitation was to the brother of A if the latter died without children; or to "survivors" when either of several devisees should die "without issue alive," or "without lawful issue." In many of the states much of the difficulty is obviated by express statutory enactments. The American cases generally follow the English common law rule in regard to limitations over upon the bequest of chattels; and, by confining the expression "without issue" to issue living at the death of the first taker, support executory devises. **II.** In pleading, the point or matter in contest between the parties to a

suit. When in the course of their alternate pleadings the parties have reached a specific matter which one of them affirms but the other denies, they are said to be at issue, or, in the ancient language of the law, *ad exitum*, or at the end of their pleadings. An issue may be either of law or of fact. When a defendant demurs to the plaintiff's allegation, that is, denies its sufficiency as matter of law to support the plaintiff's action, he is said to tender an issue in law, and the other party is compelled to accept it. But if the defendant traverse the plaintiff's fact and propose to refer the matter disputed to some mode of trial, he tenders an issue of fact. The plaintiff may demur to the traverse or may join issue; indeed, he must do so when the issue is well tendered. An issue of fact is properly framed upon a direct negation or denial of an averment. As the object is to reach the precise and essential subject for decision, the pleadings should develop some matter either of law or fact which, when decided, shall dispose of the whole controversy. They must therefore be directed not merely to the production of an issue, but to the production of one which is material. For issue joined upon an immaterial point, that is, a point not decisive of the right of the case, is fatally defective, and judgment upon any verdict found will be arrested by the court. Further, as in respect to any single subject of suit the decision of one material point may decide the action, it has become a rule that the pleadings shall tend not only to materiality, but also to singleness in the issue; in other words, no plea may allege several distinct matters, when any one of these would singly support the action. Finally, this single material issue must be so particular in its character as to point out distinctly the nature of the matter in controversy. Upon the declaration the parties may join general or special issue; issues joined on later pleadings in the suit are called simply issues without other description. The general issue denies all the material allegations in the declaration, or rather it enables the defendant to demand proof of all of them. A special issue, properly speaking, is the denial of one of several substantive facts which are essential to the right of action. A traverse of one essential point is plainly as complete a denial of the plaintiff's right of recovery, as the traverse of his whole declaration by a general issue could be. The legislation both in England and the United States has for some time been in the direction of requiring the specific fact in controversy to be put plainly in issue by the pleadings.—Feigned issues are sometimes framed in chancery for the purpose of submitting disputed questions of fact to the ordinary modes of trial at law. Thus, if it be contested whether A is the heir of B, the fact will be sent to be tried in a law court upon a fictitious suit. For example, one party may declare that he wagered with another that B was the heir of A; he then avers that he is so, and demands the wager. The defendant ad-

mits the wager, but avers in reply that B is not the heir of A. Upon these allegations issue is joined, and the fact is decided in the usual modes. Feigned issues may also be employed by suitors in courts of law for determining a single point expeditiously.

ISSUS, an ancient town of Cilicia, in Asia Minor, at the head of the gulf of Issus, celebrated for the battle fought near it in 333 B. C., in which Alexander the Great defeated Darius. Its exact site is uncertain. The battle also between the army of Septimius Severus and Niger (A. D. 194) was fought near Issus.

ISTAPA, or **Istapam**, a port on the Pacific coast of Guatemala, in Central America, in lat. 13° 53' N., lon. 90° 43' W., at the mouth of the river Michatoyat. Alvarado here built the vessels in which he sailed against Pizarro and Almagro in Peru, in 1533. It remained the only port of Guatemala on that side of the continent till 1853, when it was abandoned for a point called San José, 12 m. N., which was supposed to have fewer disadvantages. Both Istapa and San José, however, are entirely open to the sea, and vessels are unable to approach nearer than 1½ m. from the shore, where they are obliged to anchor on a bottom of shifting sands, prepared to stand out to sea at a moment's warning.

ISTER. See DANUBE.

ISTHMIAN GAMES, one of the four great national festivals of Greece, celebrated on the isthmus of Corinth in April or May of every alternate year, in the second and fourth years of each Olympiad. The story of their origin is as follows: Athamas, king of Orchomenus, had by his second wife Ino a son named Melicertes, whom together with his mother he pursued in a fit of madness. In order to escape from him they jumped into the sea. Ino was changed into a sea goddess, and the body of Melicertes was washed ashore and buried by his uncle Sisyphus, who was directed by the nereids to pay him heroic honors under the name of Palæmon. Sisyphus accordingly established the Isthmian games in honor of Neptune and Palæmon. The games, however, fell into disuse, and were for a time entirely interrupted, till Theseus organized them anew in honor of Neptune. In the 6th century B. C. they became Pan-Hellenic festivals. Until the overthrow of Corinth by Mummius (146 B. C.), the games were conducted by the Corinthians, though the Athenians held the places of honor, the *προεδρία* or front seats. The privilege was then given to the people of Sicyon. After the rebuilding of Corinth by Cæsar, they were again managed by that city, but the people of Sicyon had the exclusive right to sit as judges. They continued regularly till Christianity began to spread, when they fell into decay, but were still celebrated under Constantine and Julian. The Isthmian games, like the Olympic, consisted of all kinds of athletic sports, wrestling, boxing, gymnastics of every sort, racing on foot and in chariots, and also con-

tests in music and poetry. The Romans added to them gladiatorial shows and fights of wild beasts, which were continued to the time of the final decay of the festival. The prize was a simple garland of pine leaves. Solon, in his legislation, ordered the sum of 100 drachmæ to be paid to any one who took a prize at the Isthmian games, and 500 to any one taking an Olympic prize.

ISTRIA (anc. *Histria*), a peninsula and margraviate of Austria, on the N. E. coast of the Adriatic; area, including the Quarnero islands, 1,907 sq. m.; pop. about 255,000. It now forms, conjointly with the circle of Görz and the city of Trieste, the Littoral province, but has its own diet. Nearly all the inhabitants are Roman Catholics. It is in general mountainous, particularly toward the north, where the surface is occupied by offsets of the Julian Alps. The highest elevation is Monte Maggiore, about 4,500 ft. The coasts are irregular and indented by numerous good harbors. The soil is not remarkably fertile, but excellent olives, and grain, wine, lemons, and silk, are produced. Sheep and cattle are extensively reared in the mountainous districts, and the coast fisheries and salt works employ a considerable number of the inhabitants. The chief towns are Capo d'Istria, Pirano, Isola, Rovigno, Pola, Dignano, and Pisino. The people of the towns are mostly Italians, and those of the rural districts of Slavic origin.—In remote antiquity the Istrians were an Illyrian tribe, and were engaged in piratical enterprises, but prior to the second Punic war were reduced to submission by Roman consuls. They were again reduced by the consul Claudius Marcellus (183 B. C.) and the consul C. Claudius Pulcher (177 B. C.), and did not again revolt. Under Augustus Istria was incorporated with upper Italy. The most flourishing period of its ancient history was while the Roman government was fixed at Ravenna. It formed a separate margraviate in the 10th century, and was subject successively to the dukes of Carinthia and of Dalmatia. The Italian part of Istria was held by the Venetians from the 13th century till 1797, the eastern part being incorporated with Carinthia and subject to the house of Austria. Both portions were ceded to Napoleon I., and reconquered by Austria in 1813.

ISTURIZ, Francisco Xavier de, a Spanish statesman, born in Cadiz in 1790, died in April, 1871. After the fall of Joseph Bonaparte and the restoration of Ferdinand VII., those in Cadiz who were discontented with the rule of the latter were accustomed to meet in the house of the brothers Isturiz, which was known as the *casa Otomana*. This was the headquarters of the movement led by Riego (Jan. 1, 1820), "which made an anarchy of three years succeed a despotism of six." Xavier de Isturiz went to Madrid, where he aided in establishing liberal clubs; and having thereby placed himself in opposition to Arguelles and Martinez de la Rosa, who represented the moderate con-

stitutionalists, he excited public opinion against them, especially after his election to the cortes in 1822. In 1823, while president of this body, he voted for the suspension of the royal power. Condemned to death after the restoration, he fled to London, where he was a partner in the mercantile house of Zulueta. Pardoned by the amnesty of the queen regent Maria Christina in 1834, he returned to Spain, where he at once engaged in democratic agitation and provoked the rising of the national guard, whose object was the overthrow of the minister Toreno, but which was suppressed by Quesada. Shortly afterward his friend Mendizabal became prime minister, and made Isturiz his most intimate adviser. In November, 1835, he was appointed president of the chamber of *procuradores*, a sort of state council. The chamber proved too liberal, which caused a quarrel and a duel between Isturiz and Mendizabal. After the fall of the latter in 1836, Isturiz was appointed minister of foreign affairs and president of the council, but soon grew unpopular with all parties. The tumults of August, 1836, which resulted in the proclamation of the constitution of 1812, compelled him to take refuge a second time in England, whence he went to France. Having returned to Spain in 1838, he was elected to the cortes, and was its president in 1839. He negotiated the marriages of the young queen and her sister. In 1848 and again in 1850 he was sent as minister to England, and in 1856 to Russia. On Jan. 5, 1858, he became president of the Spanish senate, and 10 days after minister of foreign affairs and president of the council, but was soon superseded. The same year he was again sent as minister to England. He signed, in conjunction with M. de Flahault and Earl Russell, the convention of Oct. 31, 1861, relative to Mexico. From March, 1863, to October, 1864, he was minister to France.

ITACOLUMITE (from Itacoluni, a mountain of Brazil), a granular silicious rock, of laminated structure, found with talcose slates and more or less intermixed with talc or with mica. It is distinguished by its peculiar flexibility, sheets of it bending back and forth as if jointed within. It is of particular interest from its occurrence at the localities in the gold regions where diamonds are found. It is met with in Brazil, the Ural mountains, and in Georgia and North and South Carolina. In the last named state Mr. Oscar Lieber has observed the passage of the itacolumite into a true sandstone or a conglomerate, proving its sedimentary origin.

ITALIC RACES AND LANGUAGES. In one sense all the various races that occupied the Italian peninsula in ancient times belong to the Italic group; in a more exact classification, only those races and languages are comprised in this division whose characteristics show that they form a distinct branch of the Aryan or Indo-European family. In the former sense we find that Liguria in upper Italy was inhabited by an ancient people called the Ligures

or Ligurians, of whose origin nothing authentic has been recorded, and of whose language no monuments are extant. Several modern writers have maintained the Celtic origin or affinity of the Ligurians, while others have denied that they have any connection with the Indo-Europeans. The Gauls of upper Italy, according to the authorities followed by Livy, immigrated in the reign of Tarquinius Priscus, and they are classed as Celts. The inhabitants of Venetia, the Veneti in the west, and the Carni in the east, are spoken of by Polybius as a different people from the Gauls their neighbors, and as using a different language. Herodotus represents the Veneti as an Illyrian tribe, but it seems that the name Illyrian was given indiscriminately to all the mountaineers of the N. and E. coasts of the Adriatic. Modern scholars are inclined to consider the Veneti as related to the Illyrians or the ancestors of the present Albanians. There is good reason for referring their neighbors the Istrians to the same stock; but the Carni were more probably Celtic. The Euganei, whom Livy describes as once great and powerful, and occupying the whole tract between the Alps and the sea, were of little importance in historical times, and there are no data from which to deduce their ethnological relation. The affinity of the Etruscans also has not yet been established, and they have been variously classed as Semites, Indo-Europeans, and Mongolians; but it is probable that their origin will some day be determined, as we are in possession of a sufficient number of monuments of their language to lead finally to their interpretation, while the linguistic material of the other nations consists only in proper names and a few words scattered through the writings of the Greeks and Romans. The Japygians of the S. E. portion of Italy seem to have been composed of several tribes or nations, among which were the Messapians, Salentines, and Peucetians. Niebuhr considers the name as etymologically connected with the Latin *Apulus*. The Apulians properly so called were probably a branch of the great Oscan or Ausonian, and not of the Sabellian race. The Daunians, neighbors of the Peucetians, were from their first appearance in history completely blended with the Apulians. The Peucetians, however, retained a separate nationality to a comparatively late period. On the Calabrian peninsula were the Messapians or Calabrians proper and the Salentines. Both races are represented in ancient tradition as Cretans, and it seems that they were closely related to the Hellenic races, as they adopted with great facility the manners and arts of Greek settlers. Modern authorities consider the Calabrians and Messapians as of the same tribe. Traces still remaining of the Messapian dialect have confirmed the opinion of their Pelasgic or Hellenic origin, as their language appears to have differed from Greek to no greater degree than the Macedonian and other dialects. Many of the oldest tribes of Italy

are described by ancient writers as belonging to the Pelasgic race. (See PELASGIANS.) A large portion of central Italy was occupied from an early period by a people whom the Greeks called Opicans and the Latins Oscans, and whom many identify with the Ausonians of the Greeks and the Auruncans of the Romans. The Volsci and their neighbors the Æqui also were probably of Oscan race. It is believed that the Latini or inhabitants of Latium were composed of two distinct races, the one more closely related to the Greek or Pelasgic stock, the other to the Italic race proper; but when the Latin people first appeared in history, these two elements were certainly blended into one, and they and their language are always regarded by Roman writers as an organic whole. The oldest form of the Latin bore a close resemblance to the extant monuments of the Oscan language. It is difficult to determine the precise relation which the primitive Oscans bore to the Sabines or Sabellians, but there are strong reasons for supposing that both nations were members of the same family or race. It seems certain that the immigration of the Sabellians cannot be carried back to a very remote age. When first mentioned they had not been long established in central Italy, and their extension further south took place soon after the establishment of Greek colonies in the south of the peninsula. The original territory of the Sabines was the central Apennines, whence they descended and pressed upon an Oscan race whom they expelled from the valleys about Reate. The Sabines gradually extended as far as the region still known as La Sabina, and separate colonies of Sabines established themselves to the east and west of their early abode. The most celebrated of these were the Samnites and the Piceni or Picentes. The Sabine descent of the Peligni is clearly attested, and the close connection of these with the Marsi, Marucini, and Vestini renders it probable that these four nations were of the same ethnic origin. The Frentani, Hirpini, and Lucanians are also usually described as separate Samnite colonies, and the Bruttians seem to have been a mixed population, made up of Lucanian conquerors and Enotrian serfs. But though the Sabellian race reached thus from the neighborhood of Ancona to the southern extremity of Bruttium, it appears to have been a race of conquering warriors who rapidly blended with the Oscan population whom they subdued. The most ancient people of Italy, on the unanimous testimony of ancient authors, were the Umbrians, who at a very early period were a great and powerful nation in the northern half of central Italy. According to Xenodotus of Troezen, the Sabines themselves were a branch of the Umbrians. Philological research has clearly established that the Umbrian language was quite distinct from the Etruscan, and closely related to the Oscan as spoken by the Sabellian tribes, and also to the old Latin. This

seems to warrant the now generally received opinion that the Umbrians, Oscans, and Latins, or at least the most important element of them, as well as the Sabines and their descendants, were branches of one race, or form a distinct and independent group of races belonging to the Aryan or Indo-European family.—LANGUAGES. The Italic group of languages is divided into two distinct classes, the Umbro-Samnite or Umbro-Oscan and the Latin. Oscan and Umbrian bear about the same relation to Latin as the Ionic bears to the Doric dialect in Greek, and the differences between Oscan and Umbrian are no greater than those between Sicilian and Spartan Doric. The most ancient if not the only extant Umbrian record of importance is the celebrated Iguvine or Eugubian inscription on seven bronze plates found in 1444 at Gubbio, the ancient Iguvium in Umbria. It is now in the town hall of Gubbio. The Oscan, Samnite, or Sabellian language is preserved only in a few inscriptions. The *Cippus Abellanus*, which dates from shortly after the second Punic war, contains a treaty of alliance between the citizens of Abella and the neighboring town of Nola, where it is now preserved. The *Tabula Bantina* is a bronze tablet found in 1790 at Oppido, 8 m. from Banzi, an ancient town of Apulia. This tablet furnished the starting point for the study of these languages, as it contains an inscription in both Latin and Oscan. Another bronze tablet was recently discovered at Agnone, in northern Samnium, which contains a dedication of various sacred offerings. The Oscan language prevailed extensively in Campania, and numerous inscriptions have come to light at Herculaneum and Pompeii, several of which have been copied and translated, and all of them are published from time to time in the official reports of the progress of the excavations. The language of the Latins was spoken before the emigration of the Samnites by the Ausonians in Campania, by the Itali proper in Lucania and Bruttium, and probably also by the Sicilians in the eastern portion of Sicily. In Latium proper it was developed, through the influence of the Etruscans and Umbro-Samnites, into the Latin language, which became the prevailing speech of Italy and was finally known as the Roman language (*lingua Romana*), and gave rise to the modern dialects now described as the Romance languages. (See LATIN LANGUAGE AND LITERATURE, and ROMANCE LANGUAGES.)—For the Umbrian language, see Grotefend, *Rudimenta Linguae Umbricae* (Hanover, 1835-'9); Aufrecht and Kirchhoff, *Die umbrischen Sprachdenkmäler erläutert* (Berlin, 1849-'51); and Huschke, *Die iguvischen Tafeln*, containing a grammar and glossary (Leipzig, 1859). For the Oscan language, see Grotefend, *Rudimenta Linguae Oscanæ* (Hanover, 1839); Mommsen, *Oskische Studien* (Berlin, 1845); Kirchhoff, *Das Stadtrecht von Bantia* (Berlin, 1853); Huschke, *Die oskischen und sabellischen Sprachdenkmäler* (Elberfeld, 1856), which contains also a

grammar and glossary of the language. For comparative purposes, see Mommsen, *Die unternitalischen Dialekte* (Leipzig, 1850); Corssen, *De Volscorum Lingua* (Naumburg, 1858), and several articles in Kuhn's *Zeitschrift für vergleichende Sprachwissenschaft*; and *Corpus Inscriptionum Latinarum Consilio et Auctoritate Academiae Litterarum Regiæ Borussicæ editum* (Berlin, 1869 *et seq.*).

ITALY, a kingdom of southern Europe, comprising the Italian peninsula and the islands of Sardinia and Sicily, between lat. 36° 38' and 46° 40' N., and lon. 6° 30' and 18° 33' E. The island of Corsica and the district of Nice (which encloses the independent principality of Monaco) belong geographically to Italy, but politically to France; the republic of San Marino is also included in Italy geographically, but is an independent state. The origin of the name Italy is differently explained by ancient writers. According to Timæus and Varro, it is derived from *italós*, calf or ox, meaning a country in which cattle abound; while Thucydides and Dionysius of Halicarnassus assume the existence of a mythical king named Italus, to whom the country owes its name. The kingdom is bounded N. W. by France, N. by Switzerland and Austria, N. E. by Austria, E. by the Adriatic and the Ionian sea, and S. and W. by the Mediterranean. The total area of the kingdom was officially estimated in the work *Italia Economica* (Rome, 1873) at 114,409 sq. m., while other official publications of the Italian government give 114,850 and 114,372 sq. m.; the population, according to the first complete census, taken Dec. 31, 1871, amounted to 26,801,154. Italy has been until recently merely a geographical and ethnographical division of Europe, but not a political unit. During the middle ages it was divided into independent commonwealths, republican and monarchical, which were constantly changing in name, number, and extent. The treaty of Vienna (1815) divided the Italian territory into the kingdoms of Sardinia and the Two Sicilies, the States of the Church, the grand duchy of Tuscany, the duchies of Parma, Lucca, and Modena, the Lombardo-Venetian kingdom (which was united with Austria), the republic of San Marino, and the principality of Monaco. Lucca ceased to be an independent state in 1847; the king of Sardinia in 1859 and 1860 annexed Lombardy, Parma, Modena, Tuscany, a part of the Papal States, and the Two Sicilies, and in February, 1861, assumed the title king of Italy. In 1866 Venetia was incorporated with Italy, and in 1870 the remainder of the Papal States. The kingdom is at present (1874) divided into 69 provinces, which are again subdivided into districts (*circondarij*) and communes. The names of the principal old divisions are still in common use, though they have no longer any political significance. The following table exhibits the area, number of districts, number of communes, and population of the provinces and large historic divisions, ancient and modern:

—The length of the coast line of Italy, exclusive of the islands (for the description of which the reader is referred to the respective articles), is upward of 2,000 m. The western portion of the coast of the gulf of Genoa is called Riviera di Ponente, shore of the setting sun; it is lofty and precipitous, and extends from the mouth of the Roja at Ventimiglia to Genoa. From Genoa to Spezia is the Riviera di Levante, shore of the rising sun, offering less of alpine characteristics, but still bold and mountainous. From the mouth of the Arno to that of the Tiber, the coast in Tuscany is occasionally bold, but for the most part low and swampy, with several bays toward the south. In the former Papal States it is almost everywhere low and marshy, scarcely raised above the sea level in the neighborhood of Ostia, and S. of the Tiber presents the same dull level aspect, broken only by the headland and large projecting moles of Porto d'Anzio. The Neapolitan coast along the Tyrrhenian sea is for the most part bold and rocky, and scooped out into broad and deep bays, whose shores are dotted with historic cities and towns. The part washed by the Ionian sea, from the straits of Messina to Cape Rizzuto, is faced by steep rocks backed by alpine heights. Beyond Taranto, and almost through-

out the whole peninsula of Otranto, the shore is low and sandy; and at the bottom of the gulf of Taranto lies the only marshy district along the coast of the Ionian sea. From Cape Santa Maria di Leuca the shore is only broken by the spur on which stand Mts. Gargano and Sant' Angelo, and the gulfs of Manfredonia and Venice. From the river Tronto the shore is flat and sandy as far as Ancona, between the promontories of Monte Ciriaca and Monte Conero. Thence northward to Rimini the coast rises gradually, to subside rapidly beyond that city into a series of sandy islands, lagoons, and pestilential marshes, extending almost to the mouth of the Isonzo. The principal harbors along this vast line of coast are: on the west, Genoa, Spezia, Leghorn, Civit  Vecchia, Ga ta, Naples, and Reggio; on the south, Taranto; on the east, Brindisi, Bari, Ancona, Rimini, Chioggia, and Venice. The most important islands along the coast are Elba, Ischia, and Capri on the west.—The surface of the peninsula is divided by its mountain ranges into a wonderful diversity of sublime alpine scenery, upland valleys, broad plains, pestilential lowland and marsh, and numerous lakes surrounded by every charm of nature. Between the steep northern wall of the Alps and the ridges of the Apennines, to the west and south, stretches the great Lombard plain, the most fertile region in Europe, watered by the Po and the Adige, the two largest rivers of Italy. From Bologna and Imola, on the S. extremity of this plain, to the straits of Messina, the remainder of the peninsula is divided by the Apennines into a broad mountainous belt, marked by lofty peaks clad with forests to their summits, by numberless valleys between the parallel ranges or their interlocking spurs, and by rolling uplands and plains available for all the purposes of husbandry. Between the central ridges and the seashore lie wide bands of marshy and pestilential country, and several plains which, though far inferior in extent and fertility to that of Lombardy, possess considerable importance. These are, on the W. side, Campagna di Roma with the Pontine Marshes, and the Campagna Felice near Naples; on the E. side, the Apulian plain, anciently one of the chief seats of Grecian civilization, now almost a desert and thinly populated (the plain of Basilicata), extending in the south along the shore of the Ionian sea, on which formerly flourished the Greek cities of Sybaris and Heraclea.—The great mountain systems are the Alps and the Apennines, including the Sub-Apennine ranges. The former begin on the axis of the Ligurian chain, not far from the source of the Bormida, and sweep round in an irregular semi-elliptic curve along the frontiers of France, Switzerland, and Austria, to the western declivities of the Carnic Alps. The latter from Monte Apio in the Maritime Alps stretch N. E. and E. around the gulf of Genoa, and from Monte Cimone on the confines of Emilia and Tuscany extend to the straits of Messina. (See ALPS,

and APENNINES.) The Sub-Apennines lie wholly W. of the main chain, to which they do not appear geologically to belong, and, under the appellations of Tuscan, Roman, and Neapolitan Sub-Apennines, extend to Mt. Vesuvius in the south, and terminate at Punta della Campanella opposite the island of Capri; they embrace a great part of the plain of the Arno and the Campagna di Roma. Of the innumerable valleys of the sub-Alpine region, the most renowned are the Val di Clusone, once the refuge of the Waldenses, that of the Dora Susina above Turin, the Val d'Aosta, and the Valtellina, with such as are formed by the other affluents of the Po and those of the Ticino, the Adige, and the Piave, as well as by the rivers that empty into the great lakes. Along the Apennines are the Val d'Arno, those of the Tiber, Volturno, &c., and the beautiful upland valleys of the centre and south.—Italy has but two rivers of importance, viz., the Po and the Adige. The former, with a length of about 400 m., waters, with its tributaries (the Ticino, Adda, Oglio, and Minicio on the N. bank, the Tanaro, Trebbia, Taro, Secchia, and Panaro on the S. bank), a plain extending over 300 m. in length and 170 in breadth. The Adige, descending from the Alps, flows in a semicircle to the east, falling into the Adriatic at no great distance from the Po; it is navigable only to a short distance above Verona. Nearly all the other rivers are mere mountain torrents, having a short course and no considerable depth; hence they afford very limited facilities to commerce. The most noted of them are the Brenta, Piave, and Tagliamento in the north, the Arno and Tiber in the centre, and the Garigliano, Volturno, and Silaro (Sele) in the south. The mouths of most small rivers of S. Italy are surrounded with swamps, the noxious gases of which generate malaria and render the surrounding districts almost uninhabitable. Nine principal canals, chiefly for the purposes of irrigation, were constructed during the middle ages in Lombardy and Venetia. The finest of these, the Naviglio Grande or Ticinello, between the Ticino and Milan, was begun in 1179; it is 28 m. long and navigable for vessels of large size. Piedmont is intersected by about 250 canals. This system was perfected at an early period, and proved extremely beneficial to agriculture. The most extensive lakes, several of which are celebrated for the picturesqueness of their surrounding scenery, belong to upper Italy. Lago Maggiore, 40 m. long, has a depth of about 2,500 ft.; its surface is about 700 ft. above the level of the sea; it is fed chiefly by the river Ticino. The lake of Lugano belongs mainly to Switzerland. The lake of Como, 35 m. long, and of great depth, is fed by the river Adda and a large number of smaller streams. Lake Iseo, 15 m. long, is chiefly supplied by the Oglio. Lake Garda, which belongs partly to Tyrol, is 33 m. long, and of sufficient depth to carry vessels of the greatest draught. Besides these, there are the lake of Bientina in Tuscany, the lake of

Perugia (Trasimeno) in Umbria, and the lakes of Bolsena and Bracciano in the province of Rome.—Italy offers a rich and in many respects an almost unexplored field to the geologist. Granite, porphyry, and gneiss are found at both the northern and southern extremities, as well as in the centre. Monte Corvo and other peaks in the Abruzzi are of compact quartz, which also covers large tracts in Calabria. Aspromonte on the straits of Messina consists almost exclusively of primitive rocks. The mass of the Apennines is composed of limestone, chalk, and sandstone, through which at various points throughout their whole extent masses of serpentine have erupted, or have been injected between the strata. This rock forms an important component of the Ligurian Apennines. Commencing near Savona, and showing itself for a considerable space inland as far as Voltaggio, and toward the sea to Genoa, it forms many detached groups of hills, and ceases to be prominent only at Orbetello, in the province of Grosseto. It also rises in great masses near Bobbio and Fornovo, and between Sassuolo and Modena in the basin of Lombardy. The great dislocations and contortions of strata in the Ligurian chain are attributed to the eruption of this rock. Gneiss, mica slate, clay slate, talc slate, and limestone form together the lowest stratified series tilted up by the serpentine; above them lies an assemblage of argillaceous slates, marly sandstones and slates, sandstones, and limestones; while uppermost are marly limestones and a sandstone called in the country *macigno*, with impressions of marine plants. Upon these are tertiary deposits in horizontal stratification, of limited extent and in detached spots, on the Mediterranean side, but forming in Piedmont and Lombardy a continuous zone on the northern slope of the chain from Ceva to Fornovo. The *macigno* is the prevailing stratified rock in the northern Apennines; it contains subordinate beds of limestone, but no metallic veins or deposits, and is supposed to extend southward as far as Cortona. In this part of the chain are extensive tracts of crystallized limestone, which extend southward along the shore of the Mediterranean, forming the brocatello marble of Siena, the hill of San Giuliano near Pisa, and insulated hills at Piombino, Civit  Vecchia, and Cape Circello. The Alpi Appuane, at the southern end of the Ligurian Apennines and containing the Carrara marbles, are composed (according to Hoffmann) of Jura limestone, the crystalline state of which is due to the heat contemporaneous with the eruption of the serpentine. Eastward and southward from Liguria, the Apennines are chiefly composed of limestone; it forms the Apennines of Tuscany, Romagna, Fabriano, Foligno, and the Abruzzi, extending through the provinces of Potenza and Bari to the extremity of Otranto. Throughout the northern portion of the Lombard plain limestone is the prevailing rock. Above this limestone, and almost coextensive

with it, is chalk with its accompanying rocks; it stretches along the coast of Genoa and into Parma, crosses Modena and Tuscany, forms to the south a long narrow belt along the E. side of the limestone, and after some partial breaks reaches Cape di Leuca, where its white cliffs form a landmark. In the north of the Neapolitan territory a large oval tract of chalk is enclosed by the limestone. Above chalk and limestone are tertiary sandstones, travertine, and marl, occupying a considerable portion of Tuscany and of central Piedmont, but stretching chiefly in a narrow belt along the E. coast from near Rimini to Monte Gargano; thence the same band spreads out and is continued to the gulf of Taranto. On the coast of Tuscany and in the Roman territory, particularly in the Pontine Marshes, are found partial tracts formed by immense diluvial and alluvial deposits, and covering the preceding strata; but it is in the plains of Lombardy, on the N. W. shore of the Adriatic, and filling the greater part of the basin of the Po, that these deposits are most conspicuous. Besides these formations, there are in Italy four distinct volcanic districts, distributed from the head of the gulf of Venice to Sicily. The first is that of the Euganean hills, extending from near Padua to Este, and separated from the Alps by the Paduan plain. The next and largest district is in the Roman territory, where it forms three remarkable groups, the Monti Albani, with Monte Cavo (anc. *Mons Albanus*); the Monti Cimini, stretching from the Tiber to Civit  Vecchia; and on the road from Siena to Rome a group to which belong the lofty volcanic mass of Radicofani, and 4 m. away Monte Amiato, 5,794 ft. above the sea. The lakes of Bolsena, Bracciano, Vico, Albano, and Nemi are in this district, all or most of them the craters of extinct volcanoes. At the foot of Monte Amiato is a hot crystal spring, holding in solution a considerable amount of sulphur and carbonate of lime, of which advantage is taken to form casts. The water is allowed to fall in broken showers upon moulds, and the calcareous deposit hardens into cameos and intaglios of exquisite beauty. The Terra di Lavoro or Campania Felice (now province of Caserta) in Naples is the third district, subdivided into several marked groups: the Roccamonfina group to the north of the Campanian plains; the Phlegræan Fields, embracing the country around Baja and Pozzuoli, together with the neighboring islands, and the lakes Averno, Lucrino, Fusaro, and Anagno; and Mt. Vesuvius. The last volcanic district is in Apulia, having for its centre the huge mass of Monte Volture, and for its highest peak the Pizzuto di Melfi, 4,357 ft. In the widest crater are two small lakes. The pools of Ampsanctus (Le Mofete) are in this district, in a wooded valley south of Triggento; they emit carbonic acid and sulphuretted hydrogen.—The mineral wealth of Italy has been famed from remote times. In the Col di Tenda are mines of lead and silver, considered

as a prolongation of those of Argentière in the French department of Hautes-Alpes, or of those of Pezey in Savoy. Piedmont is rich in metals; the Val d'Anzasca is renowned for its auriferous pyrites, the Val di Macagnaga for its beds of auriferous schists, and the Val d'Aosta for copper pyrites. In the serpentine rocks bordering the gulf of Genoa are rich ores of copper, not sufficiently appreciated in the country; while the mountains of Modena are filled to their very summits with ores of iron, lead, and silver, and most valuable deposits of copper. The Apuan Alps adjacent to the Modena chain, and forming the northern frontier of Tuscany, are traversed by veins of quicksilver, magnetic iron ore, and argentiferous copper and lead ores. The silver was worked by the ancients, as the numerous remains in the neighborhood attest. On the seashore are the ruins of the Etruscan city of Luna, which had for its emblem a crescent, the symbol of silver dedicated to Diana. All through the middle ages the most violent contests raged between the local lords and the city of Lucca for the possession of these mines; the latter remained mistress of them, and coined their silver into money. They were afterward opened afresh by the Medici; and the Bottino mines are still worked and productive. The central and southern districts of Tuscany are equally favored with metalliferous deposits, among which the mines of Terricio and Castellina in the centre, and those of Monte Catini near Volterra, deserve special mention. The latter, known even to the Etruscans, were reopened not many years ago, and now yield enormous profits. Further off are the mines of Campiglia, from which the Etruscans drew the greater part of their bronze. During the middle ages also various mines of iron, lead, copper, silver, alum, and sulphur were worked with great success in Massa Maritima, hence called *Massa Metallifera* to distinguish it from *Massa Carrara*. All over the face of the country, now covered with marsh and ravaged by fever, ancient pits and ruins of old founderies are counted by the hundred. This same region, in the districts between Massa and Monte Catini, contains the famous *soffioni* or vapor vents, utilized for the extraction of boracic acid. The districts of Siena and Grosseto also have silver and copper mines; and in southern Tuscany, besides these, are veins of quicksilver at Selvina, Pian Castagnajo, and Castellazzero, and lodes of antimony at Montanto and Pereta. All these districts are on the W. flank of the Apennines, or rather on a littoral chain which is a continuation of that skirting the coast of Genoa; hence it has been denominated the metalliferous chain. The former States of the Church are poor in metallic deposits; but the Calabrias possess iron lodes and ancient silver mines. The most important product of the Italian mines is sulphur, which is found in the island of Sicily and exported in large quantities. Sea salt is likewise an im-

portant article of export. The average annual produce of the most important mineral productions is as follows: salt, 440,000 tons; sulphur (1864), 198,000; coal (1862-'6), 49,500; raw iron, 27,500; lead (1862-'6), 4,500; raw copper (1862-'6), 550; zinc (1865), 88; mercury, 25; silver (1865), 7; gold (1864), 482 lbs. —Fossil remains of uncommon interest are found in various parts of the peninsula. Besides the great abundance of fossil shells in Lombardy and Piedmont, the soil covering the marine deposits is filled with bones of the mastodon, elephant, rhinoceros, and other large quadrupeds. But it is in the neighborhood of Parma and Piacenza, and particularly in the basins forming the upper Val d'Arno, that the most extraordinary discoveries have been made. The skeleton of a whale 20 ft. long was found in the marl at Arquato in the former district; while in the latter, among the lacustrine deposits left in the very centre of the Apennines, are enormous quantities of bones of great quadrupeds of extinct species and belonging to warm climates. Skeletons of the elephant, rhinoceros, mastodon, and hippopotamus are so abundant that the valley is like a vast cemetery, and the peasants were formerly in the habit of enclosing their gardens with legs and thigh bones of elephants.—There is no part of Italy not possessed of a soil naturally fertile, or capable of being made productive by labor and artificial means. The vast plains of Piedmont and Lombardy have a soil equalled in fertility only by that of Campania Felice, while the remainder of the peninsula, being of calcareous and volcanic formation, is almost everywhere susceptible of tillage. The Apennines in many places are cultivated in terraces to their very summits. Even in the most wintry district of the centre, only the highest peaks are naked; the inferior ranges are covered with forests, the pine tree highest up, the oak beneath, and the chestnut near the plain or valley; while lower still the fig tree and olive flourish. The soil yields abundant harvests everywhere in these central valleys, or affords rich and perennial pastures. The unproductive plains of the former kingdom of Naples were once under high cultivation, and the home of a numerous people. The vast marshes on the east and west anciently fed a large population; parts of them have been reclaimed in recent times, and the present government of Italy has manifested the intention of restoring the remainder to agricultural uses. In the volcanic districts the tufa and lava form a soil favorable to husbandry.—The climate of Italy is generally considered the most genial and wholesome in all Europe, but proportionately to the number of inhabitants the mortality is greater there than in any other European country. In summer the burning heat, unrelieved by refreshing showers, withers all vegetation, parches the ground, and imparts to the landscape a gloomy brownish tint. In many places a subterranean heat periodically sends

forth noxious gases. The lagoons and marshes which border the coast generate poisonous miasmata. Besides all this, legions of noxious insects fill the air and infest the dwellings. Nevertheless, there are districts in Italy which in regard to salubrity compare favorably with any in the world. In respect to its climate it may be divided into four regions. Of these the first comprises upper Italy, N. of the Apennines, between lat. 46° 40' and 43° 30' N. There the temperature in winter is sometimes as low as 10° F.; the snow remains on the ground from 10 to 14 days; the lagoons on the Adriatic are frequently covered with ice; and though the mulberry tree and rice are raised to perfection, the more tender fruits of a southern climate ripen only in sheltered localities. Night frosts begin as early as November, and continue until March or April. Even in the summer months piercing cold N. winds are not uncommon. The second region, extending from lat. 43° 30' to 41° 30' N., is that of the olive tree and orange. Frost and snow appear regularly only in the higher mountain districts, but occasionally snow may be seen even in the valleys and plains. The third region extends over 2½ degrees of latitude, comprising nearly the whole continental portion of the former kingdom of Naples. There the thermometer seldom falls below 26° F.; snow is very rarely seen except on the highest mountains, and never remains; aloe and other semi-tropical plants thrive even in unprotected localities. In the fourth region, comprising the southernmost part of the peninsula, as well as Sicily, the thermometer scarcely ever falls below the freezing point of water; snow and ice are unknown except on the summit of Mt. Etna; tropical fruits, dates, sugar cane, and the cotton plant thrive in the open air; aloes are so common that they are planted for hedge rows; a serene sky of the deepest blue spans the earth and bracing sea breezes temper the heat. But at the same time this portion of Italy often suffers from the common drawbacks of tropical regions, droughts and hot winds (siroccos), equally obnoxious to human and vegetable life. Earthquakes and volcanic eruptions, causing sometimes an appalling loss of life, occur frequently in lower Italy and Sicily. The mean annual temperature is as follows: Milan, 55.4°; Rome, 59°; and Naples, 61°.—The vegetable productions of Italy partake of its semi-tropical character. At Bordighera, on the Riviera di Ponente, are found groups of indigenous palm trees. In the basin of the Po the mulberry tree abounds, and great crops of rice are raised. Thence southward the same contrasts of climate and vegetation strike the traveller, as he proceeds from the bare shore into the interior, or leaves the central ridge and its valleys for the coast. In the coldest uplands of the Abruzzi there often occur heavy falls of snow as late as June; while 40 m. to the south the olive, fig tree, and orange thrive luxuriantly. In Calabria the

shores are lined with groves of orange and citron trees, the gardens are filled with the date palm, the fields are divided by hedges of aloes and pomegranate, and in the fields the sugar cane and cotton plant are cultivated. The forests of evergreen oak and arbutus which form a feature of the landscape have an undergrowth of oleander and cistus. On the uplands a short distance from the coast the forests are of oak and chestnut, and higher up still, in the table lands of Pollino and the Sila, the country is covered with firs and pines, which afford grateful shade and rich pasture in midsummer to the large herds of cattle. On the shores of the Adriatic, exposed to the N. E. winds, is found a vegetation entirely different. Italy is above all an agricultural country. It produces all kinds of cereals, but wheat is used principally as a breadstuff by the wealthy, and maize by the poor. The latter also consume great quantities of pulse and chestnuts. The potato is beginning to be extensively cultivated in upper Italy. Vegetables of all sorts are raised in great abundance. The most luscious fruits ripen spontaneously, such as oranges, lemons, citrons, figs, almonds, carob beans, and dates. The sugar cane, though extensively cultivated in lower Italy and Sicily, is inferior in quality to that of the West Indies. The cotton plant has been raised successfully in Calabria and Sicily since 1862. The culture of tobacco has always been limited, and its manufacture and sale are now a monopoly of the government. Hemp and flax are grown for home consumption. Saffron, safflower, and capers are exported. Silk is the most important product, and its value is yearly increasing with the foreign trade of Italy. The olive is indigenous to almost every part of the peninsula, and its culture, like that of silk, is constantly increasing in importance. The attention of Italian economists and agriculturists has been lately turned to the improved cultivation of the grape, and large quantities of wine are exported from every part of the kingdom. The wines of lower Italy and Sicily equal in body and flavor the best wines of Spain and Portugal; but those of upper and central Italy, from want of careful preparation, are not in such general demand. The Italian government is endeavoring to introduce improved methods of agriculture. About 85 per cent. of the area is productive, and 13 per cent. unproductive soil. The former may again be divided into 48 per cent. of arable and wine land, 25 per cent. of meadows and pastures, 5 per cent. of olive and chestnut forests, and 22 per cent. of woodland. The average annual yield of the principal agricultural products is estimated as follows:

Wheat.....	105,650,000	bushels.
Indian corn.....	48,000,000	"
Barley and oats.....	22,150,000	"
Eye.....	7,950,000	"
Rice.....	4,500,000	"
Other grain.....	18,450,000	"
Total grain.....	200,700,000	"

Potatoes.....	27,250,000 bushels.
Hemp.....	111,100,000 pounds.
Flax.....	80,100,000 "
Cotton.....	22,000,000 "
Tobacco.....	7,200,000 "
Olive oil.....	42,250,000 gallons.
Wine.....	800,000,000 "

—The animal kingdom is not represented by many species in Italy. The domestic animals common to all Europe, including horses, cattle, sheep, swine, goats, asses, and mules, are raised. Animal food being not as extensively used as in more northern countries, but little attention is paid to the improvement of breeds. Swine are principally raised in Parma and the N. E. provinces of the late Papal States, where the manufacture of sausages is carried on upon a large scale. The dairy products of Parma, especially cheese, are largely exported to foreign countries. The number of horses, mules, and asses in 1872 was reported to be 1,500,000; of cattle, 3,700,000; of buffaloes, 40,000; of sheep, 8,800,000; of goats, 2,200,000; of swine, 3,900,000. The coast fishery employs a great amount of tonnage and capital. Tunny and anchovies are caught in immense numbers, and the latter are exported to all parts of the world. Oysters are obtained from beds in the Adriatic, but are poor in quality. The sea furnishes also a great variety of smaller shell fish, which are used as food by the lower classes, or as delicacies by the wealthy.—The increase of the population of Italy since 1861, when a census was taken in the countries at that time forming part of the kingdom, has been about 0.72 per cent. annually. Of the 3,382 communes into which the kingdom is divided, 1 (Naples) had in 1872 a population of more than 400,000, 4 (Rome, Palermo, Turin, and Milan) above 200,000, 5 above 100,000, 12 above 50,000, 25 above 30,000, and 22 above 25,000. The Italians now constitute a compact nationality, although they are descended from a number of different races who have successively obtained the mastery of the country. The Gallic (Celtic) and Roman elements have become the principal ingredients of Italian nationality, but few traces of the character of the aboriginal population being now discernible. In upper Italy the Germanic element has contributed its share; even the name of Lombardy is derived from that of a German tribe. In southern Italy and Sicily the Arab element enters into the mixture of national characteristics. In 1872 the population of other than Italian nationalities was estimated at about 330,000. Of these, 140,000 were French (chiefly in the circles of Aosta, Pinerolo, and Susa, in the province of Turin), 58,000 Albanians (in south Italy), 35,000 Jews, 30,000 Slovans (in the province of Udine), 25,000 Germans (chiefly in a few mountain valleys of the provinces of Novara and Turin, and in the provinces of Vicenza and Verona), 21,000 Greeks, and 7,000 Catalonians (in the town of Alghero and its vicinity in Sardinia). Only the written language is the same in all parts of Italy, while

the vernacular of the common people consists of various dialects, almost as unlike each other as different tongues. It is in Tuscany that the Italian language is spoken in its utmost purity. But while the Florentine dialect excels in purity and delicacy, the Roman pronunciation and accent are most admired; hence to speak Italian with perfect grace one must unite *la lingua Toscana e la bocca Romana*. The Italian has generally a fine exterior. He is rather slim than stout, but strong and agile. A dark complexion, an expressive countenance, sparkling eyes, black hair, and a grave gait combine to render the native of Italy prepossessing. A great proportion of the inhabitants retain many of the characteristics of the Roman conquerors of the world. The decline of the Italian military greatness was followed by eminence in letters. Italy was long the foremost nation of Europe in literature, art, and science, and she has given birth to some of the greatest men of modern times. There are numerous high schools, academies, lyceums, and universities, and the last enjoyed during the middle ages a world-wide reputation, though they are now eclipsed by some of the German seats of learning. The number of universities in 1873 was 22; of which 17 were royal, 4 (Ferrara, Perugia, Camerino, and Urbino) provincial, 1 (the Sapienza in Rome) papal. The 17 royal universities had in 1873 the following number of professors and students:

UNIVERSITIES.	Professors.	Students.	UNIVERSITIES.	Professors.	Students.
Bologna.....	58	577	Catania.....	38	238
Naples.....	73	...	Genoa.....	46	460
Padua.....	65	1,121	Macerata.....	20	115
Palermo.....	56	306	Messina.....	36	112
Pavia.....	45	718	Modena.....	42	815
Pisa.....	66	503	Parma.....	47	270
Rome.....	51	534	Sassari.....	31	74
Turin.....	69	1,403	Siena.....	32	118
Cagliari.....	30	88			
			Total.....	738	6,957

The theological faculty has been abolished at all these universities. Bologna, Catania, Genoa, Messina, Naples, Padua, Palermo, Pavia, Pisa, Rome, and Turin have four faculties each; Cagliari, Modena, and Parma three; and the others two. The institutions of secondary instruction in 1870 comprised 352 gymnasia (104 royal) and 272 technical schools, and for more advanced pupils 142 lyceums and 89 industrial and technical special schools. Elementary education is to be compulsory, but the attendance at the primary schools is still far from being satisfactory. In 1872 there were 34,213 public and 9,167 private elementary schools, together 43,380; the number of pupils was 1,745,467. Immense literary treasures are stored in public libraries. The principal of these are the Vatican and the Minerva libraries at Rome; the Borbonica and the Brancacciana at Naples; the university library at Bologna; the Ambrosian at Milan; the library of St. Mark at Venice; the royal library

at Turin; and the libraries at Florence, Brescia, Ferrara, and Parma. Literary and scientific societies have been numerous in Italy ever since the 14th century, but only a few of them have retained their vitality. Among them the *accademia della Crusca* at Florence, the royal institute at Milan, and the academy of sciences at Turin, are the most prominent. Museums, cabinets of art, and picture galleries are found almost everywhere, rendering Italy the Mecca of artists. Observatories exist in Rome, Bologna, Padua, Milan, Florence, Naples, and Palermo. The number of charitable institutions is enormous. No state religion is legally recognized, and any profession of religion or creed is excluded from the coronation oath. The civil and political rights of the citizens are independent of their profession of any religion. The Roman Catholic church has 47 archbishops, 217 bishops, and 8 abbots with quasi-episcopal jurisdiction. The pope, though no longer recognized as a sovereign, continues to enjoy extensive prerogatives, which are regulated by the law of May 13, 1871. His person is sacred and inviolable; the Italian government renders to him the honors of a sovereign, and guarantees to him a yearly donation of 3,225,000 lire (\$622,500). The number of Catholic priests is about 100,000. The convents and monasteries of Italy were abolished in 1866, and in 1873 this law was extended to the city and province of Rome.—The industry and commerce of Italy have greatly declined since the middle ages, when the republics of upper Italy were the commercial centres of the continent, and held the same position which during the 17th century was held by the Netherlands, and which since the 18th century has been held by Great Britain. Since the establishment of the kingdom of Italy a new impulse has been given to the development of industry in Tuscany and most of the northern provinces. About 13 per cent. of the total population derive their support from industrial pursuits. The number of chambers of commerce and industry in 1873 was 71. In point of ship building Italy occupies a prominent place among the maritime states of Europe; it is most extensively carried on in Liguria. Musical instruments are manufactured in all the large cities. The silk manufactures of Italy are the most important in Europe, and are one of the great sources of national wealth; the number of spindles employed in silk spinning is about 3,000,000. Of the other manufactures, those of earthenware, straw goods, glass, artificial flowers, and macaroni and other fine pastes, are of special importance. The principal articles of export are: from Piedmont, oil, oranges, wine, corals, silk, rice, fish, wood, hides; from Tuscany, oil, fish, silk, straw goods, marble, salt meat; from Naples and Sicily, oil, sulphur, sumach, almonds, lemons, grain, licorice, alcohol, wool, skins, silk; from Parma, silk, cattle, grain, cheese, wool; from Modena, wine, silk, fruit, marble,

oil; from the former Papal States, grain, wool, oil, beeswax, silk, cattle. The total value of the commercial movement of Italy from 1869 to 1872 was as follows:

	1869.	1870.	1871.	1872.
Imp'rts	\$180,000,000	\$171,000,000	\$156,000,000	\$229,000,000
Exp'rts	153,000,000	146,000,000	209,000,000	225,000,000

The value of the Italian transit trade amounted in 1870 to \$1,780,000. The shipping of Italy, owing to its favorable situation, is of great importance. The number of merchant vessels belonging to the kingdom in 1873 was 19,600 (118 steamers), and there were also about 12,300 fishing boats. The seafaring population in 1870 included 180,800 adult males. The number of entries in the Italian ports in 1870 was 90,001 loaded vessels, tonnage 8,347,506, and 28,723 vessels in ballast, tonnage 1,363,346; of these, 73,368 loaded vessels, tonnage 4,939,943, and 25,941 vessels in ballast, tonnage 983,317, belonged to the coast navigation. The aggregate length of railroads in operation in 1872 was 4,148 m.; aggregate length of telegraph lines, 12,009 m.; aggregate length of wires, 37,218 m. The number of large moneyed institutions is considerable, the most important of which is the national bank of the kingdom of Italy, at Rome, founded in 1849, a bank of issue, with a capital of \$40,000,000, having establishments in Florence, Genoa, Milan, Naples, Palermo, Rome, Turin, and Venice.—The crown of Italy is hereditary in the house of Savoy. The statute of the kingdom of Sardinia of 1848 is considered as the fundamental charter of Italy, although it has been modified by new acts relating especially to the complete separation of church and state, and the abolition of the former privileges of the church of Rome in Italy. On assuming the government the king takes an oath to support the constitution. He exercises the legislative power conjointly with a national parliament consisting of a senate and a chamber of deputies. The senate is composed of the princes of the royal family who are of age, and an unlimited number of members appointed by the king for life. The senators must be 40 years of age or over, and belong to certain classes of citizens, as archbishops, bishops, deputies, ministers, other high officers of the state, generals, admirals, members of the provincial councils or of the Turin academy of science, persons who have distinguished themselves in behalf of the country, or who for three successive years have paid 3,000 lire of direct taxes. In 1873 the senate had 317 members. The members of the chamber of deputies are elected by a majority of all citizens who are 25 years of age and pay a certain amount of taxes (in most provinces 40 lire) or of rent. Some classes of the population, as members of the academies, of the chambers of commerce and industry, professors, state officers, physicians, lawyers, &c., have the right of voting in virtue of their educational

qualification, without regard to their property. The kingdom is divided into 508 electoral colleges, each of which elects a deputy for the term of five years. No election is valid unless at least one third of the inscribed voters appear at the polls. The average number of inhabitants for every electoral college was 52,955. The aggregate number of electors enrolled on the roll list of 1870 was 528,932, being 1·97 per cent. of the total population. The number who took part in the election was 238,448, or 45·8 per cent. of those enrolled. All voters 30 years old or over are eligible as deputies. The chambers are convoked annually, and their sittings are public. All citizens are equal before the law, and have equal rights and duties. The constitution of the provinces and communes is based upon the law of March 20, 1865. For local administration, each province has a provincial council elected by the communes for a term of five years, and a provincial deputa- tion which is convoked by the provincial councils. The affairs of a commune are administered by a communal council elected for five years, and by a municipal *giunta* elected by the municipal council. The chief of the communal administration is the *sindaco*, who is appointed by the king for a term of three years from among the members of the communal council. The ministry, which is responsible to the chambers, consists of nine sections: foreign affairs, interior, justice and public worship, finances, war, navy, public instruction, public works, and agriculture and commerce. At the head of each of the provinces is a prefect, who is assisted by a prefectural council. At the head of each circle, except the one in which the prefect resides, there is a sub-prefect (or district commissioner in the divisions exceptionally termed districts); the prefect attends to the duties of the sub-prefect in his own circle. For the administration of justice there are 4 courts of cassation (in Turin, Florence, Naples, and Palermo), 24 courts of appeal, 97 courts of assize, 162 civil and correctional tribunals, and 1,903 pretorships.—By the new law on the reorganization of the army which was presented to the chambers on Dec. 20, 1872, the liability to military service is made universal, the exceptions formerly allowed being reduced to an insignificant number. The annual contingent is to be 100,000 men, of whom from 75,000 to 80,000 are to be taken for the first class, whose term of service is three years (for the cavalry five years); the remainder enter the second class, to which the former belong after the expiration of their active service. The time of service in the second class is 19 years; in the second and first classes together, 22 years. The actual strength of the army in March, 1873, was as follows: standing army, on the peace footing (men actually under arms), 183,205; men on unlimited furlough, 358,370; total on war footing, 541,575; to which must be added provincial troops 202,081, making the total armed forces in time of war 743,656.

The national guard (corresponding to the German *landsturm*), which was first organized in 1843, may be called upon for the defence of the monarchy, and for the preservation of peace and order at home. To it all citizens belong from their 21st to their 55th year, except those who are in the army. The standing army is divided into six *corps d'armée*, each corps consisting of three divisions and each division of two brigades, four or six battalions of *bersaglieri* or riflemen, two regiments of cavalry, and from six to nine companies of artillery. The provincial militia is divided into battalions and companies, and when fully organized is to comprise 960 companies of infantry, 16 of riflemen, and 10 of sappers. The national guard consists exclusively of infantry divided into battalions, of which there were 343 organized in 1873. The navy in 1872 consisted of 59 steamers, 22 of which were ironclads, and 17 transports; total, 76 vessels, carrying 653 guns. It is manned by 11,200 sailors and 660 engineers and working men, with 1,271 officers, including 1 admiral, 5 vice admirals, 12 rear admirals, and 102 captains.—The finances of the kingdom have from its first year been in an unsatisfactory condition. In every year the expenditures have considerably exceeded the revenue, as this table of budgets shows:

	Revenue.	Expenditure.	Deficit.
1861.....	\$94,700,000	\$155,300,000	\$60,600,000
1862.....	102,400,000	162,100,000	59,700,000
1863.....	118,700,000	180,400,000	61,700,000
1864.....	124,700,000	174,100,000	49,400,000

The alarming deficits were but slightly covered by augmented revenue; the larger portion of them had to be met partly by loans and partly by the sale of state property and monopolies. Thus in 1867 the sum of \$116,000,000 was levied on church property; in 1868 the state monopoly on tobacco was made over to a French company in consideration of a loan of \$34,700,000; and in 1864 the state railways had been sold for \$38,600,000. As a result of these deficits a very heavy public debt has rapidly accumulated, amounting at the end of 1872 to a nominal capital of \$1,741,900,000. The total charges on account of the public debt, comprising interest, management, and sinking fund, were estimated at \$146,000,000, an amount representing more than one half of the total ordinary revenue of the kingdom.—The early history of Italy is closely connected with that of the Roman state. Among the earliest inhabitants of the country we find the Etruscans or Tuscans, Umbrians, Oscans, Siculi, Latins, Volsci, Æqui, Sabines, Peligni, Marsi, Marru-

cini, Vestini, Hernici, Enotrians, Daunians or Apulians, Japygians, Peucetians, Messapians, and numerous other tribes, besides various Grecian colonies in the southern part or Magna Græcia. The name Italy, however, which replaced the Greek appellation of Hesperia or Hesperia Magna, was originally applied only to the peninsula stretching southward from Squillace on the gulf of that name, and gradually extended to more northern parts, until the time of Augustus, when it received its full extension, embracing the provinces of Liguria, Gallia Cisalpina, Venetia, and Istria, in the north; Etruria, Umbria, Picenum, Samnium, Latium, and Campania, in the centre or Italy proper; and Apulia, Calabria, Lucania, and Bruttium, in the south or Magna Græcia. Poetically the country was also called Enotria, Ausonia, Opica, Tyrrhenia, and Japygia, from various parts of the whole, and Saturnia, because Saturn was said to have once reigned over it. Augustus divided Italy into 11 regions, which division prevailed during the latter period of the history of the Roman empire. Since the downfall of the western division of that empire the Italian peninsula has been the theatre of a political history which in its general features resembles that of Germany, being a continuous shifting of boundaries and contest of dynasties, relieved by temporary successes of municipal self-government in the free cities of upper Italy, and by the brilliant development of literature, commerce, and the fine arts. Odoacer, having dethroned the last West Roman emperor, Romulus Augustulus (A. D. 476), assumed the title of king of Italy; but in 493 he succumbed to Theodoric the Great, king of the Ostrogoths, and for a time the entire peninsula was united under Gothic dominion. The Byzantine generals Belisarius and Narses conquered it for the emperor Justinian about the middle of the 6th century, and it was ruled by Byzantine viceroys (exarchs). In 568 the Lombards (Longobards) invaded Italy and established a powerful kingdom, the name of which has been preserved to this day for a small portion of its territory. They introduced Germanic feudal institutions, and thus completed the transition of Italy from the ancient forms of political and social life to those of the middle ages. Venice, founded by fugitives during the barbarian invasions of the 5th century; the exarchate of Ravenna, reduced to a small portion of the late Papal States; Rome, and a portion of the coast districts of lower Italy (duchies of Amalfi and Gaëta), maintained their independence after having for some time remained in a nominal relation of vassalage to the Byzantine empire. During the latter half of the 8th century, the Lombards threatening Rome, which until then had been ruled by patricians, the aid of Pepin, king of the Franks, was invoked by the pope. Pepin, having conquered the exarchate, ceded it to the head of the church. Charlemagne, following up the victories of his father, subjected the Lombard

kingdom (774) and annexed it to the Frankish empire. On Christmas day, 800, Charlemagne was crowned by Pope Leo III. Roman emperor, and thus the occidental empire was re-established. Practically that title, which was eagerly coveted for many centuries by the rulers of Germany, was a pretext for territorial conquests in Italy. When in 843 the empire of Charlemagne was divided among his grandsons, the Italian provinces fell to the share of Lothaire, but the rule of the Carolingians lasted scarcely for a generation. During a period of anarchy and civil war Guy of Spoleto, Berenger of Friuli, Hugh of Provence, Berenger of Ivrea, and Lothaire, son of Hugh, successively obtained an uncertain mastership. Lothaire having been poisoned in 950 by Berenger, his widow Adelaide appealed to Otho I., king of Germany, who married her, conquered Lombardy (951), and in another campaign obtained the imperial crown. In lower Italy, the duchy of Benevento and the republics of Naples, Gaëta, and Amalfi, though undisturbed by the strifes in the northern and central divisions of the peninsula, had for a long time to contend against the Saracens, who had conquered Sicily in 827, and invaded lower Italy during the latter half of the century. Their attacks having at last been definitely repulsed, lower Italy once more returned under Byzantine rule, and remained so for nearly a century more, while the greater portion of the peninsula was held in subjection by Germany. For 50 years the German dominion was comparatively undisturbed. From the year 1000 the hatred of the Italians against the foreign rulers, diligently fostered by the clergy, manifested itself in frequent local insurrections and civil wars; but during the 11th century the German kings succeeded in maintaining their authority. In lower Italy the Byzantine rule was gradually overturned by the Normans, who, having conquered Apulia and Calabria, also wrested the islands of Sicily and Malta from the Arabs. This new realm, consolidated by Robert Guiscard (1057-85) and the two Rogers (1085-1154), became a strong point of support for the popes in their contests with the German sovereigns. Their power increased so rapidly that Henry IV., the successor of the mightiest of all the German rulers over Italy (Henry III.), was compelled to humble himself before Gregory VII. (1077). The Lombard kingdom thenceforward gradually resolved itself into several prosperous municipalities, some of which became powerful commonwealths, able to contend successfully even against the mighty Swabian (Hohenstaufen) dynasty of Germany. Milan, Venice, Pisa, and Genoa became the centres of the movement for national independence. Milan formed the league of the Lombard municipalities, which, allied with the popes, opposed the exertions of the Hohenstaufen to erect Italy into a hereditary kingdom for their own dynasty. The national party subsequent-

ly assumed the name of Guelphs (from the Bavarian dynasty of the Welfs, the most powerful opponents of the imperial rule in Germany), while the partisans of the emperors were known under the name of Ghibellines (a corrupt form of Waiblingen, one of the seats of the Swabian or Hohenstaufen dynasty). A long continued struggle ended in the victory of the Guelphs, the emperor Frederick I. being compelled to recognize the autonomy of the cities belonging to the league. As an offset to these reverses he obtained the kingdom of the Two Sicilies by the marriage of his son with the daughter of the last Norman king. When, by internal dissensions and bloody civil wars, the power of the free cities in upper Italy seemed to be exhausted, Frederick II. made another effort to obtain complete mastery; but his successes were only temporary, and the German dynasty was completely overthrown in upper Italy (1254), while the kingdom of the Two Sicilies was wrested from them by Charles of Anjou. In the mean time municipal liberty in the free cities of upper and central Italy had been gradually subverted by petty dynasties, and the second half of the 13th century witnessed a long series of fierce party struggles, the designations of Guelphs and Ghibellines being kept up, the former by the popular or democratic party, the latter by the aristocratic. The aristocracy was defeated in Venice, Genoa, and in Florence, whence all noblemen were banished (1282); but soon afterward the victorious popular party was torn into hostile factions, and, though still able to frustrate the efforts of the German emperor Henry VII., who attempted to regain the dominion of Italy (1312), they succumbed in the different states to petty tyrants. Thus Pisa fell under the rule of Uguccone della Faggiola (1314), and Lucca under that of Castruccio Castracani (1316); Padua became a principality under the Carrara dynasty (1318), Alessandria, Tortona, and Cremona under the Viscontis, Mantua under the Gonzagas (1328), and Ferrara under the Estes. The Polenta family ruled in Ravenna, the Scala family in Verona, the Pepoli family in Bologna. Genoa expelled the leading families of the Guelph and Ghibelline parties, and elected its first doge, Simone Boccanegra (1339). In Rome the democratic party, led by Cola di Rienzi, was successful for a brief time (1347). Besides all the miseries engendered by these feuds and dissensions, armies of robbers, consisting of discharged soldiers, plundered the country, a terrible famine (1347) decimated the population, and a plague, the most horrible of which we have any account, mowed down two thirds of the inhabitants of the peninsula. Yet in the midst of these inflections, science, literature, and the fine arts flourished as they had never done before, and the very plague which made Italy a vast cemetery furnished the dark background on which Boccaccio drew the light fantastical pictures of his *Decamerone*. In lower Italy, Charles of

Anjou, having lost the island of Sicily by a popular outbreak (the Sicilian vespers, March 30, 1282), consolidated his dynasty in Naples, and the country enjoyed comparative tranquillity. In 1382 Queen Joanna was dethroned and assassinated. The usurper, Charles of Durazzo, shared her fate in 1386, and her grandson maintained himself for 28 years. Toward the latter half of the 14th century and during the 15th five states were predominant: Naples, the Papal States, Florence, Milan, and Venice; while the smaller states gradually dwindled down to utter insignificance. From Milan the Visconti dynasty threatened all the neighboring princes, and gradually subjected Lombardy to their rule. Having become extinct in 1447, they were succeeded by the Sforza dynasty. In Florence the Medici family rose by their wealth and prudence to supreme power. Venice, under a strong oligarchical government, conquered Padua, Verona, Vicenza, and a portion of Dalmatia, established colonial governments in the Grecian archipelago and on the shores of the Black sea, and remained victorious in many struggles with the Turks and with Naples. Its former powerful rival Genoa had, after a feud of centuries, been compelled to acknowledge the superior power of Venice. About the beginning of the 16th century Italy became the theatre of desolating wars between the rival French and Austrian dynasties. The struggle was opened in 1494 by the attempt of Charles VIII. of France to conquer Naples; after many vicissitudes French hopes were finally crushed by the defeat of Pavia in 1525. From that time Italy enjoyed comparative peace for over 150 years, during which period its territorial and political relations became more and more consolidated. In Florence the Medici obtained hereditary power; the principality of Montferrat fell to the Gonzagas of Mantua (1536); Parma and Piacenza to the Farnese family, descendants of Pope Paul III.; Milan and Naples were secured to Spain by the emperor Charles V.; in the extreme N. W. portion of Italy the ducal house of Savoy obtained Piedmont. Venice, whose naval and commercial supremacy had declined after the discovery of the passage around the cape of Good Hope, lost the island of Candia in 1669, but reconquered the Peloponnesus, which it had formerly held. New troubles and changes were caused by the wars of France under Louis XIV. Savoy and Piedmont were repeatedly occupied by France. In 1706-'7 Austria conquered Milan, Mantua, and Montferrat, and ceded the last to Piedmont; by the peace of Utrecht (1713) she obtained Sardinia and Naples, but in 1720 exchanged the former for Sicily, which had been given to Piedmont. The Farnese family having become extinct, Parma and Piacenza were given to the Spanish prince Charles in 1731, but fell to Austria in 1738, when Charles ascended the throne of Naples. In Tuscany the Medici family became extinct in 1737, and was succeeded by

Francis Stephen of Lorraine, husband of the Austrian empress Maria Theresa. Parma and Piacenza were conquered by the Spanish prince Philip, and were conferred upon him as a hereditary duchy by the peace of Aix-la-Chapelle (1748). Thus about the middle of the 18th century a large portion of Italy had lost its independence, being subject to the dynasties of Lorraine, Bourbon, and Savoy. The republics of Genoa and Venice were mere shadows of what they had been. The political and social life of the country became a settled apathy and seemingly hopeless decay, down to the time of the French revolution. In 1792 a French army invaded Savoy, which was annexed to France in 1796. In 1797 Bonaparte surrendered Venice to Austria, and erected Milan, Mantua, a portion of Parma, and Modena into the Cisalpine republic; Genoa was transformed into the Ligurian republic, and the Papal States into the Roman republic (1798). Naples, having sided with Austria, was invaded by the French, the king Ferdinand IV. expelled, and his kingdom formed into the Parthenopean republic (1799). During Bonaparte's campaign in Egypt the allied Austrians and Russians reconquered upper Italy, and the British, Russians, and Turks lower Italy; but in a brief campaign Bonaparte restored the French supremacy (1800). By the peace of Lunéville the duke of Parma obtained Tuscany under the designation of the kingdom of Etruria, and Parma fell to France. In 1802 the Cisalpine was changed into the Italian republic, under the presidency of Bonaparte, and in 1805 into the kingdom of Italy, administered by Napoleon's stepson Eugène Beauharnais. Guastalla was annexed to the new kingdom, and Piombino and Lucca were given in fief to Napoleon's sister, Élisa Bacciocchi. By the peace of Presburg, Venice, Istria, and Dalmatia were added to the Italian kingdom, the area of which then comprised 35,400 sq. m., with a population of 5,657,000. In the following year Guastalla, the Ligurian republic, Parma, and Piacenza were completely annexed to France, while Naples was once more made a kingdom for Joseph Bonaparte, who was succeeded by Murat in 1808. In that year the Etrurian kingdom and the Papal States were added to France, but Istria and Dalmatia were separated from Italy, and united to the new Illyrian kingdom, while a portion of the Tyrol was added to Italy. The last effort of Austria to regain its former power having been frustrated by Archduke Charles's successive defeats in Bavaria (April, 1809), the supremacy of Napoleon in Italy remained undisturbed until his power was broken by the Russian campaign and the successful rising of Germany. Murat of Naples made common cause with Austria (Jan. 11, 1814), and the French army was expelled from Italy, while Napoleon fell. Murat, who was to have been confirmed in the possession of Naples for the support lent to the enemies of his benefactor, was dethroned by a

counter-revolutionary movement, and in an attempt to reconquer his kingdom died by sentence of a court martial (1815). Under the new territorial arrangements of the congress of Vienna, the king of Sardinia was reinstated in his former possessions, to which Genoa was added; Lombardy and Venetia were given to Austria, and united into a kingdom; Modena, Mirandola, Reggio, Massa, and Carrara were transferred to the dynasty of Hapsburg-Este; in Tuscany the Hapsburg-Lorraine dynasty was restored; Parma, Piacenza, and Guastalla fell to the empress Maria Louisa, wife of Napoleon; Lucca to the Bourbon princess Maria Louisa; the Papal States and the kingdom of the Two Sicilies were restored to their former rulers; and Malta, Gozzo, and Comino remained in the hands of England. The republic of San Marino and the petty principality of Monaco had been undisturbed through all these chaotic changes.—The wishes of the advocates of national unity, independence, and constitutional liberty having been baffled by the simple restoration of the ante-revolutionary institutions, dissatisfaction and hatred of the foreign rulers engendered conspiracies and secret societies (carbonari), whose extent and power increased in the same ratio as the restrictive measures adopted against the people. In 1820 and 1821 revolutionary outbreaks occurred in Naples and Sardinia, and the rulers of these states were compelled to promise measures of reform; but the congress of Laybach ordered the suppression of these movements, and the complete subjugation of the revolutionary party by the Austrian armies was followed by a long period of reaction and vindictive persecution. The government of Tuscany was at that time comparatively liberal, and continued so until Sardinia assumed the lead of the national aspirations of Italy in 1848. In February, 1831, new popular risings took place in Parma, Modena, and the Papal States, but were again suppressed by Austrian armies. In the following year the Romagna made another effort to throw off the papal rule, in consequence of which an Austrian army crossed the frontier, while a French army, in spite of the protest of the pope, occupied Ancona, and held it till 1838. The political state of Italy remained apparently tranquil, but violent outbreaks from time to time proved the existence of strong dissatisfaction, which was fostered by secret organizations, such as the *Giovine Italia* (young Italy), and by men like Mazzini, who began his career as a political agitator as early as 1831. A new era seemed to dawn upon Italy when Pope Gregory XVI. died and was succeeded by Pius IX. (June, 1846). Pius inaugurated a series of moderately liberal reforms, and was hailed as the political saviour of his country. Tuscany and Sardinia followed the example set by the pope, and a customs union was effected between the three states (1847). Partial liberty of the press and popular representation were conceded or promised. About that time the principality of Lucca was

united with Tuscany, and the reigning family of the former, after the death of Maria Louisa, obtained the duchy of Parma, according to the stipulations of the treaty of Vienna. Sicily rose in January, 1848, against the king of Naples, and declared its independence. The king, in order to reconcile his subjects, gave them a liberal constitution, which was soon broken. In upper Italy the French revolution of February became the signal for a popular rising against the Austrian rule. Radetzky, the commander of the Austrian army, was compelled to relinquish Lombardy and fall back on Verona. The king of Sardinia, Charles Albert, took the lead in the struggle, occupied Lombardy, and seemed in a fair way to conquer Venice; but two brilliant victories of Radetzky turned the scale against the popular cause, and the Austrian rule was reestablished. Venice, however, held out; Rome (whence the pope had fled, Nov. 24) and the duchies were republicanized; and, encouraged by the reverses of the Austrians in Hungary, the king of Sardinia once more ventured to measure swords with Radetzky. But in a brief campaign (March, 1849) he was utterly routed, and the very existence of the Sardinian kingdom seemed to depend upon the good will of the Austrian general. The duchies were restored to their former rulers, and guarded by Austrian troops. Rome, after an obstinate defence under Garibaldi and others, was restored to the pope by a French army of occupation. Venice surrendered in August, 1849. While in Naples, Modena, and the Papal States severe reactionary measures followed the overthrow of the popular movement, the new king of Sardinia, Victor Emanuel, fostered liberal institutions, and the Austrian government sought to reconcile the people of Lombardy and Venetia by conferring upon them some material benefits, such as the construction of railroads, the improvement of the port of Venice, reforms in the tariff and the postal system, &c. But all these efforts proved unavailing to overcome the antipathies of the people, and on Feb. 6, 1853, an insurrection broke out at Milan which was suppressed without great effort. In 1857 an unsuccessful attempt to overthrow the king of Naples was made by a small band of republicans, led by Col. Pisacane; and about the same time a republican insurrection occurred at Genoa. The fact that Pisacane had made his attempt on board a Sardinian steamer which he had forcibly taken possession of, and which was afterward seized by the Neapolitan government, gave rise to an acrimonious correspondence between Sardinia and Naples; and in 1858 a war seemed imminent, but was averted by timely intercession. In consequence of Orsini's attempt on the life of the French emperor (Jan. 14, 1858), a special law against all "suspected individuals" was enacted in Sardinia, and this fact was considered as a significant symptom of the intimate relations existing between that kingdom and France.

Austria at that time began to suspect the intentions of her neighbors, and by a series of liberal measures and promises endeavored to strengthen her foothold in Lombardy (July, 1858). Simultaneously she tried to form an Italian league; but, though Modena and Naples were willing to enter into all Austrian projects, the duchess regent of Parma, whose husband had been assassinated in 1854, and the grand duke of Tuscany declined. When, in August, 1858, it became known that Sardinia had ceded to Russia a locality suitable for a navy yard at Villafranca, and that Russia had sought to purchase the principality of Monaco and applied to the king of Naples for the cession of a naval depot at Brindisi, the opinion became general that a triple alliance against Austria, the soul of which was the Sardinian minister Cavour, was on the point of being concluded. This opinion obtained further strength when Prince Napoleon sought a matrimonial alliance with the daughter of the king of Sardinia. On New Year's day, 1859, a few words spoken by Napoleon III. to the Austrian ambassador dispelled all doubts in regard to his hostile intentions. While the preparations for war on both sides were going on, the people of Italy became assured that it was not a change of foreign supremacy, but really the liberation and national organization of Italy, which the French emperor intended to accomplish. Dreading the approach of a revolution, the king of Naples set free many prominent political prisoners. On April 21 the Austrian general Gyulai sent an ultimatum to the king of Sardinia, and crossed the Ticino in three columns, April 26-29. The duke of Modena, the duchess of Parma, and the grand duke of Tuscany, unable to make head against a popular rising, quitted their states; the duke of Modena taking his political prisoners along with him, and transferring them to the dungeons of the Austrian fortress of Verona. For nearly a month no open hostilities occurred, the Austrians contenting themselves with plundering the rich district of Lomellina. Their left wing having been defeated near Montebello (May 20), and the enemy being on the point of outflanking their right wing (battles of Palestro, May 31 and June 1), they recrossed the Ticino and were routed in a great open battle near Magenta (June 4). The consequence of this defeat was the relinquishment by the Austrians of Milan and the entire N. W. portion of Lombardy, which in the mean time had been invaded by Garibaldi. Without risking a defence of the lines of the Adda and Oglio rivers, they retreated to the line of the Mincio. There, in the great battle of Solferino, they were defeated (June 24), but under circumstances which made it appear doubtful whether the French would be able successfully to contend with them on the ground of their famous quadrilateral of fortresses. Considering this uncertainty, as well as the threatening attitude of Prussia, the French emperor suddenly

concluded a truce, which was immediately followed by a personal interview between the two emperors (July 11) at Villafranca. There the preliminaries of a peace were arranged, by which Lombardy, exclusive of the important fortresses of Mantua and Peschiera, was ceded to Sardinia, which had to pay for this conquest a sum of \$42,000,000. Venetia was confirmed to Austria. The restoration of the grand duke of Tuscany and the duke of Modena was stipulated for, the question about Parma being left open. A promise was held out to Italy of the formation of an Italian confederation under the honorary presidency of the pope. Intense discontent arose in Italy when these stipulations became known. The people of the duchies and likewise of the Romagna (the insurrection in the other provinces of the Papal States had been quelled by the mercenary troops, principally at Perugia, June 20) united in their protestations against the restoration of their former rulers. They solemnly transferred their allegiance to the king of Sardinia, but he thought best still to refuse the crown proffered to him, and to substitute Signor Buoncompagni for the prince of Carignano, to whom the regency was subsequently offered. The peace was signed at Zürich in accordance with the original stipulations of Villafranca, Nov. 10. The final settlement of the affairs of the duchies was to be effected by a European congress, the meeting of which was expected to take place in January, 1860. This, however, was delayed or prevented by subsequent diplomatic developments. A few weeks before the time fixed upon for the meeting of the congress, a pamphlet entitled "The Pope and the Congress" was published in Paris, which, though bearing the name of M. de La Guéronnière as author, was generally understood to have been written by the French emperor or under his direction. Its leading doctrine was that the revolted Papal States should not be forced to return to their allegiance, and that the pope must be restricted as a temporal sovereign to a very small territory and to limited authority. This was followed by a letter from the emperor to the pope, in which the latter was vainly urged to sacrifice the revolted provinces, and a promise was held out to him that the possession of the remainder should be guaranteed to him by the approaching congress. In February the French government demanded, and on March 24 the Sardinian government granted, the cession to France of Savoy and Nice as an indemnity for the expenses incurred in the recent war against Austria. The insurrection which broke out in Sicily on April 4 was destined to lead step by step to that unity of Italy so long the dream of her patriots. The Sardinian prime minister Cavour at first outwardly condemned the insurrection, and made some show of opposing the part which Garibaldi and his volunteers were preparing to take in it. But the latter embarked at Genoa on May 5 with his followers

on board a Sardinian steamer, landed at Marsala on the 11th, and on the 14th assumed the dictatorship of the island in the name of Victor Emanuel. On Aug. 3 the latter was there proclaimed king of Italy; on the 19th Garibaldi landed at Reggio, and on the 27th was proclaimed dictator of the Two Sicilies. Cavour now threw off the mask; Admiral Persano and his fleet coöperated with Garibaldi in the south, and the Sardinian armies, which had been wresting from the pope one after another of his provinces, received orders to proceed to Naples. The victories gained by Garibaldi at Cajazzo and on the Volturno, the flight of Francis II. to Gaëta, and the subsequent surrender of that stronghold, Feb. 13, 1861, removed the last real obstacles toward national unity. Time, it was then said, would soon restore Venice to Italy, and the shadow of sovereignty still left to the pope was felt by all to be merely a question for diplomacy to settle. On Feb. 18 the first Italian parliament assembled at Turin, and on the 26th the deputies decreed to Victor Emanuel the title of king of Italy. The decree was promulgated on March 17, and the title officially recognized by England on the 30th, by France on June 15; and the other powers, after some delay and hesitation, acknowledged the accomplished fact of Italian nationality. Cavour, dying in June, 1861, was succeeded as prime minister by Ricasoli. Garibaldi, abetted by some of the most ardent votaries of unity, feeling aggrieved by the cession to France of Nice and Savoy, by the presence in Rome of French troops, and by the keeping up in that city of the papal sovereignty, published a proclamation in August, 1862, calling on the people to resist foreign oppressors, landed in Calabria on the 24th, and was defeated and taken prisoner by the government troops on the 28th at Aspromonte. The French occupation of Rome continued to embarrass Italian statesmen, amid all the financial and social problems which demanded of them an immediate practical solution. On Sept. 15, 1864, a treaty was concluded with France stipulating for the evacuation of Rome within a specified time, and providing for the transfer of the seat of government from Turin to Florence. The announcement of this latter measure caused serious disturbances in Turin, and these were followed by another Garibaldian rising in Lombardy, which was suppressed by the government. On May 13, 1865, the king of Italy took up his residence in Florence, the minister of finance having previously demanded of parliament permission to raise a loan of \$88,000,000. Meanwhile the king and his ministers sought to enter into negotiations with the pope relating to the nomination of bishops, and a peaceful adjustment of the reciprocal claims of the holy see and the new national government; but Signor Vegezzi, who had been accredited as special envoy from Victor Emanuel to the pope, failed to bring about a conciliation. Early in 1866 negotiations were

opened with Prussia aiming at an alliance which should eventually compel Austria to give up Venetia. On April 8 a conditional treaty of alliance was concluded with Prussia, and the most active preparations were made for war. The king and Gen. Lamarmora joined the army on June 17; on the 20th war was declared; the Italian army crossed the Mincio June 23, and on the following day was defeated with great loss at Custozza; Garibaldi and his volunteers were also beaten by the Austrians at Monte Suello in Tyrol, July 3; and on the 20th the Italian fleet under Persano was defeated with great loss at Lissa in the Adriatic, by the Austrian admiral Tegetthoff. But in the mean while the war in its general aspects had been decided against Austria by the battle of Sadowa (July 3), and Francis Joseph, in order to conciliate Italy, had vainly renounced his Italian possessions. (See AUSTRIA, vol. ii., p. 150.) By the peace concluded Oct. 3, Venetia was ceded to the kingdom of Italy, and the king made his public entry into Venice Nov. 7. At this time the friendly relations existing between Italy and France were imperilled by the attack made on Rome by volunteers under Garibaldi. France had withdrawn her troops from the Roman territory, leaving temporary garrisons in Rome and Civit  Vecchia; but at the same time she encouraged the pope to raise an army for the defence of Rome, allowed a legion to be recruited on her soil for that purpose, and permitted her own soldiers to enlist in the pontifical service. To this legion were soon added bodies of volunteers from every Catholic country, even Lower Canada furnishing a contingent. The advance of Garibaldi, only apparently opposed by the cabinet under Rattazzi, was condemned by a proclamation of the new ministry under Menabrea, Oct. 27, 1867, and government troops were sent forward into the papal territory to control his movements; and on the 28th a body of French troops debarked at Civit  Vecchia, which defeated the Garibaldian forces at Mentana, Nov. 3. In the preceding month of May the financial situation had become so critical, that the king in a message to parliament gave up his own share of the civil list, and proposed the sale of church lands and the reduction of the public expenditure. A few days afterward French capitalists advanced \$86,000,000 for the proposed sale, and in August a bill was passed legalizing the sale. These and similar measures, inaugurated chiefly under the Lanza cabinet, helped to maintain the national credit; but the political situation consequent upon the presence of French troops and other foreign soldiers in Rome continued to become more and more embarrassing. There were frequent risings and disturbances throughout the country, and the general uneasiness, increased by the presence and appeals of Mazzini, at length induced the king, in September, 1870, to address a letter to the pope announcing that the occupation of Rome by Italian troops was indispensable to the public tran-

quillity. At the beginning of the Franco-German war the French emperor had withdrawn his last soldier from Italy (Aug. 21); on Sept. 12 the government troops took possession of Viterbo, and on the 20th, after a brief resistance, they entered Rome. This event was notified to the European courts by a circular of Oct. 18. In the beginning of December the Italian parliament met and declared Rome the capital of Italy. On the 26th of that month the Mont Cenis tunnel was completed, and hailed as inaugurating an era of great commercial prosperity for the peninsula. On May 13, 1871, the Italian parliament, still sitting at Florence, passed the act known as the bill of the papal guarantees, which defined the situation of the sovereign pontiff and regulated the relations of church and state. The pope was to remain in possession of the Vatican with its dependencies, known as the "Leonine City," and of the Lateran and Castel Gandolfo. On July 2 Victor Emanuel made his solemn entry into Rome, and took up his residence at the Quirinal. The opening of the Mont Cenis tunnel to traffic was celebrated at Turin on Sept. 17. On Nov. 27 the king opened the first Italian parliament held in Rome, and at the close of his inaugural discourse announced that the tunneling of Mont St. Gothard would be speedily undertaken. During 1872 Italy enjoyed comparative political and social tranquillity, and was only visited by a fearful eruption of Mount Vesuvius, beginning April 24, lasting a week, and causing great destruction of life and property, and by autumnal inundations in the basin of the Po, which left 80,000 persons dependent upon public charity. The debates of the parliament in May were rendered memorable by an attempt of the government to introduce a bill granting privileges to the heads of religious corporations in Rome, and by the vehement opposition offered to it by the party of the left, headed by Prince Emanuele Ruspoli. The debates were attended by popular demonstrations, rioting, and bloodshed. On Oct. 20 the Jesuits were expelled from the Roman college and the three other houses occupied by them in Rome; and on the same day the first scientific congress held in Rome met in the capitol under the presidency of Count Mamiani. (See VICTOR EMANUEL.)—The most important historical works on Italy are: Guicciardini, *Storia d'Italia* (10 vols., Pisa, 1819-'20; English translation by A. P. Goddard, 10 vols., London, 1763); Muratori, *Annali d'Italia* (12 vols., Milan, 1741-'9); Botta, *Storia d'Italia dal 1789 al 1814* (Paris, 1824), and *Storia d'Italia dal 1490 al 1814* (Paris, 1832); Gualterio, *Gli ultimi rivolgimenti italiani* (6 vols., Palermo, 1869); Lebret, *Geschichte von Italien* (1778-'87); Leo, *Geschichte der italienischen Staaten* (1829-'32); Reumont, *Beitr ge zur italienischen Geschichte* (1853-'7); Fantin des Odoards, *Histoire d'Italie* (1802-'3); Sismondi, *Histoire des r publiques italiennes* (16 vols., Paris, 1807-'18; later eds. in 10 and 8 vols.;

abridged in English, 1 vol., London, 1832); Wrightson, "History of Italy from the French Revolution to 1850" (London, 1855); Arrivabene, "Italy under King Victor Emanuel" (2 vols., London, 1862). The principal travellers in Italy who have given accounts of their tours in letters, journals, or more elaborate works, are Montaigne, Evelyn, Gray, Smollett, Dr. Moore, Goethe, Joseph Forsyth, Mme. de Staël ("Corinne"), J. C. Eustace, Henry Matthews, Lady Morgan, Miss Eaton, W. S. Rose, Hans Christian Andersen ("The Improvisatore"), Mrs. Kemble, William Spalding, and George S. Hillard. See also Fulchiron, *Voyage dans l'Italie méridionale, centrale et septentrionale* (7 vols., Paris, 1847-'58); H. Alford, "Letters from Abroad" (2d ed., London, 1865); and Taine, *Voyage en Italie* (2 vols., Paris, 1866; English translation by J. Durand, 2 vols., New York, 1869; 1 vol., 1874).

ITALY, Language and Literature of. The term Italian language is applied in literary history to what is at present the universal vehicle of official communication, religious instruction, epistolary correspondence, and general literature throughout Italy. But it is only in Tuscany and parts of the adjacent provinces that this is the household speech of even the educated classes. In Piedmont, Lombardy, the Venetian and Ligurian territories, in a great part of the former States of the Church, and in the Neapolitan provinces, as well as in Sicily and Sardinia, all alike employ local dialects in ordinary oral intercourse. Persons of even moderate culture are, indeed, able everywhere to use Tuscan freely, though always with local peculiarities of pronunciation and expression; but the vernacular is the habitual medium of thought, and, as Biondelli emphatically states, the written productions of non-Tuscan authors are translations. The parentage and formation of this Tuscan or Italian constitute a much discussed and most interesting linguistic problem. According to Giuseppe Micali, ancient Italy most probably had a common language of many dialects, which were divided into two main branches, the dialects of Etruria and Umbria, represented chiefly by the Iguvian, and the Sabine, Samnian, and Oscan, which included the Marsican, Volscian, and Hernician. Greek was spoken in the south, in Magna Græcia. The Latin was the dialect used by the mixture of Pelasgian Siculi and Osci from the Abruzzi, who together formed the historical Latini on the lowlands about the Tiber. Their idiom became in time the official language of the Roman republic and empire. This supremacy of the Latin, apart from any intrinsic excellence of its own, may have contributed to the neglect and debasement of the cognate dialects. In this debasement the Latin itself must have shared during the occupation of Italy by the barbarians. Whether the local dialects recovered their old popular ascendancy while the governmental language of Rome was in disfavor with the conquerors, is a matter of con-

jecture. It is certain that the Oscan became extinct in the 1st century B. C., and that the Etruscan continued to be spoken under the republic and the empire down to the middle of the 2d century A. D., as attested by Aulus Gellius. But in Cisalpine Gaul and along the shores of the Adriatic, as far at least as Ancona, the Celtic was spoken at the epoch of the Gothic domination, and contributed, according to O. M. Toselli, more elements to the Italian than did the Latin itself. Thus many of these local dialects survived through the middle ages, were modified by the influence and literature of the church, and are more or less faithfully represented by the vernacular idioms of modern Italy. The common roots of all of them are traced to an Indo-European stem; but the formation and growth of the modern Italian has not been conclusively shown to be derived from any known parentage, as the pedigree of English is carried back to Anglo-Saxon and Norman French. Three theories have been advanced on this subject. The first asserts the Italian to have anciently coexisted with the Latin; the latter being the language of the learned, of public oratory, and of legal documents, while the former, as the *Romana rustica*, was the language of the common people and of ordinary conversation, and maintained its ground after the other had died with the aristocracy. Such is the theory of Leonardo Bruni, Cardinal Bembo, Saverio Quadrio, and others. The second maintains that the primitive dialects lived in spite of neglect and proscription, and, modified by time, concurred with the Latin to form the basis of modern Italian. This hypothesis has the authority of Muratori, Fontanini, Tiraboschi, Denina, Ginguené, and Sismondi. A third theory, which is that of Maffei, affirms that Italian is merely a corrupt Latin, without any admixture of foreign tongues. But no facts are adduced to support this theory of a gradual change of Latin into modern Italian speech. Latin died like Mæso-Gothic, and, in Italy at least, left no lineal descendant, though the present speech of Rome, as it is nearest in lineage, is probably nearest also in character of all the modern Italian dialects to the vernacular language of old Rome at her best period. Mediæval Latin, it is true, became corrupt, and was often mixed with words borrowed from the vulgar idioms; but it still remained essentially Latin, and as yet no well authenticated remains have been found of a transitional stage from the old classical to the modern Italo-Romance dialects. When the modern Tuscan was first used in literary composition in the 13th century, it was in idiom, grammar, and structure what it is to-day. The writers of that age used the familiar speech of their firesides; and Italian was full-grown, ripe, and perfect when the first native poet embodied his inspiration in it. If we trace it up chronologically, we find that Isidore of Seville in the 7th century mentions the *lingua Italica* as distinct from the Latin. Ciampi

finds that it was in use in the 5th century; and in 960 Gonzo attests its use among the educated classes, while Wittekind mentions its being spoken under the name of *lingua Romana* by the emperor Otho I. (936-'73). Pope Gregory V. (996-'9) delivered his instructions to the people in the same. It was spoken at the court of the emperor Frederick II. (1212-'50) as the *lingua Siciliana*, of which the oldest authentic specimen is a rude song by Ciullo d'Alcamo (about 1195). The Siense idiom of Folcachiero is more chaste, but somewhat later in date. Thus, already in the 13th century the Italian language had attained its regular forms in the north, centre, and south of Italy. While other modern European languages, with the exception of the Icelandic, were still in their infancy, Dante (1265-1321) did most of all in developing and consolidating the native elements, legitimating the exotic accessions, and polishing the whole language. In the 14th century the language was still further perfected by Petrarch and Boccaccio. To the latter part of the 15th century and the beginning of the 16th belong the works of artists and scientific men like Leonardo da Vinci, who enriched the language with a new terminology, and those of Machiavelli, the father of Italian prose. Pietro Bembo, Giovanni Rucellai, Jacopo Sannazaro, Trissino, Ariosto, Tasso, Guarini, and others followed, raising it in refinement and melody above all other European languages. Angelo Beolco di Ruzzante, a Paduan (1502-'42), wrote six comedies, in which each person speaks his native dialect; a method analogous to the use of Prakrit in Indian dramas. Benedetto Varchi, a Florentine (1502-'65), reformed the orthography and established the grammar. Grazzini with Leonardo Salviati founded, in the *accademia della Crusca* at Florence, a tribunal of the language (1582). The influence of French on European languages during the 17th century began to be exerted on the Italian, especially on its syntax. Algarotti was the chief fosterer of this influence. But Monti and Perticari strenuously and successfully resisted this denationalization, and restored to their cherished tongue the direction imparted to it in the 14th century.—The following details relate to the *illustre favella* of Dante, unless a dialect be mentioned. The comparative harmony of intonation of the Italian and Spanish languages is a matter of individual preference. We place the Italian first with respect to music, but prefer the Spanish as to the *numerus* or euphony of speech. Only five Italian words end in consonants (three liquids), viz.: *il, in, con, non, per*. By dropping *e* and *o* after liquids only, other words are made to end in them, thus: *parlarono, or parlaron*; dropping *n, parlare*; also *parlar*, which is also the infinitive (from *parlare*) or the negative imperative. Too many words end in *i* (plural from *e, o*, and from a masculine, and second person singular of verbs); for instance: *Sapete, amici miei, che tutti i celebri poeti italiani*

sieno stati colmi di allori ed onori, nei secoli passati. The sound of *h* exists only in the *lingua toscana*. The Spanish has only one rough sibilant, *ch* (as in our *church*), whereas the Italian has this, written *ce, ci*, as well as the sound of our *sh* (in *ship*), written *sce, sci*; moreover, *ge, gi* (as in English *gem*), the double consonants *ts* and *dz* (both written *z*), of which the former supplants the melting sound of the Latin *tia, tie, tio*, as in *tristezza, pazienza, nazione* (for *tristitia, patientia, natio*), &c. *Oggi, fuggire, uccidere*, and the like, exaggerate the harshness by a preceding sound of *d* and *t*. The ratio of initial and medial consonants to the vowels is as two to one in Latin, while they are about equal in number in Italian. Besides the above mentioned sounds, there are *b, d, f, l, m, n, p, q, v*, as in English; *c* like *k* in the same positions as in English, and *g* hard (written *ch, gh*, before *e, i*); *j* medial sound, like our *y* in *yes*, but as final it is a long *i*; *r* always rolling; *t* always hard (in old writings also like *z*); *s* as in English *sun, rose*, never as in *vision, mission*, the *i* retaining its distinct sound, as in *vi-si-o-ne*. The letters *k, w, x*, and *y* are not used, and *ph, th* are represented by *f, t*, as in *filosofia, teatro*. *H* only occurs in *ho, hai, ha, hanno* (Latin *habeo, habes, habet, habent*, which Metastasio wrote *ò, ài, à, ànno*), and combined in *ch, gh*. The *l* and *n mouillés* of the French are written with *gli* and *gn*. The vowels sound as in the words *father, pat*; *fête, pet*; *marine, pin*; *note, not*; *too, put*. The Italian accent is strongly marked, and affects one of the four last syllables of words; hence its adaptability to pentameter and hexameter verse, and its singularly musical prosody. Rhyme is only accessory. The mark (') is only used for the sake of instruction; the sign of the grave accent is written on the finals of abbreviated words, such as *città, mercè, di, virtù, ciò* (for *cittade, mercede, die, virtude, Lat. quod*), &c.—In richness of augmentatives and diminutives, both of endearment and aversion, the Spanish is equal and the Karalitic (in Greenland) superior to the Italian. The definite article is more multifarious than in the cognate languages. This is due to its contraction with prepositions and also with *non*, thus: *del, dalla, al, nello, coi, pel, frai, sugli, nol, &c.* There are two forms of the masculine: *il, lo*, plural *i, gli*. The auxiliary verbs are due to the influence of the Teutonic tongues, though faint traces of a similar use of *esse* and *habere* may be found in ancient low Latin. Conciseness of expression is obtained by the following means: *a*, by using the infinitive of a verb as a substantive, thus: *il parlar vezzoso*, genteel speech; *b*, by joining pronouns, when regimens, to the imperative, infinitive, or gerund, thus: *datemelo*, give it to me; *il pensarne mi consola*, the very thought of it consoles me; *raccontandoglielo*, in telling it to him, &c.; *c*, by dropping the final *e* or *o* after liquids, mostly before words commencing with consonants (see above); *d*, by dropping final vowels or syllables before both consonants

and vowels, with or without the sign of the apostrophe, even of initial vowels, as in the following from Dante :

Quando l' udi' nomar se stesso il padre (mio),

and

Io vo' con voi della mia donna dire

(for *io udi, voglio*). The construction is direct, inversion frequent, and the whole phraseology freer, bolder, and more variable than in French. On the other hand, some terminations are fatiguingly long, unless the writer be master of his style, and ornaments of speech often superfluous. The poetic idiom differs more from the prosaic than in any other living language of Europe, not only on account of great licenses in the alteration, addition, and omission of sounds, but also by a multitude of exclusively poetic words.—The area of the Italian language comprehends the whole peninsula and the islands of Sicily, Sardinia, Corsica, &c.; the Swiss canton of Ticino, and parts of the Grisons and Valais; south Tyrol, some cities of Istria and of Dalmatia, and partly the Ionian islands. A rough idiom of Mediterranean navigators, and a jargon known as the *lingua franca*, are spoken in the Levant. Many of the dialects differ as much from the cultivated Italian as it differs from Spanish, and some even more. This is owing to the ancient local varieties of the *Romana rustica* and of others, as well as to the tongues of foreign invaders. While some words have many significations, as for instance *cassa*, which has 25 in Milanese, other objects have very many names devoid of analogy of any kind, as for instance turkey (*meleagris gallopavo*), which has about 20 Italian provincial names. Dante (*De Vulgari Eloquentia*) speaks of 14 dialects, one class on the west, the other on the east of the Apennines. Those on the north approach the Provençal language. K. L. Fernow (*Römische Studien*, Zürich, 1808) distinguishes in the Toscana alone, though considered as the most homogeneous, 8 sub-dialects. Dante's classification has been somewhat modified. In the "North American Review" for October, 1832, 17 principal dialects are noticed. All the varieties of idioms amount to nearly 1,000. There are German-speaking communities in the north of Italy, viz., the *sette* and the *treddici comuni*; Greek-speaking villages in Calabria; and Albanian (Skipetar) settlements in both Sicilies.—The Toscano had the principal part in forming the *volgare nobile*, all great writers of the 13th and 14th centuries having been Tuscans. Machiavelli's *Discorso* asserts that the idiom of Dante, Boccaccio, and Petrarch, or *la lingua fiorentina*, is the genuine Italian. Other Italians rebel against this autocracy; and the decrees of *la Crusca* have often been unrecognized. The Florentine and Siense emasculated utterance of the *c*, *ch*, *g*, and *gh*, is extremely unpleasant to an unspoiled ear; but this is in part compensated by a great regularity and uniformity in the pronunciation of the

vowels, for which there are fixed and acknowledged standards in Tuscany, while elsewhere there seem to exist no authoritative rules for vowel sounds. In the suburbs of Rome there are at least three *patois*. In Tuscany the sub-dialects of Siena, Pisa, Arezzo, Leghorn, Lucca, Fucecchio, and Volterra are worthy of mention. The Bolognese drops many medial and final vowels, as for instance: *Acqsi vâ st' nostr mond; o prest o tard al bô murir* (for *Così va questo nostro mondo, al bisogno*, &c.). Those of Norcia and Spoleto, on the contrary, have lost many consonants. The Perugino, Loretano, and Camerinese are among the most noticeable in the old papal legations. The Venetian softens consonants effeminately, thus: *Lassate dar un baso a boccoletto* (for *Lasciate dar un bacio*, &c.). The Paduan, a transition from this to the Lombard, is one of the least intelligible. The high Lombardic and the Tanzi Milanese drop final vowels, and often medials; they share with the Piedmontese and Genoese in the use of the French vowels *eu*, *u*, the nasals *an*, *in*, *on*, and also of French *j*. These, however, are wanting in the low Lombardic, the Mantuan, and Cremonese. The Bergamask is the rudest of all, from contractions, thus: *Za Giove l'hiva fatt el grand decret; Da colocat o gatt la su in di steli, insem col cà* (for *Gid Giove aveva fatto il gran decreto; Di colocar il gatto fra le stelle, insieme col cane*). The Piedmontese also contracts much, and has many almost French sounds, thus: *bsogne, mangé* (*besoin, manger*), &c. The Genoese approaches the Provençal, but has some rough sounds; it often uses *r* for *l*. The Neapolitan transposes many sounds, and rejects many syllables, but is very rich in literature. There are several forms of *patois* in the city of Naples. The dialects of the Abruzzi, Apulia, Calabria, &c., are very rude. The Sicilian is very mild and graceful, has many Arabic words (from the 9th century), and vestiges of Greek, Punic, Norman, French, and Spanish domination. In the Sardinian dialects there occur many Greek, Latin, French, and Catalan words intact, and many roots without known filiation. (See *Nou dizionariu universali sardu-italianu, compilau de su sacerdotu benefiziau Vissentu Porru*, &c., Casteggio, 1832.) The Corsican is more akin to the Tuscan than to the idioms of the isles of the gulf of Genoa. In the Friulic there are many Slavic and old French words. This and the Tyrolese most differ from the *favella illustre*. The study of the Italian dialects is now receiving much attention, and the recent labors of Ascoli and Caix, as well as various contributions of Mussafia, and the earlier essays of Biondelli and others, deserve special notice. The linguistic interest of these dialects is great; but though several of them have been reduced to writing, and many lyrical, satirical, humorous, and dramatic compositions of merit have been published in them, yet in no case are these productions sufficiently numerous and comprehensive to constitute a body of litera-

ture; they are rather dilettantisms than serious efforts.—Italian, though practically wordy, is not necessarily periphrastic and diffuse. Davanzati boasts that his translation of Tacitus is more concise than the original. Nor is it by any means so deficient in the power of self-development as is generally supposed. Giuliani has shown that the unlettered Tuscan peasants are very happy in the enrichment of their speech; the use of the privative *s* is extending, and it is often employed with new and striking effect; and new words are not merely introduced from abroad, but freshly formed from Latin or provincial roots. The involution of periods is by no means an inherent defect in the language. Villari, in his life of Savonarola, employs a style of remarkable clearness, logical exactness, and directness, which, if not Tuscan, is, at least according to general principles of criticism, something better than Tuscan; and the *Spagna* of De Amicis is a specimen of light, lively, fluent, and correct composition, of which the literature of our day cannot boast many examples. One of the points which first strike a foreigner who seeks to become acquainted, through the native medium, with the new life which pulsates in united Italy, and especially with the physical character of the country and the material interests of the people, is the poverty of the language of common speech in descriptive terms and epithets. As he advances in a knowledge of Italian general literature, he will find the written dialect almost equally inadequate to express sensations, images, and thoughts which every hour brings to the lips of an American. For the absence of a descriptive and picturesque nomenclature in conversational language, and in poetry and other imaginative compositions, there are several reasons. First, the culture of Italy is to a great extent fashioned after classic models, and of course its tongue partakes of the poverty of the Latin in the material vocabulary; in the next place, the Italian literature known to foreigners belongs chiefly to a period anterior to the development of the sense of landscape beauty and the love of nature in modern life; and finally, in England and America, and in a less degree in northern continental Europe, the diffusion and importance of physical science, of foreign commerce, and of agricultural and mechanical art, have made the vocabularies of all industries a part of the common speech of all classes, and have consequently entered far more largely into the diction of social life, of poetry, and of all belles-lettres literature, than they have done in Italy.—The helps to the study of the Italian language are very insufficient. Pesavento has lately published a valuable comparative view of the structure of Latin and Italian, under the title *Metodo comparativo*; but few good practical Italian grammars, and only one or two tolerable bilingual dictionaries of Italian and other modern languages, exist; and many hand dictionaries with Italian explanations are very deficient in ful-

ness and incorrect in definition, in the department of which we have just spoken. These defects are beginning to be felt by the Italian people. Carena's *Prontuario* and Palma's *Vocabolario dell' agricoltura* supply many a term not found in general handbooks; and a series of technical dictionaries now in preparation under the patronage of the government, of which Canevazzi's excellent *Vocabolario dell' agricoltura* is the first, will soon bring Italian lexicography, at least in the material department, to a level with that of the other European tongues.—LITERATURE. The example of the emperor Otho I. and Pope Gregory V., before mentioned, while it attested the universal prevalence in the peninsula of the Italian or *lingua comune*, contributed also not a little to its being further used and cultivated by all classes in church and state. Thenceforward it became the language of the palace and the pulpit, of deliberative assemblies and law courts, and of all commercial and legal transactions. The Provençal troubadours, who were to be found everywhere in the 12th century from Sicily to the Alps, were superseded by sweeter and better singers in the native tongue of Italy; and the romantic exploits of chivalry and the annals of the courts of love were written in the popular idiom. Thus the growth and polish of the Italian language were the work of religion and patriotism. Frederick II. made it the language of his court at Palermo (1212), of the schools he founded in that and other cities, and of the university of Naples (1224), which owed to him its existence. He, his sons Enzo and Manfred, and his secretary Pietro delle Vigne, wrote verses in it. A sonnet of Pietro's is the earliest known specimen of the kind, but several written by the Sicilian Giacopo da Lentino (about 1250) manifest a much greater perfection. Frederick's literary tastes excited emulation in the cities of central and northern Italy. Guido Guinicelli, who died in 1276 and is called by Dante "the father of me and of my betters," advanced this poetic form to still higher perfection, as is evidenced by his canzone styled "The Gentle Heart" in Dante Rossetti's "Early Italian Poets" (now entitled "Dante and his Circle"). Contemporary with or immediately succeeding him were Guido Ghislieri, Fabricio, and Onesto; Guittone d'Arezzo, in Tuscany (died 1294), whose forty letters to a friend furnish the earliest specimens of the epistolary style in Italian; other Tuscans, among them Bonagiunta da Lucca, Gallo Pisano, and Brunetto Fiorentino; the Neapolitan chronicler Matteo Spinelli, who wrote the earliest Italian prose work of importance, a history of events from 1247 to 1268; and the Florentine historian Ricordano Malespini (died 1281), the genuineness of whose works has been questioned by recent critics. Brunetto Latini (died in 1294), the teacher of Dante, author of the cyclopædic work *Il Tesoro* and the collection of didactic rhymes called the *Tesoretto*, also belongs to this time;

and finally Guido Cavalcanti (died 1300), the friend of Dante, who surpassed all his predecessors in the learning and polish of his philosophic poems, and did much in preparing the way for the great writers who followed him. These authors, of whom little but the names is now familiar to the ordinary student, brought Italian literature to the beginning of its most brilliant and most glorious period, in which Dante (1265–1321) was the great master spirit. Brought up, like all the scholars of his age, in the familiar use of mediæval Latin, his two earlier works (*De Monarchia* and *De Vulgari Eloquentia*) were written in that tongue. But he soon forsook it for the Italian, which he cherished as the main instrument of that national unity which was a dream of his life. His earliest poem, the *Vita nuova*, was written about 1294; the rest were produced in the following order: the *De Monarchia*, the *Convito*, the *De Vulgari Eloquentia*, and finally his crowning masterpiece, beside which all his previous works become insignificant, the *Divina Commedia* (probably 1300–'20), comprising the *Inferno*, *Purgatorio*, and *Paradiso*. It would be impossible to exaggerate the influence of Dante upon the literature of Italy. Though he did not positively re-create the language in which he wrote, he displayed for the first time, and with a power that has not since been equalled, all its capabilities, and its fitness for the highest form of epic poetry and the expression of the noblest thought. The *Divina Commedia*, one of the greatest poetical creations of any age, had an incalculable effect on the scholarship, the taste, and the literary products not only of Dante's own time, but of all succeeding periods. It was as much the basis and foundation as the master work of Italian literature. Chairs for the exposition of the *Divina Commedia* were established in the 14th century in many Italian universities, Boccaccio being appointed to the first, that of Florence, in 1373; and from that time it has never ceased to exercise a paramount influence over Italian writers. Francesco Stabile, called Cecco d'Ascoli, a contemporary of Dante, was almost the only writer who ever endeavored to detract from the poet's fame. His satire, the *Acerba*, a witty but ill-grounded attack, had little permanence. Dante had barely completed his great work when Petrarch and Boccaccio came to share and confirm his literary supremacy, and to form with him that great triumvirate which gave to the 14th century its glory in Italian literary history. Petrarch (1304–'74), distinctively the poet of love, was still more, like Dante, the poet of a united Italy. His chief celebrity consists in his being the father of Italian lyric poetry; in this he outstripped all his predecessors, and has been surpassed by no poet of his country. He sang all the passions, hopes, and memories of love, and lamented all the divisions and miseries of Italy. He, like Dante, preached to his countrymen mutual forgiveness, peace, and

union. His compositions, embracing sonnets, songs, and "triumphs," abound in favorite quotations. And yet his principal philosophical treatises, like his first poem, *Africa*, are in Latin, and afford evidence of his great learning, just philosophical thought, and perfect mastery of the language. But great as is the praise due to Petrarch for the intrinsic excellences of his writings, he deserves still more for his lofty patriotic purpose, and the great services rendered in promoting the revival of sound learning. Giovanni Boccaccio (1313–'75), the third in this great literary triumvirate, was the ardent admirer and sentimental biographer of Dante, the warm friend of Petrarch, and had the good fortune of being the protégé of the accomplished and luckless queen Joanna I, granddaughter of Robert of Anjou, king of Naples. Like Frederick II, Robert had been the munificent protector of Italian art and literature, and like him cherished the Tuscan dialect, in which he left several compositions. Boccaccio's *Teseide* was written in *ottava rima*, which was known in Sicily before him, and which he perfected. This and a prose romance were his earliest compositions. Several works in Latin followed. In 1352 appeared his *Decamerone*, or "Ten Days' Entertainment," so called because each of the seven ladies and three young men introduced into it relates a story each day, thus producing 100 stories in 10 days. This work is regarded as the purest specimen of prose of which the Italian language could boast until that day; but its graces of composition too often adorn the most licentious descriptions. Boccaccio's stories must not be confounded with the *Cento novelle antiche*, "A Hundred Ancient Tales," which are partly written from the *Decamerone*, and partly from older popular stories, but all free from indelicacy, and narrated with great simplicity. Franco Sacchetti of Florence (died about 1500) emulated the style of Boccaccio, and composed in a pure and elegant diction 300 tales, of which 258 are still extant, published in the beginning of the 18th century. Another Florentine, Ser Giovanni, left the *Pecorone*, a collection of 50 similar stories. The *Storia fiorentina* of Dino Compagni, embracing the annals of Florence from 1280 to 1312, is considered by modern critics as of doubtful authenticity. Of the work of Giovanni Villani, which embodied the history of Florence from its foundation till a few years before the author's death in 1348, only that part is considered trustworthy which treats of the author's own time. This work was continued by Giovanni's brother, Matteo, down to 1363, and to 1365 by Filippo, Matteo's son, who also wrote biographies of illustrious Florentines. Of ascetic works in the Italian language, the first known example is the *Specchio della vera penitenza* of Giacompo Passavanti (died in 1357), which is comparable for purity and grace of diction with the *Decamerone*. Passavanti's was followed by similar treatises

of equal excellence, written by Domenico Cavalca of Pisa, Bartolommeo da San Concordio, and Agnolo Pandolfini.—Most of the men who flourished in the 14th and 15th centuries were not distinguished like Dante and Petrarch for creative genius, but delighted rather in reproducing and commenting on the authors of antiquity. The printing press, invented in Germany, was most usefully employed in Venice, Bologna, and Rome, in multiplying copies of the ancient authors, corrected by learned scholars. To the passion for discovering and publishing new manuscripts was joined that of finding and interpreting ancient monuments, medals, inscriptions, and sculptures. Only the first steps toward a new civilization had been taken by Petrarch and Boccaccio. The introduction of the mariner's needle by Flavio Gioja had opened the ocean to the Europeans; the travels of Marco Polo had awakened that curiosity concerning the way to the East Indies which led Columbus to the discovery of the new world; the Arabic numerals had been substituted in Italy for the Roman; academies were established to nurture the love of letters, and courts became an asylum for the most distinguished men; and the popes in Rome, the Medici in Florence, the houses of the Visconti and the Sforzas in Milan, and of the Gonzagas and Estes in Mantua and Ferrara, became protectors of literature and the arts. Pope Nicholas V. is especially distinguished for the encouragement which he gave to every branch of learning. It was under his liberal protection that Francesco Filelfo translated the Iliad and the Odyssey into Latin verse. His example was followed by numerous courts in Italy; hundreds of authors found employment and support; and the advantages of literature were to some degree extended among the people. Alfonso of Aragon, king of Naples, is eminent among these Mæcenas-like patrons. Montefeltro of Urbino, the house of Bentivoglio in Bologna, Filippo Maria Visconti, and Francesco Sforza vied with the Medici and the house of Este in protecting letters and giving an asylum to those exiled Greeks who brought to Italy their learning and advanced culture. Lodovico Sforza, surnamed 'il Moro, invited to his court in Lombardy many learned men, painters, and architects, among whom were Leonardo da Vinci and Bramante, patronized the university of Pavia, granting it many privileges, and opened schools in Milan, to which most renowned professors gave distinction. Gian Francesco Gonzaga, marquis of Mantua, invited Vittorino da Feltre to instruct his sons, and the school which he opened was frequented by young men from Greece, Germany, and France. The example of the houses of Este and Gonzaga was imitated by the dukes of Savoy, who in the beginning of the 15th century founded the university of Turin. But the most illustrious of the patrons of letters was Cosmo de' Medici, who rose to preëminence among the noble families of Europe. He found-

ed one library in Venice (the Laurentian) and three in Florence, and established the first academy for the study and promulgation of the Platonic philosophy. Pico della Mirandola and Cristoforo Landino exercised the happiest influence in advancing and creating a popular esteem for knowledge, and especially in exciting the Florentine youth to an enthusiasm for it. The former was almost unrivalled in erudition, being profoundly versed in numerous languages, in metaphysics, and in mathematics. Lorenzo de' Medici (died in 1492) greatly and variously increased the glory which his grandfather had acquired in the culture of learning. But the taste for Latin composition again became predominant, and Italian was at this period hardly used at all in writing; it was even disdained for legal documents, and its development was arrested by a boundless reverence for antiquity. But Lorenzo the Magnificent may be considered the reviver of Italian literature, and was even called its father. Most esteemed for his virtues and manners, he enriched libraries, aided in founding a Platonic academy in Florence, reopened the university of Pisa, collected numerous remains of antiquity, promoted the study of the popular poetry, and wrote himself many admired pieces for the improvement of the public taste. His *Nencia da Barberino* is the first example of Italian rustic poetry, and his *Compagnia del Mantellaccio* seems to have given the first idea of Italian satire in *terza rima*. Under him Florence became a new Athens. Angelo Poliziano (1454-'94) enjoyed the friendship of Lorenzo, attained to great erudition, and was an elegant writer both in Italian and Latin. His most celebrated works are the *Giostra* and the *Orfeo* (the first regular and consistent Italian drama), which were imitated even by Ariosto and Tasso. Contemporary poets of less note were Burchiello, Girolamo Benivieni, and Giusto de' Conti. To the various kinds of composition which have thus far appeared must now be added some epics. Of the brothers Bernardo, Luca, and Luigi Pulci, only the last (1431-'87) achieved lasting eminence in poetry. His *Morgante Maggiore*, burlesque and fantastic, opens the brilliant Italian series of romantic poems of chivalry. It belongs to the circle of legends concerning Charlemagne and his paladins, but degrades the primitive simple faith in them by persiflage. The *Mambriano* of Cieco da Ferrara deserves to be mentioned and compared with the *Morgante*. The best of the romantic poems of the 15th century is the *Orlando innamorato* of Boiardo, which introduced materials so beautiful and so vast as to induce Ariosto to follow in the same path. To sustain the marvels of his subject, he employed magicians and fairies in connection with the classic divinities, and beneath the veil of poetry he represented the most useful truths of philosophy. The *Orlando innamorato* was left incomplete, and the original has become rare even in Italy, on account of its rude and an-

tique diction. Its tone is much modified in the elegant version of it by Francesco Berni, which has enjoyed the most general favor. The prose literature was enriched by the writings of two artists: Leone Battista Alberti, the author of a dialogue *Della famiglia*, containing philosophical precepts for domestic life and the education of children, and of treatises on painting and architecture which gained him the name of the Italian Vitruvius; and the renowned Leonardo da Vinci (1452-1519), at once painter, sculptor, architect, mathematician, musician, the best extemporaneous poet of his time, and the author of a *Trattato della pittura*, which reveals both his scientific and artistic knowledge, and is a classical authority on the use of terms pertaining to the arts and sciences. Numerous historians also belong to this age. Pandolfo Collenuccio was the first to write an esteemed history of the kingdom of Naples, revived and corrected the taste for comedy, founded the first museum of natural history in Europe, and wrote dialogues after the manner of Lucian, and the solemn *Inno alla morte*. Historians of travels were the Genoese Giorgio Interiano and the Venetian Cadamosto, who give the oldest narratives of the Portuguese discoveries, and the Florentine Amerigo Vespucci. Aldo Manuzio (Aldus Manutius) rendered signal services to letters, and gained a European repute by the care and taste with which he published the classics. —The 16th century, the *cinquecento* of the Italians, is known as in many respects the golden age of Italian literature and art. Leo X. was on the papal throne what his father Lorenzo the Magnificent had been in Tuscany, the munificent patron of artists and men of letters; and the other sovereigns of Italy vied with the popes in this liberal patronage. But if the writers patronized by them, and breathing the atmosphere of their courts, gave evidence of improved taste and more exquisite perfection of form, they manifested also not a little of servility. The native literature of the two preceding centuries had sprung up and flourished amid free institutions, and was the expression of the popular mind and heart. Men of letters in the 16th century were for the most part the hirelings of princes, and literature became a courtly exercise. In poetry Ariosto (1474-1533) stands preëminent. The protégé of the dukes of Ferrara, he aims at describing in his romantic epic, *Orlando furioso*, the origin of the house of Este. Tasso praises him for fertility of invention and propriety of treatment. Ariosto wrote also satires on the rulers and politics of the age, and two comedies, for the performance of which a theatre was constructed by the poet's patrons. A number of other writers, carried away by his success, attempted epic compositions, among which are Alamanni's *Girone il cortese* and *Avarchide*, Valvasone's *Angeleide*, which is thought to have suggested to Milton the conception of the "Paradise Lost," Tris-

sino's (1478-1550) *Italia liberata dai Gotti*, a poor imitation of Homer, Brusantini's *Angelica innamorata*, the *Guerino meschino* of Tullia d'Arragona, and the *Amadigi* of the Bergamese Bernardo Tasso. But nearest in excellence to Ariosto comes Bernardo's son, Torquato Tasso (1544-'95), who aimed at combining in his *Gerusalemme liberata* the epic grandeur of Virgil with the lighter graces of the romantic muse. His *Rinaldo* and *Aminta* are also full of poetic beauty. The success of Ariosto in comedy had awakened zeal for dramatic composition. Trissino produced *Sofonisba*, the first Italian tragedy of high merit, and Rucellai his *Rosmunda* and *Oreste*, represented at the expense of Leo X. Superior in merit to these are the tragedies *Tullia* by Martelli, *Canace* by Sperone Speroni, *Torrismondo* by Torquato Tasso, and *Edipo* by Andrea dell'Anguillara, all moulded on the Greek drama. In comedy the Italian authors of this century were the servile imitators of Plautus and Terence. In high comedy (*commedia erudita*) the best examples are the *Calandra* of Cardinal Bibbiena, the *Cassaria* and *Suppositi* of Ariosto, and the *Madragola* and *Clizia* of Machiavelli. To the Florentines belongs the invention of the opera, *Daphne*, the first ever written, having been represented in 1597; the words were from that of Peri. The melodramas of the Modenese Orazio Vecchio are considered by Muratori as the beginning of modern opera. In pastoral poetry, besides the *Aminta* of Tasso, this age boasts of Guarini's *Pastor fido* and Sannazaro's *Arcadia*. The chief didactic poems are the *Api* of Giovanni Rucellai, the *Navigazione* of Bernardino Balbi, the *Coltivazione* of Alamanni, and the *Caccia* of Valvasone. A school of burlesque poetry arose about 1520, named *genere berneseo* after Berni, whose *Orlando innamorato* unites grace, elegance, and originality. In satire the first place belongs to Ariosto, after whom may be mentioned Ercole Bentivoglio and Filippo Nerli. Luigi Alamanni, like Pietro Aretino, whose versatile talent led him to write on many subjects, is chiefly known for his indelicacy. Macaronic poetry owed its invention or its happiest improvement to Teofilo Folengo (died in 1544), known as Merlino Cocajo. Angelo di Costanzo's sonnets are models of perfection, which Michel Angelo nobly emulated, while Bembo aimed like them at popularizing the language of Dante among the learned. Annibale Caro gained great praise for his translation of Virgil and his original compositions. Bernardo Davanzati's version of Tacitus is thought to surpass the original in conciseness and energy; he also wrote a history of the reformation in England. To Vittoria Colonna (1490-1547), among the women of this century, Ariosto awarded the palm of poetical excellence. An important place in the literature is held by political writers, foremost among whom was Machiavelli (1469-1527). A dramatist and historian of Florence, he is

chiefly known as a profound and philosophical statesman by his discourses on Livy, his dialogues on the art of war, and especially by his *Principe*, a manual of government, which was constantly in the hands of such sovereigns as Charles V. and Sixtus V., and the real intent and character of which has been long in dispute. His style is marked by simplicity, strength, thought, and a rare but felicitous use of ornament. Other political writings were the *Ragione di stato* of Botero, and the *Repubblica fiorentina* of Giannotti. Nearer to Machiavelli in merit was Paruta (1540-98), the author of *Discorsi politici*, and of a treatise *Della perfezione della vita civile*. The most renowned of Italian historians is Guicciardini (1482-1540), whose work, embracing the period from 1490 to 1534, is esteemed for impartiality, but is diffuse and tedious. Paolo Giovo wrote in Latin a partisan history of his own time. Historians of Florence were Nardi, Varchi, Nerli, Segni, Capponi, and Scipione Ammirato; the *Storie fiorentine* of the last extends from the foundation of the city to 1574. Historians of Venice were Bembo (1470-1547), Paruta, and Contarini; of Genoa, Giustiniani, Bonfadio, and Foglietta; of Ferrara, Cinzio and Falletti; and of Naples, Costanzo, Porzio (*La congiurazione dei baroni*, &c.), and Summonte. General histories were written by Giambullari and Adriani. The splendor of the fine arts in this century gave occasion for historians of art, the principal of whom was Vasari (1512-74), whose lives of the most excellent painters, sculptors, and architects of Italy are written with naturalness and grace, and contain interesting notices of prominent Italian works of art. The autobiography of the Florentine goldsmith Benvenuto Cellini, one of the liveliest books in the literature, not only recounts his own fortunes, but gives curious notices of the courts of Rome, Florence, and France. He wrote also valuable treatises on jewelry and sculpture. Works on painting were written by Bernardino Campi of Cremona, Lomazzo of Milan, and Armenino of Faenza. Vignola and Palladio gained distinction as writers on architecture, and Marchi by a treatise on military architecture. Philosophy now began to assume an independence of the scholastics, and Girolamo Cardan and Giordano Bruno ventured upon the boldest speculations. Mathematics were cultivated by Tartaglia, Cardan, and others. The *Instituzione di tutta la vita dell'uomo* of Alessandro Piccolomini treats of education, marriage, the government of a family, and the chief end of man. The *Cortigiano* of Castiglione (1478-1529) has rare literary merits, making courtesy the theme of many learned and weighty reflections. Numerous novelists now flourished, among whom Banello holds the first rank, his *Novelle* being chiefly founded on real and common events. The novels of the monk Firenzuola and the *Cene* of Lasca are both elegant and indelicate. Vettori and Salviati commented on the older

poets, and the latter was engaged in compiling the *Vocabolario della Crusca*, then the most important philological work in the language. All words not used by the great Florentine authors were excluded from it; even Tasso was not admitted as an authority.—In the 17th century the natural sciences especially flourished. Under able patrons, the principal of whom was Grand Duke Ferdinand of Tuscany, the Italian universities attained unprecedented celebrity. Scientific academies were founded in Rome, Florence, Bologna, and Naples; the Florentine *accademia del Cimento* embraced the most illustrious savants of the time, and published important accounts of its researches. Preëminent among philosophers was Galileo (1564-1642), who was denounced as an innovator, and maintained the Copernican system only at his peril. His *Dialoghi* and other works are written with elegance, his style and taste having been formed by reading Ariosto. His most noted pupils were Viviani, Torricelli, and Castelli; and contemporary physicists were Borelli, Malpighi, Bellini, and Francesco Redi. The learned and philosophical juriconsult Vincenzo Gravina attracted scholars from all parts of Europe to his lectures in Rome on public law, contained in his *Origine del diritto civile* and other publications. The greatest historians were Sarpi, Davila, Bentivoglio, and Pallavicini. Sarpi (died in 1623), the defender of the republic of Venice in its contest with the holy see, wrote an anti-papal and spirited history of the council of Trent, which was republished by Pallavicini in a work on the same subject. Davila, after 16 years' residence in France, narrated the civil wars of that country in a work esteemed for its truthfulness, and in respect of style one of the best Italian histories. Bentivoglio, the papal nuncio in Flanders, wrote of the Flemish wars of his time, many of the heroes of which he knew personally. Balduino, Dati, and Scamozzi were historians of the fine arts, and Cinelli and Boccacini of literature, while Bianchi treated important historical problems as to migrations, colonies, voyages, and the origin of monarchies and republics. Montecucculi, the military antagonist of Turenne, acquired distinction as an author by his aphorisms on the art of war. The Jesuit Bartoli wrote the history of his society, and the sermons of the Jesuit Segneri were unrivalled in eloquence. Pietro della Valle (died in 1652) described his travels (*Viaggi*) in Turkey, Persia, and India. The first Italian literary journal, the *Giornale de' letterati*, was established in Rome in 1668. A want of naturalness and truthfulness marked the poetry of the age; external delineations, trifling details, conceits, and plays upon words were the leading objects of the poets. At their head was Marini of Naples (died in 1625), who was admired not only in Italy but in France and Spain, and originated the poetical school of the Marinists, by which only his faults were imitated. Among his contemporaries and suc-

cessors were Chiabrera, Guidi, Tassoni, and Marchetti. The foundation of the academy of Arcadians in Rome in 1690 by Crescimbeni and Gravina introduced an affectation of pastoral sentiments and habits in place of Marinism. Menzini, Zappi, Maggi, Lemene, Salvatore Rosa, and Bracciolini wrote satirical, erotic, and facetious verses. Throughout the 17th and 18th centuries the opera was the favorite Italian exhibition. It had long been produced with theatrical and musical splendor, when Zeno of Venice (died in 1750), and especially Trapassi, called Metastasio (died in 1782), wrote operatic plays having remarkable poetical merits.—When early in the 18th century the war of the Spanish succession raged in Italy, and the kingdom of Naples fell beneath the sceptre of the infante Don Carlos, and afterward of Ferdinand III., literature and the sciences were cultivated with renewed vigor. Naples produced Giannone, distinguished in the department of history, Capasso in literature, Cirillo in medicine, Mazocchi in archæology, Genovesi in political economy, one Gagliani in architecture, and another in domestic economy and philology. Filangieri rivalled Montesquieu in the philosophy of legislation; Pagano wrote on the criminal law; Poli distinguished himself in the positive sciences; Maffei both in history and poetry. The university of Bologna was now in its splendor, its academy of sciences taking the name of "The Institute." Marsigli, Stratico, Cesarotti, Foscarini, the brothers Gozzi, Morelli, Pompei, Lorenzi, Mazzuchelli, and Serassi made the city of Venice illustrious; but political jealousy prevented the culture of the economical and legislative sciences there, which under Beccaria and others were making great progress in other parts of Italy. In Tuscany, the famous French encyclopædia was republished. In the cities of Lombardy flourished Scopoli, Fontana, Tissot, Spallanzani, Bertola, Villa, Natali, Volta, Scarpa, Tamburini, Parini, Beccaria, Verri, Landriani, Maria Agnesi, Carli, and others, devoted to literature, art, science, and the development of political and ethical principles. Bodoni raised the art of typography to an admirable elegance. Prominent among the patrons of literature was Victor Amadeus II. of Savoy. The Italian drama had as yet attained to excellence only in the opera, and lacked superior tragedies and comedies. It received an impulse in the 17th century from the French theatre, Martelli of Bologna (died in 1727) being the first who attempted to naturalize not only the structure of French tragedy but the Alexandrine verse. The *Merope* of Maffei was the best tragedy produced in the early part of the 18th century. A greater influence was exerted upon his age and upon literature by Alfieri (1749–1803), the head of an important school of tragedy. Hostile alike to the operatic lightness of the Italian drama and to the formal and complicated intrigues of the French, he went to an opposite extreme, demanding in tragedy

both the utmost intensity of passion and the utmost simplicity of treatment. He was the poet of energetic action and profound thought and feeling, as Metastasio was of love. Abandoning the customs of the court of Louis XIV., he revived the simple sublimity of the Greek stage, which had been the object of his favorite studies, and which was removed alike from French effeminacy and Spanish extravagance. A reformation in the Italian comedy was meantime effected by Goldoni (1707–'93), the only genuine comic poet that Italy can boast, who sought in imitation of Molière to substitute for the *commedia dell'arte* a natural comedy of manners. In his efforts to give to the stage a more human and real character by ridding it of the traditional masks of the harlequin, pantaloon, and other stock characters, he had to contend especially against Chiari and Carlo Gozzi. The example of Kotzebue and Iffland gave rise to a lachrymose school of dramatic composition, maintained by Avelloni, Gualzetti, Greppi, and especially by Federici. The most illustrious historians were Muratori (died in 1750), Maffei, Denina, Mazzuchelli, Tiraboschi, and Lanzi (died in 1810). The *Annali d'Italia*, *Verona illustrata*, *Revoluzioni d'Italia*, *Scrittori d'Italia*, *Storia della Letteratura d'Italia*, and the *Storia pittorica d'Italia* were respectively their best works. The writings of Muratori and Tiraboschi still maintain their reputation both for erudition and criticism. In archæology, the names of Fabretti, Gori, Mazocchi, Martorelli, Passeri, and Carli were distinguished. Campanella continued the philosophical movement of Bruno in opposition to scholasticism, and Vico (1668–1744) founded the new science of the philosophy of history; his *Scienza nuova* is a view of general history, founded on the idea of Divine Providence and the essential elements of the common nature of man. Gasparo Gozzi, Algarotti, Buonafede, Vanetti, Tartarotti, and Alessandro Verri also added to the glory of the literature by abandoning the pedantic style that had been in vogue and introducing an acquaintance with foreign ideas and productions. Baretti contributed to the revival of good taste by ridiculing the Arcadians. Parini (1729–'99) excelled in satirical poetry, his *Giorno* being as remarkable for elegance as for severity upon the effeminate life of the wealthy Milanese nobles. Among the works of Cesarotti was a translation of Ossian, esteemed in many respects among the happiest productions in the language, and which Alfieri confessed to have been of service to him in the composition of his tragedies.—The political and military movements in Europe of the last decade of the 18th century occasioned a regeneration not only of the literature but of the national spirit of the Italians. The early part of the 19th century rivals the age of Leo X., presenting Canova, Longhi, Cicognara, Appiani, and Beltrami in the fine arts; Monti, Foscolo, Pindemonte (partly contemporary with whom was Alfie-

ri) in literature; and Volta, Melchiorre Gioja, Romagnosi, Scarpa, Spallanzani, and Oriani in the sciences. The author who doubtless exerted the greatest influence on the regeneration of poetry was Vincenzo Monti (1754-1828), who in the contest between the classic and the romantic tendencies favored the former, and in the contest between the Gallicists, or imitators of the French literature and idioms, and the purists, who made Petrarch, Dante, and the other old Italian masters their models, sided with the latter. His poems, as *Basvilliana* and *Feroniade*, his tragedies, as *Galeotto Manfredi*, his elegy *Mascheroniana*, the *Proposta*, in which he disputed the restrictions which the Della Crusceans had fastened upon the language, and his translation of the *Iliad*, alike display an admirable and nervous style. Two works of Monti deserve special mention, his *Basvilliana* and *Prometeo*. The former, in which the spirit of Basseville, a French revolutionist, is condemned to travel through France under the guidance of an angel, witnessing the suffering resulting from the adoption of the principles he advocated, is in many respects an imitation of the *Divina Commedia*. It is filled with remarkable poetical descriptions, presented with intense dramatic vividness. The *Prometeo* (1797) is also a close imitation of Dante, and is in effect an apotheosis of Napoleon as the impersonation of might and virtue. Pindemonte also made a light and graceful version of the *Odyssey*, and in his original poems especially lamented the desolation of his country. Ugo Foscolo (1777-1827) belongs to the school of Alfieri. His *Ultime lettere di Jacopo Ortis*, a political and passionate romance in imitation of Goethe's *Werther*, is supposed to describe his own troubled life. He wrote the lyric *I sepolcri*, and other works in prose and verse, remarkable both for power and beauty. Mezzanotte celebrated in verse the struggle of the modern Greeks for liberty, regarding it not only as a political but as a religious conflict between Christianity and Islamism. The lyrical poems of Leopardi (died in 1837) are highly esteemed. Among the epic and didactic poets were Botta, Ricci, Bagnoli, Arici, Grossi, Sestini, Pananti, and Lorenzi. Antonio Cesari (died in 1828) was the chief of the Trecentists, a school which carried its love of the Italian authors of the 14th century to affectation. Stratico published a dictionary containing only the words used by the Marinist authors. Prati, Aleardi, and the versatile priest, dramatist, and journalist Dall' Ongaro (died in 1873), are among the best Italian lyric poets of our time. The conte Giraud, a Roman by birth but of French parentage, revived Italian comedy at the beginning of the century, and aimed at imitating both Goldoni and Molière. He did not try however to reproduce anything like the *Tartufe* or the *Misanthrope*, but took as his model the *Bourgeois gentilhomme* and other low comedies of the French master. To this class belong the numerous dramas of Giraud, chief among which is *L'Ajo*

nell'imbarazzo; this and *Il prognosticante fanatico*, *La capricciosa confusa*, and *Don Desiderio*, are his best comedies; the others belong to the low amusing type introduced by Eugène Scribe. Less amusing than Giraud, but superior to him in every other respect, is Alberto Nota, who has equalled Goldoni in dramatic excellence, and surpassed him as a writer. In 1808 his *I primi passi al mal costume* was played in Turin, and in 1813 he brought out his *Filosofo celibe*, which greatly heightened his reputation. Both are elegant in their diction and full of wit. In 1826 he produced *La fiera*, his best work. From 1826 to 1847 Italian comedy had no representatives. At the close of Charles Albert's reign appeared Paolo Ferrari, Gherardi del Testa, and Giacometti. Ferrari obtained a great reputation by three principal comedies, *Goldoni e le sue sedeci commedie*, *La Satira e Parini*, and *La Prosa*. Other productions of Ferrari, such as *La bottega del cappellaio* and *Il ballo in provincia*, still maintain their place on the comic stage; but since 1860 his dramatic compositions are all inferior to these. Gherardi del Testa before 1859 had written farces like *Il beretto bianco* and *Il sogno di un brillante*, and graceful comedies like *Il sistema di Giorgio* and *Un'avventura ai bagni*, which had shown him the equal of Giraud for invention, and his superior for style. Since 1859 he has much increased his reputation for excellent light comedies. Giacometti remains far beneath these two authors. Among his numerous productions three have been favorably mentioned by critics, *La donna*, *La donna in seconde nozze*, and *Il fisionomista*, this last being a poor imitation of Giraud's *Prognosticante fanatico*. Other dramatic compositions of the ante-unitarian period are Sabbatini's *Tassoni*, and Teobaldo Cicconi's *Pecorelle smarrite*; *Cromwell*, *La notte di San Bartolommeo*, and *Luigia della Valliera*, by Pietro Corelli; *Cuore ed arte*, by Caterino de' Medici Fortis; and the tragedies *Gaspara Stampa* by Casabianca, *Piccarda Donati* by Marengo, *Camma* and *Tentazione* (1856) by Montanelli, the last having great merit not only as a play but as a poem. According to some critics, Giovanni Battista Niccolini is the first tragic writer of Italy in this century; he is less remarkable for regularity of plot than for simplicity of dramatic action. *Filippo Strozzi* and *Arnaldo da Brescia* are his masterpieces. Among the writers of historical and national dramas is also to be mentioned Revere; and among Italy's eminent actors are Modena, Salvini, Rossi, Marchioneri, and Signora Ristori.—Among the historical writers of the earlier part of the present century, two, Vincenzo Coco (died in 1823) and Carlo Botta (died in 1837), deserve a special mention. Coco left two works, *La rivoluzione di Napoli* and *Platone in Italia*, which prove him to be a profound thinker of the school of Vico. His narrative of events in the kingdom of Naples concludes with the wholesale exe-

cutions of 1799, which he himself had witnessed. Carlo Botta, whose chief work is a history of the American war of independence, is inferior to Coco for deep philosophical insight, but superior for artistic literary forms. Italian critics, however, reproach him with stiffness and pomposity in his *Storia dell' indipendenza degli Stati Uniti*; but they admit that his continuation of Guicciardini's history of Italy is written with more simplicity and naturalness, though lacking proportion in some of its principal parts, as well as accuracy in statement of facts and political impartiality. Colletta, in his *Storia del reame di Napoli*, produced a classical work which completes Coco's. His history begins with the inauguration at Naples of the Bourbon dynasty in 1734, and ends with the year 1825. His work is conspicuous for its powerful grouping of facts, and for energy of thought and diction. Vacani was a historian of the Peninsular war. Amari wrote the history of the Arabs in Sicily and of the Sicilian vespers, illustrating obscure periods in an age of national glory. Cesare Cantù began his career as a historical writer by *Ragionamenti sulla storia Lombarda del secolo XVII*. In 1837 appeared his great work, *Storia universale*, which has passed through several editions and been translated into German and French. His reputation was still further heightened by his *Storia degli Italiani, Il tempo de' Francesi, Gli eretici d' Italia, La storia di cento anni*, and his latest work, *L'Indipendenza italiana*, embracing exclusively Italian independence during the French, German, and national periods of the present century (vols. i. and ii., Turin, 1874). Cantù is also the author of histories of the Latin, Greek, and Italian literatures, of the city of Como, and of Italian contemporary poetry; of several novels, educational works, and religious lyrics. Cantù is a firm Catholic in his religious belief; but the Neapolitan Ranieri and the journalist and historian Bianchi Bovini are decidedly adverse to Catholicism. The latter is the author of a history of the popes, a biography of Fra Paolo Sarpi, a history of the Hebrews, and a monograph on Pope Joan. Cesare Balbo wrote historical meditations, a life of Dante, and a summary of the history of Italy. Balbo, Gino Capponi, the author of a history of Florence, and Carlo Troja belong like Cantù to the Guelphic school of publicists, who would fain see the popes at the head of Italy. Frascini wrote an accurate and authoritative statistical work on Switzerland (1847-'51). La Farina is the author of a history of Italy from the most ancient to recent times; Federico Sclopis, of a history of Italian legislation (completed in 1857); Luigi Zeni, of an excellent compendium of Italian history; Romanin, of a learned history of Venice, written in opposition to that of Daru, and of a work on the Venetian inquisitors; Carlo Gemelli, of a history of the Belgian revolution of 1830; Giuseppe Rubini, of a history of Russia

from 862 to 1725; Canette, of a history of Amadeus II. of Savoy; Canales, of a history of the Crimean war; Gallenga, of a general history of Piedmont; Angelo Brofferio, of a history of Piedmont from 1814 to 1849, and of other works interesting from their patriotic spirit as well as literary merit; Anelli, of a history of Italy from 1814 to 1850; Carlo Cattaneo, of a history of the insurrection at Milan in 1848 (he was a member of the committee that directed the operations against the Austrians, and a participant in the struggle), and of the *Archivio triennale*, an elaborate and most careful and valuable collection of authentic documents relative to the events that occurred in Italy from 1848 to 1850; Federico Torre, of a history of the French expedition to Rome in 1849. Ferrari, in a work on republican federation, treated the question under what form of government Italy ought to be reorganized. L. C. Farini wrote a history of the Papal States from 1814 to 1850; Gualterio and Vecchio of the events in Italy in 1848-'9. Among the latest writers on mediæval Italian history are Atto Vanucci and Pasquale Villari. The latter is known as the biographer of Savonarola, and a life of Machiavelli by him is now (1874) in the press. On social science the most recent publications are Minghetti's *Economia pubblica* and *Opuscoli letterarj e economici*, containing a series of letters on religious liberty; Cibrario's *Economia politica del medio evo* and *Della schiavitù e del servaggio*; Zamboni's *Gli Ezzellini* and *Dante e gli schiavi*; and Celestino Bianchi's history of Italian diplomacy. Among ecclesiastical writers are the Benedictine Tosti, who wrote a history of the church; the Jesuits Luigi Taparelli d'Azeglio (the brother of Massimo), author of remarkable works on natural right and international law, and one of the founders of the *Civiltà Cattolica*; Pianciani, distinguished as a chemist and physicist; Secchi, as an astronomer and a writer on solar physics; Passaglia and Perrone, as authors of standard works on theology; and Abbate Lambruschini, as a writer on education; and the Theatine Ventura, celebrated alike as a pulpit orator and philosophical writer. The taste which prevailed in the first half of the 19th century for illustrating the national antiquities has even increased of late years. In the former period were produced Inghirami's *Monumenti etruschi*, Delfico's *Origini italiane*, Fanucci's *Storia dei Veneziani, Genovesi e Pisani*, Manno's *Storia di Sardegna*, Bras's *Malta illustrata*, and Pompeo Litta's *Famiglie celebri d'Italia*. Visconti (1751-1818) made himself a name in classical archæology, and Sestini in numismatics, the latter making his medals serve in illustrating geographical questions. Angelo Mai, De' Rossi, Borghesi, Gestaldi, Canestrini, Foresi, and others are the representative archæologists of the latter period. De' Rossi's chief works are *La Roma sotterranea cristiana* (1864) and *Inscriptiones Christianæ Urbis Romæ* (1857-'61). Toward the close of the 18th

and in the early part of the 19th century the natural sciences were advanced by four illustrious savants, who were nearly contemporary, Volta, Galvani, Scarpa, and Spallanzani. The discussions of Galvani and Volta concerning their new discoveries in electricity divided the scientific men of Europe into two factions, and the poets followed their example. Scarpa, a learned disciple of Morgagni, reduced anatomy to a positive science. Spallanzani wrote on physics and physiology in a style worthy of one who declared philosophy itself imperfect unless its principles were elegantly expressed. Astronomical science was represented by Piazzi, Oriani, Cagnoli, and Plana; medical science by Rasori; natural science by Genè; geography by Balbi; and jurisprudence by Cannignani and Nicolini of Naples. Later De Vico and Donati obtained a reputation as astronomical discoverers, and Pianciani as a physicist. Later still Schiapparelli, Cappocci, and De Gasparis rendered great service to astronomy; and among living scientists Secchi and Respighi occupy an eminent place. With them must be mentioned the geographers Marmocchi and De Luca, the naturalists Simonda and De Filippi, the chemist Piria, the physicists Melloni, Marianini, and Matteucci, and the historian of science Libri. Ranalli has also published a history of the fine arts; and a rich source of information in ancient and modern political and natural history and geography of Italy is found in a series now publishing under the general title of *L'Italia*, of which 20 volumes are already issued (1874).—In general literature during the first half of the century Gioja and Romagnosi treated philosophical questions and the economical and political sciences, the *Filosofia della statistica* being the principal work of the former, and the *Genesi del diritto penale* of the latter. Manzoni (1784–1873) produced new models of lyric verse, and examples of historical dramas and novels in his *Adelchi*, *Il conte di Carmagnola*, and *I promessi sposi*. To the modified classical school of Monti belong the dramas of Silvio Pellico (1789–1854), chiefly known by his *Francesca da Rimini* and *Le mie prigioni*, and those of Niccolini, often founded on the history of his country, and strongly marked by patriotic feeling. The example of Sir Walter Scott in the production of historical romances had many followers in Italy. *I promessi sposi* of Manzoni (1827) was succeeded by the *Monaca di Monza*, *Luisa Strozzi*, and *Il conte Ugolino della Gherardesca* of Rosini; the *Margherita Pusterla* of Cesare Cantù; the *Marco Visconti* of Grossi; the *Etторе Fieramosca* and *Nicolò de' Lapi* of Massimo d'Azeglio (1798–1866); and the *Battaglia di Benevento*, *Assedio di Firenze*, *Isabella Orsini*, and *Beatrice Cenci* of Guerrazzi (died in 1873). Italy received with enthusiasm these romantic delineations from her ancient history. The romance entitled *Famiglia* (1850), by Bersezio, is one of the best late Italian novels. The *Dr. Antonio* of Ruffini is esteemed for its pictures of Italian scenery. Accomplished women

have taken a considerable part in recent Italian literature. The *Morte di Adone* of Teresa Bandellini was followed by the learned philosophical and religious poems of Diodata Saluzzo, with which she intermingled slight lyrical pieces. Cecilia de Luna Folliero wrote on the education of girls and the moral influence of music. Giustina Rinier Michiel celebrated in song the festive days and memorable events of Venice. Isabella Teotochi Albrizzi wrote a graceful and truthful biography of Canova. The work of the Signora Ferucci on the education of girls received the encomiums of Gioberti and other distinguished thinkers. Other female authors are Lucrezia Marinella, Sabina Rasori, Silvia Curtioni Verza, Costanza Moscheni, and Leonora Fonseca Pimentel.—In philosophy, the names of Gioja and Romagnosi were succeeded by that of Pasquale Borelli (Lallebasche), the author of an introduction to philosophy, and of works on the nature and genesis of thought, in which he opposed the empiricism of Romagnosi. Cardinal Gerdil (1718–1802) was the author of numerous remarkable works on philosophy, theology, and mathematical and physical science. Pasquale Galuppi (1770–1846), in elaborate works, combated the philosophical tendencies of the 18th century by doctrines founded on the philosophy of the fathers of the church. He was a student of the German philosophers, and one of his most interesting works was on the changes of modern philosophy from Descartes to Kant. Contemporary philosophy has had a large number of representatives in Italy. Foremost in celebrity was Gioberti (1801–'52), whose philosophical theory was so constructed as to suit itself to the national aspirations of Italy; he is also known as the author of *Del primato morale e civile degli Italiani*, *Il Gesuita moderno*, and *Del rinnovamento civile d'Italia*. Next to Gioberti were Cardinal Rosmini-Serbati (died in 1855), whose ontological theory has met with even less favor than Gioberti's, and Mamiani, the author of *Rinnovamento dell'antica filosofia italiana*. Ausonio Franchi is diametrically opposed to all these philosophers. He places the criterion of truth in the individual reason and feeling, both corresponding to the two most intellectual spheres of the mind, philosophy and religion. According to him, the philosophy of Italy is scholasticism, which is the negation of reason, and its religion Catholicism, the negation of liberty. Thus he is antagonistic to Tommaseo, the representative of the spiritualist and religious schools. Greek philosophy is represented by Centofanti, and philosophical skepticism by Giuseppe Ferrari, the author of *Filosofia della rivoluzione* and *Corso di lezioni sugli scrittori politici italiani* (1862–'3); and Hegelianism by the Neapolitan Vera. To the school of Franchi belong Alfonso Testa and Carlo Cattaneo. The *Calcolo di probabilità dei sentimenti umani* (1855) of Mastriani is an attempt to found philosophy on a physiological basis. Giordani may be considered as the founder of

the school of æsthetic criticism in modern Italy. He contributed effectually to put down the literary "Gallomania" which had so long prevailed there. The articles published by him in the *Biblioteca Italiana* of Milan, his æsthetic studies on sculptors, painters, and authors, and his panegyrics on Napoleon, Canova, &c., together with a vast collection of letters, are held in the highest estimation by his countrymen. Cicognara, Pindemonte, Foscolo, Perticari, Basilio Puotti, Mamiani, Giudici, Arcangeli, Ranalli, and Giuliani have also distinguished themselves in this department of literature.—Besides the contemporary authors whose works have gained such permanence as to have required special mention in this article, many others are gradually taking their places in the lasting literature of Italy, or rendering themselves conspicuous by timely and popular works. Such are most of those named in the following list of living authors. Leading poets are Giovanni Prati (one of the most prominent writers of Italian political lyrics), Frullani, Tigrì, Carducci, and Zanella; De Spuches, Pardi, and other Sicilians; Barattani, Mercantini, Giotti, and De' Marchi. Female poets are Francesca Lutti, Alinda Brunamonte, Emilia Fua, Rosina Musio-Salvo, and others. Historians are Ricotti (Savoy), La Lumia (Sicily), Giudici (*Storia dei comuni italiani*), Celesia (Genoa), and Peluso (Milan). Novelists are Nievo, Arrighi, Donati, Bezio, De Amicis, and Signora Teresa de Gubernatis.—The principal historians of Italian literature are Tiraboschi (1772-'83), Ginguené (1811-'19), Maffei (2d ed., 1834), Cimorelli (1845), Emiliano Giudici (1851), Malpaga (1855), Lombardi (of the 18th century, 1827-'30), Ugoni (of the second half of the 18th century, new edition, 1856-'9), and Levati (of the first quarter of the 19th century, 1831). See also Sismondi's *Littérature du midi de l'Europe* (4 vols., Paris, 1813), translated by T. Roscoe (1823); Hallam's "Literature of Europe;" and W. Roscoe's "Life of Lorenzo de' Medici." For more recent literature, see especially Amédée Roux's *Histoire de la littérature contemporaine en Italie* (Paris, 1874); and for modern philosophy, Botta's "Historical Sketch" in Ueberweg's "History of Philosophy," translated by G. S. Morris (New York, 1874).

ITALY, Wines of. From time immemorial Italy has been noted as a wine-growing country, and at the present day, next to the cereals, wine is the most important production of her soil. The amount annually made has been variously estimated, but is probably as much as 800,000,000 gallons, of which but a small proportion is of good quality or fit for export. The Falernian, Massic, Cæcuban, and other growths famous in ancient times, are now known only by the descriptions of them found in old Latin writers, no means of identifying them with modern wines being accessible. For many centuries succeeding the overthrow of the Roman empire vinification was practised after the most primitive methods; and although vines

were grown and wine was made in every province of the country, it was exclusively a local product, intended for home consumption. This state of things may be said to have practically extended into the present century. Forty years ago Italian wines of high grade were scarcely known to the inhabitants of the country, and still less to foreigners. Now they have an established reputation, and by the close of the century are not unlikely to become formidable rivals of the best growths of France and Germany. This is due in great measure to the formation of œnological societies, which have encouraged the practice of wine making after improved methods, and to the general development of the national life since the union of the Italian people under one government. Grape culture in many parts of Italy, and notably in Lombardy and Venetia, is practised on a different system from that prevalent in the chief wine-producing countries. The vines, instead of being closely pruned and attached to low stakes fastened in the ground, are allowed to run up the trunks of trees, planted in rows for that purpose. The maple, trimmed to the form of a pollard, is the tree most commonly employed, and its branches, stripped of the greater part of their foliage, form the support of the head of the vine. The shoots of the latter, when they have attained a sufficient growth, are twisted into a rope and then tied to a similar rope from an adjoining tree. Rows of trees thus festooned with vines, loaded in the vintage season with full clusters of grapes, present a peculiarly attractive appearance, and form one of the most picturesque features of the country; but the grapes never attain that perfection, even in the climate of Italy, which is necessary to produce wines of the first class. In fact, it has been proved from experiments made under government direction during the vintage of 1873, that the must obtained from vines thus trained usually contains one third less saccharine matter than that from vines trained on the low system, as practised in the best wine-growing countries. The result is a thin, acid wine, which cannot be kept for any considerable period. In certain parts of Italy this method of cultivation is so intimately connected with the general system of agriculture, that no immediate change is probable or perhaps possible. This is especially the case in the level country, and it is consequently in the hilly and mountainous districts that Italian viticulture will be the soonest developed.—Twenty-five years ago the wines of Piedmont first became known to any considerable extent outside of the country; but their name had scarcely been established in the London market when the grape disease, which for a time almost paralyzed vinification throughout Europe, attacked the vines of northern Italy. The district of Asti, long celebrated for the superior quality of its wines, was only partially affected by the disease, and continued to produce abundantly while the rest of the country was suf-

fering from its effects. The reputation which the Asti wines thus acquired has continued to the present day, and is founded in no small degree upon superior skill in manipulation. Hence it is customary to designate the Barbera, Barolo, Nebbiolo, Brachetto, Grignolino, and all other varieties of wines which are the common produce of Piedmont, as wines of Asti, and to sell them as such. As a rule these wines are full-bodied and somewhat rough, but are capable of being greatly improved by increased carefulness and skill. Attention has recently been called to the admirable sites presented by the valleys and mountain slopes bordering on Switzerland, and no portion of Piedmont gives better promise of viticultural development. Upward of two centuries ago the Valtellina, then a dependency of the Swiss canton of the Grisons, yielded wine which found a ready market both in Switzerland and Germany; and it is believed that the Val di Sesia, the Val d'Aosta, and in fact the whole adjoining Alpine district of Piedmont, can in a few years be made equally productive.—The plains of Lombardy and Venetia yield an immense amount of wine, although, owing to the system of culture above described, which prevails there, the quality is poor. It contains very little sugar or alcohol, much acid, and no aromatic properties. But here, as in Piedmont, the Alpine district, bordering on Switzerland and Tyrol, presents unsurpassed facilities to the intelligent wine grower. "In many of these valleys viticulture might attain the highest perfection if it were directed to quality, and if selected vines were grown in closed vineyards with that care and attention which are bestowed upon this branch of production on the Rhine and in France. Here wines might be produced which would be unsurpassed by any other wines in the world. Here there is an equable temperature, and a sufficiency of those precipitations of moisture during nights of calm radiation from the neighboring hills. Here is rain at the proper time, and plenty of the direct rays of the sun come in the warmth of August, when the vine is most in need of it. Indeed, here are all the conditions for producing not only a sweet wine such as is common in climates which have only sun and heat, but for the production of those flavored wines which are the privilege of those parts of the world where the so-called great wines are grown." (Thudicum and Dupré, "Treatise on Wine.") The indolence characteristic of the Italian race has hitherto prevented the development of this favored region; but under the present improved conditions of the national life, and in view of the increasing demand for wines of high grade, its future seems full of promise.—In Tuscany wine making may be said to have been brought to a higher degree of perfection than in other parts of Italy, mainly because for many years it has been conducted by persons of means and superior intelligence. The former grand-ducal government

encouraged it, and the nobles made their vineyards an important source of income, selling their wine at retail from their cellars by the flask. This has a capacity of three quarts, and is not stoppered in the usual manner. A film of oil is deposited on the surface of the wine at the neck of the flask, and answers the double purpose of keeping off the air and of allowing the escape of any bubbles of carbonic acid that may arise in case of after fermentation. The oil may be flung out, or soaked out with tow, previous to using the wine. The most famous wine of Tuscany was for many years the Montepulciano, once designated the "king of wines;" but latterly the product of the vineyards of Chianti, near Siena, made from a peculiar grape, has obtained the supremacy, and almost every good flask of wine sold in the country now goes by that name. It is full-flavored and astringent, with an alcoholic strength equal to about 20 per cent. of proof spirit. The wines of Artimino, a former grand-ducal estate, and of Carmignano, are also of good quality. To these may be added the verdea, or green wine, so called from its color, produced at Arcetri, near Florence, and the Trebbiano, described as a "gold-colored sirup, made from grapes passulated on the vine by torsion of the stalk."—The best known wines of the former Papal States are those of Orvieto and the muscats of Albano and Montefiascone, all of good repute. The southern portion of the Italian peninsula yields a large amount of spirituous wines, many of which reach foreign markets in a highly fortified condition. Those of Gallipoli and Taranto have been known to reach the ordinary strength of cognac. Lachrymæ Christi, the most noted growth of this part of Italy, is a name liberally bestowed on all sweet red wines made there, although the genuine is grown only on the slopes of Mt. Vesuvius. It has a wide reputation, but is rarely met with in perfect condition. The Capri wine, both red and white, is also celebrated, but, like the Lachrymæ Christi, is too often a spurious or factitious product.—Sicily, once fruitful in wine and oil, now produces but a single variety which is exported in large quantities; this is the Marsala, an amber-colored or brown wine, which derives its name from the seaport Marsala, whence it is shipped to various parts of Europe and America. It is generally strongly brandied before leaving the island, and much of it is transformed into imitation sherry. Red wines are also grown in Sicily, which, owing to their low price, are exported to various parts of Italy and to America. The total quantity of wine produced has been estimated as high as 200,000 pipes, of which less than a fifth part is believed to be fit for exportation. The island of Sardinia produces a considerable amount of red and white wines of fair quality; but the art of wine making is very imperfectly understood there, and the quantity produced is far below the capacity of the soil.

ITARD, Jean Marie Gaspard, a French surgeon, born at Oraison, Provence, in 1775, died in Paris, July 5, 1838. At 18 he was appointed by the revolutionary committee surgeon of the military hospital of Toulon, although he had never read a medical book or seen a surgical operation. He devoted himself to study, and two years later was made a surgeon of the second class at the hospital of Val de Grâce. In 1799 he was appointed physician of the institution for deaf mutes, where he became known by his efforts to instruct a young man found wild in the forests of Aveyron. (See IDIOCY.) In 1801 Itard published a memoir giving the results of a year's effort in instructing him, and in 1807 another giving the final results. He next gave his attention to the training of deaf mutes in articulation, in which he succeeded almost as well as Pereira. In 1821 he published an elaborate work, in 2 vols. 8vo, on the diseases of the ear and of the sense of hearing. He also wrote a treatise on pneumothorax.

ITASCA, a N. county of Minnesota, bounded N. by Rainy lake and Rainy Lake river, separating it from British America, and drained by several tributaries of that stream, and by the Mississippi; area, about 9,600 sq. m.; pop. in 1870, 96. Its surface is uneven and diversified by many small lakes.

ITASCA, Lake of, a small body of water in Minnesota, on the N. W. border of Cass co., being one of the uppermost of the multitude of lakes which form the sources of the Mississippi river. It lies in lat. 47° 10' N., lon. 95° W., near the summit of the Hauteurs de Terre, the watershed between the Red river of the North and the streams flowing to the gulf of Mexico, 1,575 ft. above the level of the sea. It is a beautiful sheet of water, surrounded by hills, and its shores are clad with pines. It was discovered by Schoolcraft, July 13, 1832. The remotest source of the Mississippi is a small rivulet rising among the hills a few miles S. of this lake, and falling into it after forming a number of little basins. The stream issues from the N. end of the lake 10 or 12 ft. wide, and 12 or 18 in. deep.

ITAWAMBA, a N. E. county of Mississippi, bordering on Alabama, and drained by Tombigbee river; area, about 600 sq. m.; pop. in 1870, 7,812, of whom 986 were colored. It has a level or undulating surface, almost without timber. The soil is a dark, rich loam, containing much lime. The chief productions in 1870 were 7,053 bushels of wheat, 122,363 of Indian corn, 24,942 of sweet potatoes, and 1,865 bales of cotton. There were 1,420 horses, 2,235 milch cows, 3,915 other cattle, 6,130 sheep, and 9,734 swine. Capital, Fulton.

ITCH, or **Scabies**, a parasitic disease of the skin. There is no doubt that the true character of scabies was known among the ancient Greeks and Romans, but the animal was supposed to be a louse. Avenzoar in the 12th century alluded to its parasitic nature; and Aldro-

vandus about 1600 gives a good description of the animal, but says it has no legs. Moufet at the same time says it is identical with the mite inhabiting cheese. Occasionally after this we find mention of this parasite in the writings of the great medical fathers, but it was generally forgotten when the grand scientific hoax was played in 1812 by the medical student Gales in Paris, who was cunning enough to substitute a cheese acarus concealed beneath his nail, and thus deceived the judges on the prize offered to the discoverer of the cause of this disease. The Corsican Renucci finally established its reality, taught by the old women of his birthplace, and Raspail gave the first scientific description of the animal in 1839. Since then the best observers of its habits have been Bourguignon, Eichstedt, Schinzinger, and Hebra.—The *sarcoptes hominis*, or *acarus scabiei*, presents three forms. The mature female is discernible by the unaided eye, as a white speck $\frac{1}{50}$ of an inch long by $\frac{1}{75}$ of an inch broad. It is white, and resembles in shape a tortoise shell, with an arched back and flat belly. On the back are seen bristles or hairs, and little spines. The skin is tough, and shows irregular transverse parallel rings. There are four pairs of legs, two of which are situated in front and project beyond the anterior, the others toward the posterior end of the body. The two anterior pairs of feet are provided with sucking disks, and with hairs or bristles armed at their extremities with minute claws; the two posterior pairs of feet have no sucking disks, but only long bristles and small claws. The head is bluntly conical, somewhat retractile, and situated between the anterior feet. The mouth consists of a double upper and under lip, between which play the jaws armed with teeth, moving in a horizontal direction up and down, like the blades of scissors over each other, and resembling the claws of a lobster. Eyes are wanting. The male is only half the size of the female, of a blackish color and flattened form. It has sucking disks instead of bristles upon the fourth pair of feet. In other respects it resembles the female. The young, when first hatched, have but three pairs of legs, and in them no distinction of sex is noticeable. In order to become mature they undergo three separate stages of torpidity, before each of which the body is fat and large in comparison with the extremities. During these they burrow into the skin. By the first process they acquire the wanting pair of legs. When mature the female digs a shallow burrow, and after impregnation ceases to creep over the outer skin, but pene-

Acarus scabiei, magnified.

ceases to creep over the outer skin, but pene-

trates deeper and deeper, forming the long holes or "galleries" so well known. The male never enters these galleries where the eggs are found, but digs himself a shallow cell, or seeks new fields for his rambles. The female as she goes on her oblique and downward course deposits her eggs in the gallery, one after the other. The young acarus is hatched about the eighth day, and then emerges from its birth-place to go through the process above described, leaving behind it its broken shell. All stages of development may be seen in these burrows, from the amorphous form in which the eggs are deposited to the perfect young before they break their prison walls. The mother never leaves her hole, and sometimes wanders along for 4 in. beneath the surface; 50 eggs and broken shells are sometimes counted in such burrows. The whole time required for the young to reach maturity after impregnation is estimated at six weeks.—Infection is produced by the transfer of males and young from one host to another. The *sarcoptes* loves warmth, and on this account has been called a nocturnal animal, though improperly, for its wanderings are caused by the warmth imparted to the body of its host by lying in a warm bed, by sleeping with another, or by dancing in the evening; and thus it is that they are conveyed from one person to another. It may happen that the female may be scratched out of her burrow, and thus be transplanted to another part of the same host, or to the body of another. Scabies is seldom if ever caught by handling patients, however freely this may be done, from the fact that such examinations take place in cool rooms, when the parasites are quiet. Their favorite lurking places are the tender skin between the fingers, and folds of the axillæ; and on infants we find them distributed over the whole surface of the body. They have been cultivated also on the face and scalp, and may inhabit any part of the body. In persons who suffer from cold hands and feet we often find these parts entirely free from them, while the rest of the body may be covered with the eruption; and the same love of heat is exemplified by the immediate relief which a patient, wrought up to frenzy by the itching of a general scabies at night, finds by jumping out of bed into the cold atmosphere of winter. In order to bore through the epidermis, beneath which it seldom penetrates, the acarus supports itself on its anterior end by means of its hinder legs, and works away with its lobster-like claws. It takes generally 20 or 30 minutes to penetrate the outer layer, but when this has been pierced the progress is more rapid. The poorer in nutriment they find the epidermis the deeper they penetrate, and the greater is the exudation, which lifts up the animal, and causes the white color of the burrow. The young brood seems to require the tender and last formed epidermal layers for its food, and therefore bores further and causes more itching. The long bur-

rows of the females, which cause the real disease, run an irregular course, and become smaller by age as the exudation is absorbed. The entrances generally remain open for the exit of the young and admission of air. The third or fourth week after inoculation a papular eruption appears; subsequently excoriations, vesicles, pustules, and deposition of pigment show themselves, which are merely the results of scratching, and have no other connection with the parasite than that they are caused by the itching which the animal excites. The same results precisely would follow the same amount of scratching from any other cause.—A peculiar form, known as the Norway itch, consists of conical crusts, sometimes an inch thick, raised on the surface of the skin. This variety affects even the face and nails. Its common occurrence in Norway and rarity elsewhere, only half a dozen cases having been observed in other countries, has led to the supposition that the disease is owing to some other acarus; but Hebra has shown that the crusts consist of dried epithelium and dead acari, and in the few cases in which they have been found present the live animals were identical with the ordinary *sarcoptes*. This variety leads often to serious complications, as immobility and great swelling of the limbs. Sometimes a circumscribed part of the body is thus affected, while elsewhere it presents the usual appearances of itch. No satisfactory explanation has yet been offered of its cause, but it yields to treatment as well as the simple sort.—Scabies is found all over the world. In Germany, where the old system of apprenticeship and its attendant wanderings through the land is kept up, and where barracks are filled with dirty soldiery, the disease is borne from one part of the land to another, and thus never dies out. In America it is now comparatively rare, though it occasionally runs through asylums and schools, and thus finds its way into good society. As to treatment, the chief indication is of course to destroy the parasite and its eggs. Little can be said here about the many plans of the present dermatologists; and it is almost unnecessary to say that the use of internal remedies is absurd. Several methods have been advised, called "quick cures," which require but a few hours for their application; but in many cases they fail, and produce an artificial inflammation of the skin. Of course, if any animal or a single egg remain, the disease is not cured. Hundreds of remedies are advised, but the essential agent in its treatment is sulphur. This, in the form of lotions or ointment, and combined with the proper use of baths and potash soaps to soften the skin, will almost always cure in two or three days. But after the death of the animals and their embryos, much may still remain to be done to remove the eczema, papules, and pustules which they have indirectly caused, and which are to be treated as simple cases of the same disease.

ITHACA, a village in the town of the same name, capital of Tompkins co., New York, situated on both sides of the Cayuga inlet, $1\frac{1}{2}$ m. from the head or S. end of Cayuga lake, and 142 m. W. by S. of Albany; pop. in 1870, 8,462; of the town, 10,107. The village is built partly on a fine plain, partly on the slope of a range of hills which bound it on all sides except the north. The court house, jail, and clerk's office are good brick or stone buildings. There are 10 or 12 beautiful cascades in or near the village. It is the terminus of the Cayuga division of the Delaware, Lackawanna, and Western railroad, and of the Ithaca and Athens, the Geneva and Ithaca, the Ithaca and Cortland, and the Cayuga Lake railroads; while by means of a daily line of steamboats on the lake between Ithaca and Cayuga bridge, it is connected with the New York Central railroad. It is a place of commercial activity, and an entrepot for the transshipment of Scranton and Lackawanna and Lehigh Valley coal. The principal manufactures are of paper, bent work, agricultural implements, calendar clocks, glass, steam engines, and boats. There are two national banks with an aggregate capital of \$500,000. The village is the seat of Cornell university. (See CORNELL UNIVERSITY.) Graded public schools are in process of organization, and there are several private schools, a preparatory school, a public library, one daily and four weekly newspapers, and 12 churches.

ITHACA (mod. Gr. *Thiaki*), the sixth in size of the Ionian islands, 2 m. E. of Cephalonia, of which it forms an eparchy, and 17 m. W. of the mainland of Greece; length 15 m., greatest breadth 4 m.; area, 38 sq. m.; pop. in 1870, 9,873. It is nearly divided by the deep harbor of Porto Molo on the E. coast. The surface is mountainous, a limestone range, with many craggy peaks, running the whole length of the island. The soil is light and shallow, but nearly one third of the surface is cultivated, and yields grain, currants, and olives, which with good wine and honey are the principal agricultural products. The people are mainly engaged in maritime trade. The climate is noted for its salubrity. The capital and chief port is Vathy, built on a harbor of the Porto Molo. The island is divided into four districts: Vathy, Aëto, Anoge, and Exoge. Ithaca is commonly believed to be the island of that name celebrated in the Homeric poems as the kingdom of Ulysses. On the sides and summit of Mount Aëto, which rises 1,200 ft. above the sea, at the foot of Porto Molo, are some Cyclopean ruins which the islanders call the Castle of Ulysses. At the foot of a white cliff on the S. E. coast there is a perennial spring, traditionally regarded as the famous fountain of Arethusa; and it is believed that the precipice is the one to which the poet refers when he represents Ulysses as challenging Eumæus "to throw him over the great rock" if he lies.—See Schliemann, *Ithaka, der Peloponnes und Troja* (Leipsic, 1869).

ITTENBACH, Franz, a German painter, born at Königswinter, near Bonn, in 1813. He studied in Düsseldorf under Schadow, and in Italy, and became known as one of the best religious painters of the Düsseldorf school, and as a successful imitator of the Italian masters. His "Holy Family in Egypt" was purchased in 1868 for the national gallery at Berlin.

ITURBIDE, Agustin de, emperor of Mexico, born at Valladolid (now Morelia), Sept. 27, 1783, executed near Padilla, July 19, 1824. His parents were from Pamplona, Spain, and settled in New Spain shortly before his birth. He studied at the seminary of his native town until the death of his father, when at the age of 15 years he assumed the direction of the patrimonial estates. In the same year (1798) he became lieutenant in a militia infantry regiment of Valladolid. In 1805 he joined the army at Jalapa. On his return in 1809 he aided in repressing a revolutionary movement, which was followed on Sept. 16, 1810, by the revolution planned by the priest Hidalgo, who offered to make Iturbide lieutenant general. He declined from a conviction that the plan was not feasible, and Hidalgo sought to secure his neutrality, granting him a safe-conduct for himself and family, and promising that his hacienda should be protected from pillage and fire. But this proposal also was rejected, and Iturbide took the field "in the service of the Mexicans, the king of Spain, and the Spaniards," vying with the latter in rigor toward the insurgents. He gained great distinction in the battle of Cruces, and was made a captain in the southern army; but ill health compelled him to go to the city of Mexico, and he was sent to Michoacan as second in command under Garcia Conde. Here he again aided in quenching the revolutionary fire, rekindled by Albino Garcia, whom he captured; and he was soon afterward made colonel. From that time till the end of 1815 he took part in all the engagements of the royal troops, directed for the most part against José Maria Morelos, who after the execution of Hidalgo succeeded him as leader of the insurgent forces. The year 1816 found him in command of the provinces of Guanajuato and Michoacan, and of the northern army, by which they were then occupied; but he had incurred the displeasure of some leading citizens, and grave accusations were preferred against him, which led to his dismissal, although he was acquitted of the most serious charge, that of complicity with the revolutionists. On returning to private life, Iturbide set seriously to maturing his long cherished project of independence, and events soon opened a way to the accomplishment of his design. The news of the Spanish constitution, proclaimed in the peninsula in 1820, filled Mexican soldiers with the desire of freeing their country. The movement soon became general, and Iturbide, seeing that the time for action had come, secured the command of the southern army, about to march against Guerrero,

who was then at Acapulco at the head of the remaining rebel forces. On Nov. 16, 1820, he set out from the capital, and to lull the suspicions of the government simulated some encounters with Guerrero, to whom he in reality communicated his project; and having concerted with him relative to future operations, he informed the viceroy that the rebellion was entirely at an end. This intelligence restored confidence among merchants, and a convoy was despatched to Acapulco with \$525,000, which money Iturbide seized, promising to refund it to its owners. With these resources at his disposal, and secret agents in all parts of the country, he promulgated on Feb. 24, 1821, his plan of independence, known in history as the "plan of Iguala," from the name of the town where it was put forth. The principal bases of the plan were "religion, union of Spaniards and Mexicans, and independence; Ferdinand VII., or in case of his refusal, such other member of a reigning family as the congress soon to be organized might choose, to be called to the new empire." His next step was to inform the viceroy of what had taken place; and the latter immediately organized an army to crush the revolution in its infancy. But this measure came too late; public opinion was everywhere in favor of the plan of Iguala, and its author began his march toward the capital with comparatively little opposition, his forces increasing daily. Meantime the newly appointed viceroy, Don Juan de O'Donoju, arrived from Spain, and finding the suppression of the new order of things to be impossible, he concluded with Iturbide, at Cordova, Aug. 24, 1821, a treaty in accordance with the plan of Iguala, except in the clause relating to the election of emperor, who, in case of the refusal of Ferdinand VII. and of some other princes enumerated, should be "any one designated by the cortes." On Sept. 27 Iturbide made his entry into the capital amid the acclamations of the people. The *junta gubernativa* prescribed in the plan of Iguala was at once organized, and Iturbide, who at Iguala had prudently refused the title of lieutenant general, and accepted that of first chief of the army, was formally installed in office. Peace was soon established; the few Spanish troops in garrison at important stations became discouraged; the only stronghold left to the Spanish government was the fortress of San Juan de Ulua off Vera Cruz; and the peninsula of Yucatan, with the province of Chiapas, and several towns in Guatemala, declared their independence and were ultimately united to the Mexican empire. Such of the Spanish residents as desired to leave the country were permitted to do so without restraint; which liberal measure, with numerous others emanating from the new government, served to increase its short-lived popularity. But Iturbide, who had been so successful in organizing and carrying out a bloodless revolution, was unable to establish a government upon a solid basis. A regency, composed of three

members, according to the plan, was appointed; Iturbide was proclaimed generalissimo of the land and marine forces, and president of the regency, with an annual salary of \$120,000, an immediate donation of \$1,000,000, 20 square leagues of land in Texas, and the title of serene highness. Before long signs of discord between Iturbide and the junta became visible. The treasury was depleted, and nearly all sources of revenue were cut off, while the national expenses were greatly enhanced; the army was without discipline; and public opinion was divided between republicanism and the new form of government. Iturbide hastened the convocation of the first congress, in the hope of immediate relief; but that body obstinately refused to grant him money for the troops, and even declared the command of the army to be incompatible with the executive power. But the generalissimo had 16,000 men at his disposal in the capital; and through the agency of his partisans, who knew his popularity with the military, he was proclaimed emperor on the night of May 18, 1822. On the 21st the proclamation was confirmed by congress, which declared the crown hereditary in his family, fixed the civil list at \$1,500,000 annually, created an order of knighthood and other accessories of a monarchy, established the imperial household with the customary pomp, and ordered money to be coined with his effigy. He was crowned on July 21. But the symptoms of anarchy had not disappeared; the friends of liberal institutions either fled or temporized; and a conspiracy organized in Valladolid led to the arrest of several persons suspected of participating therein, and among them 15 deputies. This act, together with the arbitrary seizure by the government of \$1,300,000 deposited at Perote and Jalapa, exasperated the people; and the emperor, harassed by the continued opposition of the congress, dissolved that body by decree on Oct. 31. But Santa Anna proclaimed the republic at Vera Cruz on Dec. 2; the *junta instituyente*, which had succeeded the congress, was unable to establish order; defection became general among the army officers, and the republican troops were fast advancing to the capital. Iturbide in despair hastily reassembled the congress, and tendered his abdication; but that body, not recognizing the abdication, annulled the election of the emperor, and decreed that he should at once leave the country and "fix his residence in Italy," granting him a yearly pension of \$25,000, and declaring null the plan of Iguala and the treaty of Cordova. On May 11, 1823, Iturbide set sail for Leghorn, whither he arrived on Aug. 2. But, impelled by an insane desire for the recovery of his crown, he proceeded to England, and on May 11, 1824, embarked for Mexico. During the year a new government had been formed, with a republican constitution, and Iturbide had no influential friends left in the country. The government, apprised of his movements, declared him

"a traitor and an outlaw, in case he should at any time, and under any title whatsoever, set his foot upon Mexican territory, and that by that act alone he should be regarded as a public enemy of the state." Iturbide arrived at Soto la Marina on July 14, unaware of the severe measures taken against him, and landed in disguise, in company with his secretary Beneski; but he was apprehended by the military commandant, who retained him a prisoner at Padilla, awaiting the decision of the congress of Tamaulipas. That body, in spite of entreaties, remonstrances, and protestations of innocence, in proof of which he referred to the presence of his wife and children on board the vessel he had come in, sentenced him to immediate execution. He was shot on the evening of July 19, after assuring the multitude that his intentions were not treasonable, and exhorting them to religion, patriotism, and obedience to the government. The congress of Mexico decreed that his family should reside in Colombia, and settled upon them a yearly pension of \$8,000. But as there was no ship for a Colombian port, his wife was permitted to go to the United States. She lived for many years in Philadelphia, and then went to Bayonne in France. Angel de Iturbide, the eldest son of the emperor, died in the city of Mexico in 1872, leaving a son who had been adopted by Maximilian as heir to the throne; and the emperor Iturbide's younger son died in Paris in May, 1873, where he had earned a precarious subsistence as keeper of a public house.

ITZA, Lake of. See **PETEN**.

ITZAES, a powerful Indian family of Central America, who at the time of the conquest inhabited the islands and shores of Lake Itza or Peten in Guatemala. They spoke a dialect of the language of the Mayas, and were probably a branch of that nation; for tradition reports that on a disruption of the feudal monarchy of Yucatan in 1420, one of the powerful *caneks* or princes migrated southward with his followers, and after many wanderings fixed his seat on the island of Tayasal, in the lake of Chultuna, now Peten. He built a considerable city, and his people increased so rapidly that, according to the chroniclers, they numbered 25,000 on the island, besides a large population in the adjacent country. Cortes reached the retreat of the Itzaes in his march from Mexico to Honduras in 1525, and has left us an account of their chief and his insular capital. The canek received the Spaniards kindly, and elevated to the rank of a god a lamed horse which Cortes left with him. Its image, cut in stone, was found in the temple of Tayasal when it was destroyed in 1698. Their country being destitute of the precious metals, and remote from the sea, the Itzaes were suffered to retain their independence and isolation long after the subjugation of Yucatan and the principal parts of Central America. Until 1698 they had successfully defended themselves against numerous invaders; but in that year they were

finally subdued by Manuel de Ursula, governor of Yucatan, whose troops spent a whole day, says Villagutierre, in destroying the temples of the city alone. Numbers of the Itzaes fled eastward and were confounded among other tribes; the descendants of those who remained, though subject to Guatemala, and nominally Catholics, have made little change from the condition of their forefathers.

IVAN, czars. See **RUSSIA**.

IVANOFF, Alexander Andreyevitch, a Russian painter, born in St. Petersburg in 1801, died there, July 15, 1858. He studied in that city, and became known in 1832 by his "Christ and Magdalen," and subsequently by a colossal painting representing "Christ appearing before the People," executed in Rome, where he lived for about 20 years.

IVES, Levi Silliman, an American bishop, born in Meriden, Conn., Sept. 16, 1797, died in New York, Oct. 13, 1867. He was brought up on a farm in Turin, Lewis co., N. Y., to which his father had removed. When 15 years old he was sent to the academy at Lowville, where his studies were interrupted nearly a year by his service in the war with England, under Gen. Pike. He entered Hamilton college in the summer of 1816 to prepare for the ministry of the Presbyterian church; but from impaired health he left college before the close of his senior year. Having changed his religious views, he joined the Protestant Episcopal church in 1819, studied theology in New York, and received deacon's orders in August, 1822. His first services were rendered at Batavia, N. Y., then a missionary station. Thence he went the next year to the charge of Trinity church, Philadelphia, and was ordained to the priesthood. In 1827 he took charge of Christ church, Lancaster, Pa.; at the end of the year he became assistant minister of Christ church, New York, and about six months after was made rector of St. Luke's church in the same city. He served in this place till September, 1831, when he was consecrated bishop of North Carolina. To promote the cause of education in the church, he established an institution at Valle Crucis, among the mountains of that state, which finally exposed him to great pecuniary loss. Soon after his settlement in his diocese he prepared a catechism for slaves, which was successfully introduced under his own supervision on some of the large plantations. He published a volume of discourses on the "Apostles' Doctrine and Fellowship," and another on the "Obedience of Faith" (New York, 1849). During the excitement in the Episcopal church caused by the Oxford tracts, he sided strongly with the tractarian movement; and though his diocese was eminently high church, his language and acts touching this movement excited distrust, and the result was alienation. In December, 1852, he visited Rome, and was there admitted into the Roman Catholic church. He was consequently deposed from his bishopric, Oct. 14, 1853, and

published "The Trials of a Mind in its Progress to Catholicism" (London and Boston, 1854). After his return he became professor of rhetoric in St. Joseph's theological seminary at Fordham, and lecturer on rhetoric and the English language in the convents of the Sacred Heart and the sisters of charity. His last years were devoted to establishing the protectories for destitute Roman Catholic children at West Chester, N. Y., and to teaching in Manhattanville college, New York, which he aided in founding.

IVORY, the osseous substance which composes the tusk of the elephant, and which is a peculiar modification of dentine. In commerce it is customary to include in the term the tusks of the hippopotamus, the walrus, the narwhal, and some other animals; but according to Owen and other high authorities it can only be strictly applied to the peculiar reticulated modification in the elephant's tusk, although this is analogous to the substance (dentine) which forms the main part of all teeth. The appearance given by a cross section of any portion of an elephant's tusk, of circular lines intersecting each other so as to form lozenge-shaped figures with curved boundaries, distinguishes true ivory from all other bony substances, and from all other tooth substances, whether dentine or not. The principal supplies of ivory are derived from the W. and E. coasts of Africa, the Cape of Good Hope, Ceylon, India, and the countries eastward of the straits of Malacca. The best comes from Africa, and is of a finer texture and less liable to turn yellow than that brought from India. Prof. Owen says: "The African elephant, as is well known, is a distinct species from the Asiatic one; and some of the Asiatic elephants of the larger islands of the Indian archipelago, as those of Sumatra, if not specifically distinct from the elephants of continental Asia, form at all events a strongly marked variety;" and he remarks that in the Asiatic elephants tusks of a size which gives them the value of ivory in commerce are peculiar to the males, while in the African elephants both males and females afford good-sized tusks, although the males have the largest. The best tusks are nearly straight, and in section nearly circular. One of the largest has been found to measure $8\frac{1}{2}$ in. on its longer and 7 in. on its shorter diameter. They are hollow for about half their length, and a line is traced from the termination of the cavity to the tip of the tusk, which marks in the solid ivory the former extension of the cavity. Upon the outside they are coated with a rind one tenth to one fifth of an inch thick, the color of which in the African varieties may be one of numerous transparent tints of orange, brown, or almost black, and in the Asiatic an opaque fawn or stone color. It conceals the quality of the ivory within, which may be partially exposed at the worn tip, but is finally ascertained only on the introduction of the saw by which the tusk is cut up for use. Even in the interior it is often found to be of variable character,

opaque patches appearing in the transparent quality, and the white being sometimes marked in rings alternately light and dark colored. In the larger teeth the grain is often coarse in the outer portion, and becomes fine within; and some varieties are of chalky consistency like bone, and present dark brown spots. The qualities are so variable, that when exact matches are required of several articles it is important to cut them from the same tusk. The chemical composition of ivory is said to differ considerably in the animals of different countries; but this probably depends upon the age of the animal and the part of the tusk from which the specimen is taken, although the kind of food will exercise an influence. The following analysis, taken from the *Dictionnaire universel*, may be assumed as its average composition: animal matter, dried, 24.00; water, 11.15; phosphate of lime, 64.00; carbonate of lime, 0.10. By very long exposure under favoring circumstances the animal matter becomes dissipated, rendering the texture brittle. This was the condition of some ancient ivory carvings found by Layard in the ruins of Nineveh. To restore their tenacity Prof. Owen recommended boiling them in a solution of gelatine. The experiment proved perfectly successful, and the ivory thus regained its original strength and solidity. A remarkable source of ivory, which has long supplied the Russian markets, is the tusks of fossil mammoths found in the banks of the rivers of northern Siberia. This fossil ivory is of similar quality to that of living animals, and some of the tusks are of immense size. Holtzapffel says he has seen tusks which were 10 ft. long and weighed 186 lbs. They were solid from their tips to within 6 in. of the larger end, and the ivory was of fine grain and sound texture.—The uses of ivory are very numerous. It is exquisitely smooth in working, altogether devoid of the harsh meagre character of bone, and is in all respects the most suitable material for ornamental turning, as it is capable of receiving the most delicate lines and cutting. The artists of Greece and Rome carved from the tusks of the elephant statues and various works of art, among which those of Phidias are especially famous. The size of some of the statues has led to the opinion that the ancients obtained larger tusks than those of modern times, or that they had a method of softening and flattening out the material, or built it up in plates around a central core. (See Quatremère de Quincy's *Le Jupiter olympien, ou l'art de la sculpture antique*, Paris, 1815.) Ivory was a favorite material for sculpture also in the middle ages, and many beautiful specimens then executed are preserved in museums and private collections. Dieppe in Normandy has been for two centuries the chief seat of this branch of art in modern times. The Chinese possess extraordinary skill in working ivory, carving out of a solid block a number of hollow balls one within another,

all curiously ornamented with various devices. Their chessmen are unequalled in ingenious workmanship. Ivory is largely used for the handles of knives, and for the keys of pianofortes and other musical instruments. Its fine texture and smooth surface recommend it for plates for miniatures; and it is used for a great variety of toys, and of mathematical and other instruments. For drawing scales the material is not found so suitable as box or lance wood, for its dimensions change as it absorbs and gives out atmospheric moisture. Billiard balls are liable to the same difficulty; and as the shrinkage or expansion is greater in the direction of the width of the tusks than in that of their length, the two diameters of the balls are sometimes found to differ materially after they have been made a short time. For this reason they are sometimes roughly shaped and then kept for months in the room in which they are to be used, to acquire the form due to its usual condition as to moisture, when they are finished. Veneers are cut out of the blocks either in straight longitudinal slips, or, by the method first practised by the Russians upon cylindrical blocks of wood, in a spiral sheet, as if this were unrolled from the cylinder submitted to the operation. In the London exhibition of 1851 a veneer of this kind was exhibited in the United States department, a foot wide and 40 ft. long. In Paris they have been cut in strips of 30 by 150 in.; and a pianoforte has been entirely covered with this material. Ivory may be made flexible by immersion in a solution of phosphoric acid of specific gravity 1.13 till it becomes translucent. It hardens on exposure to dry air, but assumes its flexibility when placed in hot water.—Ivory may be dyed black by soaking it in a solution of nitrate of silver and exposing it to the sunlight, or better by boiling for some time in a decoction of logwood and then steeping in a solution of red sulphate or red acetate of iron; blue by immersion in a solution of sulphate of indigo containing potash; green by dipping the blued ivory in a solution of nitro-muriate of tin, and then in a hot decoction of fustic; yellow by first soaking the ivory in a mordant of nitro-muriate of tin and then in a hot decoction of fustic, or better by steeping it for 24 hours in a solution of neutral chromate of potash, and then immersing it in a boiling hot solution of acetate of lead; red by first saturating it with the tin mordant, and then immersing it in a decoction of Brazil wood or cochineal, or a mixture of both. Lac dye will produce a scarlet, and this immersed in a solution of potash will become a cherry red. Violet is produced by mordanting with tin and then treating with a decoction of logwood; if this is placed a short time in a weak solution of nitro-muriatic acid, it will be changed to a beautiful purple red. Ivory may also be dyed with any of the aniline colors.—The imports of ivory, hippopotamus teeth, and narwhal teeth into Great Britain from 1861 to 1871 varied

from 9,290 cwt. to 14,599 cwt. a year.—Various substitutes for ivory have been introduced. The best known is that called vegetable ivory, an albuminous substance formed from a milky fluid in the fruit of a species of palm common in Peru and New Granada, the *phytelephas macrocarpa*. It corresponds to the meat of the cocoanut, the fruit of another species of palm. When the nuts are perfectly ripe and dry, the kernels are hard like ivory and very white. It answers very well for many small articles instead of the genuine ivory, but is more liable to tarnish, and does not wear so well when exposed to friction. The French preparation known as Pinson's artificial ivory is a compound of gelatine and alumina. Slabs or tablets of gelatine or glue are immersed for some time in a solution of alumina in acetic or sulphuric acid. The alumina separates and becomes incorporated with the glue, and the plates are then removed, dried, and finally polished. Another preparation of artificial ivory is made by working together bone or ivory dust with an equal portion of albumen or gelatine to form a paste, and then rolling this into sheets, and hardening them by drying. Sulphate of barytes finely powdered is used to advantage with one half its quantity of albumen. Tablets thus prepared are used in photography to receive positive pictures.—**IVORY BLACK**, prepared by calcining the shavings and dust of ivory, is ground and levigated on a porphyry slab to produce the beautiful velvety material which is the chief ingredient of the ink used in copperplate printing. (See **BONE BLACK**.)

IVORY, James, a Scottish mathematician, born in Dundee in 1765, died near London, Sept 21, 1842. He completed his professional course in theology at the university of St. Andrews in 1786, after which he was a teacher in the academy of Dundee for three years. He was afterward for 15 years superintendent of a flax-spinning factory at Douglstown. Meantime he pursued his mathematical studies, and became known by remarkable memoirs read before the royal society of Edinburgh. In 1804 he was appointed professor of mathematics in the royal military college, then at Marlow, Buckinghamshire. He retired with a pension in 1819, and from that time prosecuted his favorite studies in the vicinity of London. He was a member of the principal learned societies of England and Germany, and in 1831 received an annual pension of £300. His principal writings are papers in the "Transactions" of the royal societies of Edinburgh and London. Three of these were on the attractions of the spheroids, and contained a process of analysis which was acknowledged by Laplace to be superior to his own.

IVORY COAST, a part of the coast of Upper Guinea, W. Africa, between the Grain coast and the Gold coast, extending from Cape Palmas to the Assinie river. The coast is low, marshy, and unhealthy, but the country back of it rises into table lands of vast extent and

great fertility. It is drained by a few small rivers, the principal of which are the Lahu, Tabetah, and Cavally. There are a number of small native towns on the coast, among which are Grand Lahu, Jack Lahu, Jack-Jack, and Grand Ivorytown, which has a considerable trade in gold dust, palm oil, and ivory. The French trading station of Grand Bassam has been abandoned since 1870.

IVREA (anc. *Eporedia*), a town of Italy, in the province and 30 m. N. N. E. of the city of Turin; pop. about 10,000. It is walled and fortified, and beautifully situated at the foot of the Alps, at the entrance of the Val d'Aosta, and on the river Dora Baltea, on the opposite side of which is one of the two suburbs. The Gothic cathedral is believed to occupy the site of a temple of Apollo, and several of the parish churches are very old. It is the see of a bishop, and contains an episcopal seminary and various schools. Woollens, cottons, silks, vermicelli, and other articles are manufactured, and there are dye and tile works.—Eporedia was a considerable town of Cisalpine Gaul, and the strength of its strategical position, commanding two great passes of the Alps, gave it importance. Ivrea was a marquisate under Charlemagne, which in the 13th century was united with Savoy.

IVRY-LA-BATAILLE, a village of France, in the department of Eure and on the river Eure, about 40 m. W. of Paris; pop. about 1,200. It contains the ruins of an ancient castle and renowned manufactories of wind instruments. It passed through many vicissitudes during the wars with England, and Dunois captured it in 1449 and destroyed the fortifications. It is most celebrated for the decisive victory gained on the adjoining plain by Henry IV., March 14, 1590, over the forces of the league under the duke of Mayenne. The obelisk on the site of the battle, pulled down in 1793, was restored by Napoleon in 1809.

IVRY-SUR-SEINE, a village of France, on the left bank of the Seine, about a mile from the southern *enceinte* of Paris; pop. in 1866, 10,199. It is pleasantly situated, contains a fine parish church, a terrace of an old palace, a renowned *maison de santé* for lunatics, and extensive wine vaults in natural caves cut in the rocks. There are many handsome villas around it. Vast quantities of wine bottles and many other articles are manufactured here. The fort of Ivry figured conspicuously during the siege of Paris in 1870-'71.

IVY, a common name, from the Anglo-Saxon, for species of the genus *hedera* (Celtic *hedra*, a cord) of the *araliaceæ*, a family which is closely related to the *umbellifera*, but different in the structure of its fruit, which has always more than two carpels. The genus *hedera* consists of evergreen climbing shrubs, with simple leaves and the flowers in umbels. Its most familiar representative is the common or English ivy, *H. helix*, a plant which contributes largely to the English landscape, and

around which are clustered so much of poetry and legend. This is found all over Britain, in western and southern Europe, western Asia, and northern Africa, but scarcely at all in central Europe. In its wild state the slender lower branches spread upon the ground, while

English Ivy (*Hedera helix*).

the main stems climb upon trees, buildings, and other supports to a great height, by means of aerial rootlets. The leaves are three- to five-lobed, and of a pleasing dark green color. The plant rarely flowers until it has reached the summit of the support upon which it climbs; it then throws out from the main stem short flowering branches, upon which the leaves are not lobed, like those upon the other stems, but nearly oval; each branch terminates in a sort of panicle of numerous small umbels of yellowish green flowers; these open in early autumn; they are fragrant, and very attractive to bees; the berries, which are black, ripen the following spring. The ivy climbs to the tops of the tallest trees and surmounts the highest buildings; the largest specimens in England have trunks 10 to 11½ in. in diameter; it is a very long-lived plant. Ivy formerly enjoyed some medicinal reputation, but it is scarcely used at present; the berries, which to man are emetic and cathartic, are readily eaten by various birds; in warm climates it exudes an aromatic, resinous matter, said to possess stimulant properties. In England the ivy naturally clothes ruins, old trees, and rocky places, and thus forms a prominent feature in the landscape; but besides this it is largely used in gardening, it being employed to cover buildings, to form evergreen walls, and to make screens to hide unsightly objects. In this country ivy cannot be considered as certainly hardy north of Philadelphia; in the sheltered streets of cities like New York it has sometimes attained a large size, to be destroyed by an unusually severe winter; it is not only the severity of the winters at its northern limit

that makes it difficult of cultivation, but the direct rays of the sun in the latter part of winter have an injurious effect upon it; hence it succeeds best upon the northern sides of buildings. In Virginia the plant flourishes luxuriantly, and some fine specimens may be found growing upon the old mansions of that state. In modern gardening ivy has been introduced as a bedding plant; it is grown with its stems prostrate, and as these take root at every joint a dense mat of its peculiar dark green foliage may be readily produced; it is used in the form of broad edgings to flower beds cut in the lawn, as well as to form beds by itself; its darker green contrasted with the light green of the grass produces a fine effect. In the northern states, however, the great use of ivy is for indoor decoration, for which purpose it is unequalled. It is made to run over window frames, over the arch of folding doors, along cornices, around picture frames, or wherever it may be desired. It is also used to form screens, either for windows or for use in various parts of the room; a trellis of the desired form is fixed to a platform, upon which the ivy plants stand in pots or in a suitable box. It is of the easiest propagation, and for after success only care and patience are required. Cuttings may be rooted in the usual way in sand, or a branch several feet long may be made to strike root by surrounding its lower end for several inches with a ball of sphagnum moss, which is to be tied on. The ball is placed in a jar or other convenient receptacle in which it can be kept constantly moist; when roots have formed, it may then be set in a pot of earth. Ivy requires a rich soil, and while it is growing an abundance of water. The principal care it needs, besides proper watering, is the washing of the foliage; dust accumulates upon the leaves, and must be removed from time to time by means of a damp sponge. It is sometimes attacked by a scale louse, which upon its first appearance should be removed by a blunt knife or other mechanical means. In summer most of the interior ivy decorations are taken outdoors to a partly shaded spot, but those which are very large must remain in place and receive proper care as to light, water, and cleanliness.—The English ivy presents many varieties, differing in the size and form of the leaf, depth of green, color of fruit, &c.; notable among these are several with the foliage beautifully marked, margined, or veined with white and yellow, known as gold and silver ivies, all of which are very beautiful, but in this country can only be enjoyed under glass. What is known as the tree ivy is propagated from the flowering shoots; it ultimately forms climbing stems. Irish ivy, so called, is really a native of the Canaries (*H. Canariense*), and has much larger leaves than the common. These two are all the species recognized by the late Berthold Seeman in an elaborate memoir ("Journal of Botany," vol. ii.) on the genus; and while the

catalogues and works on gardening enumerate scores of species, they are believed to be all reducible to these two. Mr. Shirley Hibbard in 1869, in a communication to the Linnæan society, and later in a work entitled "Ivy, its History and Characteristics" (London, 1873),

Variegated-leaved Ivies.

ignoring all former names, has attempted to arrange the garden forms of ivy, and impose a nomenclature which is not likely to be generally adopted.—Among other plants to which the name ivy has been applied are German ivy, a climbing composite (see GERMAN IVY); Colosseum ivy (*Linaria cymbataria*), a small creeping toad flax; ground ivy (*Nepeta Glechoma*), a prostrate European labiate, which is not rare as a weed in the older portions of this country, and which before the introduction of hops was used in England to give bitterness to beer, and is also called alehoof; American ivy, more generally known as the Virginia creeper (*Ampelopsis quinquefolia*), which, though a deciduous plant, occupies much the same place in our vegetation that the ivy does in Europe; and poison ivy, a name which with several others is applied to the well known *Rhus Toxicodendron*, for which see SUMACH.

IXION, a mythical Thessalian prince, king of the Lapithæ, and father of Pirithous. When Deioneus, whose daughter Dia he had espoused, demanded of him the customary bridal gifts, Ixion treacherously invited him to a banquet, and then had him cast into a fiery pit. None would hold intercourse with the murderer, or purify him, till Jupiter at length performed the necessary rite, and made him his guest. But Ixion presumed to make love to Juno, whereupon Jupiter made a phantom resembling her, by which Ixion became the progenitor of the centaurs. For his impiety he was chained by Mercury to a wheel which revolved perpetually in the air.

IXTLILXOCHITL, **Fernando de Alva**, an Indian historian, descended in a direct line from the kings of Tezcuco in Mexico, born about 1568, died about 1648. He was interpreter of the native languages to the viceroys of Mexico, and assiduously collected the ancient MSS. and traditions of his country, which he embodied in a

series of memoirs or "Relations." His most important work is a "History of the Chichimecas," which, with most of his other writings, was first printed from the MSS. in Mexico by Lord Kingsborough ("Mexican Antiquities," vol. ix.). His works evince a disposition to overestimate the power and policy of the Tezucan kings, but are nevertheless interesting, and on the whole trustworthy.

IZABAL, a seaport of Guatemala, in the department and 123 m. N. E. of the city of Guatemala, on the S. shore of Lake Dulce; pop. about 600. It is a miserable place of about 150 houses, and owes its importance to its being the sole Atlantic port for the trade of the capital. The water being very shallow on the bar at the mouth of the river leading from the gulf to the sea, only vessels of light draught can go up to the town. Large vessels go to Balize, and the merchandise is transmitted by coasting craft to Izabal.

IZALCO, a volcano of the republic and 36 m. N. W. of the city of San Salvador, in lat. 13° 15' N., lon. 89° 44' W. It is one of the most curious volcanoes, and except Jorullo in Mexico the only one in the world that has risen from the level of the plain within the memory of man. A priest of Sonsonate, an eye-witness of its origin, related to Mr. Stephens the history and progress of its formation. In 1798, after a series of destructive earthquakes, dust and pebbles were observed rising from a fissure in the plain; soon after lava was upheaved, and this, together with large stones and other substances, gradually accumulated around the orifice until the vast isolated cone as it now stands was formed. It is contiguous to another mountain sufficiently elevated to afford from its crest a distinct view of the burning crater of the volcano; and the lurid flames and never-ending shower of incandescent stones issuing from it are clearly visible from Sonsonate, near by. Izalco is supposed to have had its origin from a deviation of the subterranean fire which animated the neighboring system of extinct volcanoes clustered around the great peak of Santa Ana. The eruptions, though incessant, are somewhat intermittent in regard to violence, and have often been disastrous to the adjacent town of Izalco. Dense columns of smoke are constantly emitted, and detonations like the rumblings of distant thunder are regularly repeated at intervals of from 5 to 15 minutes. Vegetation is of course impossible on the brown arid flanks of the mountain, down which streams of liquid fire are occasionally seen to roll, offering a spectacle of terrific grandeur, especially by night. Its height at present is estimated at about 6,000 ft.; and,

though some 40 m. from the coast, it serves as a convenient landmark for mariners, among whom it is sometimes designated *el faro del Salvador*.

IZALCO, a town of San Salvador, Central America, situated near the base of the preceding volcano, 36 m. N. W. of the city of San Salvador; pop. 5,000, chiefly Indians. It was once the centre of the most important cacao district in all America, and still preserves many evidences of past importance. Its fine large church was nearly destroyed by the earthquake of Dec. 8, 1859. The country around it is remarkably fertile and well watered.

IZARD, a N. county of Arkansas, drained by White river, which is here navigable; area, 864 sq. m.; pop. in 1870, 6,806, of whom 182 were colored. It has an uneven surface and a fertile soil. The chief productions in 1870 were 20,076 bushels of wheat, 303,242 of Indian corn, 17,358 of oats, 11,107 of Irish potatoes, 13,435 of sweet potatoes, 24,975 lbs. of tobacco, 92,686 of butter, 10,496 gallons of molasses, and 1,568 bales of cotton. There were 2,293 horses, 2,501 milch cows, 1,392 working oxen, 3,281 other cattle, 4,413 sheep, and 17,276 swine. Capital, Mount Olive.

IZARD, Ralph, an American statesman, born near Charleston, S. C., in 1742, died at South Bay, May 30, 1804. He was educated at Cambridge, England, inherited an ample fortune, and in 1771 settled in London, from whence the troubled condition of American politics induced him in 1774 to retire to the continent. He subsequently endeavored to impress upon the British ministry the ill-advised nature of the course they were pursuing, but without effect. In 1780 he returned to the United States, where he was instrumental in procuring the appointment of Gen. Greene to the command of the southern army. He also pledged his whole estate as security for funds needed in the purchase of ships of war in Europe. In 1781 he entered the continental congress; and upon the adoption of the federal constitution he was elected a United States senator from South Carolina. The "Correspondence of Ralph Izard from 1774 to 1804, with a Short Memoir," was published by his daughter (Boston, 1844).

IZTACCIHUATL, a volcano of Mexico, 15,705 ft. above the sea, not far from that of Popocatepetl, near the city of Puebla. It is sometimes called the Sierra Nevada, its top being almost always covered with snow. Its name is aboriginal Mexican, from *iztac*, white, and *cihuatl*, woman, suggested by its fancied resemblance to a woman in a white dress. It has not been active since the conquest.

J

J, THE 10th letter of most European alphabets, is a spurious counterpart of the letter 'I. It is also called the consonant of that vowel, fulfilling that function of the original letter when it precedes another vowel. This, however, is the case only where it sounds like *y* in *yet*; for in some European languages it is either a superfetation of other legitimate letters, or the representative of sounds which have nothing in common with that of its prototype, I. It is in German miscalled *Jot* (pronounced *yot*), in Spanish *jota* (pronounced 'hota), from *iāra*. The following are the sounds with which it is uttered in various languages: 1. As consonant I in Italian, German, Danish, and other Teutonic languages, in Lusatian, Polish, Magyar, &c., where the Czechs use *g*, and the Spaniards and English *y*, before vowels; for instance: Ital. *ajuto* or *aiuto*, aid; Ger. *Joch*, yoke, *ja*, yes; Lusat. and Pol. *jeden* (Czechic *geden*), one; Magyar *jég*, ice, &c. 2. The French and Portuguese *J*, a lingui-dental sibilant, the weak and sonorous counterpart of *ch* (Eng. *sh*), like the sound of *s* and *z* in the English words *pleasure*, *grazier*, and rendered by the combination *zh* in English. This sound is also written with *g* before *e* and *i* in Portuguese and French. It exists in Russian, Polish, and other Slavic languages, in Persian, Turkish, &c., but not in Sanskrit, Greek, Latin, Hebrew, Arabic, Ethiopian, Irish, German, and many other languages. 3. The English sound of *J* represents the preceding intimately combined with that of *d*, equivalent to *dzh*; it is written *dj* in French and *dsch* in German transcriptions of oriental names. This compound sound is also written in English with *g* before *e*, *i*, and *y*, in Italian with *g* before *e* and *i*. It exists in many eastern languages, and in Polish, but is unknown in the ancient Greek, Latin, Hebrew, Ethiopic, and Irish, as well as in German, French, and most other European languages. 4. In Spanish it is sounded like the German *ch*, as in *joven*, young, and is equivalent to *g* before *e* and *i*, and to *x* in some cases, so that Mexico is also written *Méjico* and *Mégico*.—The use of the tailed or elongated *J* was introduced by Dutch printers, and was long called *I hollandais* by French printers. It bears the same relation to *I* that the new *W* does to *V*. (See I.)

JABIRU, a large wading bird of the stork family, found in South America and Africa, of the genus *mycteria* (Linn.). The bill is about a foot and a half long, and strong, resembling that of the stork except that it is bent a little upward at the point. It is a large bird, measuring between 5 and 6 ft. in length; the wings are long and ample, with the second and third quills longest; tail moderate and broad; tarsi much longer than the middle toe, and covered

with reticulated scales; the toes are long, united at their bases, with most of the hind toe resting on the ground. Only two species are described by Gray, of which the best known is the American jabiru (*M. Americana*, Linn.); in this the bill is black, the head and about two thirds of the neck bare and blackish, and the lower part of the neck bright red; there are a few white feathers on the hind head, and the rest of the plumage is white. It inhabits Brazil and Guiana, frequenting swamps, seeking for fish and reptiles; it rises slowly to a great height, supporting itself for a very long time. The nest is made on lofty trees, and the eggs are generally two; the young are fed with fish; the flesh of the young is tender and tolerably

Jabiru (*Mycteria Senegalensis*).

good eating. The African species (*M. Senegalensis*, Shaw) is an equally large bird, generally white, with head, neck, and scapulars black; it has two pendent wattles at the base of the bill.

JABLONSKI, Paul Ernst, a German orientalist, born in Berlin in 1693, died in Frankfurt-on-the-Oder, Sept. 13, 1757. He was professor of theology at the university of Frankfort, and head minister of the Calvinistic church in that city. He published at least 50 different works on oriental philology, history, divinity, and antiquities, the most important of which is his *Pantheon Egyptiorum, sive de Diis eorum Commentarius, cum Prolegomenis de Religione et Theologia Egyptiorum* (3 vols., 1750-'52).

JACAMAR, a diurnal fissirostral bird of the kingfisher family, and subfamily *galbulina*, comprising the two genera *galbula* (Möhr.) and *jacamerops* (Cuv.) The plumage is brilliant, green predominating, and the habitat is tropical South America and some of the West Indian islands. In the genus *galbula* the bill is

long, slender, straight, pointed, and four-sided; the wings are moderate and rounded, with the fourth quill longest; tail elongated and graduated; tarsi very short, slender, and nearly covered with feathers; the toes two before and two behind, the inner hind one very small (in

Jacamar (*Galbula viridis*).

some species wanting), and the outer anterior one the longest. About ten species are described, inhabiting the moist forests, and leading a solitary life; they perch on naked branches, whence they dart in pursuit of insects, in the manner of the bee-eaters; some species are said to feed on fish and their fry. The nest is a hole in a tree or a river bank, with a small entrance, and the eggs are usually three in number. The green jacamar (*G. viridis*, Lath.) is about the size of a lark, of a brilliant glossy green, with white chin and rufous abdomen; the paradise jacamar (*G. paradisea*, Linn.), with the same metallic green color, has a violet-brown head, and white throat, front neck, and under wing coverts. In *jacamerops* the bill is shorter, broader, and more curved, more like that of the bee-eaters. The species are few, inhabiting tropical South America, with habits similar to those of the preceding genus. The great jacamar (*J. grandis*, Gmel.) is about 11 in. long, of a coppery green above, and beneath ferruginous.

JACANA, a wading bird of the family *palameidae*, and subfamily *parrinae*, of which the principal genus is *parra* (Linn.), found in the warmer parts of America, Asia, and Africa. The bill is long, slender, straight at the base, and vaulted at the tip; the base of the bill has a large, naked, dilated plate, standing up in front of the forehead; wings long, the third quill the longest; tail very short, partly concealed by the coverts; tarsi long, naked, and slender, with transverse scales. The most remarkable peculiarity is the great length of the toes, four in number, entirely separated, and all armed with long, straight, and sharp claws; that of the hind toe in the common species is

so acute and long as to obtain for the bird the name of "surgeon;" in some the naked plates about the bill descend toward the neck. These birds frequent marshes, the sides of rivers, and ponds, in pairs or in small flocks; they are shy, when alarmed diving or skulking among the reeds; by the length of their toes they are enabled to walk upon the floating leaves of water plants, in search of aquatic insects, buds, and seeds; they are quarrelsome and noisy, striking each other with their spurred wings; the flight is rapid, straight, and not very elevated; they wade into the water as far as the knees, but do not swim, as their feet are not webbed; they are monogamous, the females making a nest among the reeds, and depositing four or five eggs. More than a dozen species are described, of which the best known are the chestnut jacana (*P. jacana*, Linn.), black with a red mantle, with the primaries green, a native of South America; the Indian jacana (*P. Indica*, Lath.), blackish with blue and violet reflections, bronzed green mantle, rump and tail sanguine red, anterior quills green, and a white stripe behind the eye; and the African jacana (*P. Africana*, Gmel.), with wings unarmed, and forehead not carunculated and greenish black. They are about 10 in. long. The genus *hydrophasianus* (Wagl.) has very long wings, with the shafts of the first three quills prolonged, and the ends of the fourth to the seventh lengthened, narrowed, and falcated; the tail narrowed, with the four central feathers much prolonged and the lateral ones short and graduated; the base of the bill and head entirely covered with feathers. To this genus belongs the Chinese jacana (*H. Sinensis*, Gmel.), which is the only

Chestnut Jacana (*Parra jacana*).

species described by Gray; the habits are the same as in the preceding genus. The general color is brown, with the head, throat, front part of the neck, and wing coverts white; hind neck with golden silky plumes; the long tail feathers black.

JACHMANN, Eduard Karl Emanuel, a German naval officer, born in Dantzig, March 2, 1822. He rose from the most inferior station to be one of the directors in 1857-'9 of the newly established Prussian admiralty, and commander of an expedition to China in 1862. In March, 1864, he defeated the Danes at Jasmund on the island of Rügen. In 1867 he became chief of the ministry of marine, and in 1868 vice admiral, and contributed greatly to the organization and efficiency of the service. During the Franco-German war (1870-'71) he was commander-in-chief of the Baltic fleet; and on Dec. 31, 1871, he was placed at the head of the imperial navy.

JACK, a N. W. county of Texas, intersected by the W. fork of Trinity river; area, 870 sq. m.; pop. in 1870, 694, of whom 72 were colored. It lies chiefly in the "cross timbers," and has great diversity of surface and soil. Stock raising is the chief industry, though there is some excellent farming land. The chief productions in 1870 were 6,750 bushels of Indian corn, 3,620 of oats, and 176 tons of hay. The value of live stock was \$15,925. Capital, Jacksboro.

JACKAL, a species of wild dog, living in troops in the warmer parts of Asia and Africa, generally placed in the genus *canis* of authors, but raised to a genus of its own (*sacalius*) by Hamilton Smith. These animals live under great varieties of climate, in the moist jungles of Asia, the dry deserts of northern Africa, in forest and plain, and wherever the warmth is sufficient; like other dogs, they are voracious, feeding with avidity even on decomposing matter, and in this way, with the hyæna and vulture, are of considerable advantage to man in hot climates. They are generally harmless, but make night hideous by their dismal howlings; they dwell in burrows which they excavate themselves, and in caves; they are said to disinter dead bodies, and occasionally when pressed by hunger to attack man. Though exceedingly timid, they are easily tamed, and rarely snarl at the hand which caresses them; this character gives great probability to the opinion that the jackal has mingled its blood in many of the races of our domestic dog, though perhaps not to the assertion of Pallas that it is the chief original of this useful animal. The organization of the jackal does not differ from that of the dog, and the habits of digging, living and hunting in troops, and feeding on carcasses are the same in both in the wild state; the former, at least in some of the species, possesses a disagreeable odor from which the latter is free. The pupil of the eye is round, as in the diurnal canines; the nostrils open on the end of the muzzle; the ears are pointed, with a tubercle on the external edge; the tongue is very soft, and the upper lip and sides of face provided with bristly whiskers; the feet are four-toed, with a rudiment of a fifth on the anterior on the inner side, and the nails are short and thick; the dentition, habits, movements, and

instincts are those of the dog; the hair is thick, the tail being nearly as bushy as that of a fox. The jackal is often seen in attendance on the lion, and has been supposed to run down animals for him, contented with a small share for itself; but it follows for the sake of the

Common Jackal (*Canis aureus*).

pickings and stealings in the train of the lion, who perhaps is often led to his prey by the howlings of a troop of jackals hunting for themselves. The common jackal or jungle koola of India (*canis aureus*, Linn.) is of the size of a small dog, reddish gray above, darkest on the back, and lighter beneath; the tail is bushy and dark at the end. It inhabits the warmer parts of S. Asia, N. Africa, and S. E. Europe. The African jackal or dieb (*C. anthus*, F. Cuv.) is of a yellowish gray above, lighter beneath; the tail yellow, with a longitudinal black line at the base, and some black hairs at the tip. It is found in Egypt, Nubia, Senegal, and other parts of Africa. The average height of the jackal is about 15 in., the length of the body 14 in., and of the tail about 10 in. The above species have been known to breed together, producing five young after a gestation of about 60 days; and they will also intermix with domesticated dogs; in fact, the agency of the jackal in the production of the southern dogs can no more be doubted than that of the wolf in the case of the northern, and the crossings of these jackal dogs and wolf dogs, either by accident or design, would explain satisfactorily a great number of our domestic varieties. (See Dog.)

JACKDAW, a European conirostral bird of the crow family, and genus *corvus* (*C. monedula*, Linn.). The form is more compact and graceful than that of any other British corvine bird; of about the size of the domestic pigeon, with large head, short neck, ovate body, and moderate wings, tail, and feet; the bill is shorter than the head, stout and conical, slightly arched, and sharp-edged; the gape almost straight;

the plumage full and soft; the tail straight, of 12 broad, rounded feathers; claws arched and strong. The length is about 15 in., the bill $1\frac{1}{2}$, and the alar extent 30 in.; the female is slightly smaller. The bill and feet are black, irides grayish white, upper and fore part of the head

Jackdaw (*Corvus monedula*)

black with bluish purple reflections; grayish black about the eyes and throat; back and sides of neck bluish gray; rest of plumage grayish black, approaching leaden gray on the under parts; wings and tail black, the latter with the primaries glossed with green, and the secondaries with purple. In rare instances, individuals have been found variegated with white. It is a very active, impertinent, playful, and loquacious bird, altogether the most agreeable and sociable of the crows. The flight is rapid, very irregular, and generally accompanied with frequent cries. It dwells in ruined buildings, towers, steeples, and retreats in high rocks, and is often found in the heart of large cities; it nestles in the same places, and occasionally in chimneys, making a large nest, and laying about five bluish white eggs with brown or pale purple spots at the larger end, $1\frac{1}{2}$ by 1 in.; the eggs are laid in May, and the young are abroad by the end of June. Sallying from their retreats at early dawn, they betake themselves to the fields in search of worms, larvæ, and insects, walking about gracefully, but frequently quarrelling; they also eat mollusks, crustacea, fishes, and even carrion; when feeding, they are very vigilant; they pick up food from the streets with the rooks and pigeons, and possess the corvine propensity to carry to their nests all kinds of objects which can serve for their structures, and to steal shining articles of value; they may be taught many tricks, and to pronounce words. They inhabit Great Britain and most parts of the European continent; species in Asia are very nearly allied to this, both in appearance and habits.

JACKSON, the name of 20 counties in the United States. **I.** A W. county of West Vir-

ginia, separated from Ohio by the Ohio river, and drained by Sandy and Big Mill creeks; area, 480 sq. m.; pop. in 1870, 10,300, of whom 58 were colored. It has a diversified surface; the soil near the rivers is fertile, and elsewhere well adapted to grazing. The chief productions in 1870 were 59,845 bushels of wheat, 272,044 of Indian corn, 48,524 of oats, 50,397 of potatoes, 96,265 lbs. of tobacco, 29,850 of wool, 87,052 of butter, and 2,934 tons of hay. There were 2,558 horses, 2,289 milch cows, 3,644 other cattle, 13,610 sheep, and 8,821 swine; 2 manufactories of woollen goods, 1 of boats, 7 of cooperage, 3 flour mills, and 7 saw mills. Capital, Ripley. **II.** A S. W. county of North Carolina, bordering on South Carolina, and drained by head waters of the Tennessee and Savannah rivers; area, about 750 sq. m.; pop. in 1870, 6,683, of whom 274 were colored. The Blue Ridge occupies its S. E. frontier, and the surface is generally mountainous. Since the census a portion has been taken to form Swain co. The chief productions in 1870 were 13,560 bushels of wheat, 9,187 of rye, 156,050 of Indian corn, 10,668 of oats, 13,235 of Irish and 7,116 of sweet potatoes, 11,697 lbs. of tobacco, 10,634 of wool, 64,032 of butter, and 11,571 of honey. There were 1,022 horses, 2,136 milch cows, 3,422 other cattle, 5,028 sheep, and 8,152 swine. Capital, Webster. **III.** A N. county of Georgia, drained by the head waters of Oconee river; area, 432 sq. m.; pop. in 1870, 11,181, of whom 3,710 were colored. It is a hilly and not very fertile district, abounding in granite and quartz, and containing some iron ore. The chief productions in 1870 were 35,200 bushels of wheat, 218,780 of Indian corn, 25,990 of oats, 10,656 of sweet potatoes, 56,115 lbs. of butter, and 1,825 bales of cotton. There were 1,143 horses, 663 mules and asses, 1,904 milch cows, 3,028 other cattle, 6,379 sheep, and 8,141 swine. Capital, Jefferson. **IV.** A N. W. county of Florida, bordering on Georgia, and separated from Alabama on the E. by the Chattahoochee river, which unites with the Flint to form the Appalachicola on the S. E. border; area, 1,040 sq. m.; pop. in 1870, 9,528, of whom 5,598 were colored. It is intersected by the Chipola river, and has a level surface, partly covered with pine forests. The soil near the streams is very fertile. The chief productions in 1870 were 150,780 bushels of Indian corn, 25,005 of sweet potatoes, 27,972 gallons of molasses, 39,280 lbs. of rice, and 3,391 bales of cotton. There were 440 horses, 516 mules and asses, 1,974 milch cows, 4,340 other cattle, 1,439 sheep, and 6,097 swine. Capital, Marianna. **V.** A N. E. county of Alabama, bordering on Tennessee, and intersected by Tennessee river; area estimated at 975 sq. m.; pop. in 1870, 19,410, of whom 3,060 were colored. It is mountainous, and the soil, drained by numerous streams, is generally fertile. The Nashville and Chattanooga and Jasper branch, and the Memphis and Charleston railroads traverse

it. The chief productions in 1870 were 50,925 bushels of wheat, 506,777 of Indian corn, 26,952 of oats, 11,107 lbs. of tobacco, 16,809 of wool, 121,075 of butter, 24,547 of honey, and 2,339 bales of cotton. There were 3,541 horses, 3,737 milch cows, 2,062 working oxen, 6,146 other cattle, 9,745 sheep, and 25,837 swine; 3 flour mills, 6 tanning and currying establishments, and 6 saw mills. Capital, Bellefonte. **VI.** A S. E. county of Mississippi, bordering on Alabama and the gulf of Mexico, and intersected by Pascagoula river; area, 1,175 sq. m.; pop. in 1870, 4,362, of whom 1,194 were colored. The soil is sandy and not fertile, and pine forests cover a large part of the surface. The New Orleans, Mobile, and Texas railroad crosses it. The chief productions in 1870 were 5,377 bushels of Indian corn, 9,460 of sweet potatoes, 11,058 lbs. of wool, and 18,970 of rice. The value of live stock was \$57,790. Capital, Americus. **VII.** A N. parish of Louisiana, drained by branches of Washita and Little rivers; area, 550 sq. m.; pop. in 1870, 7,646, of whom 3,443 were colored. It has a moderately uneven surface, and a soil generally of good quality. The chief productions in 1870 were 132,224 bushels of Indian corn, 29,603 of sweet potatoes, and 4,097 bales of cotton. There were 912 horses, 729 mules and asses, 1,955 milch cows, 5,764 other cattle, 3,192 sheep, and 12,370 swine. Capital, Vernon. **VIII.** A S. county of Texas, bordering on Lavaca bay, and drained by Lavaca river and other streams; area, 852 sq. m.; pop. in 1870, 2,278, of whom 1,164 were colored. The surface is level and occupied chiefly by prairies, although there are undulating timber lands near the rivers. The soil is fertile and suited to sugar cane. The chief productions in 1870 were 36,125 bushels of Indian corn, 6,770 of sweet potatoes, and 595 bales of cotton. There were 956 horses, 708 milch cows, 13,846 other cattle, 977 sheep, and 2,694 swine. Capital, Texana. **IX.** A N. E. county of Arkansas, bounded W. by Black and White rivers; area, about 600 sq. m.; pop. in 1870, 7,268, of whom 1,612 were colored. It has a level surface, covered in many places with valuable ash and cypress timber, and a fertile soil. The Cairo and Fulton railroad passes through it. The chief productions in 1870 were 115,215 bushels of Indian corn, 50,395 lbs. of butter, and 3,996 bales of cotton. There were 890 horses, 1,386 milch cows, 2,853 other cattle, and 7,042 swine. Capital, Jacksonport. **X.** A N. county of Tennessee, bordering on Kentucky, and intersected by Cumberland river; area, 666 sq. m.; pop. in 1870, 12,583, of whom 767 were colored. The surface is much diversified. The chief productions in 1870 were 33,046 bushels of wheat, 530,276 of Indian corn, 54,314 of oats, 713,578 lbs. of tobacco, 26,311 of wool, 88,542 of butter, and 4,213 tons of hay. There were 2,984 horses, 2,780 milch cows, 2,040 working oxen, 3,751 other cattle, 15,323 sheep, and 29,120 swine. Capital, Gainesborough. **XI.** A

S. E. central county of Kentucky, drained by the sources of Rock Castle river and by an affluent of the Kentucky; area, about 425 sq. m.; pop. in 1870, 4,547, of whom 51 were colored. The surface is hilly. The chief productions in 1870 were 4,537 bushels of wheat, 137,181 of Indian corn, 14,361 of oats, 11,141 of potatoes, and 51,540 lbs. of butter. There were 774 horses, 1,124 milch cows, 1,579 other cattle, 5,730 sheep, and 6,748 swine. Capital, McKee. **XII.** A S. county of Ohio, drained by Little Scioto river; area, 400 sq. m.; pop. in 1870, 21,759. It is rich in coal, iron, marble, and salt. The surface is hilly, and the soil fertile. The Marietta and Cincinnati railroad and Portsmouth branch pass through it. The chief productions in 1870 were 90,127 bushels of wheat, 469,920 of Indian corn, 119,534 of oats, 53,637 of potatoes, 69,162 lbs. of wool, 390,898 of butter, and 15,879 tons of hay. There were 4,294 horses, 4,490 milch cows, 9,698 other cattle, 24,439 sheep, and 11,692 swine; 4 manufactories of charcoal, 13 of pig iron, 1 of woollen goods, 5 flour mills, and 7 saw mills. Capital, Jackson. **XIII.** A S. county of Indiana, drained by the E. fork of White river; area, 544 sq. m.; pop. in 1870, 18,974. It has a level or undulating surface, and contains beds of iron ore. The soils are of various qualities, some parts of the country being very fertile. The Ohio and Mississippi, and the Jeffersonville, Madison, and Indianapolis railroads pass through it. The chief productions in 1870 were 191,477 bushels of wheat, 861,520 of Indian corn, 143,737 of oats, 65,894 of potatoes, 47,648 lbs. of wool, 259,131 of butter, and 8,307 tons of hay. There were 5,842 horses, 944 mules and asses, 4,821 milch cows, 6,918 other cattle, 16,604 sheep, and 34,733 swine; 13 carriage factories, 2 woollen factories, 9 tanneries, 8 currying establishments, 5 flour mills, 2 planing mills, and 24 saw mills. Capital, Brownstown. **XIV.** A S. W. county of Illinois, separated from Missouri by the Mississippi river, and drained by Big Muddy river; area, 576 sq. m.; pop. in 1870, 19,634. It contains extensive coal beds and several salt springs. The surface is uneven, and diversified by prairies and timber lands. The Illinois Central, the Grand Tower and Carbondale, and the Carbondale and Shawneetown railroads traverse it. The chief productions in 1870 were 329,926 bushels of wheat, 611,951 of Indian corn, 149,931 of oats, 68,481 of potatoes, 61,717 lbs. of tobacco, 20,326 of wool, 167,334 of butter, 134 bales of cotton, and 4,353 tons of hay. There were 4,429 horses, 1,034 mules and asses, 3,230 milch cows, 4,631 other cattle, 9,011 sheep, and 26,438 swine; 2 manufactories of boxes, 3 of brick, 1 of cars, 1 of iron castings, 3 of tin, copper, and sheet-iron ware, 1 of patterns and models, 1 of sash, doors, and blinds, 1 woollen factory, 1 railroad repair shop, 4 flour mills, and 9 saw mills. Capital, Murphysborough. **XV.** A S. county of Michigan, drained by the head waters of Grand, Kalamazoo, and Raisin rivers; area,

720 sq. m.; pop. in 1870, 36,047. The surface is undulating and diversified by many small lakes. The soil is a good sandy loam. It contains bituminous coal, iron, limestone, and sandstone. The Michigan Central railroad and the Jackson, Lansing, and Saginaw, the Grand River Valley, and the Air-Line divisions of the same, the Jackson branch of the Michigan Southern railroad, the Fort Wayne, Jackson, and Saginaw, and the Detroit, Hillsdale, and Indiana railroads traverse it. The chief productions in 1870 were 825,505 bushels of wheat, 759,146 of Indian corn, 239,021 of oats, 62,546 of barley, 401,558 of potatoes, 616,238 lbs. of wool, 1,021,831 of butter, 32,955 of cheese, and 62,090 tons of hay. There were 10,201 horses, 8,946 milch cows, 10,623 other cattle, 130,289 sheep, and 15,879 swine; 6 manufactories of agricultural implements, 4 of boots and shoes, 6 of brick, 14 of carriages, 13 of clothing, 8 of cooperage, 1 of drain pipe, 1 of drugs and chemicals, 6 of furniture, 5 of iron castings, 2 of curried leather, 1 of morocco, 1 of engines and boilers, 9 of saddlery and harness, 5 of sash, doors, and blinds, 2 of stone and earthenware, 7 of tin, copper, and sheet-iron ware, 3 planing mills, 4 saw mills, and 11 flour mills. Capital, Jackson. **XVI.** A S. W. county of Minnesota, bordering on Iowa, intersected by the Des Moines river, and drained by the Changuska, an affluent of the Blue Earth; area, 720 sq. m.; pop. in 1870, 1,825. It contains several lakes, the largest of which is Heron lake. The surface is undulating and the soil fertile. The Sioux City and St. Paul railroad crosses the N. W. part. The chief productions in 1870 were 24,150 bushels of wheat, 6,405 of Indian corn, 24,366 of oats, 7,637 of potatoes, 35,510 lbs. of butter, and 4,263 tons of hay. There were 237 horses, 469 milch cows, 740 other cattle, 413 sheep, and 251 swine. Capital, Jackson. **XVII.** An E. county of Iowa, separated from Illinois by the Mississippi river; area, 628 sq. m.; pop. in 1870, 22,619. It contains valuable mines of lead and iron, is well watered, fertile, and well timbered, and has an uneven surface. The Sabula, Ackley, and Dakota railroad skirts the S. border, and the Maquoketa branch of the Davenport and St. Paul line terminates in it. The chief productions in 1870 were 429,515 bushels of wheat, 1,485,250 of Indian corn, 807,511 of oats, 168,701 of potatoes, 42,060 lbs. of wool, 724,366 of butter, 77,750 of cheese, and 33,742 tons of hay. There were 8,043 horses, 9,991 milch cows, 16,554 other cattle, 10,672 sheep, and 34,667 swine; 24 manufactories of carriages, 8 of furniture, 24 of cooperage, 12 of saddlery and harness, 4 of woollen goods, 1 pork-packing establishment, 2 breweries, 14 saw mills, and 9 flour mills. Capital, Bellevue. **XVIII.** A W. county of Missouri, bordering on Kansas, and bounded N. by the Missouri river, which receives the Kansas at its N. W. extremity; area, 525 sq. m.; pop. in 1870, 55,041, of whom 5,223 were colored. The surface is moderately uneven. Lime-

stone is the principal rock. The soil is well watered and very fertile. The Pacific railroad of Missouri crosses it, and several other lines terminate at Kansas City within its limits. The chief productions in 1870 were 312,084 bushels of wheat, 1,504,439 of Indian corn, 173,229 of oats, 91,419 of potatoes, 70,312 lbs. of tobacco, 237,623 of butter, and 2,373 tons of hay. There were 6,961 horses, 1,703 mules and asses, 5,294 milch cows, 9,162 other cattle, 11,016 sheep, and 30,227 swine; 9 manufactories of boots and shoes, 7 of brick, 24 of carriages, 23 of clothing, 4 of confectionery, 17 of furniture, 1 of hosiery, 3 of iron castings, 1 of machinery, 9 of marble and stone work, 17 of saddlery and harness, 4 of sash, doors, and blinds, 1 of scales, 25 of tin, copper, and sheet-iron ware, 4 of tobacco and snuff, 14 of cigars, 7 of upholstery, 5 breweries, 14 flour mills, 4 saw mills, 4 establishments for packing beef, and 4 for packing pork. Capital, Independence. **XIX.** A N. E. county of Kansas, drained by Grasshopper river, Soldier creek, and other affluents of the Kansas; area, 556 sq. m.; pop. in 1870, 6,053. The surface is diversified, the soil fertile. The Central branch of the Union Pacific railroad passes through it. The chief productions in 1870 were 51,583 bushels of wheat, 486,940 of Indian corn, 137,894 of oats, 52,497 of potatoes, 145,698 lbs. of butter, and 16,273 tons of hay. There were 3,484 horses, 3,349 milch cows, 5,826 other cattle, 2,857 sheep, and 4,622 swine. Capital, Holton. **XX.** A S. county of Oregon, bounded S. by California, and traversed by the Cascade mountains; area, 11,000 sq. m.; pop. in 1870, 4,778, of whom 634 were Chinese. Rogue river drains the W. portion; E. of the Cascade range are numerous lakes, containing the head waters of Klamath river. The soil in the west is fertile; much of the E. portion is desert. The surface is much diversified, and there is a great variety of climate. Water power is abundant. Gold has been found on Jackson creek. The chief productions in 1870 were 15,226 bushels of wheat, 6,000 of Indian corn, 47,800 of oats, 8,020 of barley, and 1,814 tons of hay. There were 1,404 horses, 1,007 milch cows, 2,509 other cattle, 2,108 sheep, and 5,772 swine; 2 flour mills, and 1 woollen factory. Capital, Jacksonville.

JACKSON, a city and the county seat of Jackson co., Michigan, on both banks of Grand river, near its source, 74 m. W. of Detroit and 36 m. S. by E. of Lansing; pop. in 1850, 2,363; in 1860, 4,799; in 1870, 11,447, of whom 2,448 were foreigners. It is lighted with gas, and has paved streets, water works on the Holly system, and an efficient police force. There are two fine hotels and many excellent business structures. Several of the churches are handsome edifices, and the two union school houses are large and well arranged. An iron bridge has recently been built across the river. The Michigan state penitentiary, the buildings and walls of which are of stone, is situated here.

It occupies an enclosed area of eight acres. The main building is 500 ft. long, 57 broad, and 44 high. The city derives its chief importance from its position at the intersection of six railroads, viz.: the Michigan Central (main line); the Jackson branch of the Lake Shore and Michigan Southern; the Fort Wayne, Jackson, and Saginaw; and the Jackson, Lansing, and Saginaw, the Grand River Valley, and the Air-Line divisions of the Michigan Central. The last named company has lately erected here the finest passenger depot in the state; the building is of brick and stone, 294 ft. by 40, and is finely fitted up. The company has also extensive machine shops and other structures here. In the N. part of the city are two mines of bituminous coal, and a third 2 or 3 m. beyond the city limits, which yield a valuable product. The river furnishes good water power, and there are manufactories of chemicals, bricks, drain pipe, fire bricks, agricultural implements, wagons, and furniture, founderies, machine shops, a large rolling mill and nut, bolt, and spike factory, breweries, flour mills, planing mills, potteries, &c. The value of manufactures in 1872 was about \$3,000,000. The sales of merchandise amounted to \$3,230,500. There are four banks with an aggregate capital of \$350,000. Besides the union schools there are eight ward school houses. The schools are graded, and in 1872 included two high, five grammar, and seven primary schools, with 40 teachers and 2,000 pupils. There are also a business college, a German Lutheran school, a young men's library of 2,500 volumes, two daily and two weekly newspapers, and 13 churches. Jackson became a city in 1857.

JACKSON. I. A town of Hinds co., Mississippi, capital of the state, on the W. bank of Pearl river, at the intersection of the New Orleans, Jackson, and Great Northern and the Vicksburg and Meridian railroads, 183 m. by rail N. of New Orleans, and 45 m. E. of Vicksburg; lat. 32° 23' N., lon. 90° 8' W.; pop. in 1850, 1,881; in 1860, 3,191; in 1870, 4,234, of whom 1,964 were colored; in 1874, about 6,000. It is regularly built on undulating ground. The principal public buildings are the state house, executive mansion, state lunatic asylum, the state institutions for the deaf and dumb and the blind, and the city hall, in which the United States courts and the courts for the first judicial district of the county are held. The state penitentiary, a large and handsome edifice, was nearly destroyed during the civil war, but it is soon to be rebuilt. The state house is an elegant building, erected at a cost of \$600,000, and in it the sessions of the supreme court of the state are held. Considerable quantities of cotton are shipped from Jackson, and there are two founderies, a sash and blind factory, about 60 stores, several hotels, two banks, several public and private schools, three weekly newspapers (one of which also issues a daily edition during the session of

the legislature), and ten churches. The state library contains 15,000 volumes. Jackson was occupied by the federal forces on May 14, 1863, when the railroad depots, bridges, arsenals, workshops, storehouses, and many residences were destroyed; and on two subsequent occasions during the war it was in the possession of the Union troops. II. A town of East Feliciana parish, Louisiana, 30 m. N. of Baton Rouge; pop. in 1870, 934, of whom 218 were colored. It is the seat of the state asylum for the insane, founded in 1848, and of Centenary college, under the charge of the Methodists, founded in 1825, and having in 1872 4 professors, 83 students, and a library of 2,000 volumes. A weekly newspaper is published. III. A city and the capital of Madison co., Tennessee, on the Forked Deer river, at the intersection of the Mobile and Ohio and the Mississippi Central railroads, 117 m. W. S. W. of Nashville and 72 m. N. E. of Memphis; pop. in 1850, 1,006; in 1860, 2,407; in 1870 4,119, of whom 1,500 were colored; in 1874 estimated by local authorities at 10,000. It is pleasantly situated in the midst of a fertile region, and has a large and growing trade, more than 20,000 bales of cotton having been shipped from this point in 1873-'4. The city contains three planing mills, a foundery, two soda water manufactories, a brewery, a cooperage establishment, and the machine shops of the Mobile and Ohio railroad. A cotton factory is to be erected, and the shops of the Mississippi Central railroad are soon to be established here. There are a national and a savings bank, a daily and two weekly newspapers, a monthly periodical, two public and several other schools, including a female institute under the management of the Memphis Methodist Episcopal conference, and 11 churches. Jackson is the seat of West Tennessee college, which in 1871-'2 had 4 professors and 152 students.

JACKSON, Andrew, seventh president of the United States, born in the Waxhaw settlement, N. C., March 15, 1767, died at the "Hermitage," near Nashville, Tenn., June 8, 1845. His parents, who were Scotch-Irish, emigrated from Carrickfergus, Ireland, in 1765, and settled on Twelve-mile creek, a branch of the Catawba river. They had been very poor at home, the father tilling a few acres, while his wife, Elizabeth Hutchinson, belonged to a hard-working and scantily paid family of linen weavers. Mr. Jackson never owned any land in America, and after his death, early in the spring of 1767, his widow removed to Waxhaw creek, where her relatives resided. It was in the house of her brother-in-law, George McKemey, that the future president was born, a few days after the death of his father. Shortly afterward Mrs. Jackson removed to the house of another brother-in-law, Mr. Crawford, whose housekeeper she became, because of the illness of his wife. Little is known of Andrew's childhood. He is described as a frolicsome, mischievous generous, brave, and resolute boy, passion-

ately fond of athletic sports, in which he was excelled by no one of his years. He was not addicted to books, and his education was limited, though it is said his mother wished to train him for the pulpit. At an early age he took up arms, and was a witness of the defeat of Sumter at Hanging Rock in 1780. He had previously seen the dead and wounded of the Waxhaw militia, after the massacre by Tarleton, and had assisted his mother and his brother Robert in ministering to the wants of the disabled Americans. The two brothers were active whigs, and were captured by the enemy in 1781. The British commander ordered Andrew to clean his boots, and on the boy's refusal struck him on the head and arm with his sword, inflicting two wounds. Robert, who displayed equal spirit, was knocked down and disabled. Imprisoned at Camden, Jackson was an eye-witness of the defeat of Gen. Greene at Hobkirk's Hill. While the brothers were suffering from the smallpox, in prison, their mother effected their exchange, and took them back to Waxhaw, where Robert died; and it was many months before Andrew's health was restored. His mother then proceeded to Charleston to aid the imprisoned Americans, and soon died of ship fever. Left utterly destitute, Jackson had to labor hard for subsistence. He worked for a time in a saddler's shop kept by one of his relatives, and taught school. Before he had completed his 18th year he commenced the study of law at Salisbury, N. C., in the office of Mr. Spence McKay. He did not neglect his studies altogether, but paid more attention to horse racing, foot racing, cock fighting, and similar amusements common at that time, than to the law. Finishing his studies in the office of Col. Stokes, he was licensed to practise before he had reached the age of 20. In 1788 he was appointed solicitor or public prosecutor of the western district of North Carolina, embracing what is now the state of Tennessee. He arrived at Nashville in the autumn, and entered immediately upon an active career. His practice was large. He had to travel much, making 22 journeys in seven years between Nashville and Jonesborough, 280 m., always at the risk of his life, owing to the numbers and hostility of the Indians. In the summer of 1791 he married Mrs. Rachel Robards, a daughter of Col. John Donelson of Virginia, one of the founders of Tennessee. Her first husband was Mr. Lewis Robards of Kentucky. Mr. and Mrs. Robards were boarding with Mrs. Donelson, then a widow, when Jackson arrived at Nashville, and took up his residence in the same family. In 1790-'91 Mr. Robards applied to the legislature of Virginia for an act preliminary to a divorce, stating that his wife was living in adultery with Andrew Jackson. The act was passed, under it a jury was summoned late in 1793, and the court of Mercer co., Ky., declared the marriage between Lewis Robards and Rachel Robards dissolved. Jackson and

Mrs. Robards believed the act passed by the legislature was itself a divorce, and they were married at Natchez two years before the action of the court. At the suggestion of their friend Judge Overton, who also was surprised to learn that the act of the legislature had not divorced Capt. Robards, they procured a license in January, 1794, and had the ceremony performed again. When Gen. Jackson had become the chief of a great party, the circumstances of this marriage led to very serious misrepresentations. Mr. Robards was prone to jealousy without cause, and Jackson was not the first man of whom he was jealous. His statement to the legislature of Virginia is believed to have been wholly unfounded. His relatives all sided with his wife, and never supposed her to be guilty of even an act of impropriety. In all his relations with women Jackson's conduct was singularly pure. Thomas H. Benton, who knew the parties intimately many years, says: "There was an innate, unvarying, self-acting delicacy in his intercourse with the female sex, including all womankind; and on that point my personal observation (and my opportunities for observation were both large and various) enables me to join in the declaration of the belief expressed by his earliest friend and most intimate associate, the late Judge Overton of Tennessee. The Roman general won an immortality of honor by one act of continence; what praise is due to Jackson, whose whole life was continence? I repeat, if he had been born in the time of Cromwell, he would have been a Puritan. Nothing could exceed his kindness and affection to Mrs. Jackson, always increasing in proportion as his elevation and culminating fortunes drew cruel attacks upon her." Jackson became district attorney of Tennessee when that country was made a federal territory; and when the territory became a state, in 1796, he was a man of some wealth, owning much land. He was chosen one of the five members from Davidson co. of the convention which met at Knoxville, Jan. 11, 1796, to make a constitution for the new state, and he was appointed on the committee which drafted that instrument. In the autumn of 1796 he was elected to represent the state in the popular branch of congress. He entered the house Dec. 5, 1796, when Washington was on the eve of retirement. Jackson belonged to the republican (afterward democratic) party, then forming under the lead of Thomas Jefferson, who had just been elected vice president. He was one of the twelve representatives who voted against the adoption of an address to President Washington, in reply to his last annual address to congress, as he could not conscientiously approve of all the acts of the administration. His first speech was made on Dec. 29, in support of claims for services against the Indians. He pushed the question with his usual earnestness, speaking more than once, and succeeding in his purpose. During the session he voted in favor of laying taxes

on slaves, of completing three frigates, against buying peace of the Algerines, against a large appropriation for furnishing the president's house, and against the removal of the restriction confining the expenditure of public money to the specific objects for which each sum was appropriated. His course was highly approved by his constituents; and he was made a member of the senate, in which he took his seat Nov. 22, 1797. Nothing is known of his senatorial career. So far as appears, he never made a remark or cast a vote as a senator. In April, 1798, he returned to Tennessee on leave, and resigned his seat. He was elected a justice of the supreme court of Tennessee by the legislature, at a salary of \$600 a year, and held courts in various parts of the state. None of his decisions remain. While he was on the bench he was involved in a quarrel with Gov. Sevier, which came to a crisis in 1801, when Jackson was elected a major general of militia over Sevier. Jackson suspected Sevier of having been engaged in certain land frauds. An informal duel at Knoxville, in 1804, was prevented at the last moment by the interference of friends. In 1798 he had sold lands to a Philadelphian, and on the basis of the notes he received bought goods for the Tennessee market; but the failure of the Philadelphian threw him into difficulties, and in order to clear them off he resigned his judgeship, July 24, 1804, sold a large amount of property, and relieved himself from debt. He removed to what subsequently became known as the "Hermitage," with his slaves, and dwelt in a log house. He extended his business, being chief of the trading firm of Jackson, Coffee, and Hutchings, and raised cotton, corn, wheat, horses, cows, and mules. He had a cotton gin, then a rarity. The firm traded to New Orleans, and built boats for other traders; but it lost much money, and came to an end. Jackson was an exact and judicious business man, and succeeded in all undertakings managed by himself. His commercial failure grew out of the proceedings of the firm during his absence. In the opening days of 1806 commenced a quarrel which led to a duel between Gen. Jackson and Charles Dickinson, and to the latter's death. Mr. Dickinson had previously used disparaging words of Mrs. Jackson, which he had explained away; but he repeated them, whereupon Jackson remonstrated with his father-in-law, Mr. Ervin, saying: "I wish no quarrel with him; he is used by my enemies in Nashville, who are urging him on to pick a quarrel with me. Advise him to stop in time." Becoming involved in a quarrel with a Mr. Swann relative to the terms of a horse race, Jackson found the name of Dickinson offensively introduced into the letters written by Swann, which drew from him certain characteristic comments, and these were carried to their subject, as was the intention of their writer. Dickinson, on Jan. 10, just before starting for New Orleans in a flat-boat, wrote to Jackson,

charging him with equivocations, falsehood, and cowardice. During his absence the controversy between Jackson and Swann was continued, and led to a tavern fight, begun by the former. Dickinson returned to Nashville on May 20, and on the 21st he published a severe attack on Jackson, provoked in part by the language of the latter in the Swann quarrel. Jackson challenged him, and the parties met on the banks of the Red river, in Logan co., Ky., early in the morning of May 30. The place is a long day's journey from Nashville, and the duellists had to leave their homes early on the 29th. Dickinson was accompanied by a number of his associates, as he was very popular, and stood high in the society of Nashville. His second was Dr. Catlet, and Jackson's was Gen. Overton. The distance was eight paces, and Overton won the right to give the word. Dickinson fired at the word, breaking a rib, and raking the breast bone; but Jackson gave no sign of being hit, and his antagonist, who had made sure of killing him, exclaimed: "Good God! have I missed him?" Jackson then fired, and Dickinson fell mortally wounded. He died that night, not even knowing that his ball had hit Jackson, with whom it was a point of pride not to let him know that his aim had been effectual. His reason for concealing his wound, as he once said to a friend, was, "that as Dickinson considered himself the best shot in the world, and was certain of killing him at the first fire, he did not want him to have the gratification even of knowing that he had touched him." But, according to Mr. Parton, his "wound proved to be more severe and troublesome than was at first anticipated. It was nearly a month before he could move about without inconvenience, and when the wound healed, it healed falsely; that is, some of the viscera were slightly displaced, and so remained." This duel made Jackson unpopular in Tennessee, until his military exploits had withdrawn public attention from it. In 1805, when Aaron Burr made his first visit to the west, he twice became the guest of Jackson. The western people were anxious for a war with Spain, and Burr was popular with them, because he was believed to represent and support their opinions. Jackson was of the war party. After Burr's return to the east he and Jackson corresponded, the latter even making out the lists of officers for two regiments which the former suggested might be raised in Tennessee. Burr arrived at the Hermitage in September, 1806, and was warmly received; and at the instance of his host a public ball was given in his honor at Nashville, though rumors adverse to him and his doings were then current. Jackson, in military costume, led Burr into the room, and introduced him. In November Burr sent an order to Jackson for boats and provisions, which was fulfilled. A week later (Nov. 10) Jackson received intelligence that led him to doubt Burr's integrity; he directed that no

further engagements should be made with Burr, and wrote to him, demanding to know the truth. He also wrote a warning letter to Governor Claiborne of Orleans territory, and another to President Jefferson, tendering the services of his militia division to the general government. Burr arrived at Nashville Dec. 14, and sought Jackson, whom he assured of the falsity of the charges against him. They had a pecuniary settlement, and Burr departed, taking but two of the eight boats for which he had contracted. Shortly after his departure the president's proclamation denouncing him arrived, and he was burned in effigy. On Jan. 1, 1807, Gen. Jackson received orders from the government at Washington to hold his command in readiness to act. The revolutionary veterans in Nashville tendered their services to Jackson, who accepted them. He exerted himself with his usual energy; but his active loyalty did not save him from the suspicion that he was leagued with Burr. Summoned to Richmond as a witness in the trial of Burr, he acted as one of Burr's most zealous partisans. "There he harangued the crowd in the capitol square," says Mr. Parton, "defending Burr, and angrily denouncing Jefferson as a persecutor. There are those living (1859) who heard him do this. He made himself so conspicuous as Burr's champion at Richmond, that Mr. Madison, the secretary of state, took deep offence at it, and remembered it to Jackson's disadvantage five years later when he was president of the United States, with a war on his hands. For the same reason, I presume, it was that Jackson was not called upon to give testimony upon the trial." Jackson at this time belonged to that portion of the democratic party which sought to have Mr. Monroe nominated as President Jefferson's successor, the president himself preferring Mr. Madison. For some years he held no office, living at the Hermitage, and devoting himself to agriculture. His life was not altogether quiet, however, as, besides lesser disputes, he had an animated quarrel with Mr. Dinsmore, agent of the Choctaw Indians.—When, in 1812, war was declared against England, Gen. Jackson promptly tendered his services, and those of 2,500 men of his division of Tennessee militia, to the national government, and the offer was as promptly accepted; but it was not until Oct. 21 that the government requested Gov. Blount to send 1,500 men to New Orleans. Jackson appointed Dec. 10 for the meeting of the troops at Nashville. A force of infantry and cavalry, 2,070 strong, was organized, and on Jan. 7, 1813, the infantry embarked, while the cavalry marched across the country. On Feb. 15 the little army assembled at Natchez, where it remained by direction of Gen. Wilkinson. At the close of March Jackson received an order from the secretary of war to dismiss his corps, but he conducted his force back to Tennessee before disbanding it. It was on this march that the soldiers gave him the name of "Hick-

ory," because of his toughness, and in time this was changed into "Old Hickory." He tendered his corps for an invasion of Canada, but no answer came from Washington, and on May 22, at Nashville, the men were dismissed. Government allowed his transportation drafts to be protested, and his private fortune would have been irretrievably ruined had not his friend Col. Benton made "an appeal from the justice to the fears of the administration." When the administration found that the state of Tennessee would be lost to it if this scandalous act were persisted in, justice was done. In 1813 Jackson's friend William (afterward Gen.) Carroll became involved in a quarrel with Mr. Jesse Benton, a brother of Col. T. H. Benton, and challenged him. Carroll asked Jackson to be his second, which he declined, until Carroll told him there was a conspiracy "to run him (Carroll) out of the country," when he resolved to interfere. At first he was successful in his remonstrances with Benton, but the latter finally resolved that the duel should go on. Jackson acted as Carroll's second. Benton sent an offensive account of the affair to his brother, who was then serving Jackson so well at Washington. Other enemies of Jackson sent him similar accounts. This led to an angry correspondence between Gen. Jackson and Col. Benton, and the latter made use of the harshest language in speaking of the former, all of which was reported to the general, who threatened to horsewhip the colonel the first time they should meet. On Sept. 4 Jackson, accompanied by Col. Coffee, met the Bentons in the streets of Nashville. Bidding him defend himself, and avowing his purpose, Jackson advanced upon Col. Benton, who sought to draw a pistol, but was anticipated by his antagonist, who drew one and aimed at him. Benton retreated, and Jackson followed him, until they reached the back door of the city hotel, when Jesse Benton fired at Jackson, shattering his left shoulder, the pistol being charged with two balls and a slug. Jackson fell; and Coffee, who entered on hearing the report, fired at Col. Benton, but missed his aim. He was then about to strike down the colonel, when the latter stumbled down a staircase. Meantime Mr. S. Hays, a nephew of Mrs. Jackson, who knew that it was Jesse Benton that fired at the general, volunteered in his relative's aid, and a fierce conflict ensued between him and Jesse, he making use of a sword cane first, and then of a dirk, and throwing him down. Benton was wounded in several places, and would have been killed had not a bystander caught Hays's hand. Nothing but Jackson's own resolution prevented the loss of his left arm, as all the doctors but one recommended amputation.—The massacre of Fort Mimms by the Creek Indians, Aug. 30, 1813, created an extraordinary excitement throughout the southwest. Jackson addressed the volunteers, and appointed Fort St. Stephen as the rendezvous for all who would arm themselves to

take part in a war of Indian extermination. On Sept. 25 the legislature of Tennessee called 3,500 volunteers into the field, besides the 1,500 that were in the national service. Jackson, though too feeble to leave his bed, issued addresses, and aided in the organization of the troops. Still suffering from his wounds, he was at Fayetteville with his division on Oct. 7. On the 11th his force moved, and is said to have marched 32 m. in six hours, in the hope of meeting the Indians. Operations were delayed by a defective commissariat. On Nov. 3 Col. Coffee, who had been sent out with a cavalry force, defeated the Creeks at the town of Tallushatchee, inflicting heavy loss, and destroying the place. On Nov. 9 Jackson defeated the Creeks at Talladega, where hundreds of them were killed or wounded. The want of food prevented these victories from being very useful. The troops were starving and mutinous. A misunderstanding as to the term of service of the volunteers occurred between them and their commander. With fewer than 1,000 newly raised men, besides Indians, he entered the enemy's country in January, 1814. He defeated the Indians at Emuckfau and Enotochopeo, Jan. 22 and 24, and these were among the severest reverses they ever experienced. The details of the battle showed much skill on the side of the victors, Jackson's energy and bravery being very conspicuous. The troops were then dismissed, but a new force was speedily formed, composed in part of regulars. In February Jackson was at the head of 5,000 men. The Creeks made a final stand at Tohopeka, or the Horseshoe, a peninsula in the Tallapoosa river; and their position was very strong, though defended by inadequate numbers. Jackson arrived before this post, March 27, 1814, with 2,000 troops, and attacked it the same day. It was taken, and of its 900 defenders 750 were killed or drowned, the victors losing 201 men. This victory ended not merely the Creek war, but the power of the Indian race in North America. Jackson's victories settled for ever the long quarrel between the white man and the red man. Weathersford, the principal Creek chief, surrendered to him, and was protected. Some of the Indians fled to Florida, but most of them obeyed Jackson's order to retire to the north. In the summer of 1814 Gen. Jackson and Col. Hawkins made with them the treaty of Fort Jackson, the terms of which were as moderate as regard for the peace and safety of the white settlers allowed. The chiefs gave Jackson three miles square of land, and President Madison was desirous that he should be allowed to accept the gift, in which view congress could never be brought to concur.—Gen. Jackson had now obtained a national reputation, and on May 31 his appointment as a major general in the United States army was officially announced. Thus in the national service, he became the acknowledged military leader of the southwestern part of the

Union, various circumstances having placed him in a position to which six other generals had claims. The English were preparing a grand attack on the southwest, and in July, 1814, Jackson left his home for Mobile, against which the first blow of the enemy was to be delivered. Florida was then a Spanish province, but the English used it as if it were their own; and from Pensacola, the best harbor on the gulf, they organized expeditions against the United States, and aided the Indians. It was now the rendezvous of their forces, and the Spaniards had neither the power nor the disposition to prevent this abuse of neutral territory. The headquarters of the British commander were in the house of the Spanish governor, Manriquez. When Jackson arrived at Mobile, he found but a small force at his command, yet he resolved to seize Pensacola. He wrote to the secretary of war, asking permission to attack that place, but the secretary's reply reached him only at the end of six months. He opened a correspondence with Manriquez, which led to no change of conduct on the part of the Spaniards, Col. Nichols, the English commander, continuing his preparations at Pensacola for an attack on Mobile. Assuming the responsibility, as was his custom both in politics and in war, Jackson determined to act without orders. He gave direction that the Tennessee levies should march upon Mobile. The call he made upon his old comrades was so well obeyed, that men paid large sums for the privilege of filling vacancies in the corps that had been mustered into the service. Meantime he threw a small force into Fort Bowyer, on Mobile point, commanded by Major Lawrence. This fort, which was incomplete, was assailed, Sept. 15, by a British fleet, aided by a combined force of Indians and marines. The enemy were repulsed, losing one of their ships and 72 men. A mutiny in the ranks of the Tennessee troops delayed the arrival of the force under Gen. Coffee, and it was not till Oct. 26 that Jackson found himself at their head, his entire force consisting of 4,000 men, 1,000 of whom were regulars and 1,500 mounted volunteers. He hung six of the mutineers, and his conduct was the subject of much hostile discussion at a later period. He marched immediately upon Pensacola, at the head of 3,000 men. Negotiations failing, he seized the town by force, Nov. 6; and the British blew up the fort that commanded the mouth of the harbor, their seven vessels leaving the bay. On Nov. 11 Jackson was again at Mobile, where he remained till the 22d to meet an expected attack, and whence he sent a force that expelled Nichols and his Indians from Florida. He sent the mass of his troops to New Orleans, and reached that place himself Dec. 2, 1814. The city was miserably defended, and had the English moved with ordinary rapidity it must have fallen into their hands. Jackson immediately prepared to meet the enemy. On Dec. 14 a powerful British naval force captured five

American gunboats and a schooner, which gave the enemy command of the route to New Orleans, had they known how to use it. The next day Jackson declared martial law, having already called out the whole of the state militia. The forces under his orders consisted of Tennessee, Kentucky, Louisiana, and Mississippi militia, a few regulars, Baratarian privateersmen, and a battalion of colored men. The vanguard of the British army, under Gen. Keane, was landed on Dec. 16, and marched to within 9 m. of New Orleans on the morning of the 23d. Jackson heard of their arrival before 2 P. M., assembled a motley force 2,131 strong, of whom only about 1,800 were engaged, and, aided by Lieut. Henley in the schooner *Carolina*, attacked the enemy. A very hot action was fought, with decided advantage to the Americans, as it prevented the enemy's advance upon the city; and the victory might have been made complete had not large British reinforcements arrived during the night. New Orleans was really saved on the night of Dec. 23, as the enemy were made over-cautious by the result of that battle. Jackson fell back to a canal 4 m. from the city, where his famous line was constructed, and provided against attacks from other directions. Sir E. Pakenham arrived on the 25th, and made new arrangements in the British army. The *Carolina* was destroyed by his batteries that evening. He attacked Jackson on the 28th, and was repulsed. On Jan. 1, 1815, another attack was made, principally with artillery, and again the enemy were signally beaten. These results were owing to the skilful manner in which Jackson managed the resources at his command, and to the enthusiasm with which he had inspired his inexperienced troops. He caused the invaders to be constantly harassed by night attacks. On Jan. 1 he was reinforced by the arrival of 2,250 Kentucky militia, mostly unarmed, the arms that had been ordered from Pittsburgh to New Orleans having failed to reach that place. Reinforced on Jan. 6, the entire British army, including seamen and marines, probably consisted of 14,000 effective men; but British authorities place it as low as 8,000, and greatly exaggerate Jackson's numbers, placing them as high as 25,000. His line on the left bank of the Mississippi was about a mile long, with 12 guns, and was defended by only 3,200 men, while 800 more were distributed in positions hard by. It was a strong position; the cannon were well served by Lieut. (afterward Gen.) Armstrong, and by the Baratarians; and so slippery was the soil that, according to Major Latour, an eye-witness, a man unincumbered and unopposed would have found it difficult to mount the breastwork at leisure and carefully. Its weakness was, that it was commanded from the right bank, where were American batteries, manned by seamen, and supported by Kentucky militia. The English enlarged the Villeré canal, and prepared to

throw a force upon the right bank of the river, to storm the American position there before commencing their attack on Jackson's line. Col. Thornton was despatched, at the head of two regiments and 600 marines and seamen, across the river, on the night of the 7th; but delays were experienced, and it was not until the event of the campaign had been decided on the left bank that he was able to advance. Meantime, on the left bank the British columns were directed against the American line; but they were received with a severe fire and beaten back, Gen. Pakenham being killed, Gen. Gibbs mortally wounded, and Gen. Keane severely wounded. The attack was repeated, but with no success. The weight and precision of the American fire were irresistible. A small British force succeeded in carrying a battery near the river, after losing three fourths of its number, but abandoned it. One regiment, the 93d highlanders, distinguished for its services in many parts of the world, lost more than half its men, having been brought to a point where it could do no good, but where it could be most effectually operated upon by the Americans. The British troops never behaved better, but they were badly handled; and it is the evidence of one of their own officers that Sir E. Pakenham's impatience in giving the signal of attack too soon, instead of waiting for the development of Thornton's movement, was the cause of his severe loss. The merit of Jackson consisted mainly in the fact that he adapted his means of defence most shrewdly to the character of his own forces no less than to that of the enemy. His opponents have never hesitated to admit his merits in the strongest language. The number of the British engaged on the left bank is variously stated, the lowest figure on the British side being 5,195. On the right bank Col. Thornton's attack was entirely successful, owing to one of Gen. Morgan's aids having directed a retreat that was rapidly converted into a flight. The seamen, under Capt. Patterson and Lieut. Henley, who served a heavy battery on the right bank, though compelled to abandon it, spiked their guns and threw their ammunition into the river. Their success on that side gave the British virtual command of the left bank and of New Orleans; but they had been so roughly handled before Jackson's line that they had no heart to pursue the signal advantage they had gained over his lieutenant. Gen. Lambert, who had succeeded to the command of the British army, proposed an armistice. Jackson consented, on condition that while hostilities should be suspended on the left bank, they should not be so on the right bank, and that neither party should send reinforcements there. Gen. Lambert ordered Col. Thornton to return to the left bank, and the British gave up their solitary advantage. The enemy's loss on the left bank was about 2,000 in killed, wounded, and prisoners; the American

loss, 7 killed and 6 wounded. On the right bank neither party suffered much, but even there the loss was mostly on the side of the enemy. Jackson watched the enemy until the 18th, when they retreated, abandoning their guns, and leaving 80 wounded men to the care of the Americans. Jackson was involved in much trouble by the conduct of many civilians during the campaign, who forgot that a dictatorship alone could save the state, which the enemy, had they been victorious, would possibly have tried to retain, in spite of the treaty of Ghent, on the ground that the treaty of 1803, by which France had ceded Louisiana to the United States, was void, because she had no claim to the territory. A Frenchman, M. Louaillier, a member of the legislature of Louisiana, was conspicuous among the general's enemies, and Jackson had him arrested on March 5. Judge Hall, of the United States district court, granted Louaillier's petition for a writ of *habeas corpus*, and was himself arrested and imprisoned, and then banished from the city. On March 13 martial law was abrogated by Jackson's order, and Hall returned. Jackson was then arrested on a charge of contempt of court, and fined \$1,000. He refused the offers that were made from all sides to pay the fine, and paid it himself, protecting the court, which could not have stood a moment against his opposition. After his retirement from public life some of his friends requested congress to refund the amount. After considerable opposition, the bill refunding the money, principal and interest, was passed in February, 1844.—The brilliant successes of the Louisiana campaign made Jackson very popular throughout the country. He was appointed commander-in-chief of the southern division of the United States in April, 1815, and received the thanks of congress. Even at that early day he was thought of as a candidate for the presidency, and his political prospects were not injured when it was known that he advised President Monroe to pursue a liberal course toward the federalists, whose political importance had vanished, and to select his cabinet without regard to party. Toward the close of 1817 a war with the Seminoles was commenced, and Jackson was ordered to take the field in person. He formed a large force, consisting of regular troops, militia from Tennessee and Georgia, and Creek Indians. He was successful, and without much fighting. He seized the Spanish fort of St. Mark's, where he found a Scotchman named Arbuthnot; and at the Indian town of Suwanee he captured one Ambrister, a native of the Bahamas. These British subjects were tried before courts martial, and condemned on the charges of having stirred up the Indians against the United States, and of supplying them with the means of war; and they were executed. The court softened Ambrister's sentence to whipping and imprisonment, but Gen. Jackson hung him nevertheless. Two Indian chiefs, one of them the prophet

Francis, were promptly hanged by his orders. He then marched upon Pensacola, and, in spite of the remonstrances of the Spaniards, seized it. These proceedings created great sensation. The execution of Arbuthnot and Ambrister was the cause of much irritation in England, and Lord Castlereagh, secretary of state for foreign affairs, told Mr. Rush, the American minister, that he could have had war with the United States merely by holding up his hand. The administration of President Monroe was divided on the subject. J. Q. Adams, secretary of state, ably defended the course of Jackson in his correspondence with the Spanish minister, who had demanded an apology and an indemnity for the seizure of the two places in Florida, and in the cabinet against Mr. Calhoun, secretary of war, who was in favor of putting him on his trial; which last fact was unknown to Jackson, who believed that Calhoun had acted with Adams, and that Mr. Crawford, secretary of the treasury, was his enemy. In congress his conduct was the subject of vehement debates, but resolutions of censure and condemnation were rejected by the house of representatives, and the senate did not come to any decision on the question. The report made to the senate, by Mr. Lacock of Pennsylvania, was very full and very severe, but was never acted upon. So offensive was it to Jackson that, it is said, he threatened to cut off the ears of certain senators. His anger was caused by his belief that he had acted in strict conformity to the wishes of the administration; and it is by no means certain that he did not. In 1819 he made a visit to the north, proceeding as far as New York, and was everywhere well received. The government of New York city employed Vanderlyn to paint his portrait. When Spain ceded Florida to the United States, Jackson was appointed governor of that territory, March 10, 1821, and took possession of it July 18. He held the office only a few months, but during that time he had a dispute with Col. Callava, late Spanish governor of Florida, relative to certain judicial papers which the latter was endeavoring to carry out of the country. Callava was imprisoned, but released on the seizure of the papers. Judge Fremontin granted him a *habeas corpus*, which Gov. Jackson disregarded, and summoned the judge before him. The judge did not obey the summons, and the governor's course was condemned by some members of congress, in debate; but they failed to obtain a formal censure. President Monroe offered the post of minister to Mexico to Gen. Jackson, which he would not accept.—In 1823 the Tennessee legislature elected him a United States senator, and nominated him for the presidency. "At first," says Mr. Tucker, "this nomination afforded matter of jest and merriment rather than of serious animadversion in other states, since, unquestionable as were Gen. Jackson's military qualifications, he was not thought to possess the information, or respect

for the civil authority, or temper, deemed requisite in the office of president; and very few believed that the favor which his military successes had produced for him in his own state would find much support in other parts of the Union." But in the ensuing presidential election of 1824 Jackson received 99 electoral votes, 84 being cast for John Quincy Adams, 41 for William H. Crawford, and 37 for Henry Clay. No candidate having received a majority, the choice devolved upon the house of representatives, and Adams was elected. Jackson then apparently retired from public life; but the entire opposition to the administration of Adams supported him for the presidency in 1828, and he was elected, receiving 178 electoral votes, while only 83 were cast for Adams. The contest which thus resulted was among the most bitter in American history. Jackson's whole public career was severely assailed, and his private life was not spared. The circumstances of his marriage were grossly misrepresented, and it is said with fatal effect on Mrs. Jackson, who died only a few days after it was known that her husband had been chosen president. Assuming the presidential office, March 4, 1829, he commenced a course of vigorous government, which he maintained for eight years. Mr. Calhoun, who had been vice president under Adams, and reelected when Jackson was chosen president, headed an influential section of the democratic party, and expected to succeed his chief, who had avowed his intention not to be a candidate for reelection. The president was personally alienated from Calhoun on being informed that he had been his enemy in the Monroe cabinet at the time of the Seminole war, and became politically hostile in consequence of Calhoun's assertion of the doctrine of nullification. The democratic party, outside of South Carolina, supported the president; and in 1831 a new cabinet was appointed. Mr. Ingham, secretary of the treasury, and a friend of Calhoun, made way for Mr. McLane; Mr. Branch, another friend of Calhoun, left the navy department, which was taken by Mr. Woodbury; and Mr. Berrien, attorney general, was succeeded by Mr. Taney. Mr. Van Buren gave up the state department to Mr. Livingston, and was appointed minister to England; and Mr. Eaton retired from the war department, which was taken by Gen. Cass. Scandal attributed these changes, and the rupture that had preceded them, to the influence of Mrs. Eaton, wife of the secretary of war, with whom the wives of the Calhoun leaders, as well as many other ladies, refused to associate. Her husband was an old and intimate friend of the president, who zealously espoused Mrs. Eaton's side of the quarrel. When the question of Mr. Van Buren's confirmation came before the senate, in 1832, it was decided in the negative by the casting vote of Calhoun. When congress in 1832 rechartered the bank of the United States, President Jackson vetoed the bill, July 10. His course relative

to appointments gave much offence, as numerous removals were made on political grounds alone, and the vacancies were filled by the selection of ardent partisans; and this proceeding was the more censured, because the president had advised Monroe to disregard party in making appointments to office. The followers of Calhoun had now become "nullifiers," and threatened open resistance to the government. They demanded the reduction of duties to the extent of the disavowal of the protective principle, threatening that South Carolina would nullify the revenue laws if they should not be repealed. A state convention of South Carolina was held at Columbia in 1832, which took measures for resisting the tariff laws. Jackson was opposed to a high tariff, and was ready to continue his constitutional exertions in behalf of such modifications of existing laws as would leave no reasonable ground for complaint on the part of South Carolina; but while the tariff laws endured, he was determined that they should be rigidly enforced; and he early let it be understood that he would show no quarter to active disunionists. The presidential election of 1832 came on while the troubles concerning the United States bank, nullification, and removals from office were at their height. Jackson had reconsidered his intention not to be a candidate, and was formally nominated, Van Buren being the democratic candidate for vice president. His chief opponent was Mr. Clay, who represented the interests of the friends of the national bank and of protection. Mr. Wirt was nominated for the presidency by the anti-masonic party. The contest, though vigorous, was less personal than that of 1828. When the election was over, it was found that Jackson had been supported by every state but seven, Clay receiving the votes of six states, and Wirt those of Vermont only. The nullification crisis occurred in the interval between the decision of the contest of 1832 and Jackson's second inauguration. The president issued his proclamation against the nullifiers on Dec. 10, 1832; and the "force bill," to enable him to maintain the supremacy of the laws, was passed. Fortunately, a compromise was effected, under the lead and influence of Clay, by which the tariff was essentially modified, and an excuse for not proceeding to extremities was afforded to South Carolina. Jackson's second term of service was even a more exciting period than his first. The "bank war" was renewed with vigor. He recommended in his annual message of 1832 that the stock in the bank owned by the government should be sold; and though the house of representatives had declared in favor of continuing the deposits of the public money in the bank, the president resolved upon their removal. This was effected on Sept. 22, 1833, when an order was issued by Mr. Taney, secretary of the treasury, directing the collectors to cease making deposits in the bank, as no removal of money actually on deposit was con-

templated by the president. The measure was the president's own. He called a cabinet council on Sept. 10, at which he read a paper in support of it, but found few of his advisers ready to agree with him. Mr. McLane having been appointed to the state department, Mr. Duane was placed at the head of the treasury, for the purpose of executing the intention of the president; but as he refused to act, he was summarily dismissed, and Mr. Taney, who succeeded him, carried out the measure, whereupon the senate refused to confirm his appointment. The senate also rejected four of the persons appointed government directors, and insisted upon its rejection when they were a second time nominated. That body made a call upon the president for a copy of the paper read to the cabinet on Sept. 10, 1833; but he refused to furnish it. A formidable combination against the president was effected in the senate, headed by Calhoun, Clay, and Webster, and a resolution condemning his course was adopted by a vote of 26 to 20. The president sent in a protest, which the senate voted a breach of its privileges. The house of representatives sustained the president. A panic existed for some time, and the opposition was supported by a powerful popular party. The gold currency was revived, and gradually confidence was restored; and in 1837, just before the expiration of his public life, the censure passed upon President Jackson was expunged by the senate, 24 to 19. The foreign diplomacy of President Jackson was very successful. Useful commercial treaties were made with several countries, and were renewed with others. Indemnities for spoliations on American commerce were obtained from France, Spain, Naples, and Portugal, and the most amicable relations were sustained with England. During his second term the national debt was extinguished, the Cherokees were removed from Georgia and the Creeks from Florida, the original number of the states was doubled by the admission of Arkansas and Michigan into the Union, and the gold currency was greatly increased. On the other side, the agitation of the slavery question was then renewed with more vigor than ever before, and the Seminole war was recommenced. He issued a farewell address to his countrymen, and on March 4, 1837, retired from public life. Leaving Washington on the 6th, he returned to the Hermitage, where he resided until his death, ever taking a lively interest in politics, and especially in the welfare of his party. The immediate occasion of his death was dropsy, but throughout most of his life he had suffered severely from various diseases; and some of those actions of his which have been most warmly condemned were largely owing to the irritation of illness. He was a thoroughly honest man, as straightforward in action as his thoughts were unsophisticated. His charities were frequent and unostentatious; and in his last days he made an open profes-

sion of those religious sentiments which he had always entertained. His chief intellectual gifts were energy and intuitive judgment. In private life at the Hermitage he is described by Benton as a careful farmer, overlooking everything himself, seeing that the fields and fences were in good order, the stock well attended, and the servants comfortably provided for. "But he needed some excitement beyond that which a farming life can afford, and found it for some years in the animating sports of the turf. . . . His temper was placable as well as irascible, and his reconciliations were cordial and sincere."—The following are the most noted biographies of Andrew Jackson, and works relating to his career: "Life of Andrew Jackson, Major General in the Service of the United States," by John Henry Eaton (Philadelphia, 1824; 1st ed. about 1818); "Life of Andrew Jackson, President of the United States of America," by William Cobbett, M. P. (New York, 1834); "A Narrative of Events in the South of France, and of the Attack on New Orleans, in 1814 and 1815," by Capt. John Henry Cooke (London, 1835); "The Campaign of the British Army at Washington and New Orleans, in the years 1814 and 1815," by the author of "The Subaltern" (London, 1837); "Life of Andrew Jackson, Private, Military, and Civil," by Amos Kendall (New York, 1844); "Thirty Years' View, or a History of the Workings of the United States Government for 30 Years, from 1820 to 1850," by Thomas H. Benton (2 vols., New York, 1854-'6); "Jackson and New Orleans," by Alexander Walker (New York, 1856); and "Life of Andrew Jackson," by James Parton (3 vols., New York, 1860).

JACKSON. I. Charles, an American jurist, born in Newburyport, Mass., May 31, 1775, died in Boston, Dec. 13, 1855. He was the son of Jonathan Jackson, a merchant greatly respected for his virtues and intelligence. He graduated at Harvard college in 1793, studied law three years with Theophilus Parsons, then of Newburyport, established himself there as a lawyer, and rose rapidly into practice. In 1803 he removed to Boston, and for ten years was a leading member of the Suffolk bar. He entered into partnership with Judge Samuel Hubbard, and the business of their office became more lucrative probably than that of any other in New England had been up to that time. In 1813 he was chosen a judge of the supreme court of Massachusetts, which office he resigned at the end of ten years on account of ill health. He was an influential member of the convention of 1820 for amending the state constitution. In 1832 he was appointed one of the commissioners to revise the general statutes of the state, and drew up the second part of the "Revised Statutes." In 1828 he published a "Treatise on the Pleadings and Practice in Real Actions." **II. James**, an American physician, brother of the preceding, born in Newburyport, Oct. 3, 1777, died in Boston, Aug. 27, 1867. He graduated at Harvard col-

lege in 1796, and in December, 1797, became a pupil of Dr. Edward Augustus Holyoke of Salem, with whom he studied nearly two years. He then went to London, where he was a "dresser" in St. Thomas's hospital, and attended lectures at that and at Guy's hospital. After his return he practised in Boston. In 1810, in connection with Dr. John C. Warren, he brought before the community a proposition for establishing a hospital in Boston. The result was the organization of the asylum for the insane at Somerville, and afterward of the Massachusetts general hospital in Boston, of which Dr. Jackson was the first physician. In 1810 he was chosen professor of clinical medicine in Harvard college, and two years afterward professor of theory and practice. In 1835 he resigned his place as physician to the hospital and his office in the medical school. He was several times chosen president of the Massachusetts medical society. His principal publications are: "On the Brunonian System" (1809); "Remarks on the Medical Effects of Dentition," in the "New England Medical and Surgical Journal" (1812); various articles in the "Transactions of the Massachusetts Medical Society," including some reports drawn up principally or entirely by him, viz.: "On Cow Pox and Small Pox," "On Spotted Fever," and "On Spasmodic Cholera;" "Eulogy on Dr. John Warren" (1815); "Syllabus of Lectures" (1816), and "Text Book of Lectures" (1825-'7), for the use of the medical class; a memoir of his son James Jackson, jr. (1835); "Letters to a Young Physician" (1855); and "Another Letter to a Young Physician" (1861).

III. Patrick Tracy, an American merchant, brother of the preceding, born in Newburyport, Aug. 14, 1780, died in Beverly, Sept. 12, 1847. At the age of 15 he was apprenticed to William Bartlett, a merchant of Newburyport, and subsequently established himself in Boston in the India trade, in which he acquired a handsome fortune. In 1812, at the invitation of his brother-in-law, Francis C. Lowell of Boston, who had recently examined the process of the cotton manufacture in England, he engaged in a project to introduce the power loom, then newly invented, and the mode of constructing which was kept secret, into the United States. As the war between the United States and England prevented communication with the latter country, they were forced to invent a power loom themselves, and, after repeated failures, succeeded in the latter part of 1812 in producing a model from which a machine was constructed by Paul Moody. In 1813 they built their first mill at Waltham, near Boston, which is said to have been the first in the world that combined all the operations for converting the raw cotton into finished cloth. In 1821 Mr. Jackson made large purchases of land on the Merrimack river near the Pawtucket canal, on which a number of mills were constructed by the Merrimack manufacturing company, organized under his auspices. This settlement formed the

germ of the city of Lowell. After superintending the formation of another company in the same place, he procured in 1830 a charter for a railroad between Lowell and Boston, the construction of which he directed until its completion in 1835. It was then probably the finest work of the kind in the country. Pecuniary reverses having overtaken him in 1837, he assumed the charge of the locks and canals company of Lowell, and subsequently of the Great Falls manufacturing company at Somersworth, N. H., managing both with complete success. He labored zealously to promote the moral and intellectual improvement of the operatives in his mills.—See memoir of P. T. Jackson, by John A. Lowell, in Hunt's "Lives of American Merchants" (New York, 1856-'8).

JACKSON, Charles Thomas, an American physicist, born in Plymouth, Mass., June 21, 1805. He devoted much attention to science in his youth, studied medicine under Drs. James Jackson and Walter Channing, and received the degree of M. D. from Harvard university in 1829. In 1827 and 1829 he made, in company with Francis Alger of Boston, a mineralogical and geological survey of Nova Scotia, an account of which was published by them, together with a geological map of the province, in the "Memoirs of the American Academy of Arts and Sciences." In the autumn of 1829 he went to Europe, where he remained three years, studying in Paris. In 1831 he made a pedestrian tour through Switzerland, Piedmont, Lombardy, Tyrol, Bavaria, and Austria. He afterward visited the principal cities of Italy, and made a geological tour of Sicily and of Auvergne in France. In October, 1832, he embarked for New York in the packet ship Sully, taking with him an electro-magnet, two galvanic batteries, and other philosophical apparatus. During the voyage a discussion arose among the passengers, of whom Prof. S. F. B. Morse was one, on the subject of electro-magnetic experiments, and their applicability to telegraphic use. Dr. Jackson asserts that during this discussion he pointed out the possibility of correspondence by means of electricity, and suggested several ways of accomplishing it. His plan as then developed in conversation, he declares, embraced the essential and peculiar features of the American telegraph patented in 1840 by Prof. Morse. Dr. Jackson also asserts that in the spring of 1834 he constructed and successfully worked, and exhibited to Francis Alger and other friends, a telegraph combining the peculiar features of that which he had invented on board the Sully, though he did not think it could be profitably brought into public use till the invention of the sustaining battery by Daniell in 1837 furnished the means of obtaining a long continued voltaic current of uniform strength. A controversy arose in 1837 between Morse and Jackson upon their respective claims, the evidence in regard to which was printed for the use of the court and counsel in subsequent trials of telegraph causes. In

1833 Dr. Jackson settled in Boston, and entered upon the practice of medicine, but in a few years he abandoned it to devote himself to chemistry, mineralogy, and geology. In 1836 he was appointed geologist of Maine, and directed to survey that state; and at the same time he was commissioned by Massachusetts surveyor of her public lands in Maine. In 1839 he was appointed geologist of Rhode Island, and in 1840 of New Hampshire. His surveys of these three states occupied respectively three, one, and three years, and his reports to the legislatures were published by them, with plates. Meanwhile he drew up a plan for a geological survey of the state of New York, which was adopted. In 1844 he explored the then unbroken wilderness on the southern shore of Lake Superior, and made known its mineral resources. In 1845 he again visited Lake Superior and opened mines of copper and discovered mountains of iron ore, which were explored by his assistants, and are now extensively wrought. In 1847 Dr. Jackson was appointed to superintend a geological survey of the mineral lands of the United States in Michigan, and he was thus engaged for two years, when, on a change of administration at Washington, the superintendence was transferred to another. His report of these labors was published in 1850, in 1 vol. 8vo. Dr. Jackson is one of the claimants of the discovery of anæsthetics. His claims are substantially as follows: In 1834 he discovered that an alcoholic solution of chloroform, when made to act locally on a nerve, renders it insensible to pain; and that if a piece of lint saturated with a mixture of one part of chloroform and three parts of alcohol is inserted into the cavity of a painful tooth, it allays the pain at once, and by repeated applications completely destroys the sensibility of the nerves. Having long before experimented with exhilarating gas or protoxide of nitrogen, he resumed in 1837 his experiments with that gas in order to test the comparative effects of different modes of administering it; but the only new result he obtained was to satisfy himself that the temporary insensibility which it sometimes produces is due in a greater or less degree to partial asphyxia. Subsequently, but previous to the winter of 1841-'2, having received some perfectly pure sulphuric ether, he tried its effects upon himself, administering it with a mixture of atmospheric air, and inhaled it to such an extent as to lose all consciousness, without suffering any of the dangerous or disagreeable consequences that had hitherto attended the inhalation of impure sulphuric ether unmingled with atmospheric air. In the winter of 1841-'2 he inhaled ether vapor for relief from the very severe pain occasioned by the accidental inhalation of chlorine. The relief he experienced led him to infer "that a surgical operation could be performed on a patient under the full influence of sulphuric ether, without giving him any pain." Dr. Jackson's claims to the discovery

of anæsthetics, disputed by Dr. W. T. G. Morton and Dr. Horace Wells, gave rise to a long controversy. In 1852 a memorial was presented to congress, signed by 143 physicians of Boston and its vicinity, ascribing the discovery exclusively to Dr. Jackson. About the same time the question was investigated by a committee of the French academy of sciences, and on their report the academy decreed a prize of 2,500 francs to Dr. Jackson, and another of 2,500 francs to Dr. Morton. M. Élie de Beaumont remarked in a letter to Dr. Jackson, dated May 17, 1852: "In point of fact, the academy of sciences decreed one of the Montyon prizes of 2,500 francs to you for the discovery of etherization, and it has decreed a prize of 2,500 francs to M. Morton for the application of this discovery to surgical operations." Dr. Jackson has received orders and decorations from the governments of France, Sweden, Prussia, Turkey, and Sardinia. His scientific discoveries have been very numerous. Besides the geological reports above mentioned, he has furnished many scientific communications to the "American Journal of Science and Arts," to the French *Comptes rendus*, and to the *Bulletin de la société géologique de France*. He has also published the results of chemical researches on the cotton plant, the tobacco plant, on Indian corn, and on 38 varieties of American grapes in the United States patent office reports, and a "Manual of Etherization, with a History of the Discovery" (1863).

JACKSON, John, an English painter, born at Lastingham, Yorkshire, in 1778, died in London, June 1, 1831. He was assisted in his youth by Sir George Beaumont, and acquired reputation as a portrait painter. He was remarkable for rapidity, having on one occasion for a wager painted the portraits of five gentlemen in a single day, for each of which he received 25 guineas. He was a royal academician, and painted many of his associates.

JACKSON, Samuel, an American physician, born in Philadelphia in 1787, died there, April 5, 1872. He was for 28 years professor of the institutes of medicine in the university of Pennsylvania, and occupied for a long time a leading position as a physician and surgeon. He was also popular as a lecturer, and distinguished as a writer. His most important work is "The Principles of Medicine" (Philadelphia, 1832).

JACKSON, Thomas, an English clergyman, born at Sancton, Yorkshire, Dec. 12, 1783, died in Richmond, March 11, 1873. He was early apprenticed to a carpenter, but entered the itinerant ministry of the Wesleyan connection in 1804. After 20 years of labor in this profession in Lincolnshire, Lancashire, Yorkshire, and London, in 1824 he was chosen by the British conference "connectional editor" of the Wesleyan church. He continued his editorial service for 19 years, when he was appointed tutor in the Richmond theological institution. This post he held till 1861, when he re-

tired on account of age. Among his chief literary labors are: "Centenary of Methodism" (1839); "Library of Christian Biography" (12 vols., 1837-'50); "Life of Charles Wesley and Contemporary Events" (2 vols., 8vo, 1841); "Journal of Rev. Charles Wesley" (2 vols., 1849); "Lives of Early Methodists" (3 vols. 12mo, 1849); "Duties of Christianity" (1857); "Providence of God viewed in the Light of Scripture" (1862); and "Curiosities of Pulpit Literature" (1868). He also wrote the preface to the 11th edition of the complete works of John Wesley (15 vols. 12mo, 1856-'7).

JACKSON, Thomas Jonathan, an American soldier, born at Clarksburg, Va., Jan. 21, 1824, died at Guinea's station, near Fredericksburg, May 10, 1863. He graduated at West Point in 1846, and served in the war with Mexico, in which he was successively brevetted as captain and major for gallant and meritorious conduct at Contreras, Churubusco, and Chapultepec. He subsequently served on garrison duty in the fortifications in New York harbor, and in Florida during the Seminole war. In February, 1852, he resigned his commission in the army, and was chosen professor of natural and experimental philosophy and instructor in artillery tactics in the Virginia military academy at Lexington. He also became a deacon in the Presbyterian church, and was somewhat noted for his extreme shyness and eccentricities of habit; he was indeed rather a laughing-stock for the students of the academy. On the opening of the civil war he entered the confederate service with the rank of major, and was placed in command at Harper's Ferry. From this moment his demeanor underwent a sudden change. He had before hesitated to lead in prayer at the meetings of his church, and was wont to take his food only in measured quantities. He now seemed inspired with the genius of command, and bore without a thought the extremest hardships of a soldier's life. He was soon made a brigadier general, and took a prominent part in the first battle of Bull Run (July 21, 1861). Here, at a moment when the day was apparently lost, his brigade made so firm a stand that some one cried out, "Here is Jackson, standing like a stone wall;" and thenceforth "Stonewall Jackson" became his sobriquet. In the spring of 1862 Jackson was in command in the Shenandoah valley, where by his celerity and skill he foiled greatly superior Union forces under Banks, Fremont, Shields, and McDowell. (See *Cross Keys*.) At the commencement of the seven days' battles on the peninsula he joined the army of Lee, and his command took a leading part in the battle of Cold Harbor (June 27), and a less important one in that of Malvern Hill (July 1). In the ensuing operations against Gen. Pope, Jackson's corps was first sent northward, and fought the indecisive action at Cedar Mountain (Aug. 9). Not long after, having been made a major general, he was placed in immediate command of nearly half of Lee's army, with

which he made a rapid march and gained Pope's rear, whence resulted the second battle of Bull Run (Aug. 29, 30), fought almost on the same ground as the former one. In the Antietam campaign, which immediately followed, Jackson, by a rapid movement, captured a Union force of about 11,000 men at Harper's Ferry (Sept. 15), and then by a forced march rejoined Lee, and took a leading part in the battle of Antietam (Sept. 17). His corps was actively engaged at the battle of Fredericksburg (Dec. 13), and he was made lieutenant general. At Chancellorsville (May 2, 1863), at the head of nearly two thirds of the confederate force, he made a march of 15 miles, mostly by forest roads, and turned Hooker's right, upon which he fell by surprise, driving it in rout upon the main body. The engagement being apparently over, he rode into the woods to reconnoitre, having with him only a small escort. Returning, his companions were mistaken for Union scouts and fired upon by his own men. Several of the escort were killed, and Jackson received three balls, one through each hand, and another which shattered his left shoulder. He was placed upon a litter; but one of the bearers stumbled, and he fell to the ground, striking upon his broken shoulder. He was at length carried to the rear, where his arm was amputated. But pneumonia soon set in, which was the immediate cause of his death. Stonewall Jackson is considered by the confederates to have been their most brilliant commander, at least of forces actually engaged in the field. His life has been written by M. Adday (New York, 1863) and John Esten Cooke (New York, 1866).

JACKSON, William, an English composer, born in Exeter in 1730, died in 1803. He pursued his musical studies in London, under Travers, and in 1777 became organist of Exeter cathedral. He is celebrated in England for his songs, canzonets, and trios, which display remarkable tenderness and grace. As a composer of instrumental music he was less successful. He wrote "Thirty Letters on Various Subjects," and "Four Ages, together with Essays." He was also a painter.

JACKSONVILLE. I. The county seat of Duval co., Florida, port of entry of the district of St. John's, and the largest city of the state, situated on the left bank of St. John's river, 25 m. from its mouth, and at the terminus of the Jacksonville, Pensacola, and Mobile railroad, 155 m. E. of Tallahassee, and 125 m. S. S. W. of Savannah; pop. in 1850, 1,045; in 1860, 2,118; in 1870, 6,912, of whom 3,989 were colored. The population in 1874, including the suburbs, was estimated by local authorities at 12,000. The city is regularly laid out, with streets crossing each other at right angles and shaded with trees. On the S. W. and N. E. are picturesque bluffs, covered with fine residences, and commanding a beautiful view of the river. There are several suburban villages, which are connected with the city by ferry. The com-

merce of Jacksonville is important. The chief business is the cutting and shipping of lumber. There are several large saw mills, and the shipments amount to about 50,000,000 feet annually; cotton, sugar, fruit, fish, and early vegetables are also shipped to northern and foreign ports. The value of the foreign commerce for the year ending June 30, 1873, was \$91,162, chiefly exports. The entrances were 26 vessels of 3,456 tons, and the clearances 40 vessels of 6,455 tons. In the coastwise trade the entrances were 100 steamers of 69,123 tons, and 345 sailing vessels of 66,962 tons; clearances, 101 steamers of 69,439 tons, and 383 sailing vessels of 76,089 tons. There were 12 steamers of 1,442 tons and 20 sailing vessels of 2,212 tons belonging to the port. A semi-weekly line of steamers runs to Savannah and Charleston, and the river steamers furnish daily communication with St. Augustine *via* Tocoi and the St. John's railroad and with Palatka, and tri-weekly with Enterprise, 205 m. above Jacksonville. The city is much resorted to by invalids on account of its mild and salubrious climate. It is governed by a mayor and a board of eight aldermen, and contains a branch of the Freedmen's savings bank and trust company, 9 hotels, 2 public schools (one white and one colored), a Catholic female seminary, several private schools, 2 tri-weekly and 4 weekly newspapers, and 10 churches, viz.: 3 Baptist (2 colored), 1 Episcopal, 4 Methodist (2 colored), and 2 Presbyterian. Of the Methodist (white) and Presbyterian churches, one each belongs to the northern and one to the southern branch. The Roman Catholic church, which was burned during the civil war, is now nearly rebuilt. A session of the United States circuit and district courts for the N. district of Florida is held here annually. **II.** A city and the capital of Morgan co., Illinois, situated near Mauvaiseterre creek, an affluent of the Illinois river, 30 m. W. by S. of Springfield, and 200 m. S. S. W. of Chicago; pop. in 1850, 2,745; in 1860, 5,528; in 1870, 9,203, of whom 2,098 were foreigners. It is pleasantly built in the midst of an undulating and fertile prairie, at the intersection of the Jacksonville division of the Chicago and Alton railroad with the Toledo, Wabash, and Western, the Peoria, Pekin, and Jacksonville, and the Jacksonville, Northwestern, and Southeastern railroads. The streets are wide and adorned with shade trees; the houses are partly of wood and partly of brick, and surrounded with flower gardens and shrubbery. The principal manufactures are a woollen mill, a machine shop, four flour mills, two planing mills, two soap factories, an iron foundry, gas works, and a car shop. There are two national banks, with \$400,000 capital, and a savings bank. Jacksonville is the seat of the state institution for the education of the deaf and dumb; of the state institution for the blind; of a state hospital for the insane; of the state institution for the education of feeble-minded children;

and of a private insane asylum. Illinois college (Congregational), organized in 1830, in 1874 had 13 professors and instructors, 150 students (50 collegiate), and a library of 10,000 volumes. Illinois female college (Methodist), organized in 1847, had 10 instructors, 172 students (81 collegiate), and a library of 2,000 volumes. Jacksonville female academy had 11 instructors and 218 students (128 collegiate). There are another female college, an academy and commercial college combined, an orphan asylum, seven public school houses with a system of graded schools, including a high school, a daily and three weekly newspapers, a free reading room, a free public library of 1,600 volumes, and 20 churches.

JACMEL, a seaport town of Hayti, at the head of a bay of the same name, on the S. coast, 30 m. S. W. of Port-au-Prince; pop. about 6,000. It is divided into the upper and lower town, the former being commonly called Belair; the streets are very narrow in the lower town, and the houses in both are chiefly of wood. The harbor is commodious, and has good anchoring ground for vessels of any size, but is exposed to the S. winds and to a heavy sea setting in toward the shore. It is well frequented by shipping, mostly from the United States, and is a station for the West India mail steamers. The climate is hot and unhealthy.

JACOB, the third and last of the Hebrew patriarchs, son of Isaac and Rebekah, and younger twin brother of Esau. Even in his mother's womb he and Esau struggled together, and he was called Jacob (*Ya'akob*, heel-holder) because his hand took hold on his brother's heel at their birth. Esau was a hunter and the favorite of Isaac, but Rebekah loved the gentler Jacob. In his youth Jacob purchased his elder brother's birthright for some bread and pottage of lentiles, which he gave to Esau when he was famishing. At the instigation of his mother he obtained by fraud from his blind father the blessing of the first born. Obligated to flee from his brother's wrath, he went at the command of his father to take a wife from the daughters of Laban, his mother's brother. On his way he saw in a dream the vision of a ladder reaching to heaven, which established him in the belief that he was the heir of the promise made to Abraham. He served seven years for the love of Laban's daughter Rachel, and was then disappointed by finding in his veiled bride her elder sister Leah. He served another seven years for Rachel, and six years longer for a herd, which he greatly increased by an artifice, and then departed with his wives, children, and possessions for the land of Canaan. On his way he met and was reconciled with Esau, immediately preceding which "there wrestled a man with him until the breaking of the day. And when he saw that he prevailed not against him, he touched the hollow of his thigh, and the hollow of Jacob's thigh was out of joint, as he wrestled with him. . . . And he said, Thy name shall

no more be called Jacob, but Israel; for as a prince hast thou power with God and with men, and hast prevailed." He tarried successively at Succoth, Shechem, and Bethel, where the Abrahamic covenant was renewed to him. While journeying toward the residence of his father at Mamre, Rachel died in giving birth to Benjamin. Among his domestic troubles was the loss of his favorite son Joseph, sold by his brethren and carried to Egypt, where he became the highest officer at court. In a famine which followed, Joseph established his father and brethren in Egypt under his protection, and Israel lived 17 years in the land of Goshen, where he died at the age of 147. At his own command he was buried with Abraham and Isaac near Mamre. He was the father of Reuben, Simeon, Levi, Judah, Issachar, and Zebulun by Leah; of Joseph and Benjamin by Rachel; of Dan and Naphthali by Bilhah, Rachel's handmaid; and of Gad and Asher by Zilpah, Leah's handmaid; also of a daughter, Dinah, by Leah. These 12 sons became the heads of the 12 tribes of Israel, and before his death he assembled them and gave them his parting words.

JACOBÆAN LILY (*amaryllis formosissima*), a bulbous-rooted plant from tropical America. Its large bulb is covered with a dark skin and has a long flattened neck; planted out in the flower border in May, it throws up its flower stalks before the leaves appear; a bulb usually produces but one, sometimes two flower stalks, each of which produces a large irregular flower, of a most brilliant dark crimson color, which appears two-lipped from the bending down of three of the divisions of the perianth (petals),

Jacobean Lily (*Amaryllis formosissima*).

which at the base are involute around the lower part of the deflexed stamens and style. After the flowers open the leaves appear, which should be allowed to grow until the approach of frost, when the bulbs are to be taken up, and kept in a dry place, secure from frost, un-

til the following spring. The plant may also be cultivated in pots in the manner given for the hyacinth.—The original genus *amaryllis* has been much subdivided by botanists, some of whom place the plant in question in the genus *Sprekelia*.

JACOB, Bibliophile. See LACROIX, PAUL.

JACOBI, Abraham, an American physician, born at Hartum, Westphalia, May 6, 1830. He graduated at the university of Bonn in 1851, and was a political prisoner for nearly two years, after which he went to London, and in the autumn of 1853 to New York. Here he acquired reputation in obstetrics and diseases of women and children, and was professor at the New York medical college from 1860 to 1869, and subsequently at the college of physicians and surgeons. He has published "Dentition and its Derangements" (New York, 1862), "The Raising and Education of Abandoned Children in Europe" (1870), &c.; and he was one of the authors of "Contributions to Midwifery," &c. (1859), and from 1868 to 1871 an editor of the "American Journal of Obstetrics and Diseases of Women and Children."

JACOBI. I. Friedrich Heinrich, a German philosopher, born in Düsseldorf, Jan. 25, 1743, died in Munich, March 10, 1819. In his 18th year he was sent to Geneva to complete his mercantile apprenticeship, and during a residence there of three years studied mathematics, medicine, and philosophy. On his return to Düsseldorf he was placed at the head of his father's mercantile establishment, and soon after married; but in 1770 he renounced commerce, being appointed councillor of finance for the duchies of Berg and Jülich. This office allowed him to indulge his tastes for literature and philosophy, and he was soon associated or in correspondence with Wieland, Goethe, Herder, Lessing, Hamann, Lavater, Richter, Kant, Fichte, Reinhold, and other leading thinkers. His country seat at Pempelfort, near Düsseldorf, was after Weimar and the university towns the most remarkable literary centre in Germany. On the French invasion in 1794 he took refuge in the north of Germany, and passed ten years in Wandsbeck, Hamburg, and Eutin, engaged in literary and philosophical studies, till in 1804 he was called to Munich as a member of the newly formed academy of sciences, of which he became president in 1807. He resigned in 1813, but the title and salary were continued to him till his death. In youth Jacobi had been led to singularly intense religious and philosophical meditations. At the age of eight the idea of eternity struck him so clearly and forcibly that he fell fainting with a shriek. The thought of annihilation and the perspective of an infinite duration long weighed equally upon his mind as terrible and insupportable conceptions. The perusal of Kant's tractate on the proofs for the being of a God produced on him the most violent palpitation of the heart. He at length was able to check this susceptibility, but even in 1787 he affirmed

his belief that, if he should yield to it, a few successive shocks would kill him. His first works were the philosophical romances *Woldemar* (Flensburg, 1779) and *Eduard Allwilt's Briefsammlung* (Königsberg, 1781), the former of which reveals his ethical system, making morality a matter of instinctive sentiment, rational intuition, or divine impulse. It was never his purpose to develop any connected system, and his philosophical writings are all brief. The first was *Ueber die Lehre des Spinoza, in Briefen an Mendelssohn* (Breslau, 1785), in which he assails Spinozism as a type of all formal, rationalistic, demonstration-seeking systems. His doctrine is more fully developed in his dialogue entitled *David Hume über den Glauben, oder Idealismus und Realismus* (Breslau, 1787). His relation to the Kantian critical philosophy appeared in his essay *Ueber das Unternehmen des Kriticismus, die Vernunft zu Verstande zu bringen* (1802). His principal works, besides those already mentioned, are *Sendschreiben an Fichte* (Hamburg, 1799), and *Von den göttlichen Dingen und ihrer Offenbarung* (Leipsic, 1811), which occasioned a controversy with Schelling. His collected works were published at Leipsic (6 vols., 1812-'24), to which his letters were added (2 vols., 1825-'7). **II. Johann Georg**, a German poet, brother of the preceding, born in Düsseldorf, Dec. 2, 1740, died in Freiburg, Baden, Jan. 4, 1814. After studying theology and literature at Göttingen, he was appointed in 1765 professor of philosophy and eloquence at Halle, became soon after intimately associated with Gleim, in 1769 received a canonry at Halberstadt, and devoted himself to poetry till in 1784 he became professor of belles-lettres at Freiburg. His poems are marked especially by grace and purity of diction. His complete works were published at Zürich (7 vols., 1807-'22). **III. Maximilian**, a German physician, son of F. H. Jacobi, born in Düsseldorf, April 10, 1775, died at Siegburg, near Bonn, May 18, 1858. He studied at Jena, Göttingen, Edinburgh, and Erfurt, was for a time assistant in a London hospital, and afterward director of an insane asylum at Salzburg. He early embraced the views of Pinel and Tuke on the subject of non-restraint, and sought to introduce them throughout Germany. About 1820 he was selected to take charge of the insane hospital at Siegburg. He published several essays on the treatment of the insane, and a work on "Construction and Management of Lunatic Hospitals" (1834), and was a frequent contributor to the *Allgemeine Zeitschrift für Psychiatrie*. On the 50th anniversary of his doctorate (1857) a festival was held in his honor, attended by distinguished men from England and France as well as from every part of Germany. At this festival an association was organized called the Jacobi foundation, for the improvement of physicians, officers, nurses, and attendants in the care of the insane.

JACOBI. I. Karl Gustav Jakob, a German mathematician, born in Potsdam, Dec. 10, 1804, died in Berlin, Feb. 18, 1851. In 1825, on the recommendation of Hegel, he was sent to Königsberg as instructor in mathematics, and in 1827 was appointed professor of mathematics there. In 1842 he made a journey to England, but on his return was obliged by ill health to resign his professorship, and after visiting Italy resided in Berlin. His importance in the history of mathematics is chiefly due to his discoveries in the theory of elliptic functions, and his principal work is the *Fundamenta Nova Theoriæ Functionum Ellipticarum* (Königsberg, 1829), besides which he wrote many special memoirs. Under him, Bessel, and Neumann, the university of Königsberg enjoyed a reputation as a school of mathematics surpassed by none in Europe. **II. Moritz Hermann**, a German savant resident in Russia, brother of the preceding, born in Potsdam, Sept. 21, 1801, died in St. Petersburg, March 10, 1874. At the age of 28 he went to Russia to seek his fortune, and soon attracted attention by his researches in physics. In 1830 he constructed a short electric telegraph in St. Petersburg, and in 1832 one of 18 miles between two of the imperial residences, on which he made many experiments, and the important discovery that the earth could be used to complete the electric circuit. In 1837, simultaneously with Thomas Spencer of Liverpool, he invented the process of electrotyping; and in 1840 he published *Die Galvanoplastik*, which gained him admittance into the imperial academy of St. Petersburg. He soon after proposed to the czar the formation of a regiment of galvanic sappers, to be trained in the management of electricity. An immense battery was constructed for him, and he received the title of colonel in the galvanic regiment. He published many memoirs on the applications of electro-magnetism in the collections of the academy of St. Petersburg.

JACOBINS, the most celebrated of the clubs of the first French revolution. Its origin is traced to a society established a few days after the opening of the states general at Versailles, in May, 1789, by the deputies from Brittany, called the *club Breton*. On the removal of the constituent assembly from Versailles to Paris, this club established itself there in the old convent of Dominican friars of St. James, or Jacobins, in the rue St. Honoré, admitted any citizen who was presented by four members, and assumed the name of *société des amis de la constitution*, but was also, from its place of meeting, styled Jacobins. It soon became very numerous, not only deputies, but all who aspired to political influence, seeking admission to it. Every political question and every motion was here debated before being presented to the national assembly; the most popular orators participated in the debates, and were anxious to secure the favor of the majority; the club became the controlling power of the

revolution. Extreme opinions gaining the ascendancy in it, its original founders abandoned it, and established the *société de 1789* or *des Feuillants*, where more moderate notions were entertained. The only result was to make the Jacobins more radical and boisterous. They extended their influence all over France, 1,200 branch societies being established previous to 1791, and this number increasing in the following years. All the affiliated societies obeyed orders from the headquarters in Paris. The *Journal de la société des amis de la constitution* was added to the ordinary means of correspondence in May, 1791, and conveyed revolutionary principles to every corner of the kingdom. The Jacobins were foremost in the insurrectionary movements of June 20 and Aug. 10, 1792; they originated the revolutionary *commune de Paris*, which became a formidable power, and changed their former name to *les amis de la liberté et de l'égalité*. From this time they ruled supreme, and for a while the convention itself was but their tool. Robespierre was indebted for his political supremacy to the popularity he had secured among them. The revolution of the 9th Thermidor, which overthrew him, was a fatal blow to the Jacobins; the terror they had inspired gradually vanished; the reactionary affiliation styled *la jeunesse dorée* went in force to attack their headquarters, and the convention issued decrees for the suspension of their meetings and the closing of their hall (November, 1794). The scattered remains of the party attempted to regain influence by establishing the *club du manège*, and then the *club de la rue du Bac*, but in vain.

JACOBITES. I. A Christian sect in the East, particularly in Syria and Mesopotamia. They derive their name from Jacobus Baradæus, bishop of Edessa, who in the 6th century established a permanent ecclesiastical organization among the Monophysites, or those who maintained that the divine and human natures in Jesus Christ were so united as to form only one nature. At the death of Baradæus in 578, this sect was very numerous in Syria, Mesopotamia, Armenia, Egypt, Nubia, and Abyssinia. The Egyptian Jacobites in the course of ages separated from their Asiatic brethren, and formed the Coptic church. (See COPTS.) At the head of the Jacobites is a patriarch, who now resides in a monastery near Mardin. Next to the patriarch is the *maphrian*, who was formerly the head of the eastern branch of the Jacobites and had power equal to that of the patriarch. At present he has the jurisdiction of a bishop, retaining of his former prerogatives only the title. He resides in a monastery near Mosul. Formerly there were under the jurisdiction of the patriarch 20 metropolitans and 103 bishops; but this number has been reduced to 8 metropolitans and 3 bishops. The Jacobites are reported to number about 34,000 families. In their church service they use the Syriac language, which is no longer understood

by the people. Those Jacobites who have joined the Roman Catholic communion are called United Syrians. They have a patriarch, who has the title of patriarch of Antioch, 4 archbishops, and 8 bishops. The entire population connected with the church is estimated at 30,000. **II.** A party in Great Britain (so called from Lat. *Jacobus*, James) who after the revolution of 1688 adhered to the cause of the dethroned King James II. and his descendants. They were numerous and powerful in Scotland, and for more than half a century continued to conspire for the restoration of the exiled house of Stuart. They rose in unsuccessful revolt in 1715, and again in 1745. Their final extinction as a party may be dated from the death of the pretender Charles Edward in 1788, though they had long before ceased to be formidable to the established government.

JACOBS. I. Christian Friedrich Wilhelm, a German author, born in Gotha, Oct. 6, 1764, died there, March 30, 1847. He was for many years in charge of the library and numismatic cabinet at Gotha, and from 1831 to 1842 of all the art collections in that town. He published over 50 volumes, the principal of which are his editions and translations of the classics and his *Elementarbuch der griechischen Sprache* (4 vols., Jena, 1805). **II. Paul Emil**, a German painter, son of the preceding, born in Gotha in 1802, died Jan. 6, 1866. From 1818 to 1825 he studied in the academy at Munich, where he acquired reputation by his paintings of "The Flight into the Wilderness" and "Adam and Eve finding the Dead Body of Abel." He went to Rome in 1825, where he produced several pictures in the manner of Raphael, among which are the "Resurrection of Lazarus" and the "Rape of Proserpine." In 1828 he returned to Germany, and in 1830 went to St. Petersburg, where he remained till 1834, painting "General Diebitsch in the Camp at Adrianople," and an altarpiece. Returning to Germany, he decorated in fresco a hall in the royal castle at Hanover. In 1840 he went to Gotha, where he became court painter to the grand duke, and produced several successful paintings, among the best of which is "The Sultan and Scheherazade." His "Judith and Holofernes" and "Samson and Delilah" received prizes in Philadelphia in 1850.

JACOBS, Jacques Albert Michel, known also as JACOBS JACOBS, a Belgian painter, born in Antwerp in 1812. He studied in Antwerp, travelled in the East, and produced many marine pieces, landscapes, and views of towns. His "Shipwreck of the Florida" and "View of Constantinople" are at Munich.

JACOBS, Pierre François, a Belgian painter, born in Brussels about 1780, died in Rome in 1808. He repeatedly won prizes while a student at the academy of Brussels, and became famous by his picture of "The Head of Pompey presented to Cæsar," executed in Rome.

JACOBSON, William, an English bishop, born in Norfolk in 1803. He graduated at Lincoln

college, Oxford, in 1827. In 1829 he was elected fellow of Exeter college, and in 1832 was chosen vice principal of Magdalen hall, which post he occupied till 1848, when he was appointed regius professor of divinity in the university. At the same time he became canon of Christ church and rector of Ewelme, and received the degree of D. D. He was also select preacher and public orator for several years, and edited a number of valuable works for the university press. In 1865 he was made bishop of Chester. He has edited *Patres Apostolici* (2 vols. with notes, apparatus, &c., 1840; 3d ed., 1847), "Nowell's Catechism" (1844), the "Collected Works of Bishop Sanderson" (6 vols., 1854), &c., and published two volumes of sermons (1840, 1846).

JACOBY, Johann, a German publicist of Jewish descent, born in Königsberg, May 1, 1805. He studied medicine at Königsberg, Berlin, and Heidelberg, and became a distinguished physician in his native city. At the same time he came forward as a politician, and was under arrest in 1841-'3 for having keenly criticised the government in a pamphlet entitled *Vier Fragen*; and other publications resulted in his being sentenced in 1845 to a long term of imprisonment, but he was acquitted on appeal to a superior court. In 1848 he was prominent in the provisional parliament of Frankfort, and subsequently in the Prussian national assembly as the chief leader of the democratic party. After sitting in the second Prussian chamber during its brief existence in the early part of 1849, he succeeded the historian Raumer in the German parliament at Frankfort, soon retiring with that assembly to Stuttgart. Once more accused of treason, he surrendered himself to the authorities at Königsberg, but was acquitted, Dec. 8, 1849. In the same year he declined a seat in the Prussian first chamber, and in 1862 one in the chamber of deputies, but occupied one in the latter in 1864-'5. His sympathy with democracy and socialism, and his opposition to monarchy as the promoter of German nationality, caused him to be arrested in 1866 for obnoxious passages in one of his electoral addresses, and for allusions in the biography of Heinrich Simon which he had published in 1865; and as he continued his agitations after the outbreak of the war with France, he was again placed for some time under arrest in 1870. The next year he declined a reelection by the radicals. Elected a member of the imperial Reichstag in 1874, he renounced his seat, declaring in a letter to his constituents his conviction of the impossibility of transforming a military state into a popular state in a parliamentary way. His writings, some of which are medical, include *Die Grundsätze der preussischen Demokratie* (Berlin, 1859).

JACOBY, Ludwig Sigismund, an American clergyman, born in Alt Strelitz, Mecklenburg, Oct. 21, 1811. His parents were Jews, but he was baptized when 21 years old, and joined the Lu-

theran church. A few years later he emigrated to America, and became a member of the Methodist Episcopal church. About 1840 he entered the ministry, and in 1841 was stationed at St. Louis. In 1844 he was presiding elder of the first German district of the far west. In 1849 he returned to Germany to establish a mission of the Methodist church there. Chiefly through his instrumentality, missions were founded in Germany and in Switzerland, and a publishing house and a theological seminary were established at Bremen. For many years he edited and published religious and educational works, and acted as a professor in the theological seminary. To him was intrusted the superintendence of all the missions of his church in Germany and Switzerland, until his return to America in 1872. In 1874 he was pastor of a church in St. Louis, Mo. He has prepared a "Concordance of the Bible," and a "History of Methodism in the Whole World down to 1869."

JACOTOT, Joseph, a French educator, born in Dijon, March 4, 1770, died in Paris, July 30, 1840. When scarcely 19 he became professor of Latin and Greek literature at Dijon. He enlisted in 1792, was elected captain of artillery, participated in the campaign of Belgium, and was called to Paris to assist in the central board for the manufacture and improvement of gunpowder. He afterward returned to Dijon, where he was successively professor of mathematics and of Roman law. During the hundred days he was elected to the chamber of deputies, favored the cause of Napoleon, and was consequently compelled to leave France. He took refuge in Belgium, where he first made a living by private teaching; in 1818 he was appointed lecturer on the French language and literature in the university of Louvain, and a little later director of the military school of Belgium. He now brought forward his new system of intellectual emancipation, designed to enable every one to learn without a teacher. In 1830 he returned to his native country, lived seven years in Valenciennes, and then went to Paris, where he spent his last years in comparative obscurity. He published *Enseignement universel: Langue maternelle* (Louvain, 1822); *Langue étrangère* (1823); *Musique, dessin et peinture* (1824); *Mathématiques* (1828); *Droit et philosophie pancastiques* (Paris, 1837); and numerous articles in the *Journal de l'émancipation intellectuelle*, which he had established for the diffusion of his doctrine.

JACQUAND, Claudius, a French painter, born in Lyons in 1805. He early became known by historical and genre pictures, and settled in Paris in 1838, where he married a daughter of Count de Forbin-Janson. Among his principal works are "Charlemagne crowned as King of Italy," "The Chapter of Rhodes," and others in the museum of Versailles. His fine picture of "The Mayor of Boulogne refusing the Capitulation of Henry VIII." is in the town hall of that city; and another of his most remarkable works, representing "St. Bonaven-

tura declining a Cardinal's Hat," is in the Luxembourg. His latest productions include "Dante at Rome" and "Guy of Arezzo and his Pupils" (1868).

JACQUARD, Joseph Marie, a French mechanician, born in Lyons, July 7, 1752, died at Oullins, Aug. 7, 1834. His parents were weavers, and his father, having become the proprietor of a loom, was enabled to give him a few months' schooling, the only education he ever received. When 12 years old he was apprenticed to a bookbinder, and subsequently in succession to a cutler and a type-founder, in which occupations he produced a variety of models and inventions. At about the age of 20 he succeeded, upon the death of his father, to a small workshop containing two looms, and commenced business as a weaver. Absorbed in plans for improving looms, and in a variety of other mechanical schemes, he neglected his business, and not only exhausted his father's savings, but was obliged to sell his workshop and fixtures to pay his debts. He married the daughter of an armorer, hoping with the aid of her dowry to retrieve his fortunes; but was disappointed, and finally obliged to seek employment with a lime burner in Bresse, while his wife gained a scanty living for herself and her son in Lyons by making straw bonnets. From about 1777 to 1792 there is no account of his life. In the latter year he embraced the cause of the revolution, but in 1793 was one of the defenders of Lyons against the army of the convention. After the reduction of the city he fled with his son, a boy of 15; and both were soon after enrolled in the army of the Rhine. They fought side by side in several engagements; but after the death of his son in battle Jacquard returned to Lyons, and joined his wife in straw weaving. When Lyons began to recover from the effects of the siege, he found employment with a wealthy and intelligent silk manufacturer, who encouraged his schemes for the improvement of pattern-weaving machinery. With a view of substituting mechanical action for that of a numerous class of workmen, who by the very nature of their employment were doomed to a premature death, he produced in 1800 the first model of his apparatus for superseding the use of draw-boys in weaving figured goods, the idea of which had occurred to him, it is said, as early as 1790. In addition to economy of labor, the apparatus greatly simplified the weaving of rich designs, and could be readily applied at slight expense to any loom. He exhibited his invention in the exposition of national industry in 1801, and obtained a bronze medal. Not long after he produced a machine for weaving nets without the use of a shuttle, which came under the notice of the prefect of police, before whom the inventor was summoned to appear. Subsequently he and his machine were conveyed to Paris and underwent an examination by Napoleon and Carnot, the latter of whom asked Jacquard if he was

the man who pretended to do the impossible, *i. e.*, to tie a knot in a stretched string. So satisfactory did the explanation prove that Jacquard received a gold medal, and was commissioned to examine and repair the machines and models in the *conservatoire des arts et métiers*, among which was a loom invented by Vaucanson, which is said to have suggested to him the principal improvements embraced in his own. This, however, is believed to be erroneous. In 1804 he returned to Lyons to find himself assailed with abuse and open violence by those whom the introduction of his apparatus had temporarily thrown out of employment. He was denounced as the man who was reducing families to ruin and starvation; his house was entered by a mob, who broke one of his looms in pieces; and on several occasions he barely escaped from their rage with his life. These scenes, however, soon gave place to a general acquiescence in the invention, which was purchased by government in accordance with an imperial decree, dated Berlin, Oct. 27, 1806, and made public property. Such was the increased production of woven fabrics in Lyons, and its consequent rapid growth, that Jacquard came to be as highly esteemed as he had formerly been detested. Although strongly urged to settle in England, he preferred to devote himself to perfecting his invention in his native city, where he lived until the death of his wife. He passed his latter years in the neighboring village of Oullins. During his life he received the cross of the legion of honor, and in 1840 a statue of him was erected in Lyons. (See WEAVING.)

JACQUELINE OF BAVARIA, countess of Hainaut, Holland, Zealand, and Friesland, born in 1400, died in 1436. She was the only daughter and heir of William VI. of Bavaria, count of Holland and Hainaut, and of Margaret of Burgundy. At the age of five years she was, by a treaty between her father and Charles VI. of France, betrothed to Prince John, brother of the dauphin, himself a child. In 1415, upon the death of his brother, John became dauphin, but continued to reside with his father-in-law. In 1417 he returned to France, but three days after his arrival there was killed by poison. The same year Jacqueline succeeded to her father's estates and dignities. Henry V. of England solicited her hand for his brother the duke of Bedford, but she married her cousin german John IV., duke of Brabant, a boy in his 16th year. She soon left him, and lived at first at Valenciennes with her mother. In 1420 she went to England, where Henry V. welcomed her and gave her a pension of £100 a month, and Humphrey duke of Gloucester, the king's brother, sought to marry her, treating her marriage with the duke of Brabant as invalid. Their marriage was delayed by King Henry, lest it should interrupt his friendly relations with the duke of Burgundy, who supported the cause of his cousin John of Brabant. After the death of Henry V. the antipope Bene-

dict XIII. annulled her former marriage, and in 1423 she married Gloucester, who at once demanded her estates, and entered Hainaut with her with 5,000 troops to reclaim them. A challenge passed between the dukes of Gloucester and Burgundy, and they agreed to settle the dispute by single combat. Both withdrew their troops, and Gloucester returned to England, leaving Jacqueline, at the entreaty of the citizens, in Mons. The duel was forbidden by the pope, and the duke of Brabant resuming the war, Jacqueline was treacherously given up by the citizens to her enemies. She was imprisoned in Ghent, but escaped in male attire on horseback by night, and fled to Holland, where she was welcomed, and sustained against the Burgundians in a war of two years. In 1426 the duke of Brabant died, and she resumed the title of duchess of Gloucester; but Gloucester helped her little, and at length she made a treaty with the duke of Burgundy, making him her heir and guardian of her fortresses, and agreed not to marry without his consent, thus virtually disavowing her marriage with Gloucester, who soon publicly married Eleanor Cobham. In disregard of this treaty Jacqueline married in 1432 a private gentleman named Francis of Borselen, governor of Zealand. The duke of Burgundy arrested and imprisoned Borselen, and Jacqueline purchased his liberation by surrendering to Burgundy all her estates, reserving to herself only a small annuity. She died three years later without issue.

JACQUEMART, Albert, a French author, born in Paris in 1808. At an early age he became a clerk in the ministry of finance, and in 1865 was made chief of bureau in the custom-house department. He was prominently connected with the universal exposition of 1867. His works include *Histoire antique, industrielle et commerciale de la porcelaine* (Lyons, 1861-'2), and *Histoire de la céramique* (Paris, 1872; English translation by Mrs. Bury Palliser, "The History of Ceramic Art," with 1,000 illustrations, London, 1873).—His son **JULES FERDINAND**, born in 1837, excels as an engineer, and has prepared many designs for some of his father's works.

JACQUEMONT, Victor, a French traveller and naturalist, born in Paris, Aug. 8, 1801, died in Bombay, Dec. 7, 1832. After studying botany under Adrien de Jussieu, he visited North America and Hayti. While in Hayti he planned a scientific voyage to the East Indies, and, laying his project before the directors of the museum of natural history, received the appointment of naturalist and traveller to that institution. Returning to France, and afterward visiting England, he was elected fellow of the Asiatic society, and finally sailed from Brest in August, 1828. He arrived at Calcutta May 5, 1829, and, having acquired some knowledge of Indian languages, started on his travels by land, Nov. 20. After visiting some of the English provinces, he explored the Himalaya mountains toward Thibet, and penetrated

as far as Chinese Tartary. Returning, he was invited by Gen. Allard to the kingdom of Lahore, where Runjeet Singh received him with marked favor, and offered him the viceroyalty of Cashmere, but Jacquemont preferred to continue his travels. He died of a disease contracted in his ramblings through the pestilential forests of Salsette island. His *Correspondance* with his friends and relatives (2 vols. 8vo, Paris, 1834) is one of the most attractive and original books of travel ever published; and the diary of his *Voyage dans l'Inde pendant les années 1828 à 1832* (6 vols. 4to), published at the expense of the French government, embodies a large amount of valuable zoölogical and botanical observations.

JACQUERIE, a French servile insurrection of the 14th century, called after its leader, Guillaume Caillet, or Charlet, of Clermont, who assumed the name Jacques Bonhomme, which the barons had long derisively applied to the peasants on account of their meek submission to oppression. Smarting under the insolence and rapacity of the nobles and driven to despair by the burdens and vicissitudes of the war with England, and particularly by the disastrous battle of Poitiers, the peasants rose in the vicinity of Beauvais, May 21, 1358, and the insurgents in various parts of the country speedily numbered more than 100,000, comprising besides the poor peasantry some of the well-to-do middle classes. They destroyed over 200 castles and mansions, and spread terror far and wide. The duchess of Orleans and 300 other ladies sought refuge in Meaux. Here the insurgents were overwhelmed early in June by the troops of the nobles, who massacred their force of 9,000 men, and put to death the mayor of Meaux, who had enabled them to enter the town. The peasants never recovered from this disaster. Many of them surrendered, and Jacques Bonhomme and his companions were treacherously tortured and slain by Charles the Bad, king of Navarre, who routed the rest of their followers. The insurrection, though lasting barely three weeks, was attended with great horrors, upward of 20,000 peasants being killed, and for a long time they continued to be persecuted.—See *L'Histoire véritable de Jacques Bonhomme*, by A. Thierry (published in the *Censeur européen*, Paris, 1820); *La Jacquerie, scènes féodales*, by Prosper Mérimée (1828); and *Histoire de la Jacquerie*, by Siméon Luce (1860).

JACQUES CARTIER, a county of Quebec, Canada, occupying the W. portion of Montreal island; area, 87½ sq. m.; pop. in 1871, 11,179, of whom 9,766 were of French descent. It is mostly level, with a fertile and well cultivated soil. It is traversed by the Grand Trunk railway. Capital, Pointe Claire.

JACQUIER, Nicolas, a French orthopedist, born at Troyes in 1790, died at Ervy, department of Aube, Oct. 13, 1859. He graduated at Paris in 1813, and became military surgeon in the campaigns of 1814. Subsequently he resided

at Ervy, and acquired fame in orthopedics by his work *De l'emploi des moyens mécaniques et gymnastiques dans le traitement des difformités du système osseux* (4 vols., Paris, 1831-'5), substituting pressure for extension, and by other kindred writings.

JACQUIN, Nicolas Joseph von, baron, an Austrian botanist, born in Leyden, Feb. 16, 1727, died in Vienna, Oct. 24, 1817. He was descended from a French family who had emigrated to Holland, was a friend of Gronovius, and completed his studies in Paris under Jussieu, and in Vienna, where he settled. In 1753 the emperor Francis I. commissioned him to lay out the garden at Schönbrunn; and from 1754 to 1759 he travelled in the West Indies and South America to collect new plants for it and for the imperial garden at Vienna. After his return he became professor in a provincial town, and subsequently he was professor of botany and chemistry at the university of Vienna, and was raised to the nobility in 1806. He discovered about 50 new genera of plants, some of which bear his name. His principal works are: *Selectarum Stirpium Americanarum Historia* (fol., with 183 colored plates, Vienna, 1763 and 1781, and Mannheim, 1788); *Hortus Botanicus Vindobonensis* (fol., 1771, with 300 plates); *Flora Austriacæ* (fol., 1773-'7, with 500 plates); *Plantarum rariorum Horti Cesarei Schönbrunnensis Descriptiones et Icones* (9 vols. fol., 1797-1804); and *Genitalia Asclepiadearum Controversa*, published in 1811 in his 84th year.—His son JOSEPH FRANZ (1767-1839) was professor of botany and chemistry, and director of the botanical garden at Vienna, and the author of a manual of medical chemistry which had several editions.

JADE, or **Jahde**, a small navigable river of Germany, in the grand duchy of Oldenburg, which falls into Jade bay S. W. of the mouth of the Weser. This bay, which covers an area of 74 sq. m., was formed in 1511 by a tempest which inundated five parishes. A tract of land adjacent to the mouth of the Jade was purchased by Prussia from Oldenburg in 1853 for the purpose of constructing a war port, which in 1869 was opened in the presence of the king of Prussia. (See WILHELMSHAVEN.) The "Territory of Jade," which had an area of 1·31 sq. m. and in 1871 a population of 3,789, was administered by the Prussian admiralty till March 23, 1873, when it was incorporated with the Aurich district of the province of Hanover.

JADE NEPHRITE, a mineral of variable composition, chiefly consisting of silica, magnesia, and lime, used as an ornamental stone, for which it is adapted by its close texture and susceptibility of taking a fine polish. It is tough, translucent, of about the hardness of quartz, specific gravity 3, and of bluish, light green, or flesh color. It fuses with great difficulty into a white enamel. It is found with the metamorphic slates and limestones.

JADIN, Louis Emmanuel, a French composer, born at Versailles, Sept. 21, 1768, died in Paris

in July, 1853. He received instruction in music from his father and brother, and in 1802 became a professor at the Paris conservatory, and in 1814 governor of the king's musical pages. His compositions are very numerous, including 39 operas and operettas, many pieces for military orchestra, a great variety of chamber music for reed and stringed instruments, and compositions for piano alone. The whole number of his works was 74. Though popular in their day, they have fallen into oblivion.

JADIN, Louis Godefroy, a French painter, born in Paris in 1805. He first produced genre and historical pictures, but his reputation rests on his hunting pieces. His numerous representations of packs of hounds are celebrated.

JAELL, Alfred, a German pianist, born in Trieste, March 5, 1832. His father was a violinist, and gave him his first instruction. At 11 years of age he was able to undertake a concert tour, appearing first in Italy and afterward in France. In 1848 he came to America, and during a residence of several years in the United States obtained much reputation. Returning to Europe, he passed his time in concert giving in Germany, Russia, France, and Holland, and was appointed pianist to the king of Hanover. His compositions for piano number about 140, and are of considerable merit, consisting mainly of operative transcriptions. Although he possesses great executive power and brilliancy, he is esteemed a player of the second order.

JAEN. I. A province of Spain, in Andalusia, bordering on New Castile, Murcia, Granada, and Cordova; area, 5,184 sq. m.; pop. in 1870, 392,100. The N. part is entirely filled with the ridges of the Sierra Morena; the central is an irregular valley, in which several streams unite to form the Guadalquivir. The soil is fertile, but little cultivated. The province produces grain, wine, fruits, oil, honey, and various minerals, and abounds in cattle and fine horses; silkworms are bred there. The trade, however, is not extensive. Among the principal towns are Andujar, Alcalá la Real, Baylen, and Ubeda. **II.** A fortified city, capital of the province, on the river Jaen, 40 m. N. of Granada; pop. about 23,000. The new town stretches beyond the walls into the plain along the river. It has two cathedrals, the principal of which occupies the site of a Moorish mosque which was demolished in 1492. A new *plaza de toros* was built in 1847. Jaen has been a bishopric since the 13th century, when the Moors were expelled from the city. The place is poor notwithstanding its fertile environs. In 1808 it was sacked by the French.

JAFFA, or **Yafa** (anc. *Joppa*; in the Hebrew Scriptures, *Japho*), a town and port of Palestine, 35 m. N. W. of Jerusalem; pop. about 10,000, of whom 4,500 are Moslems, 5,000 Christians, and about 500 foreigners and Jews. It is picturesquely situated on a little rounded hill, dipping on the west into the Mediterranean, and surrounded on the land side by orchards; the oranges are the finest of Syria. The town,

which looks well from a distance, is a labyrinth of blind alleys and dilapidated lanes and streets. Regular lines of Austrian, French, and Russian steamers ply between Jaffa and European and Turkish ports. English and Egyptian steamers and a considerable number of sailing vessels also call occasionally. The present harbor consists of a strip of water nearly 100 yards wide, enclosed by a reef of rocks forming a kind of natural breakwater, which affords shelter to boats and small vessels. Jaffa, being the port of Nablus and Jerusalem, and of the whole country south as far as Gaza, is a place of commercial importance. The chief exports are grain, oils, soap, raisins, cotton, wool, colocyath, oranges, and lemons; imports, manufactured goods, rice, coffee, tea, and sugar. There are several insignificant mosques and three large convents, and the town still retains

some of its ancient fortifications; but it is now chiefly celebrated as a landing place of European pilgrims on their way to Jerusalem.— Tradition gives to Jaffa an antediluvian existence. Among the maritime towns allotted to the tribe of Dan we find the name of Japho. It was the port at which the cedar and pine from Lebanon for the building of the temple of Solomon were landed. Jonah embarked thence for Tarshish. Peter the apostle resided in the house of "Simon the tanner." A house reputed to be the place where he had the vision is still pointed out to pilgrims. The town suffered much in the wars of the Asmoneans, and at the outbreak of the war with the Romans it was burned by Cestius Gallus and 8,000 of the inhabitants were slain. It was an important station during the crusades, and was finally taken by the Mohammedans from

Jaffa.

the Christians at the end of the 12th century. Captured by Napoleon in 1799, when a large part of the garrison were massacred at his command, the French suffered terribly there from an attack of the plague. It was taken by Mehemet Ali in 1832, and retaken by the Turks in 1840. In 1866 a small colony of Americans attempted to establish a settlement there, but failed on account of internal discord, and most of them returned home. They were succeeded by a German colony, which is yearly increasing.

JAFFNAPATAM, or **Jaffna**. **I.** A peninsular district of Ceylon, on the N. W. coast, of irregular shape; area, 700 sq. m.; pop. about 220,000. It is traversed by two long and narrow lagoons, and the surface of the peninsula is unbroken by a single hill. Large fields of madrepora and breccia have been elevated near the shore in consequence of the gradual upheaval of the W. coast, and have formed

shallow estuaries which contain large deposits of excellent salt. A still more abundant production is the palmyra, 200 trees to an acre being below the ordinary rate, and the number of palms is estimated at nearly 7,000,000, supplying food for nearly one fourth of the population. Water is scarce, but skilful irrigation favors the rice crops, and many fruits are raised in gardens formed of artificial mould. The sheep reared on the dry plains of the district are the finest of Ceylon, and cattle abound. The staple product is tobacco. The first crop of it needs high preparation, but three subsequent crops are obtained without additional manuring. It is chiefly sent to Travancore for account of the rajah of that place. **II.** A town, capital of the district, on the W. shore of the peninsula, in lat. $9^{\circ} 47' N.$ and lon. $80^{\circ} 9' E.$, about 200 m. N. of Colombo; pop. about 8,000. It is protected by a fort, the best in Ceylon,

consisting of a pentagon built of blocks of white coral and surrounded by a moat. The streets are broad and shaded by surca trees; the houses are of only one story, but are spacious and have fine verandas, and most of them stand detached in enclosed gardens. There are many fine buildings, including a church in the shape of a Greek cross and a mansion for the English commanding officer. The whole place resembles a Dutch town in its apparent cleanliness, and is singularly rich in flowers. Tamils and Moors reside in the native part of the town, and are intelligent and laborious tradesmen. Cotton cloth, jewelry, and coconut oil are manufactured, and there is much trade carried on in the bazaars.

JAGELLON, a Polish royal family, founded by Jagello or Jagiello, a pagan grand duke of Lithuania, who embraced Christianity and became king of Poland under the name of Ladislas II., consequent upon his marriage in 1386 with the Polish queen Hedvig, a daughter of Louis the Great, king of Hungary and Poland. He reigned till his death in 1434, and his dynasty, one of the best Poland ever had, expired with Sigismund Augustus in 1572; but the female line was perpetuated, through the marriage of the sister of Sigismund Augustus with Sigismund III., until the abdication of John II. Casimir, son of the latter (1668). Jagello's son Ladislas III. became king of Hungary under the name of Uladislas I., and a few other members of the family subsequently ruled over that country and over Bohemia, while intermarriage with the houses of Brandenburg, Saxony, and Brunswick established an extensive relationship between the Jagellons and many other dynasties. (See HUNGARY, LADISLAS II., LITHUANIA, and POLAND.)

JAGEMANN, Karoline, a German actress, born in Weimar in 1778, died in Dresden in 1847. She was a daughter of Christian Joseph Jagemann (1735-1804), a translator of Italian works into German, and brother of the painter Ferdinand Jagemann (1780-1820). Her father having become librarian to the duchess Amalie of Weimar, the latter had her carefully educated. Her great beauty and histrionic and vocal talents secured her success in opera as well as in the drama, and made her a favorite of Goethe, and particularly of the grand duke Charles Augustus, who presented her with the domain of Heigendorf and raised her to the nobility under that name.

JÄGER, Gustav, a German painter, born in Leipsic, July 12, 1808, died there, April 29, 1871. He studied in Dresden, Munich, and Rome, assisted his former master Schnorr in fresco paintings in Munich, and executed many works of the kind in that city and in Weimar. In 1847 he became director of the Leipsic academy of fine arts. His productions include "The Death of Moses," "The Interment of Christ," and an altarpiece for the new church in Lengenfeld.

JAGIELLO. See JAGELLON.

JAGUAR (*Felis onca*, Linn.), the largest of the American carnivora; from its size, strength, and ferocity it is often called the South American tiger. It inhabits the warmer parts of America, from Paraguay as far north as Red river in Louisiana; it is considerably larger than the cougar, and but little inferior to the tiger. There is considerable variation in the size and markings, the height at the shoulder ranging from 2 $\frac{3}{4}$ to 2 $\frac{1}{4}$ ft., and the ground color from brownish to ashy yellow; the sides are marked with open circles of black, enclosing a light area with one or more dark spots; these markings, however, vary much in different animals, and even on the two sides of the same animal; there are no distinct stripes, and the lower parts

Jaguar (*Felis onca*).

are white; the tail reaches the ground, being shorter than in the leopard and panther. The jaguar lives solitary in thick forests, especially in the neighborhood of large rivers, but is occasionally driven by hunger into the cultivated districts; it is an excellent climber and swimmer, preying upon living animals and fish; its strength is such that it kills and drags off an ox or a horse with ease; its favorite mode of attack is to leap upon the victim's back, and by placing one paw on the head and the other on the muzzle to break the neck by a single effort; it is said to stand in shallow water and throw out fish on the shore with its paws; according to Humboldt, it is very fond of turtles, digging up the eggs, devouring the young, and clearing out the flesh of the larger ones with great skill; it rarely attacks man unless pursued or pressed by hunger, and then is very formidable. Jaguars are now comparatively rare, but Humboldt states in his "Personal Narrative" that 2,000 skins were exported annually from Buenos Ayres alone, in which vicinity their depredations were formerly very extensive; their skins are handsome, and are esteemed for robes. It is occasionally seen in menageries, and, when taken young, is susceptible of partial subjec-

tion. It is sometimes called ounce (Port. *onça*), a name properly pertaining to an Asiatic species. (See OUNCE.)

JAHDE. See JADE.

JAHN, Friedrich Ludwig, a German patriot, born at Lanz, Prussia, Aug. 11, 1778, died in Freiburg, Baden, Oct. 15, 1852. In 1809 he went to Berlin, became a teacher at the Kölnisches gymnasium, and published *Deutsches Volksthum*, in the style of his friend Fichte's appeal *An die deutsche Nation*. From patriotic motives he established gymnasia where young men were fitted to endure the fatigues of war. From these gymnasia, which spread over Germany, is derived the *Turnkunst* or system of physical culture. In 1813 Jahn received the command of a battalion of volunteers, with which he entered Paris. After the peace he returned to Berlin, where he delivered a series of lectures distinguished for bold originality, and continued to labor for his gymnasia, which for a time were encouraged by government. But when it was found that he aimed at establishing a united Germany, and that his *Turner* schools were political and liberal clubs, they were all closed in 1819, and he was imprisoned successively in Spandau, Küstrin, and Colberg. Liberated after five years' confinement, he went to Freiburg, where he was a professor for many years. While there he received an invitation to become professor of German literature at Cambridge, Mass., which he declined, saying that "deer and hares love to live where they are most hunted." In 1848 he was a member of the national assembly at Frankfurt. A monument to him, on the Haasenheide, near Berlin, was formally unveiled Aug. 2, 1872.

JAHN, Johann, a German orientalist, born at Taswitz, Moravia, June 18, 1750, died in Vienna, Aug. 16, 1816. From his youth he was devoted to the study of the eastern languages. Having removed to Vienna, he was appointed professor of dogmatic theology and of oriental literature in the imperial university; but in 1806 he was compelled to resign on account of his heterodox opinions, and was appointed canon of the metropolitan church of St. Stephen. He was the author of various philological and theological works, the most important of which are his Chaldean, Arabic, Syrian, and Hebrew grammars; his *Introductio in Libros Sacros Veteris Testamenti* (1804; 3d ed., 1825; translated into English by Drs. Turner and Whittingham, New York, 1827); and his *Biblische Archäologie* (2 vols., 1797-1800; translated by Prof. Upham, Andover, 1839).

JAHN, Otto, a German philologist, born in Kiel, June 16, 1813, died in Göttingen, Sept. 9, 1869. He studied in Kiel, Leipsic, Berlin, Paris, and Rome, and was successively professor at Kiel, Greifswald, and Leipsic till 1851, when he was suspended on account of his liberalism in 1848-'9. In 1855 he was transferred to Bonn. He was eminent as an expounder of classical archæology and philology.

Among his numerous works are valuable editions of Latin classics, instructive works relating to ancient Greek and Roman art, and a celebrated biography of Mozart (4 vols., Leipsic, 1856-'9; 2d revised ed., 1867). He wrote an essay on Goethe's *Iphigenia*, edited Goethe's letters to his Leipsic friends, and published *Ludwig Uhland* (1863), *Gesammelte Aufsätze über Musik* (1866), *Biographische Aufsätze* (1867), and *Aus der Alterthumswissenschaft* (Bonn, 1868).

JAHK, Georges Henri Gottlieb, a French physician, born in Gotha, Germany, Jan. 30, 1801. After studying under Hahnemann, he took his degree of M. D. in Paris in 1840, and became a permanent resident of that city. Many of his numerous works have been published both in French and German, and translated into English by Hempel and others. Among them are treatises on the homœopathic treatment of cholera, of nervous and mental diseases, diseases of the skin, &c., and a "Homœopathic Pharmacopœia."

JAINS, or Jainas, a religious sect of India, once dominant in the Deccan, now scattered over the whole peninsula. Their faith is a mixture of Brahmanism and Buddhism, and various accounts are given of its origin. Some suppose that it preceded the rise of Buddhism, but its history can hardly be traced to the 2d century A. D. On the Coromandel coast it was introduced in the 8th or 9th century, in the reign of Amoghversha, king of Tonda Mundalam. The compiler of the Jain Purânas of the Deccan is said to have written at the end of the 9th century. Hema Chandra, one of the greatest scribes of the Jains, flourished in the latter part of the 12th century, to which time also the composition of the Kalpa Sutra must be assigned. About 1174 the Jain faith became that of the ruling dynasty of western Marwar and the territory subject to the princes of Guzerat. Numerous temples, caves, and inscriptions of ancient date are ascribed to the Jains, but it is scarcely possible to determine their age and nature. True Jaina caves occur at Khandagiri in Cuttack, and especially in the southern parts of India. A number of colossal figures, 30 to 40 ft. high, cut in the rocks of Gwalior Fort, are by some supposed to date from about the 10th or 12th century B. C., which is of course a matter of great doubt. Five Jain images in marble have been dug up at Ajmeer, with a Prakrit inscription and a date corresponding to A. D. 1182 on one of them. The principal seats of the Jains at present are the mountains Aboo and Girnar in Guzerat. At the latter place are the most ancient of their temples, some of them magnificent in structure; and at Mount Aboo is their most sacred shrine in Guzerat. The libraries of Jessulmeer, Anbulwarra, Cambay, and other places contain thousands of volumes of Jain literature. The Oswal tribe, so called from Ossi, their first settlement, professing the Jain tenets, are one of the most influential

mercantile classes of India. The sect is said to be very numerous, and most of the officers of state and revenue are from the Jain laity.—The points in which the doctrines of the Jains differ from Brahmanism are, according to Wurm: 1, the rejection of the Vedas as an infallible guide of faith, and the substitution of their own religious literature, consisting of four Yogas, several Siddhantas, a number of Agamas, a few Angas and Upangas, and 24 Purānas, legends of the saints; 2, the adoration of 24 mortal saints, Tīrthankaras, whose ascetic life raised them above the gods; and 3, the *ahinsé*, or prohibition against killing living beings. While in these respects there is an approach to Buddhism, there are others which remove the Jain religion from it. Atheism is not its starting point, but rather an attempt at monotheism. There is a god called Arugan or Jinan, from whom it is supposed that the Jains derive their name, and to whom 1,008 various appellations are given. His worship is believed to be that of the earth, the air, and the heavens. (See INDIA, RELIGIONS AND RELIGIOUS LITERATURE OR.) He is omniscient, and in his grace he communicates his thoughts to all creatures without the aid of their mind, word, or body. Nevertheless he is no creator, though himself uncreated and immortal. He says there is no god besides him; blessed are those who adore him; and all are rewarded according to their deeds. There is a hell, and there is a place where the gods dwell. Whoever is good and bad in an equal measure will be reborn as a human being; he who is rather bad than good will be an unreasoning animal; and he who is either predominantly bad or good will go accordingly either to the infernal or divine abode. Arugan has 24 attributes, which are ascribed to the 24 Tīrthankaras as incarnations of divine apprehensions, and who are worshipped in images and at temples and feasts. There is no destruction and no renewing of the world; it is eternal and uncreated. Time is divided into *yugas*, each of which has an ascending or *utsarpini* and a descending or *avasarpini* period. There are also *manvantaras*, and the present Manu, Nābi Mākrāja, is sometimes called Brahmā. It was in his reign that the 24 Tīrthankaras were born, and Vrishabha was the first. They attained unto knowledge and blessedness without the aid of a *guru*, and they are the true *svāmīs* or equals of Arugan. Jain priests are either *sādhus*, pious, or *yātis*, self-restrained, and *digambaras*, naked, or *svētambaras*, clad in white. The Jains are opposed to the ancient system of castes, and allow it only as a distinction of occupations. It is said that there are about 50 families of Jain-Brahmans in Mysore, but on the whole it seems that the sect has found the largest number of votaries among the ancient Vaisyas. Jain priests never marry, but lead a *sādhu* or pure ascetic life. Widows never remarry. The men are generally well educated, but the women are kept in ignorance. Young widows, however, commonly de-

vote themselves to the priests, with whom they live, and from whom they learn to read the sacred books of their religion, whereby they become in fact like priestesses. The priests and strict Jains are scrupulously careful to avoid destruction of animal life. They move about with a cloth over their mouths to prevent insects from entering; they use constantly a small brush or broom to sweep aside all living creatures; and they never partake of stale food, lest in the interval since its cooking animalcules may have formed in it.—See Elliot, "On the Characteristics of the Population of India" (London, 1869), and Wurm, *Die Geschichte der Indischen Religion* (Basel, 1874).

JAKOB, Ludwig Heinrich von, a German author, born at Wettin, near Halle, Feb. 26, 1759, died at Lauchstädt, July 22, 1827. In 1780 he was appointed teacher at the gymnasium in Halle, and in 1791 professor of philosophy in the university. He was very popular as a lecturer on metaphysics, but after 1800 turned his attention especially to political economy. When the university of Halle was broken up by Napoleon, he went to Kharkov in Russia as professor of political sciences. He distinguished himself as member of a committee appointed to suggest reforms in the finances of the empire, and received various tokens of regard from Alexander I. He was soon after appointed chief reviser of the criminal laws, and received a place in the department of finance. In 1816 he returned to Halle as professor of political science. A fourth edition of his *Grundriss der allgemeinen Logik* appeared in 1800; of his *Grundriss der Erfahrungsseelenlehre* in 1810; and a third edition of his *Lehrbuch der Nationalökonomie* in 1825. Prof. Jakob was the father of "Talvj," the wife of the late Prof. Edward Robinson.

JAL, Auguste, a French author, born in Lyons, April 12, 1795. He became known as the author of numerous works on art, and especially on maritime archæology, including *Scènes de la vie maritime* (3 vols., Paris, 1832); *Archéologie navale* (2 vols., 1839); *Glossaire nautique*, which obtained the second Gobert prize (1848); and *La flotte de César* (1861). He published in 1864 *Dictionnaire critique de biographie et d'histoire*, with the view of revising errors and of filling up gaps in cyclopædias.

JALABERT, Charles François, a French painter, born in Nîmes in 1819. He studied under Paul Delaroche and in Italy, executing there his famous picture of "Virgil reading his Georgics to Mæcenas in presence of Horace and Varus," which he exhibited in 1847, and which is in the Luxembourg. His "St. Luke" (1852) is at Sèvres, and his "Annunciation" (1853) is in the ministry of state. He excels both as a religious and as a genre and landscape painter. His works include "The Farewell of Romeo and Juliet," "Raphael at work on the Madonna di San Sisto," "Christ walking on the Sea," "Villanella" (a Roman landscape), and many female portraits.

JALAP, a well known purgative drug, first introduced into England from Mexico in 1609. The plant grows wild near the city of Jalapa, and was known to the Mexicans as *purga de Jalapa*; that city being the point of export, the drug retains its name, being known in the pharmacopœias as jalapa, and in commerce and popularly as jalap. The drug was in use for over two centuries before the plant which furnishes it was known; at one time it was supposed to be the root of a species of *mirabilis*, now common in our gardens as the four-o'clock, and this was called *M. Jalapa*, a name which it yet retains. The true jalap plant was first described by Nuttall in the "American Journal of Medical Sciences" for February, 1830; he determined it to belong to the convolvulus family, and gave it the name of *ipomœa Jalapa*. As botanists have taken different views of the genera of *convolvulaceæ*, this plant has been alternately called *ipomœa* and *convolvulus*, but

Jalap (*Exogonium purga*).

has apparently found a resting place in *exogonium*, a genus closely related to both of these, and is the *E. purga* of Bentham. The habit of the plant, with long twining stems, is much like that of some of our garden species of *ipomœa* or morning glory; but, as will be seen from the engraving, it differs in its salver-shaped corolla and protruding stamens; the flowers are purplish and ornamental; the root is perennial, and, according to the age of the plant, differs in size from that of a nut to that of an orange; it is somewhat pear-shaped or oval, externally brownish and white within. The plant is found in the elevated portions of Mexico, especially in the vicinity of Jalapa, at an altitude of about 6,000 ft. above the sea; it is quite hardy in England and on the continent of Europe, and might without doubt be cultivated in the southern portions of the United States; but as medicinal plants are affected in a marked degree by locality, experiment only could decide if the drug would be equally

valuable with that grown in its native habitat. The dried root is the drug of commerce, and it undergoes no other preparation than digging and drying; the smaller roots are dried entire; the largest are divided longitudinally or transversely, sometimes cut in slices, while those of intermediate size are gashed with vertical or crosswise incisions, evidently for the purpose of accelerating the drying. The dried roots are hard and heavy, and, if of good quality, show when broken an undulated resinous fracture, with concentric circles of yellowish gray and dark brown portions. A whitish, mealy fracture may indicate that the root was collected at an improper season, or that a spurious root has been substituted. Jalap has a heavy, rather sweetish odor, and an acrid disagreeable taste; it forms a yellowish gray powder, which is irritating when inhaled and produces sneezing and coughing. The roots are often worm-eaten, but as their activity depends upon a resin in which the worms leave untouched, their value for making extract is not impaired, though if such roots were used for powdering the activity of the drug might be unduly increased.—Jalap when treated with alcohol yields about 17 per cent. of resin, which is found to consist of two distinct resins; one of these, to which the name of jalapine has been given, is hard and insoluble in ether; the other, jalapic acid, is soluble in ether, is soft, and has the peculiar odor of jalap. Besides these resins, the drug contains sugar, a brown extractive soluble in water, gum, starch, and other inert matters. In the powdering of this, as of other drugs, there is an abundant opportunity for adulteration, and those who purchase the ordinary powdered jalap of commerce get a large proportion of sawdust, old ship bread, and the like; and what is known as "overgrown jalap" or "male jalap," the root of *ipomœa Orizabensis*, a very feebly active purge, is often sold for grinding. Hassall found that nearly half the samples sold in London were thus adulterated. The extract of jalap is prepared by first exhausting the root with alcohol, and then with water; after distilling off the alcohol from the tincture, and evaporating the watery infusion, the two are mixed and evaporated to form an extract; this has all the medicinal properties of the root, and is employed in half the dose. The resin of jalap is obtained by exhausting the root with alcohol by percolation, distilling off the greater part of the alcohol, and dropping the concentrated tincture thus obtained into water, to precipitate the resin, which is afterward dried and powdered. This preparation is very active, and its dose is one fifth or less of that of the powdered drug. From its action as a hydrogogue the drug is especially adapted to the treatment of dropsy, and is commonly combined, when thus exhibited, with bitartrate of potassa. In the form of a powder and mixed with calomel, it has been a popular prescription in the United States in bilious fever and

congestion of the liver, the usual dose being about 10 grains of each, though in the southern states double this quantity is often given.

JALAPA, a town of Mexico, in the state of Vera Cruz, 140 m. E. of the city of Mexico; pop. about 10,000. It is situated on the slope of the Cerro Macuiltepec, 4,500 ft. above the sea, and many of the streets are very steep. The houses are substantially built, frequently of two stories. There are several churches and convents, one of the latter dating from the time of Cortes. The hospital of San Juan de Dios is one of the oldest Spanish structures in the country. There is a home for indigent females, and a number of public and private schools. Among the productions of the surrounding country is the *exogonium Jalapa* or jalap plant. The great staples are honey and wax, the latter being here elaborated to great perfection. The silkworm has been intro-

to, Michoacan, Colima, and the Pacific; area, 48,967 sq. m.; pop. in 1869, 924,580. This state, which in colonial times was known as the kingdom of Nueva Galicia, is divided into the nine cantons of Guadalajara, Lagos, La Barca, Sayula, Etzatlan, Autlan, Tuscacuesco, Colotlan, and Tepic. Capital, Guadalajara. The face of the country is irregular, being traversed from S. to N. by the chain of the Sierra Madre, the principal mountains being those of Tapalpa and Tigre in Sayula, and in the south the Nevado and the Volcan de Colima, which last has an elevation of about 12,000 ft. above the sea. Deep and vast ravines abound in the mountainous portions. On either side of the Sierra Madre are beautiful valleys watered by numerous rivers, the largest of which, the Lerma or Rio Grande de Santiago, flows N. W. from Lake Chapala to the sea; but it rises in Lake Lerma in the state of Mex-

ico, and has a length of 600 m. There are numerous cascades in its course, many of which are very picturesque. Other rivers are the Verde, Lagos, Ameca, Ayuguilá, San Pedro, Tepic, Acaponeta, Jerez, and Cañas. Of the lakes, that of Chapala, 90 m. long and 10 to 35 m. wide, is the largest; Sayula and Magdalena, though smaller, are notable for the quantity of delicious fish which they contain; Mescaltitan, little inferior in size to Chapala, is rather an arm of the sea than a lake. The climate is in general cold in Lagos, La Barca, and Colotlan,

Jalapa.

duced with much success; and tobacco little inferior to the finest Cuban is extensively grown. There are numerous potteries, and several tanneries and cigar factories. Jalapa, with a mild and salubrious climate, far above the yellow fever region, is the favorite resort of the wealthy inhabitants of the coast.

JALEY, Jean Louis Nicolas, a French sculptor, born in Paris, Jan. 27, 1802, died there in 1866. He was a pupil of Pierre Cartillier, and obtained in 1827 the highest academical prize for his bust of Mucius Scævola, enabling him to study six years in Italy. After his return to Paris he executed many works for the Versailles museum and the Luxembourg. Among his best statues are those representing "Pudor" and "Prayer." He succeeded David d'Angers in 1856 in the academy of fine arts, and shortly before his death he was employed upon statuary for the new palace of justice.

JALISCO, a maritime state of Mexico, bordering on Sinaloa, Durango, Zacatecas, Guanaju-

mild in Guadalajara and Etzatlan, and extremely hot and unhealthy in the coast region. The soil is fertile, the arboreal vegetation luxuriant, and the varieties of useful and precious timbers very great. Wheat and barley are abundantly produced, as are also maize, the beans called frijoles, capsicum, and garbanzos; and cotton, the sugar cane, cacao, and tobacco thrive well. The fruits include those of the torrid and temperate zones. Gold, silver, iron, mercury, and copper are found. Many of the gold and silver mines are now abandoned. Education is in a prosperous condition; there is a university in the capital, and schools in all the other towns.

JAMAICA (Indian *Xaimaca*, island of springs), one of the Greater Antilles, and the largest and richest of the British West India islands, in the Caribbean sea, 89 m. S. of Cuba, 118 W. S. W. of Hayti, and 570 N. by E. of the isthmus of Panama, between lat. 17° 45' and 18° 30' N., and lon. 76° 12' and 78° 30' W. Its maximum length, from Morant Point E. to

South Negril W., is 145 m.; and its maximum breadth, from Riobueno N. to Portland Point S., 53 m. It has an area of 4,250 sq. m., or with the Caicos and Turks islands (annexed to Jamaica by act of parliament in 1873), 4,473 sq. m. The population in 1871 was 506,154, of whom 13,101 were white, 101,346 colored, and 391,707 black, the last being mostly liberated slaves and their descendants. Some thousands of coolies have been imported from Calcutta. The coast is deeply indented in many parts, especially at the eastern end, forming from 50 to 60 bays and creeks, which afford more or less shelter to shipping, and about 30 harbors. The principal ports are Kingston (the largest), at the head of a fine and narrow bay, defended by two forts, but the entrance to which is considerably narrowed by sand banks; Morant, on a bay of the same name, also a good port, but having a still narrower channel than Kingston, and being exposed to the S. and W. winds, here sometimes very violent; Port Royal, on the extremity of a tongue of land bordering Kingston bay, with a naval arsenal and hospital, and being the station for British ships of war; Black River and Savana-la-Mar, on Bluefields bay, all of which are on the S. coast; and Montego bay, Falmouth, St. Ann, Port Maria, and Annotto bay, and Port Antonio, on the N. coast. All the ports here mentioned are free. S. E. of Jamaica are the Morant keys, and due S., at a distance of some 40 m., are other keys, and Pedro bank, little inferior in length and area, and parallel to the island.—Although the surface is extremely irregular, only the E. portion of the island can be called mountainous. Three small ridges of mountains from a common knot in the west trend divergently eastward to about the middle of the island, beyond which point the middle ridge alone extends to the extreme east, rising to an average elevation of 6,000 ft., and ramifying to such an extent as to cover almost the whole of this end, being collectively designated as the Blue mountains; the culminating point attains a height of nearly 8,000 ft. The middle range is remarkable for the edge-like form of its crest, rarely exceeding three to four yards in width, and the sections of country it separates present very different aspects. That to the north, with a surface gradually rising from the coast, is intersected by low hills clothed with pimento groves, and beautiful valleys watered by numberless streams; while to the south the mountains in many places reach down to the very coast in frowning and inaccessible cliffs, by which shipping is more thoroughly sheltered here than in the ports on the N. coast. The valleys, though numerous, are of inconsiderable extent, and occupy little more than one tenth of the area of the island. The largest is the plain of Liguanea, 30 m. long by 5 m. wide, extending on the S. side from a few miles E. of Kingston to some distance W. of Old Harbor. Other plains are those of Vere and Mile

Gully on the same side, mostly devoted to pasture grounds. To the north and east are the fertile plains of Thomas in the Vale and the Vale of Bath, both covered with sugar plantations. In the west are the plains of Savana-la-Mar, Pedro, and others, chiefly swampy; but those of the northwest are dry and fertile, and bordered by low hills clothed with a luxuriant forest vegetation. Large caverns occur in various localities. The chief rivers are the Black and the Minho, both on the S. side; the former is navigable by small flat-bottomed craft and canoes some 30 m. from its mouth. Numerous other streams descend from the mountains to the sea on all sides, many of which form fine cascades; and not a few are utilized for irrigation and to furnish motive power for a large number of mills.—Limestone, containing numerous shells, is the predominant geological formation of the island, although quartz, rock spar, and micaceous schist occur in several directions. There are records of the Spaniards having in early times worked silver and copper mines; but mining is at present entirely neglected, although lead is known to exist in large quantities, with perhaps some iron and antimony ores.—The climate in the low regions is essentially tropical, the average temperature being 72° F., and the maximum 100°; but the sea breeze (called "the doctor") during the day, and the land breeze at night, temper to a considerable degree the excessive heat. In the elevated districts the thermometer ranges from 45° to 70°, and the atmosphere is mild and agreeable. In few parts of the world does so slight an elevation produce so great a modifying effect upon the heat as in Jamaica; at about 2,500 ft. above the sea, the fevers, dysenteries, and other maladies which usually prevail along the coast are unknown. The rainy seasons, comprising the months of April, May, September, October, and November, are usually preceded by the cessation of the day and night breezes, when the atmosphere becomes oppressive, and almost insupportable for Europeans. Heavy rain falls every day during these seasons, and is often accompanied by terrific thunder and lightning, and violent gusts of wind from the north. The annual rainfall is about 50 inches, though the average is becoming gradually less as the work of felling the forests advances. Yellow fever, smallpox, cholera, and typhus fever are particularly fatal on the coasts, and in the low grounds generally, the first returning every year. Hurricanes, in the summer months, between the rainy seasons, are of frequent occurrence, and commonly of great violence. Notwithstanding the absence of volcanoes, although there are some signs of their former existence, Jamaica has been visited several times by tremendous earthquakes, one of which, in 1692, extended over the whole island, rending the surface and swallowing up large numbers of people, and engulfing many of the houses of Port Royal with their inmates to a depth of 50

ft. in the sea. The buildings, still standing as they had sunk, were visible in clear weather as late as 1835. The town of Savana-la-Mar was also completely destroyed in 1780 by a hurricane, which swept most of the houses with their occupants into the sea.—The soil is not so fertile as that of most of the other West India islands. In the north a chalky marl is the prevailing character; while to the west and south the so-called Jamaica brick mould predominates, analogous to the warm yellow mould of Cuba, so favorable to the production of the sugar cane. Wherever this soil exists sugar plantations abound, but both labor and manure are essential to their productiveness. Next in importance to sugar culture is that of pimento, to which extensive tracts are devoted; the coffee yield is on the increase; cacao, arrowroot, indigo, ginger, and turmeric are likewise cultivated, but the last only in small quantities by the negroes for their own use. Maize yields abundant harvests twice and even thrice a year in all parts of the island; and Guinea corn is grown in several districts. Yams, cassava, batatas or sweet potatoes, and other articles designated as “ground fruit,” are plentiful. In the higher districts grow calavances (a species of pea used by the negroes), and several species of European garden vegetables. The fruits include nearly all the tropical varieties, especially the plantain, which forms an important element of food for the colored classes. Of European fruits, the orange, lime, lemon, and vine were introduced by the Spaniards; but only the last thrives here. Repeated attempts to introduce cotton culture have proved unsuccessful, owing in part to the uncertainty of the seasons, but chiefly to the scarcity and the enhanced price of labor, which two circumstances render abortive all undertakings requiring the immediate application of a large number of hands. The cinchona tree, acclimated of late years, is now cultivated with much profit; and the same may be said of cinnamon. Among the most precious forest productions are the breadfruit tree, mahogany, cedar, ironwood, greenheart, and other cabinet woods; the principal palms are the cabbage palm and the coconut tree; the *lignumvitæ* or *guaiacum* abounds; the cotton tree attains immense proportions, and is used for making canoes; the bamboo grows wild and is cultivated; fustic, Brazil wood, logwood, and some kindred species are likewise plentiful. Guinea grass here grows with great luxuriance, and most of the grazing farms are covered with it. Numerous herds of cattle and droves of mules are reared; the latter and oxen are exclusively devoted to labor on the farms, for the horses, resembling the other hardy breeds of the West Indies, are mostly kept for saddle and harness use. Sheep and swine are numerous; and the various barnyard fowls and pigeons are very common. Of the many wild animals which once peopled the Jamaica forests, the agouti and some species of monkey alone remain, with

one or two varieties of rats, which are extremely numerous in every part of the island, and destructive of the sugar cane. There are several kinds of lizards, the largest of which, the iguana, is commonly eaten by the lower classes. Alligators abound in every stream. The land crab, here very common, coming down in myriads from the mountains to the seacoast in the autumn months, is esteemed as a delicacy. The wild birds include ringdoves, parrots, and others of brilliant plumage; and the rice bird visits the island every year in prodigious numbers.—The chief industries are agriculture and the manufacture of rum, cotton fabrics, candles, and other commodities. The chief trade of the island is with England. The staples of export are sugar, rum, coffee, spices, and dyestuffs. The total value of the imports in 1871 amounted to \$6,655,000, and that of the exports to \$6,245,000. The sugar exported in 1870 was 30,747 hogsheads, valued at \$2,461,040; rum, 260 puncheons, \$1,182,790; coffee, 7,671,564 lbs., \$1,189,950; pimento, 5,243,109 lbs., \$145,420. Next in order of importance among the exports stand ginger, rice, cotton manufactures, cocoanuts, cacao, and beeswax. Honey to the value of over \$30,000 was exported in 1870 to the United States and England. The number of vessels entered at all the ports of the island in 1870 was 509 (of which 353 were British), of 213,283 tons; the number of vessels cleared in the same year was 580 (386 being British), of 215,759 tons.—Jamaica is divided into three counties: Surrey on the east, Cornwall on the west, and Middlesex, occupying the central and by far the largest portion. The capital is now Kingston, having replaced as such the neighboring Spanish Town, with which it is connected by rail. The government is administered by a captain general appointed by the crown, and the legislative power is vested in a house of assembly composed of 47 members. The revenue of the island in 1871 amounted to \$2,175,000, and the expenditures to \$2,110,000. The cost of the colony to the mother country in 1867-'8 was \$724,750, an expense which, however, appears to diminish from year to year. The cost of the military station in 1872-'3 amounted to \$339,355, the number of troops being usually 2,000, exclusive of the insular militia, which latter is at present not very numerous. The public debt of the island in 1871 was \$388,000. Education has ever been a subject of interest in Jamaica, and the number of public schools is increased almost every year, the expenditure for this object falling little short of \$100,000 annually. The number of churches is approximately as follows: Church of England, 95; Wesleyan Methodist, 80; United Methodist free church, 18; Jamaica Baptist union, 60; Jamaica Wesleyan Methodist association, 12; London mission society, 17; Moravian mission, 15; Roman Catholic, 8; United Presbyterian, 30; American mission, 5; Jewish, 1. The number of Episcopalians is about 40,000; Wes-

leyans, 35,000; Jamaica Baptists, 30,000; the other sects being much inferior in numbers.—Jamaica was discovered on May 3, 1494, by Columbus, who named it St. Jago or Santiago, in honor of the patron saint of Spain. The first Spanish settlement was made by Juan de Esquibal in 1509; but the colony was captured Jan. 29, 1597, by an English squadron under Sir Anthony Shirley. After having been regained by the Spaniards, it was again wrested from them by the English under Admiral Penn and Gen. Venables, May 3, 1655; since which time it has belonged to England. The island was placed in 1661 under a governor and a council of 12 appointed by the crown; and Spain, by the treaty of Madrid, July 18, 1670, recognized the right of Great Britain to Jamaica. Four years later the population was augmented by the advent of 1,200 colonists from Surinam. In 1728 the constitution of Jamaica was passed. In 1745 a conspiracy of 900 slaves for the total destruction of the white inhabitants was discovered in time to prevent slaughter, and the conspirators were punished with much severity. A tribe of the Maroons (fugitive slaves), having been permitted to establish themselves in the northern part, rose in revolt in 1795, but were finally brought under subjection in the following year. In 1807 the slave trade was abolished, and the act for the emancipation of slaves was passed in 1833. After the latter event, the blacks, who had formerly been provided with lodgings and a piece of ground rent free, were compelled to pay rent, the enhanced rate of which as well as the means used for its collection caused great dissatisfaction among the African population, who now grew inattentive and unwilling to cultivate the land of the proprietors. Revolts were of frequent occurrence; and it is estimated that no fewer than 653 sugar and 456 coffee estates were abandoned and the works entirely suspended from 1833 to 1841. Affairs continued in this disturbed and unsettled state till October, 1865, when a general uprising of the natives occurred, in which the most fearful atrocities were perpetrated. The rebellion was suppressed with much bloodshed. A wealthy mulatto and Baptist preacher named Gordon was tried by court martial for complicity in the revolution, and promptly executed; and numbers were taken in flight, summarily tried and hanged, or shot by the pursuing troops. Governor Eyre was recalled, Dec. 11; and a commission was appointed to inquire into the cause of the disturbance. A charge of murder was brought by an association against the ex-governor and two military officers who had been stationed under him at the time of the outbreak; but the bill of indictment was immediately thrown out by the grand jury.—See "History of Jamaica, from its Discovery to the Present Time," by W. J. Gardner (London, 1873).

JAMAICA, a town of Queens co., New York, on Jamaica bay, an inlet on the S. side of Long

Island, including the village and county seat of the same name, on the South Side and Long Island railroads, about 10 m. E. of Brooklyn city hall; pop. of the town in 1870, 7,745; of the village, 3,791. The village was incorporated in 1814. It is lighted with gas, has a fire department, and is the residence of many persons doing business in New York. It contains a large town hall, several hotels, two academies, four weekly newspapers (one German), and six churches.

JAMALITICA, a collection of ruins in Honduras, 20 m. N. of Comayagua. They consist of a series of rectangular tumuli faced with stones, and ascended by flights of steps, supporting the remains of what appear to have been ancient edifices. The principal tumulus stands on a broad terrace paved with stones, and is surrounded by smaller mounds regularly placed. The adjacent valley is full of remains, and many vases skilfully wrought and beautifully painted, besides various articles of sculpture well executed, are found in making excavations. Both ruins and vases resemble those found at Copan.

JAMES, a S. E. county of Tennessee, bordering on Georgia, and bounded N. W. by the Tennessee river, formed since the census of 1870; area, about 200 sq. m. The surface is somewhat mountainous; the soil is generally fertile. Coal and iron are found. The East Tennessee, Virginia, and Georgia railroad crosses it. The assessed value of property in 1871 was \$801,093. Capital, Ooltewah.

JAMES I., king of Scotland, and third monarch of the Stuart dynasty, born in Dunfermline about 1394, assassinated in Perth, Feb. 21, 1437. He was the son of Robert III. and Annabella Drummond. He became heir to the crown on the murder of his brother, the duke of Rothsay. His education was intrusted to the bishop of St. Andrews; but in 1405 it was determined to send him to France, and on his way there the ship was taken by an English man-of-war. He was detained in captivity 19 years, chiefly in Windsor castle, but both Henry IV. and Henry V. treated him well. The former attended liberally to his education, and the latter took him with him in his French campaigns. In a political sense James's education was the consequence of circumstances, and he could not have passed his youth in a better school for a monarch; but he was detained too long from his kingdom to allow of his abilities and knowledge proving greatly useful to his subjects. He showed poetical powers of no mean order, and his writings are yet admired. "The King's Quhair," or "Book," was written while he resided in England; after his return to Scotland he was too actively engaged to devote much time to poetry. Robert III. dying in 1406, his captive son was proclaimed king, and his uncle the duke of Albany was made regent, holding the office until his death in 1419. But for Albany's intrigues James would have been sooner restored to his throne. Albany was succeeded by his son

Murdoch, who might have transferred the crown to his branch of the Stuart line had he possessed his father's talents and unscrupulousness. The Scotch were then the allies of the French, and Henry V. took James to France in 1417, agreeing to restore him to freedom if he should prevail upon those of his subjects who were in France to abstain from hostilities; but the Scotch refused to obey a king who was in durance. On the death of Henry V. the new government of England resolved to give James his freedom, on condition of his paying £40,000 as the cost of his maintenance in England. He married Joanna Beaufort, granddaughter of John of Gaunt through Catharine Swynford, and niece of Cardinal Beaufort, who, seen from his window during his captivity, had inspired the "Qubhair." He reached Edinburgh in the spring of 1424, and immediately commenced that vigorous administration which had become necessary through the bad government of his predecessors. Many important legislative acts were adopted. He persecuted the Lollards, and proceeded with energy against the nobles, whose lawless conduct demanded punishment. Albany and two of his sons, and the earl of Lennox, were executed; and soon after other executions took place, of the most cruel nature, the victims being merely retainers, who believed they were bound to obey their feudal superiors. The family of Albany was popular, and their deaths made the king unpopular. James I. revived the connection of his kingdom with France, encouraged the clergy as a counterpoise to the nobility, legislated in favor of trade, labored for the restoration of order, provided for the administration of justice, and maintained the dignity of Scotland against the designs of England. An expedition against the islemen proved successful, and 300 robbers were executed. He stripped the earl of March of his earldom and property, which alarmed the nobility. A conspiracy was formed against him, the head of which was Sir Robert Graham, who was actuated partly by personal and partly by political motives. Not being well supported by his associates, he was baffled, imprisoned, and banished, and his estates were seized. In the highlands, whither he had fled, he formed his plans. His only associates of eminence were the earl of Athol and his grandson, Sir Robert Stewart, the latter being the king's chamberlain. Through the assistance of Stewart, Graham obtained access to the king's apartments, in the monastery of the Dominicans at Perth, and slew him with his own hands, but not until James had made a heroic resistance, though at last he begged his life of the assassin.

JAMES II., king of Scotland, only son of the preceding and of Joanna Beaufort, born in 1430, killed in 1460. Being but a child when he became king, his mother was appointed to take charge of his person during his minority, and the earl of Douglas lieutenant general of the kingdom. The government was really in

the hands of Sir William Crichton, who had been made chancellor by James I.; and next to him was Sir Alexander Livingston, another of the late king's statesmen. These two were rivals, and their quarrels added to the troubles of the country. Archibald of Douglas died, and was succeeded by his son, Earl William, an arrogant youth, who allowed his followers great license; and he and his brother David were put to death by Crichton's orders. The power of Crichton and Livingston was finally ended through the successes of another earl of Douglas in 1446, the king having assumed supreme power in 1444. The internal condition of the country was very bad, through the feuds of the nobles; but Douglas upheld its dignity in the wars with England. A truce for nine years had been made with England, but in 1448 the English entered Scotland, and were defeated by Douglas, whose brother Ormond soon after won the battle of Sark. The truce was then renewed. The power of Douglas was now on the decline. The king, whose intellect matured early, was jealous of him, and, aided by Crichton and by Kennedy, archbishop of St. Andrews, he asserted his authority with extraordinary vigor, punishing many of the nobles and their adherents. In 1449 James married Mary, daughter of the duke of Gueldres. Douglas made a pilgrimage to Rome, and during his absence the king took measures for the curtailment of his power, but on his return he received marks of royal favor. He soon left the court, and lived as an independent sovereign in his own territories, perpetrating many acts of lawless cruelty, and setting the royal authority at defiance. Too powerful to be encountered openly, Douglas now became the object of conspiracy. A reconciliation was effected, and the earl visited Stirling castle, where, in spite of his safe-conduct, he was stabbed by James, and then slain by the royal attendants. In the wars that followed the king triumphed, though not without encountering great resistance, and the main branch of the Douglas family was destroyed. The king sought to improve the condition of the people, and the legislative measures of his reign were often as liberal as the character of the age would allow. The disputes between the houses of York and Lancaster in England, which had now openly commenced, affected Scotland. In 1459, in a treaty between James II. and Henry VI., the former agreed to support the Lancastrians, in consideration of receiving in return portions of the north of England, including Durham and Northumberland. James entered England at the head of 60,000 men, but his army committed such ravages that Henry prevailed upon him to withdraw. In 1460 he renewed the war, not with England, but with the Yorkists, and laid siege to the frontier fortress of Roxburgh, which the English had held since the defeat of David Bruce at Durham. While the king was examining a battery, one of the guns burst, and

a fragment struck him in the groin, causing immediate death. This event occasioned great grief, and the soldiers, listening to the appeal of his widow, persevered in the siege, carried Roxburgh by assault, and razed it to the ground.

JAMES III., king of Scotland, son of the preceding and of Mary of Gueldres, born in 1453, murdered in 1488. He was crowned at Kelso monastery, and as his mother was a woman of vigorous capacity, it was hoped that his minority would not prove so disastrous as that of his father had been; but a variety of circumstances overclouded the fair beginning of this reign, and rendered it one of the most unfortunate in Scotch history. The triumph of the Yorkists in England was adverse to Scotch interests, as they were identified with those of the house of Lancaster. Henry VI. and his family took refuge in Scotland after the battle of Towton had confirmed Edward IV. in possession of the English crown. Edward showed a desire to be on friendly terms with Scotland, but the Scotch adhered to the Lancastrians. In 1462 the English king made a treaty with the earl of Ross and the lord of the isles, and the banished Douglasses, for the conquest and partition of Scotland. All of it north of the Forth was to be divided between Douglas, Ross, and the lord of the isles; and Douglas was to receive the old estates of his house in the south. The lord of the isles was to become Edward's vassal. This formidable treaty led to nothing. Ross alone acted under it. He called himself king of the Hebrides, and committed some depredations, but was soon assassinated. The Scotch nobility were now divided into two parties, the old lords and the young lords, the former favoring the house of Lancaster, while the other was desirous of peace with England, which implied abandonment of Henry VI. The peace party triumphed, the Scotch covenanting to give no assistance to Henry or his party. The queen mother died in 1463. The family of Boyd then rose to power, and the aristocratical struggles were renewed. Bishop Kennedy, the ablest Scotch statesman of that age, who had long been in the service of the crown, died in 1466. In 1469 James married the princess Margaret of Denmark, through which alliance the Orkney and Shetland islands became permanent possessions of Scotland. The Boyds fell the same year, their estates were annexed to the crown, and the Hamilton family rose. James III. has been represented as weak and vicious; but his foreign policy and internal legislation show that he had high capacity and sound views. Domestic peace and an alliance with England, the two things most desirable for Scotland, were his aims. For some time after he assumed power he was successful, but the warlike and illiterate aristocracy hated him for his love of peace and fondness for letters and art. The king's brothers, Albany and Mar, headed the aristocracy, but at first were not hostile to the monarch; but Cochrane, an architect, one of the king's favorites, caused a

breach between him and his brothers. Albany fled to France, and Mar lost his life, in what manner is not known. Troubles occurred with England, and Albany joined the enemies of his country, who promised to make him king of Scotland, for which he was to render homage. The Scotch aristocracy took advantage of the assemblage of a great feudal army against the English, seized the king and his favorites, and hung the latter, including Cochrane, who had been made earl of Mar, without trial. The king was placed in Edinburgh castle. Albany was reconciled to the king, and became lieutenant general. The struggle was repeatedly renewed, the king being often successful. The aristocracy, fearful of the result of the contest, prevailed upon the heir apparent, Prince James, then but 15 years old, to join them. In 1488 the royal party was defeated at the battle of Sauchie-burn, near Bannockburn, and the king was killed in his flight by an unknown hand.

JAMES IV., king of Scotland, son of the preceding and of Margaret of Denmark, born March 17, 1472, slain at the battle of Flodden, Sept. 9, 1513. He was crowned at Scone, June 26, 1488. His government was one of the most vigorous that Scotland ever knew. Unlike his predecessors, he determined to rule by the aid of the nobility, and not to seek their humiliation. Attempts at insurrection were put down. Aided by parliament, the king carried many measures for the improvement of the country, concerning trade and manufactures. When he found his power firmly established he withdrew his favor from the men who had acted with him against his father. Peace was made with England. The encroachments of Rome were restrained. Justice was regularly administered in the lowlands; and the king determined that the highlands should be made subject to law. He made several journeys thither and to the isles, successfully asserting the royal authority. The lord of the isles endeavored to resist, but was stripped of power and possessions. When Perkin Warbeck appeared, claiming to be the second son of Edward IV. of England, James supported him, and he is believed to have been an original party to the plot that brought him upon the stage. Warbeck visited Scotland in 1495, and was royally received. James gave him for a wife a daughter of the earl of Huntly, a near relative of his own. He invaded England, but this was injurious to Warbeck's plans, because of the hatred felt by the English for the Scotch. The latter returned home, but the war continued. Henry VII. renewed his offer to give the hand of his daughter Margaret to James, and in 1497 Warbeck left Scotland, when a seven years' truce was agreed upon. James now proceeded to complete his plans for the improvement of Scotland. Commerce and a navy received much of his attention, and prospered. He again visited the north, and enforced the law in the highlands. Learning was favored by him, and literature flourished. In

deference to the nobility, he married the princess Margaret of England, Aug. 8, 1503. The relations between France and Scotland became very close, which offended Henry VII. Printing was introduced into Scotland in 1507, by Walter Chapman, one of the king's servants. After the accession of Henry VIII. to the English throne troubles began, which ended in war in 1513, when James invaded England, and was defeated by the earl of Surrey at Flodden. The loss of the battle was due to the conduct of the king, who, from exaggerated notions of chivalry, gave up great advantages of position, for which he paid with his life. He showed eminent valor, but no generalship.

JAMES V., king of Scotland, son of the preceding and of Margaret Tudor, born in Linlithgow, April 10, 1512, died in Falkland, Dec. 13, 1542. He was crowned at Seone, and his mother became regent. His minority was a period of great trouble, owing to the weakness of his mother, the rivalry of parties, the venality and violence of the aristocracy, and the attempts of the English to obtain ascendancy. In his 17th year he escaped from the Douglases, who then had possession of his person, and became king in fact. He showed much energy in repressing the troubles on the borders, where he sent several chiefs to the gallows, among them the famous John Armstrong. A rebellion in the Orkneys was promptly quelled; and the chiefs of the Western isles were induced to submit to the king's authority by his firm but conciliatory action. Other measures to promote tranquillity were adopted; but the nobles had become lawless and licentious during the regency, so that James met with great difficulties in his endeavors to restore peace at home, and some of their leaders were treated with severity. The clergy were much esteemed by him, and held the principal offices of state; facts of not a little consequence, as the reformation was then going forward, and Scotland was affected by it. The college of justice was established in 1532, supposed to have been modelled on the parliament of Paris, and suggested by the advice of Gavin Dunbar, archbishop of Glasgow, who had been the king's preceptor, and was now chancellor; its object was to remove the means of oppression from the hands of the nobles. James was courted by foreign powers. Henry VIII. wished him to marry his daughter Mary. Charles V. offered him his sister, the late queen of Hungary, or his niece, a princess of Denmark. Francis I. favored the English alliance, as he and Henry were at that time friends. Border hostilities made it difficult for England and Scotland to be allies. Henry encouraged Scotch rebels, and James aided the disaffected Irish. In 1533, under French mediation, a truce was made, which was converted into a treaty of peace the next year. Henry made James a knight of the garter, Francis conferred upon him the order of St. Michael, and the emperor that of the golden fleece. Charles made

another futile effort to marry him to one of his nieces, though James avowed his attachment to the cause of which the emperor was chief. He persecuted the reformers, burning some, while others were compelled to fly. Henry VIII. urged his nephew to side with him in his contest with Rome, and again offered him the hand of the princess Mary; but he failed, and the pope's attentions and exertions bound James to the papal cause. Paul III. addressed him as "defender of the faith," against which Henry remonstrated. James visited France in 1536, where he married Madeleine, only daughter of Francis I. She died soon after, whereupon James married the duchess of Longueville, a daughter of the duke of Guise, who had been sought by Henry VIII. These marriages caused the king to become still more attached to the party in Europe that was hostile to the reformation, and under the influence of Cardinal Beaton persecution raged, while Henry VIII. exerted himself to change the policy of Scotland. In 1540 James led a successful expedition to the Western isles. The Hebrides, the Orkney and Shetland isles, and portions of territory in Scotland that had belonged to rebellious barons, were annexed to the crown. The king paid much attention to industrial development, inviting skilful foreign artisans to settle in Scotland. Henry VIII. sought an interview with his nephew in 1541, going for that purpose to York; but James would not visit him. War followed, and James made great preparations to meet the English; but his feudal array could not be relied upon, the nobility being thoroughly discontented. At Fala Muir and Solway Moss they openly defied his commands, and would not resist the enemy. James fell into despair, and died in a few days. When the birth of his daughter Mary was announced to him, he said: "It [the crown] came with a lass, and it will go with a lass." These were among his last words.

JAMES I. of England, and VI. of Scotland, son of Henry, Lord Darnley, and Mary, queen of Scots, born in Edinburgh castle, June 19, 1566, died in the palace of Theobalds, March 27, 1625. His reign began in July, 1567, when his mother, queen regnant of Scotland, was dethroned, and power passed finally into the hands of the Protestant party. He resided at Stirling castle, under the guardianship of the earl of Mar, and his preceptor was the learned George Buchanan, who, on being reproached with having made the king a pedant, declared that it was the best he could make of him. During his minority the contest between kingsmen and queensmen was bitterly waged, and the earls of Murray, Lennox, Mar, and Morton were successively regents. In 1577, on the overthrow of Morton, James assumed power, and the next year this assumption was confirmed by parliament. He early exhibited that fondness for masculine favorites which has left a cloud on his name. He was seized by some of the nobility in 1582, but recovered

his liberty and power, and banished his enemies. The latter returned in 1585, and forced the king to capitulate. He formed an alliance with Elizabeth in behalf of Protestantism, then threatened by the great Catholic powers, and wrote a book to prove that the pope was Antichrist. He sought, but ineffectually, to save his mother's life, when she had been sentenced to death in England. He adhered to England during the expedition of the armada, knowing that Philip II. would not conquer it for him. In 1589 he made a voyage to Denmark, and married Anne, second daughter of Frederick II. His reign was much disturbed by internal troubles caused by the nobles, the clergy, and the citizens of Edinburgh. His *Basilicon Doron*, intended for the instruction of his son Henry, was published in 1599. He endeavored to restore episcopacy, but with no success. On the death of Elizabeth, March 24, 1603, James was proclaimed king of England by the queen's council, in violation of the will of Henry VIII. His right, however, had been recognized by Elizabeth, and rested upon his descent from Henry VII. through his great-grandmother Margaret. He left Edinburgh April 5, and journeyed to London, his clumsy person and gross manners making a most unfavorable impression on his new subjects. Cecil monopolized power. Raleigh was tried and condemned for treason, and was kept for 13 years in prison. A disgraceful peace was made with Spain in 1604. Arbitrary sentiments prevailed at court, and the king had trouble with his parliaments. The gunpowder plot, in 1605, was caused by the disappointment of some Catholics, whom he had encouraged to hope for the mitigation of the penal laws under which they suffered. In 1612 two heretics were burned at Smithfield, the last executions of the kind in England. Henry, prince of Wales, died the same year, under suspicious circumstances. The princess Elizabeth, ancestress of the present English dynasty, was married to the elector palatine, Feb. 14, 1613. The "grand oyer of poisoning" took place in 1615-'16 (see *OVERBURY*, *SIR THOMAS*), ending in the disgrace of the earl of Somerset, who had been a royal favorite, though now superseded by George Villiers, first duke of Buckingham of that name. Raleigh was released, and allowed to make his voyage to Guiana, but was put to death on his return, to gratify the Spanish government. James's foreign policy was shameful, and the English felt the disgrace all the more because of the contrast it made with that of Elizabeth. When the thirty years' war broke out, though it involved the fate of his daughter and son-in-law, and they lost their dominions and became exiles and beggars, he would do nothing for them. A leading object with him was to conciliate Spain, and obtain the hand of a Spanish princess for his eldest son. Other means having failed, Buckingham, who now ruled both king and prince, persuaded Charles to go to Spain, to urge his suit for the infanta. This

journey led only to disappointment, Buckingham taking offence, and, it is said, causing the marriage to be broken off. Bacon, who was lord chancellor and a peer, was disgraced in 1621, on account of his corrupt acts. War was declared against Spain in 1624, and parliament was dissolved the same year. The hand of the princess Henrietta Maria, daughter of Henry IV. of France, was now sought for Charles, and an alliance with that country against the house of Austria was contemplated. A small force was sent to the continent, to help the Protestant cause, and this was followed by a larger one; but the first accomplished nothing, and of the second one half the men perished on board their ships, France and Holland not allowing them to land. Buckingham's favor with the king was now lost, but he had great influence over the prince of Wales; and the king falling sick, the duke and his mother were suspected of having poisoned him. His death was really caused by a tertian ague, acting on a constitution undermined by intemperance, chagrin, and mortification. The most remarkable event of James's reign was the authorized translation of the Bible into English, which was done under his patronage and by his direction. James was a man of considerable learning, but his scholarship was deformed by the most offensive pedantry, as his writings were by the grossest superstition, witches being the especial objects of his fear, hatred, and persecution.

JAMES II. of England, and VII. of Scotland, second surviving son of Charles I. and Henrietta Maria, born at the palace of St. James, Oct. 15, 1633, died at St. Germain, France, Sept. 16, 1701. He was called duke of York at once, but not by patent until 1643. He was about nine years old when the civil war broke out, and was an eye-witness of the battle of Edgehill, where he came near losing his life. He was present at the siege of Bristol in 1643. When Oxford was captured in 1646, James became prisoner to Fairfax. At a ceremonious visit of the chiefs of the parliamentary army, Cromwell was the only man who knelt to him. The prince was well treated, and allowed frequent interviews with his father, living most of the time in company with his brother Gloucester and sister Elizabeth, at St. James's, under the guardianship of the earl of Northumberland. He escaped in 1648, and fled to the Netherlands, whence, after a residence in Flanders, he went to Paris in 1649. The same year he accompanied his brother Charles to the island of Jersey, residing there four months. Returning to the continent, he visited Brussels, Rheenen, the Hague, and Breda. After the triumph of the enemies of the Stuarts in 1651, he entered the French service, distinguishing himself under Turenne. When, in 1655, the relations between England and France became close, James was forced to depart, and he entered the Spanish army, where he fought against the English and French. He was treat-

ed with much consideration by the Spaniards. He shared in the benefits of the restoration of his family to the British throne in 1660; and on Sept. 3 of that year he was married to Anne Hyde, daughter of the earl of Clarendon, to whom he had contracted himself the preceding November. She died in 1671, and James married in 1673 Maria Beatrice Eleonora, a princess of the house of Este of Modena, his junior by 25 years. He had become a Catholic while in exile, but did not avow his religion until some years after the restoration (1671). In the wars with Holland he distinguished himself in command of the English fleet. The passage of the test act in 1673 caused him to relinquish all his employments. He incurred great danger during the time of the popish plot, and when the parliamentary test was adopted in 1678, it was with difficulty that he maintained an exceptional privilege to retain his seat in the house of peers. An effort was made to exclude him from the succession, and Shaftesbury endeavored to prevail upon the grand jury of Middlesex to indict him. The commons passed the exclusion bill, but it was rejected by the peers; it had passed the commons in the preceding parliament, but through a dissolution failed to reach the upper house. James retired to Brussels in 1679, but returned when the king was attacked by illness. He was sent to Scotland, as head of the administration there, and treated the Covenanters with great cruelty. The Oxford parliament, which would have passed the exclusion bill, was dissolved at the commencement of 1681. A reaction now began. James soon returned to England, had much influence at court and in the country, and upheld all those severe measures by which the tory party sought to exterminate the whigs. When Charles II. died, Feb. 6, 1685, James succeeded him. His conduct was arbitrary from the beginning, and the parliament he called was the most servile in English history. Argyll's invasion of Scotland and Monmouth's invasion of England were subdued with little difficulty, and were followed by unparalleled punishments. He soon broke with his obsequious parliament, as he required the repeal of the test and habeas corpus acts, which were as dear to the tories as to all other of his subjects except the Catholics. He prorogued the parliament from time to time, and ultimately it was dissolved. He set himself systematically to work to effect two ends: the overthrow of the constitutional system of England, and the restoration of the Catholic religion. At first he attempted to use the established church against the dissenters; but finding the Episcopalians would not give him their aid, he sought to gain the dissenters. A great number of illegal measures were adopted. A new court of ecclesiastical commission was erected; a great standing army was created; the privileges of the universities were violated; the test act became a dead letter; corporations were modelled and remod-

elled, in the hope that a parliament might be packed that would give to the king's doings the forms of law. In less than three years the king had arrayed all his subjects against him, except the Catholics and a few of the dissenters, the greater part of the dissenting interest siding with the established church, and whigs and tories coalescing. All offices were in the hands of Catholics, or of Protestants ready to do the work of Catholics. The foreign policy of the country was made subservient to that of France, because the support of that country was necessary for the success of James's home policy. The pope and the governments of Spain and Germany were hostile to James's course, because they were alarmed at the encroachments of Louis XIV. Matters were brought to a crisis in June, 1688, by the opposition which the declaration of indulgence encountered. The archbishop of Canterbury and six bishops were sent to the tower, and tried on the charge of libel, for petitioning the king against the order that the declaration should be read in the churches. They were acquitted, but the excitement was without a parallel in English history of that century. On June 10 Queen Mary gave birth to a son, who was afterward known as the pretender (see JAMES FRANCIS EDWARD STUART), the popular opinion being that the queen's pregnancy was a sham, and that the child was spurious. This event hastened the revolution. Men had been restrained from action by the belief that, as James had no male children, the throne must soon pass to his eldest daughter, Mary, wife of William, prince of Orange, who was a Protestant; but the birth of his son dispelled their hopes, and on June 30, 1688, William was invited to invade England, the invitation being signed by the earls of Shrewsbury, Devonshire, and Danby, Lord Lumley, Henry Sidney, Edward Russell, and Henry Compton, the suspended bishop of London. Though James was warned of what was going on, both by Louis XIV. and by others, he was taken entirely by surprise when William sailed from Holland with an army of 15,000 men. The invaders landed at Torbay, Nov. 5, and James was soon abandoned by nearly every one, including his daughter Anne. He fled from England, having previously sent away his wife and son, but was detained, and returned to London, much to the regret of his enemies. Every facility for flight being placed in his way, he fled a second time, and reached France. He was magnificently received by Louis XIV., who assigned him a large pension, and the palace of St. Germain as a residence. He went to Ireland in 1689, in which country the native population were attached to his cause. There he underwent many humiliations, and was defeated at the decisive battle of the Boyne, July 1, 1690. Returning to France, he resided there until his death. The battle of La Hogue, in 1692, proved fatal to his hope of a successful descent on England, though the idea was not abandoned. He was

offered the candidature for the crown of Poland in 1696, but would not accept it. The treaty of Ryswick in 1697, by giving peace to France and England, removed all prospect of restoration; but the ex-king and his family continued to be the guests of Louis XIV. His health declined, and on Sept. 2, 1701, he was struck with apoplexy, and died in two weeks.

JAMES, Epistle of, one of the books of the New Testament canon, which has been ascribed to James the son of Zebedee, to a pseudo-James who assumed the name to gain authority, to James the son of Alphaeus, and to James the brother of the Lord. Luther doubted its apostolic origin, and called it an "epistle of straw;" but recent Protestant theologians are generally in favor of its canonicity, without being able to agree as to its author. The entire recent literature on the epistle is reviewed in the *Studien und Kritiken*, January, 1874, by Prof. Berschlag, who believes that it was written by James the brother of the Lord, whom he distinguishes from both the apostles of that name. He regards it as the oldest book of the New Testament, reflecting the sentiments of the most religious portion of the Jewish people, in which Jesus himself and his brothers were reared. It was addressed to the Jewish Christians of Asia Minor. In his doctrine, James lays the greatest stress upon the necessity of works, in distinction from Paul and John, respectively the preachers of faith and love. That his doctrine is consistent with theirs, exhibiting it from another point of view, has been shown by Neander, in his practical exposition of the epistle. Its style is highly eloquent and poetical.

JAMES, George Payne Rainsford, an English novelist, born in London in 1801, died in Venice, June 9, 1860. He was educated at Greenwich, and at the age of 15 was sent to France, where he passed several years. While a boy he was in the habit of writing small pieces in prose and verse, and became an anonymous contributor to the magazines. Strongly encouraged by Washington Irving, he produced in 1822 a life of Edward the Black Prince, the first book bearing his name. When but 17 years old he had written a collection of eastern stories, which were published in 1832 under the title of the "String of Pearls." His first essay as a novelist, "Richelieu," written in 1825 and published in 1829, met with considerable success, and was followed by "Darnley" and "De l'Orme" (1830), "Philip Augustus" (1831), "Henry Masterton" (1832), and "Mary of Burgundy" (1834). The list of original works of all descriptions published under his name amounts to more than 80, the latest being "The Cavalier" (1859). Among these are several volumes of poetry, and many of history and biography, including the "History of Chivalry," and lives of Charlemagne, Richard Cœur de Lion, Henry IV. of France, and Louis XIV. For a short time he held the post of historiographer of England by the appointment of

William IV. About 1850 he removed to the United States, and in 1852 was appointed British consul in Norfolk, Va., where he remained until his appointment in 1858 as consul at Venice. Among the novels suggested by his experiences of American life and history are "Ticonderoga" (1854) and "The Old Dominion" (1856). "Adrian, or the Clouds of the Mind" (New York, 1852), he wrote jointly with Maunsell B. Field. A collected edition of his works has been published in London.

JAMES. I. Henry, an American philosopher, born in Albany, N. Y., June 3, 1811. He studied for some time in Union college and in the Presbyterian theological seminary at Princeton. During a tour in Europe he became interested in the views of Robert Sandeman, of whose "Letters on Theron and Aspasio" he prepared an edition with an original preface (New York, 1839). In 1840 he published a pamphlet entitled "Remarks on the Apostolic Gospels," in which he maintained the absolute divinity of Jesus Christ while denying the doctrine of the trinity. In another visit to Europe in 1843 he became acquainted with the works of Swedenborg, which have ever since exercised a marked influence upon his opinions and writings. In 1846 he published "What is the State?" a lecture delivered in Albany, and in 1847 "A Letter to a Swedenborgian," in which, while asserting the doctrines promulgated by Swedenborg, he argues against the ecclesiastical organization of the New Jerusalem church. In the winter of 1849-'50 he delivered in New York a course of public lectures, which were collected into a volume under the title of "Moralism and Christianity" (1852), and excited much attention. The leading idea of this volume is that there is a radical distinction between the moral and religious life of man; the former being mere obedience to the laws of human society, while the latter is the product of divine life and love flowing into the soul; consequently the one is outward, formal, and temporary, while the other is inward, spontaneous, and permanent. A second course of lectures delivered in 1851-'2, enforcing the same general views, was published, together with several articles written for magazines and reviews, in a volume entitled "Lectures and Miscellanies," in 1852. This was followed by "The Church of Christ not an Ecclesiasticism" (1854), "The Nature of Evil" (1855), "Christianity the Logic of Creation" (1857), "Substance and Shadow" (1866), and "The Secret of Swedenborg" (1869). In these works Mr. James advocates a body of religious philosophy and social doctrine which in its theological affinities is related to the teachings of Swedenborg, while its humanitarian tendencies accord with the aims of modern socialism. **II. Henry, jr.**, an American author, son of the preceding, born in New York, April 15, 1843. He was educated partly in New York and partly in Europe, where he has lived for several years, mostly in France

and Italy. He has become favorably known as a contributor of stories, sketches of travel, and literary and artistic criticisms to various reviews and other periodicals.

JAMES, Sir Henry, an English engineer, born at Rose-in-Vale, near St. Agnes, Cornwall, in 1803. He studied at Woolwich, and became lieutenant of engineers in 1825, director of the geological survey of Ireland in 1844, and of the admiralty engineering works at Portsmouth in 1846, chief of the ordnance survey of the United Kingdom in 1852, and of the topographical and statistical departments of the ministry in 1857, which last two offices he still holds (1874). He was knighted in 1860, and made major general in 1868. He invented a new photographic process to which he applied the name of photozincography, and by means of which he made facsimiles of the "Domesday Book" in 32 volumes, and of "National Manuscripts from William I. to Queen Anne" (2 vols. fol., 1865). His other works comprise "Ordnance Survey in Ireland" (1855), "in Scotland" (2 vols., 1861), and "in England and Wales" (2 vols., 1861); "On Photozincography and other Photographic Processes" (1862); "Account of the principal Triangulation of the United Kingdom" (1864); and "Record of the Expedition to Abyssinia" (1870).

JAMES, John Angell, an English clergyman, born at Blandford, June 6, 1785, died in Birmingham, Oct. 1, 1859. He was apprenticed to a draper, but was subsequently placed in the dissenting college at Gosport to be educated for the ministry. In 1804, while still a student, he temporarily supplied the pulpit of Carr's lane chapel, Birmingham, and was unanimously requested to become the pastor, which post he held till the end of his life. Soon after he was ordained he issued the "Sunday School Teacher's Guide," which has passed through many editions; and volumes, tracts, addresses, and sermons followed each other in rapid succession. A series of his works, including "The Anxious Inquirer," "The Church Member's Guide," "The Christian Father's Present to his Children," and "The Christian Professor addressed in a Series of Counsels," have been circulated by hundreds of thousands of copies, and translated into 10 or 12 languages. Among his numerous other writings may be mentioned "The Course of Faith," "Christian Hope," "The Family Monitor," and "The Church in Earnest." He possessed the love and respect of persons of all denominations, and his funeral was said to have been the largest ever known in Birmingham.—See "John Angell James: a Review of his History, Character, Eloquence, and Literary Labors," by John Campbell, D. D. (8vo, London, 1860), and his "Life and Letters," by R. W. Dale (1861).

JAMES, Robert, an English physician, born at Kinverston, Staffordshire, in 1703, died in 1776. He was educated at St. John's college, Oxford, studied medicine, and after practising in Sheffield, Lichfield, and Birmingham, re-

moved to London. He is principally known as the inventor of the fever powder called "James's powder." He is the author of "A Medicinal Dictionary" (3 vols. fol., London, 1743-'5), in the preparation of which he was assisted by Dr. Samuel Johnson; of a posthumous publication entitled "Vindication of the Fever Powder;" and of treatises on the practice of physic, canine madness, &c. The preparation of his powder was kept a secret for many years, but it is now known to be composed of oxide of antimony and phosphate of lime, and is called antimonial powder.

JAMES, Saint. I. The Elder, one of the twelve apostles, son of the fisherman Zebedee and Salome, and brother of the evangelist John, died about A. D. 44. With his brother John he followed his father's occupation, and they seem to have been acquainted with Jesus, and to have recognized him as the Messiah, some time before their call to attend him. It was probably their zeal and boldness that gained them the appellation of Boanerges, or sons of thunder. They witnessed the transfiguration, the restoration to life of Jairus's daughter, the agony in the garden of Gethsemane, and the ascension. James preached as an apostle chiefly in the vicinity of Jerusalem. Under Herod Agrippa he suffered martyrdom by the sword, and, according to Clement of Alexandria, his accuser was so much affected by the boldness of his confession of faith that he at once professed himself a Christian, and was beheaded immediately after him. There is a tradition that he went to Spain, of which country he is the patron saint, and Santiago de Compostela claims the possession of his bones. The Gospel of St. James which was discovered in 1595 on a mountain in Granada, written upon lead, was declared by Pope Innocent XI. in 1682 to be spurious. **II. The Less**, one of the twelve apostles, son of Cleophas (or Alpheus) and Mary, a sister of the Virgin Mary, died about A. D. 62. He was the cousin of Jesus, and was sometimes called his brother. The son of Alpheus and the brother of the Lord are supposed by some critics to be two persons, and Neander pronounces the question the most difficult in the apostolic history. According to Clement of Alexandria, he was a priest and a Nazarite before he was an apostle. After the ascension he was appointed bishop of Jerusalem, and there, in the first apostolic council, he spoke against those who wished to make the law of Moses binding upon Christians. The progress of Christianity under him alarmed the Jews, and Ananus, a son of the high priest Annas, accomplished his death. The apocryphal "Gospel according to the Hebrews" states that he was first precipitated from a pinnacle of the temple, and afterward stoned. He was noted for the purity and holiness of his life, and held in the highest esteem by Jewish professors of the Christian faith.

JAMES, Thomas, an English clergyman, born in Newport, Isle of Wight, in 1571, died in

Oxford in August, 1629. He was educated at Winchester school and at New college, Oxford, of which he became fellow in 1593. In 1602 he was appointed the first librarian of the Bodleian library, a post which he occupied for nearly 20 years. In 1614 he became sub-dean of Wells, and not long after rector of Mongeham, Kent. He was author of a number of learned works, mostly controversial, the principal of which are: *Bellum Papale* (4to, 1600, 1678), and "A Treatise of the Corruption of Scriptures, Councils, and Fathers, by the Prelates, Pastors, and Pillars of the Church of Rome for the Maintenance of Popery" (4to, 1612, 1688; new ed. by the Rev. J. E. Cox, 1843). His "Catalogue of the Bodleian Library" (4to, 1605, 1620), and other writings, are highly esteemed by scholars.

JAMES CITY, a S. E. county of Virginia, bounded N. E. by York river, S. by James river, and W. by the Chickahominy; area, 184 sq. m.; pop. in 1870, 4,425, of whom 2,440 were colored. It has a rolling surface, well timbered with oak and pine. The chief productions in 1870 were 10,350 bushels of wheat, 64,128 of Indian corn, 8,238 of oats, 6,804 of Irish and 5,071 of sweet potatoes, and 11,809 lbs. of butter. There were 298 horses, 497 milch cows, 912 other cattle, and 2,485 swine; 1 flour mill, and 2 saw mills. Capital, Williamsburg.

JAMES FRANCIS EDWARD STUART, called the chevalier of St. George, a pretender to the throne of England, son of James II., born in London, June 10, 1688, died in Rome, Jan. 2, 1766. His legitimacy was suspected even before his birth, many believing that his mother, Queen Mary of Modena, was not really pregnant, but that it was intended to introduce fraudulently a pretended Roman Catholic heir. Though this charge has been disproved, it was one of the reasons why the infant prince was not proclaimed king immediately after the dethronement of his father in 1688. His childhood was passed at St. Germain, where Louis XIV. gave an asylum to the exiled family. On his father's death he was immediately acknowledged king of Great Britain by Louis XIV. under the title of James III. He was recognized also by the king of Spain, the pope, and the duke of Savoy. But no active measures were taken in his behalf till March, 1708, when he sailed from Dunkirk with a French fleet for the invasion of Scotland. The expedition returned without having effected a landing, and the prince now assumed the name of the chevalier of St. George and joined the French army in Flanders. He was present at the battle of Oudenarde in July, 1708; and in that of Malplaquet in September, 1709, he charged the English at the head of the French cavalry. Meantime the English parliament set a price of 100,000 crowns upon his head. In 1713 he was secretly favored by Bolingbroke and other ministers of Anne, and the queen herself regarded him with predilection; but he rejected their advice to renounce, or pretend to renounce, the

Roman Catholic faith. The sudden death of Anne arrested the designs of Bolingbroke and the Jacobites; and Bishop Atterbury, who vainly offered to head a procession to proclaim James at Charing Cross, is said to have exclaimed with indignation, "There is the best cause in Europe lost for want of a little spirit." The chevalier hastened to the court of Versailles, but Louis, unwilling to give England any pretext for rupture, ordered him to leave France, and he retired to Plombières, where he issued a manifesto which was published in England, asserting his right to the crown. At Commercy in Lorraine he was joined by Bolingbroke, who sought in his interest to incite the French government to war with England. This was prevented by the death of Louis XIV., and the hopes of the chevalier were languishing when, on Aug. 27, 1715, the earl of Mar invited the principal Jacobite gentlemen of Scotland to a great hunting match, took with them the oath of fidelity to James III., and raised the standard of rebellion in the highlands. Encouraged by vessels from France with arms and officers, Mar was soon at the head of 10,000 well equipped men, made himself master of Fifeshire, and marched to Dunblane. He at first fell back before the duke of Argyll, commander-in-chief of the English forces in Scotland, but being reinforced fought with him the doubtful battle of Dunblane (Nov. 13, 1715). On the same day in England the Jacobites were obliged to surrender Preston, with many prisoners, and news was received that Lord Lovat had delivered up the castle of Inverness, though hitherto professing to act in the interest of the chevalier. The clans soon began to forsake the standard of Mar, whose army dwindled to half its original number. Though the chevalier had been proclaimed in numerous places in England and Scotland, his partisans had gained no formidable successes. While his cause bore this gloomy aspect, he himself arrived at Peterhead, Dec. 22, 1715, passed incognito through Aberdeen, received Mar most cordially at Fetteresso, made his public entry into Dundee, and continued his progress to the royal palace of Scone. Though everywhere received with acclamation, he was disappointed to find, instead of a large and victorious army, only a discordant multitude, without money, arms, or ammunition. He had not the energy and courage to struggle with the difficulties of his position. The resolution to retreat was taken at a council on Jan. 29, and at Montrose he reëmbarked for the continent with every appearance of desertion and deceit. It has been asserted, however, that he yielded only to the argument that his followers would obtain better terms from the government in his absence than if he remained. After a voyage of seven days he landed at Gravelines, whence he proceeded to St. Germain. The triple alliance (1717) obliged him to leave France, and in the following year he was received with regal honors at Madrid,

and was one of the pretexts for Alberoni's preparations for an invasion of England. In 1719 he married the princess Sobieski of Poland; and in 1720 his eldest son, Charles Edward, the hero of the enterprise of 1745, was born at Rome. In 1722 he issued from Lucca a strange manifesto, proposing that if George would deliver to him the throne of his fathers, he would bestow upon George the title of king in his native dominions and invite all other states to confirm it. In 1725 his wife, with whom he had lived unhappily, retired to a convent, and during his latter years he led a quiet and pious life in Rome.—See J. H. Jesse, "Memoirs of the Pretenders and their Adherents."

JAMESON, Anna, a British authoress, born in Dublin, May 19, 1797, died in London, March 17, 1860. Her father, Mr. Murphy, was painter in ordinary to the princess Charlotte, and from him she derived her enthusiasm for art and intimate acquaintance with its technicalities. At the age of 27 she married Mr. Jameson, a barrister, who soon after received a government appointment in Canada. The marriage proved unhappy, and was soon practically if not legally dissolved. She then made a tour through France, Italy, and Germany, and in 1826 published anonymously her "Diary of an Ennuyée," a work recording her experiences of travel. She published in 1829 "Loves of the Poets" (2 vols. 8vo), a series of sketches showing the influence which women have exercised on poetic minds; in 1831, "Lives of Celebrated Female Sovereigns" (2 vols.); and in 1832, "Characteristics of Women" (2 vols.), containing disquisitions on the female characters in Shakespeare's plays. Her next work was "Beauties of the Court of Charles II.," consisting of letterpress illustrations of engravings from copies of the original pictures by Sir Peter Lely, made by her father at the desire of the princess Charlotte. It was followed by "Visits and Sketches at Home and Abroad," a collection of miscellanies, including a new edition of her "Diary of an Ennuyée." She subsequently visited Canada and a portion of the United States, recording her experiences in "Winter Studies and Summer Rambles in Canada" (3 vols., 1838), and in 1840 published a translation entitled "Pictures of the Social Life of Germany" (2 vols.), as represented in the dramas of her friend the duchess Amalie of Saxony. In 1840 the series of works on art, by which she gained her chief literary honors, properly commences with a translation of a work on the life and genius of Rubens by Dr. Waagen. It was followed by a "Handbook to the Public Galleries of Art in and near London" (2 vols., 1842), and a "Companion to the Private Galleries of Art in London" (1844). In 1845 appeared her "Memoirs of the Early Italian Painters, and of the Progress of Painting in Italy from Cimabue to Bassano" (2 vols. 18mo), containing 30 biographies, which cover a period of about three centuries. A new edition containing addition-

al biographies and other matter appeared in London in 1859. Her next publication, "Memoirs and Essays on Art, Literature, and Social Morals" (1846), contains a paper on the works and genius of Washington Allston. A more elaborate work than any of the preceding was her "Sacred and Legendary Art" (2 vols. 8vo, 1848), which, with the "Legends of the Monastic Orders" (1850), and "Legends of the Madonna" (1852), had employed her for many years. In this series she sought to trace the progress of sacred art, to explain the symbolical form in which the old masters clothed their ideas, and to indicate the purity and beauty of their conceptions. Her numerous skilful etchings from original pictures, illustrating her subject, combine to render the series a most valuable contribution to the history of art. Her remaining works are: a "Common-place Book of Thoughts, Memories, Fancies," &c. (1854); "Sisters of Charity Abroad and at Home" (1855), the substance of a lecture; and "The History of our Lord as exemplified in Works of Art" (vol. i., 1860; vol. ii., chiefly by Lady Eastlake, 1864).

JAMESON, Robert, a Scottish naturalist, born in Leith, July 11, 1774, died April 17, 1854. He studied medicine in the university of Edinburgh, and after some mineralogical explorations in Scotland went in 1800 to Freiberg, and became a pupil of Werner, whose geological dogmas he adopted with enthusiasm. Returning to Edinburgh in 1804, he was soon after appointed professor of natural history in the university of that city, a position which he held until his death. For many years he was an active advocate of the Wernerian theory, but finally adopted and taught that of Hutton. His publications are purely scientific, and include manuals of instruction, and many contributions to scientific journals. His most elaborate works are his "System of Mineralogy" (3 vols., 1804-'8), and "External Characters of Minerals" (1805). In 1819 he established the "Edinburgh Philosophical Journal," of which for many years he was the sole editor. He is also the author of the articles on "Geology," "Mineralogy," and "Organic Remains" in the "Encyclopædia Britannica."

JAMESON, George, a Scottish painter, born in Aberdeen in 1586, died in Edinburgh in 1644. He was a fellow pupil with Vandyke in the studio of Rubens, and is called by Walpole "the Vandyke of Scotland." Little is known of his career, save that it was prosperous. His pictures are found in many old family mansions in Scotland, and among his sitters was Charles I. on the occasion of his visit to Edinburgh in 1633. He occasionally painted history and landscape, and is said to have illuminated a manuscript on the life of Christ.

JAMES RIVER, the largest stream which has its whole course in the state of Virginia. It is formed near the W. border of the state, on the border of Alleghany and Botetourt cos., by the union of Jackson and Cowpasture rivers, and

thence flows S. E. and E. to the Blue Ridge, at the foot of which it receives Calpasture river on the left. Breaking through the Blue Ridge about 15 m. N. E. of the Peaks of Otter, it resumes its S. E. course to Lynchburg, near which town it bends sharply to the N. E. On reaching the boundary between Albemarle and Buckingham cos., it takes an E. S. E. direction, which it retains with little variation until it reaches Richmond, where it turns nearly S. It is here obstructed by rapids, and embraces a number of small islands. Near the S. E. extremity of Henrico co. it again takes a S. E. course, after some tortuous deviations, and finally flows into the S. part of Chesapeake bay, through a broad estuary, at the mouth of which are Hampton roads. Willoughby point and Old Point Comfort are on either side of its embouchure. The river is 450 m. long, and navigable by vessels of 130 tons to Richmond, at the head of tide water, 150 m. from the sea, whence the James River and Kanawha canal, completed to Buchanan in Botetourt co., passes along its upper course. The principal tributaries of James river are the Appomattox on the right and the Chickahominy on the left. The most important towns on its banks are Richmond and Lynchburg.

JAMESTOWN, a village of Chautauqua co., New York, at the outlet of Chautauqua lake and on the Atlantic and Great Western, and the Dunkirk, Alleghany Valley, and Pittsburgh railroads, 55 m. S. S. W. of Buffalo; pop. in 1870, 5,336. It is connected by a daily line of steamers with Mayville, at the opposite end of the lake, and contains a piano factory, several sash and blind factories, two machine shops and founderies, an edge-tool factory, a large alpaca factory, woollen mills, three large chair factories, &c. There are three national banks, four hotels, a collegiate institute, two daily and two weekly newspapers, and eight churches. The lake is becoming a favorite summer resort. Eight hotels and many cottages have been erected on its shores, and four steamers and numerous yachts ply upon it.

JAMESTOWN, the first English settlement in the United States, situated within the present limits of James City co., Virginia, on a point of land projecting from the N. bank of James river, 32 m. above its mouth. The encroachments of the river have converted the promontory into an island, and a portion of the site of the settlement has been entirely swept away. A part of the old church tower, with some tombstones standing around it, is now the only relic of the ancient town. There is a private residence on the island. Jamestown was founded in 1607 by 105 colonists sent out by the London company under command of Christopher Newport. Capt. John Smith and Bartholomew Gosnold were prominent members of the expedition. Their fleet, consisting of three vessels, entered the Chesapeake April 26, and sailing up the James river, which they named in honor of the reigning king of Eng-

land, anchored off a beautiful promontory, where in May they began to build a town. During the first season of their arrival the colony was exposed to extreme want and danger, and it was only saved from speedy destruction by the energy of Capt. Smith and the good offices of Pocahontas. The first colonial assembly ever convened in America was held at Jamestown, June 29, 1619. On March 22, 1622, several hundred colonists were massacred by the Indians. (See VIRGINIA.) Nathaniel Bacon, during the rebellion which took its name from him, burned the town in 1676.

JAMI (ABDERRAHMAN BEN AHMED), a Persian poet, born A. D. 1414, died in 1492. He derived his surname Jami from Jam, the place of his birth in Khorasan. After excelling in other studies, he applied himself to the mystical doctrine of the Sufis under the celebrated sheik Saad ed-Din of Kashgar, and was judged worthy to succeed that master in his school. His eloquence and amiable character, and the beauty of his poems, made him a favorite of the vizier Ali Shir, the sultans of Herat, Abu Said and Hussein Mirza, and also of the Ottoman sultans Mohammed II. and Bajazet II. He was equally esteemed by the common people, whom he instructed beneath the portico of the mosque of Herat in the principles of morals and religion. He is one of the best, most learned, and most voluminous of the Persian poets, and composed about 50 works in prose and verse, in Arabic and Persian. Among the more important of them are "Yusuf and Zuleika," translated into English by Thomas Law in the "Asiatic Miscellanies," and published in German with the original text by Rosenzweig (Vienna, 1824); the "Golden Chain," a satirical poem against two heretical sects, edited by F. Falconer (London, 1848); "Selman and Absal," edited by Falconer (London, 1850); the "Book of the Wisdom of Alexander;" *Beharistan* (the "Abode of Spring"); and the prose work, *Nasahat ul-ins* ("Breath of Man"), a history of mysticism.

JAMIESON, John, a Scottish clergyman, born in Glasgow, March 3, 1759, died in Edinburgh, July 12, 1838. He was the son of a Secession minister settled in Glasgow, and was educated at the university of that city. At the age of 20 he was licensed as a preacher, and in 1781 was ordained pastor of a small congregation in Forfar, where he remained 16 years on a salary of £50. During this time he published "Socinianism Unmasked" (1788), "The Sorrows of Slavery, a Poem" (1789), "Sermons on the Heart" (2 vols. 8vo, 1789-'90), and "A Vindication of the Doctrine of Scripture and of the Primitive Faith concerning the Deity of Christ" (2 vols. 8vo, 1794), in which the arguments of Priestley in his "History of Early Opinions" are ably combated. In 1797 he was settled over a congregation in Edinburgh, where he passed the remainder of his life. In 1802 appeared his "Use of Sacred History" (2 vols. 8vo), and in 1808-'9 his most important work,

"Etymological Dictionary of the Scottish Language" (2 vols. 4to), of which he published in 1818 an 8vo abridgment, followed in 1825 by a supplement to the large edition in 2 vols. 4to. Among his remaining works are: "Hermes Scythicus, or Radical Affinities of the Greek and Latin Languages to the Gothic" (8vo, 1814); "Historical Account of the Ancient Culdees of Iona" (4to, 1811); "Grammar of Rhetoric and Polite Literature" (12mo, 1818); editions of Barbour's "Bruce" and Harry the Minstrel's "Sir William Wallace;" and a number of occasional sermons and poems. He received the degree of D. D. from Princeton college, N. J., and during the last five years of his life enjoyed a literary pension of £100.

JANAUSCHEK, Fanny, a Bohemian tragic actress, born in Prague, July 20, 1830. Her talent was developed under the direction of Benedix at Cologne, and from 1848 to 1860 she was a favorite at the Frankfort theatre. Subsequently she appeared in Dresden and in other German cities. From 1867 to 1871 she performed in the United States in German, and after a visit to Germany reappeared here in 1873, performing successfully in English, and winning great applause by her tragic genius. In 1874 she went again to Germany, intending soon to return for a farewell tour.

JANES, Edmund Stoner, an American clergyman, born in Sheffield, Mass., April 27, 1807. His early life was mostly spent in Salisbury, Conn. From 1824 to 1830 he was employed in teaching, and occupied his leisure in the study of the law, intending to follow that profession; but he entered the ministry of the Methodist Episcopal church, and in 1830 joined the Philadelphia conference. From this time he devoted himself to the study of theology, and during the intervals of immediate pastoral labor he also read extensively in medicine. In May, 1840, he was appointed financial secretary of the American Bible society, and remained in this office till 1844, when he was elected bishop. During the 30 years of his episcopal labors Bishop Janes has been intrusted with some of the most grave and delicate duties connected with the affairs of the Methodist church, among which may be mentioned his appointment as delegate to the British Wesleyan conference in 1864, and the supervision and inspection of the Scandinavian, German, and Swiss missions in Europe from 1864 to 1868. In 1865 he visited England as delegate of the American Bible society to the British and foreign Bible society; and he also attended the French Wesleyan conference at Paris and the Irish conference at Cork. At Bremen he delivered before a large meeting an address on the death of President Lincoln, which was widely circulated in northern Europe, and had an important effect on public sentiment there at a critical period. His residence has long been in New York city.

JANESVILLE, a city and the county seat of Rock co., Wisconsin, in the S. part of the state,

situated on both sides of Rock river, and at the intersection of the Wisconsin division of the Chicago and Northwestern railroad with the Prairie du Chien division of the Chicago, Milwaukee, and St. Paul line, 35 m. S. E. of Madison and 71 m. W. S. W. of Milwaukee; pop. in 1860, 7,703; in 1870, 8,789. The ground on which the city is built rises gradually on either side to an elevation of nearly 100 ft. at the summit. The court house occupies a commanding position on the E. side of the river. An active trade is carried on by the railroads, and a large amount of capital is invested in manufactures, Rock river affording valuable water power. The principal establishments are flour mills, saw mills, machine shops, founderies, woollen factories, carriage factories, breweries, &c. There are two national banks, with a capital of \$225,000, and a savings bank. The city is the seat of the state institution for the education of the blind, supported by legislative appropriations, and open to pupils from Wisconsin free of charge except for clothing. This institution was founded in 1850, and in 1873 had 77 pupils. There are 14 public schools, including a high school, which in 1872 had 28 teachers and 1,150 pupils; a daily, a semi-weekly, and three weekly newspapers, and 11 churches. Janesville was founded about 1836, made the county seat in 1839, and incorporated as a city in 1853.

JANET, Paul, a French author, born in Paris in April, 1823. He is a follower of Cousin, and has been professor at Bourges and Strasburg, and at the lyceum of Louis-le-Grand, Paris. In 1864 he became professor of the history of philosophy at the Sorbonne, and a member of the academy of moral and political sciences, which institution awarded prizes to his *La famille* (Paris, 1855) and *Histoire de la philosophie dans l'antiquité et dans les temps modernes* (2 vols., 1858). Among his more recent works are *Histoire de la science politique* (1871), and *Problèmes du XIX^e siècle* (1872).

JANET-LANGE, Antoine Louis, a French painter, born in Paris about 1818, died there in 1872. He studied under Collin, Ingres, and Horace Vernet, adopted the style of the latter, and became distinguished for historical and military pieces. Conjointly with Vernet he executed in 1843 designs illustrating the history of Napoleon I. One of his finest works represents "Nero contesting the Prize at the Chariot Race" (1855), and his subsequent productions include illustrations of Solferino (1861-'3) and "An Episode of the Siege of Puebla" (1868).

JANIN, Jules Gabriel, a French author, born of Jewish parents at St. Étienne, Dec. 11, 1804, died at Passy, June 20, 1874. He completed his classical studies at the college of Louis-le-Grand in Paris, studied law, and made a living as a private tutor; but he soon became one of the contributors to the *Figaro*, a sprightly opposition paper, and was also a regular writer for the royalist journal, the *Quotidienne*, until the accession of the Po-

lignac cabinet in August, 1829. A few weeks later he became a regular contributor to the *Journal des Débats*; and after writing political and miscellaneous articles, he took charge of the theatrical notices. His articles were less criticisms than short essays, written in a colloquial and gossiping style. Besides numerous prefaces, introductions, and articles in nearly every Parisian periodical which existed during his career, Janin published several novels, the first of which was *L'Âne mort et la femme guillotinée* (1829). Among his subsequent writings of the same class are *La confession* (1830), *Barnave* (1831), *Le chemin de traverse* (1836), *Un cœur pour deux amours* (1837), *La religieuse de Toulouse* (1850), and *Les gaités champêtres* (1851). He prepared an abridgment of Richardson's "Clarissa Harlowe," with an *Essai sur la vie et les ouvrages de Samuel Richardson* (1846). Among his miscellaneous

works, exclusive of several illustrated publications to which he did little more than lend his name, are: *Contes fantastiques et contes littéraires* (1832); *Contes nouveaux* (1833); *Les catacombes* (1839); *Le voyage d'un homme heureux* (1840); *Les petits bonheurs* (1856); *Les symphonies de l'hiver* (1857), with drawings by Gavarni; and *Rachel et la tragédie*, a biographical and critical work, with photographic illustrations (1859). His *Histoire de la littérature dramatique en France* (4 vols., 1851-'6) is a selection of his weekly *feuilletons*, remodelled so as to present a sketch of the history of the French stage and dramatic artists during nearly a quarter of a century. In 1870 he succeeded Sainte-Beuve in the French academy. His latest work was *Paris et Versailles il y a cent ans* (1874).

JANINA, or **Yanina**, a city of Albania, European Turkey, capital of a vilayet of the same

Janina.

name (pop. 400,000, chiefly Greeks), on a small peninsula on the bank of the lake of Janina, 85 m. W. by N. of Larissa; pop. about 16,000, of whom 9,500 are Christians, 4,000 Mussulmans, and 2,500 Jews. The population has decreased about 10,000 since 1861, chiefly in consequence of emigration and military conscription. The streets are narrow and crooked, and most of the houses are poor. It is the seat of a Greek metropolitan, and contains 7 churches, 18 mosques, 2 synagogues, a Greek college, a library, and a hospital. Among the manufactures are gold lace and brocade, morocco leather, colored linen, and silk goods. The adjoining country yields grain, fruits, wine, tobacco, and timber in abundance, and is rich in pasture lands, sheep and goats constituting a principal source of wealth.—The site of Janina

and its lake answers to that of the city and lake of Eurœa in Epirus mentioned by Procopius. Justinian built a fortress at Eurœa, probably on the site now occupied by the citadel of Janina. In the later period of the Byzantine empire its territory was a field of contention between the Greeks and Wallach and Slavic settlers. In the latter part of the 11th century it was taken by the Normans, who defeated Alexis Comnenus under its walls. Toward the middle of the 15th century it fell into the hands of the Turks. At the beginning of the present century Janina enjoyed a high degree of prosperity, numbering about 40,000 inhabitants, possessing an extensive trade and a large annual fair, and ranking among the most accomplished and industrious of modern Greeks. But the despotic rule of Ali Pasha, governor of the city, led to

its ruin. When no longer able to defend the city, he set it on fire. (See ALI PASHA.) The mosques, the palaces, and the two academies for which Janina was celebrated, were all destroyed. Opposite the city is a small island with a fishing village and a church and monastery.—The lake of Janina is about 6 m. in length, and almost 3 m. in its greatest breadth, bounded N. E. by the Mitzikeli mountains (2,500 ft. high), and S. W. by a rocky mountain crowned with the ruins of an Epirote city, supposed to have been the ancient Dodona. The N. W. part of the lake is commonly called the lake of Lapsista, and the S. E. that of Janina. The middle resembles a marsh rather than a lake, and is traversed by two long channels which connect the two portions. The waters of both lakes are absorbed by subterranean channels; that which communicates with the river Kalamia (the Thyamis of the ancient Greeks) is in the lake of Lapsista. The lake of Janina abounds with pike, perch, carp, tench, eels, and other fish. Immense numbers of wild fowl breed in the covert of the lofty reeds upon its shores. It has been proposed to drain the lake by boring a tunnel 6 m. long through a limestone mountain.

JANIZARIES, a body of Turkish infantry now extinct. The name is derived from *yeniskeri*, or *yeni* and *askari*, "new troops." They were first assembled in 1329 by Sultan Orkhan, but were not regularly organized until 1362, when Amurath I., after conquering the southern Slavic kingdoms, claimed one fifth of the captives, including the able-bodied youth, to be converted to Islamism and educated as soldiers. This was done with extraordinary care, the recruits being distributed at first among the peasantry of Asia Minor, that they might become hardened by rural life and familiar with Mohammedanism. They manifested all the enthusiasm of proselytes; and as this spirit was warmly encouraged, and as privileges were granted them, they soon became a formidable means of defence. They were divided at first into 80, afterward into 162, and finally into 196 *ortas*, each numbering in Constantinople nominally 100 men, and elsewhere 200 or 300, in time of peace, but 500 in time of war. Besides the *aga*, or commander-in-chief of the whole body, six officers were attached to each *orta*, the chief being called the *orta-bashi*. The lowest officer was the cook, who also performed various other duties, and for whom the soldiers manifested great reverence. They never appeared without a wooden spoon in their turbans, and on extraordinary occasions always assembled around their soup kettles; their revolts were proclaimed by reversing these kettles, and to lose one of them in battle was looked upon as a disgrace equivalent to the loss of colors in other armies. Under Solymán the Magnificent they formed the best disciplined force in Europe. After his death, when the sultans ceased to lead their armies in person, the organization fell into decay. It

was no longer recruited exclusively from young Christian prisoners of war, or from levies on the Slavic provinces, but from any persons who could obtain appointments in it by intrigue, until finally it consisted in a great measure of menials and vagabonds, many of whom

Janizaries—Officers.

followed no military exercises and were permitted to engage in trade or mechanical and other occupations. But they still supplied something like an organization to the turbulent mob of the Turkish cities, and were long really formidable to society and government itself. They mutinied repeatedly against the sultans, and in some cases deposed them or put them to death. They frequently pillaged the cities which it was their duty to guard. In 1798 Selim III. attempted to form a better army by instituting the *nizam-jadid* or disciplined troops. This caused a revolt, the abdication and death of Selim (July 28, 1808), and terrible outrages in Constantinople (Nov. 14). Mah-moud II. was obliged on reaching the throne to pardon the janizaries; but, impressed with the danger of such troops, he quietly matured during several years a plan for ridding himself of them. Having gained over some of their officers and the Mohammedan priesthood, he resolved to exterminate them, and on May 29, 1826, published a decree ordering that 150 janizaries of every regiment should be formed into a regularly disciplined militia. This, as was expected, led to a revolt (June 15, 1826), the janizaries committing horrible excesses. The next day they assembled and reversed their kettles. But the mufti displaying the sacred standard of Mohammed, all the better class of the population joined the regular troops. Artillery had been long prepared in anticipation of this event, and great numbers of *galionsis*

or sailors, and *bostangis* or imperial private guards, were also ready for attacking the janizaries. "Burned alive in their barracks, cannonaded in the At Meidan, where they made their most desperate defence, massacred singly in the streets during three months, the remainder were condemned to exile." About 25,000 janizaries were thus killed, and they have never been reorganized.—See Macfarlane's "Constantinople in 1828," and *Précis historique de la destruction du corps des janizaires*, translated from the Turkish by Causin de Perceval (Paris, 1833).

JAN MAYEN, a volcanic island in the Arctic ocean, situated between Iceland and Spitzbergen, about 200 m. from the E. coast of Greenland. It contains the snow-clad volcano Beerenberg, nearly 7,000 ft. high, covered by large glaciers and frozen waterfalls. Another active volcano, the Esk (1,500 ft. high), was discovered by Scoresby in 1817. The island was discovered by the Dutch navigator Jan Mayen in 1611. It is not habitable, abounds in bears, foxes, and sea fowl, and is described by Lord Dufferin in his "Letters from High Latitudes."

JANNEQUIN, Clément, a French musician of the 16th century, popularly known as *Clemens non Papa*. The dates of his birth and death are uncertain; he lived in the reign of Francis I. His earlier compositions were for the Catholic and his later ones for the Reformed church. Most of them were for four voices. They were full of originality and invention, and many of them of great difficulty.

JAN SAHIB, a Hindoo poetess, born at Furruckabad in 1820. She received a superior education, and became proficient in letters, in music, and in the Persian language. She published in 1846 at Lucknow, where she resides, a collection of poems (*Divan*), which are greatly admired by her countrymen.

JANSENIUS (JANSEN), Cornelius, a Dutch theologian, born at Akoi, near Leerdam, Oct. 28, 1585, died in Ypres, May 6, 1638. He studied theology at the university of Louvain, which unwaveringly adhered to the Augustinian system of Baius (died 1589), though 76 propositions of it had been condemned in 1567 by the see of Rome. After studying and teaching at Paris and Bayonne, he became in 1617 president of the Pulcheria college at Louvain, where he lectured on theology, and in 1630 professor of theology at the university. In 1635 he was made bishop of Ypres. The writings of Augustine against the Pelagians he read 30 times, and his other writings 10 times. Like Baius he adopted the Augustinian doctrine of grace in its strictest sense, and was therefore opposed to the theological views of the Jesuits, whom he prevented from lecturing at Louvain on philosophy. He believed that the Catholic church of his time had in this and in other points departed from the doctrines of the old church, and therefore in 1621 projected, with his friend Duvergier de Hauranne, abbot of St. Cyran, the plan of a

reformation, Jansenius taking the doctrine and St. Cyran the constitution and the religious life as their respective fields of labor. Irish clergymen of high standing and the heads of the French Oratorians favored this plan. In spite of the violent opposition of the Jesuits and the inquisition, he was sustained throughout his controversies by the Spanish government; and he confirmed his influence at Madrid by twice visiting that city (1624-'5). Jansenius commenced his work on the doctrine of Augustine in 1627, and had hardly finished it when he died. On his deathbed he recommended to his friends its publication, which the Jesuits and the papal nuncio at Cologne, anticipating the renewal of a violent controversy, strove to prevent. It appeared (3 vols. fol.), under the auspices of the university, and the editorial care of Liberus Froidmont and Kalen, in 1640, with the title *Augustinus, seu Doctrina Augustini de Humana Natura Sanitate, Aegritudine et Medicina, adversus Pelagianos et Massilienses*, and was soon reprinted at Paris (1641) and Rouen (1643). The work sets forth the Augustinian doctrine of irresistible grace and absolute election or rejection, mostly in the words of Augustine; it rejects the use of reason in religious questions, designates philosophy as the mother of all heresy, defends Baius, and accuses the Jesuits in general, and in particular Fonseca, Lessius, Molina, and others, of semi-Pelagianism. The Jesuits attacked the work as repeating the condemned propositions of Baius, and Urban VIII. in 1642 condemned it as heretical by the bull *In eminenti*, and placed it on the prohibitory index.—The name JANSENISTS is commonly applied to those Christians who, in France particularly, considered the opinions of Jansenius the true doctrine of the Catholic church, notwithstanding their condemnation by all the popes since 1642. In Holland, where they always maintained their hierarchical organization in spite of the censures of the Roman see, they called themselves the Old Episcopal or Old Catholic church, a designation which has recently been adopted also in some parts of Germany. The friends of Jansenius in the Netherlands, among whom were several bishops and nearly all the professors of the universities, submitted after some hesitation to the bull *In eminenti* in 1647. A greater resistance was made in France, where St. Cyran, Antoine Arnauld, his sister Angélique, the abbess of the Cistercian convent of Port Royal, Pascal, and a community of scholars who lived in the manner of the ancient anchorites in the vicinity of Port Royal des Champs (*messieurs de Port Royal des Champs*), took their stand in favor of Jansenius. When Innocent X. in 1653 denounced five propositions in the works of Jansenius as heretical, a majority of the Jansenists denied that these propositions had been understood by the author in the sense in which they were condemned. Alexander VII., however, in 1656 demanded of the French clergy

a declaration by which they should reject the condemned propositions as propositions of Jansenius. This raised the question, whether the pope's admitted infallibility in matters of faith extended also to historical facts. Louis XIV. lent his support to the execution of this as well as other measures of the popes against Jansenism, declaring at a national assembly of the French clergy in 1660 that he regarded it as his religious duty to exterminate Jansenism. Clement IX. in 1668 endeavored to put a stop to the controversy by a decree (*Pax Clementina*), which demanded merely a rejection of the five propositions, without ascribing them to Jansenius. (*La paix de Clément IX.*, Brussels, 1701. The author, who is not named on the title page, was Quesnel, who died in 1719.) But Clement XI. and Louis XIV. soon had recourse to severer measures; many Jansenists fled to the Netherlands, and Port Royal was suppressed in 1709. The controversy had broken out with new violence on the publication of Quesnel's celebrated work on the New Testament (*Le Nouveau Testament en français, avec des réflexions morales*). Clement XI., by the constitution *Unigenitus* (1713), condemned 101 propositions of this book as heretical, dangerous, or offensive to pious ears. A large portion of the French clergy and people, with the archbishop of Paris, the cardinal de Noailles, at their head, publicly resisted the constitution, and were therefore called Anticonstitutionalists. A papal decree of Sept. 2, 1718, threatened with excommunication all who would not submit unconditionally. Many yielded, among them Cardinal Noailles, but four bishops (those of Mirepoix, Montpellier, Boulogne, and Senes) appealed to an œcumenical council. Those who sustained this appeal, among whom were many opposed to Jansenism, were called Appellants. The parliament perseveringly resisted the decrees against Jansenism; the Sorbonne wavered, and when pressed generally submitted to the papal decrees. Some of the bishops continued to patronize it, and the general chapter of the Oratorians resolved in 1727 not to accept the bull *Unigenitus*. A popular saint, Francis of Paris, died with the appeal in his hand (1727), and the miracles and wild convulsions which were reported to have taken place at his grave made a deep impression on large classes of the people. But when the constitution by an act of royal sovereignty had been enforced as a law of the kingdom (1730), the resistance of the Jansenists was gradually overcome, and the Oratorians accepted the bull in 1746. New difficulties arose for a while when Beaumont, archbishop of Paris, in 1752, ordered the sacraments to be refused to all who had not accepted the constitution; but in 1756 peace was restored by means of a mild pastoral letter from Benedict XIV. The Jansenist party remained very strong among the French clergy, and most of the clerical deputies in the states general of 1789 belonged to it. After the res-

toration also it found many advocates among the clergy and laity, and since 1854 has had an organ in the religious press (*L'Observateur Catholique*). In Italy several bishops who were in favor of the reforms of Leopold I. of Tuscany and of Napoleon, as Ricci, bishop of Pistoja, and Capece-Latro, archbishop of Taranto, were regarded as Jansenists.—While Jansenism remained in France a theological school, it became in the Netherlands an independent church. In 1704 Codde, the vicar apostolic of the archbishopric of Utrecht, was deposed by the pope for holding Jansenistic views, but the chapter refused to acknowledge the validity of this deposition. In 1723 the chapter chose an archbishop of Utrecht, who was consecrated by the bishop of Babylon, a French bishop *in partibus*, who lived as a fugitive at Amsterdam. The pope was informed of the election, but answered by a condemnatory brief. The archbishop appealed from the condemnation of the pope to the next general council, a step which has since been taken by each of his successors. The next archbishop, Barchman Wuytiers, received letters of communion from many bishops, more than 100 of which are preserved in the archives of the church of Utrecht. After the death of the bishop of Babylon, Archbishop Meindaerts (elected in 1739) restored the suffragan see of Haarlem in 1742, and that of Deventer in 1758, in order to secure a succession of prelates. In 1856 the bishops of the Jansenist church jointly protested against the doctrine of the immaculate conception. They took an active interest in the rise and progress of the Old Catholic movement in Germany. By invitation the archbishop of Utrecht in 1872 administered the sacrament of confirmation in a number of Old Catholic congregations of Germany, and in 1873 the bishop of Deventer, then the only surviving bishop of the Jansenists, consecrated the first Old Catholic bishop for Germany. The Jansenist church in 1873 had 25 congregations and 25 pastors, all in the dioceses of Utrecht and Haarlem, the diocese of Deventer having no congregation. In 1874 the Jansenist church of Utrecht, numbering about 5,000 members, formally joined the Old Catholics.—See Leydecker, *Historia Jansenismi* (Utrecht, 1695); Lucchesini, *Historia Polemica Jansenismi* (3 vols., Rome, 1711); Tregelles, "The Jansenists" (London, 1851); and the Rev. J. M. Neale, "History of the so-called Jansenist Church of Holland" (Oxford, 1858).

JANSENS, Abraham, a Flemish painter, born in Antwerp in 1569, died about 1631. He enjoyed the highest reputation in Antwerp until Rubens established himself there after his residence in Italy. In vigor of coloring he is scarcely inferior to Rubens.

JANUARIUS, Saint (Ital. *San Gennaro*), a Christian martyr, patron saint of Naples, born in Naples, or according to some accounts in Benevento, April 21, 272, beheaded at Pozzuoli, Sept. 19, 305. He was made bishop of Benevento about 303, just as the persecution under

Diocletian began. During a visit which he made to the imprisoned confessors of the faith at Nola, he was arrested and taken before Timotheus, the governor of the province. This officer is said to have condemned him and his companions to be cast to the wild beasts in the amphitheatre at Pozzuoli; but as the animals refused to harm them, they were all beheaded. It is further related that Januarius was buried at Pozzuoli, but two small phials filled with his blood on the place of execution were afterward presented to Severus, bishop of Naples. To this latter city the remains of the martyr were transferred about the year 400; but in 817 they were carried off to Benevento by Sicon, prince of that city, and from Benevento they were conveyed in 1159 to Monte Vergine. On Jan. 13, 1497, they were once more brought back to Naples with great pomp. Many miracles are attributed by the early annalists to the exhibition of his relics on various occasions, as the staying of the plague and of eruptions of Vesuvius. It has long been customary in Naples to expose these relics to the public veneration on the saint's festival, Sept. 19, and also on the first Sunday in May and Dec. 16, as well as in seasons of national calamity. The relics are exposed amid great solemnity on the high altar of the cathedral, or in the church of Santa Chiara. Then takes place the celebrated liquefaction of the saint's blood. The two phials, containing what appears as a hard substance, and a glass case enclosing the head, are brought separately from the chapel in which they are preserved, the body itself reposing in the shrine beneath the high altar of the cathedral. As soon as the head is brought near the phials the blood is seen to become liquid, to bubble, rise in the bottles, and fall again; the alleged miracle lasting sometimes eight days. On such occasions popular enthusiasm is raised to its height. The nature of this phenomenon has been investigated by scientific men of various creeds and nations, and several hypotheses have been suggested to account for it. Roman Catholics regard it as a miracle, but it has never received the sanction of the church, such as is granted to miracles in the solemn processes of beatification and canonization.

JANUARY (Lat. *Januarius*), the first month of the year, consisting of 31 days. It is said to have been added with February by Numa to the Roman year, which previously had but ten months. It was named from the double-faced god Janus, to whom its first day, which looks back upon the past year and forward upon that to come, was sacred. It had originally but 29 days, but two additional days were given to it by Julius Cæsar when he reformed the calendar. It was symbolized in Rome by a consul in consular robes, because those magistrates were installed in office on its first day. It corresponded in the Athenian calendar with the latter half of Poseideon and the first half of Gamelion. Among the Scandinavians it was called primitively month of Thor, and later

Ice month. The French revolutionary calendar merged it in parts of Nivose and of Pluviose. It was not uniformly the beginning of the year among Latin Christian nations until the 18th century.

JANUS and JANA, two divinities of ancient Rome. Their names are believed to be corruptions or abbreviations of Dianus and Diana, designating the sun and moon. Janus presided over the beginning of everything, and was therefore invoked on every occasion before all other deities. He opened the year and the seasons; he was the janitor of heaven, and on earth the guardian god of gates and doors; in time of war he went out to battle with the armies of Rome and aided them, while in time of peace he abode in his temple and watched over the city. At the dawn of every day the people addressed their supplications to him, and on the first day of every year sacrifices of cakes, barley, incense, and wine were offered in his honor on 12 altars. The worship of Janus is said to have been introduced into Rome by Romulus. Numa called the first month of the Roman year after him, and dedicated a covered passage near the Forum to him. This passage, frequently termed a temple, contained a statue of the god, and had two entrances, which were always kept open in time of war and closed in time of peace. They were closed only once during the republic, at the end of the first Punic war, and twice by Augustus. Janus was sometimes represented with two, and sometimes with four faces, and was accordingly styled *Bifrons* and *Quadrifrons*. In works of art he frequently has a staff or sceptre in his right hand and a key in his left.

JAPAN (called by the natives *Dai Nippon* or *Dai Nihon*), an empire consisting of a group of islands lying off the E. coast of Asia, between lat. 23° and 50° N., and lon. 122° and 153° E. The name Japan is a corruption of Marco Polo's term *Zipangu*, which represents the Chinese *Shi-pen-kue*, meaning "root of day" or "sunrise kingdom." The Japanese empire comprises the three most southerly islands of the Kuriles chain; Karafto or Saghalien S. of the 50th parallel, Yezo (Yesso), the main island, incorrectly called Nippon by Europeans; Shikoku (Sikok), Kiushiu (Kiusiu), and the Riu Kiu or Liu Kiu (Loo Choo) islands. Karafto is claimed by both Japan and Russia, and is jointly occupied by them. The entire number of islands composing *Dai Nippon* is officially stated to be nearly 4,000, though many of these are so small as to be hardly worthy of the name. The Japanese have no special name for the main island, and the foreign name *Nippon* is unwarrantable and confusing. It is about 800 m. long, and its area is about 80,000 sq. m. Yezo contains about 30,000, Shikoku about 7,000, and Kiushiu about 15,000 sq. m. Japan has been from ancient times divided into circuits similar to our terms eastern, middle, southern, and western states, and territories, a system of division still kept

up by the government, and taught in native geographies. Kioto (formerly Heian or Heian-jo, *Kioto* being a Chinese word signifying capital, of which the synonyme *miako* is used by the Japanese chiefly in poetry for Kioto or any great city, and not as a proper noun) was formerly the capital, and the divisions were named in reference to their direction from it. They were: the Gokinal, "five home provinces," surrounding Kioto; the Tokaido, "eastern-sea circuit," 15 provinces; the Tozando, "eastern mountain circuit," 8 provinces; the Hokurokudo, "northern land circuit," 7 provinces; the Sanindo, "mountain-back circuit," 15 provinces; the Sanyodo, "mountain-front circuit," 8 provinces; the Nankaido, "southern-sea circuit," 6 provinces; the Saikaido, "western-sea circuit," 9 provinces; the Hokkaido, "northern-sea circuit," 11 provinces; in all, 84 provinces, subdivided into 717 districts or shires. All these provinces, except the eleven of the Hokkaido (Yezo, Kuriles, Karafuto, &c.), and the seven into which Oshiu and Dewa have been divided since the late civil war, have each two names, one of purely native derivation, and the other composed of the Chinese word *shiu* added to the Chinese pronunciation of the character with which the native name is written; thus, Nagato is also called Choshiu, and Satsuma, Sasshiu. In many places the pedantic Chinese name has completely superseded the original Japanese in the mouths of the people; in a few both are used concurrently; while in some the original name is retained. Almost every Japanese word and name has also a Chinese synonyme or counterpart, which leads to endless confusion, and this is made greater by the names which foreigners continually misapply to mountains, rivers, and things in common use. For governmental purposes the empire is further divided into three *fu* or imperial cities, and 62 *ken* or prefectures. The most noted cities of Japan are Tokio, the capital (formerly called Yedo), Kioto, Ozaka (or Osaka), Nagoya, Hiroshima, Saga, Kagoshima, Kanagawa, and Fukuoka. These are cities of the first class, each reckoned to contain at least 100,000 inhabitants. Nagasaki, Kumamoto, Fukui, Kurume, Yokohama, Gifu, and Yonezawa rank in the second class, having more than 50,000. Hakodate (Hakodadi), Matsumae, Niigata, and Hiogo have from 20,000 to 50,000 each. There are probably 50 cities more, containing on an average more than 20,000. The population of Japan has never been properly ascertained, the Japanese method being merely to count the houses and average five persons to one house. Such a "census" was taken in 1804, and gave a population of 30,000,000. A hasty estimate was made by the department of education in 1872, and about 33,000,000 souls were reported. Foreign travellers and those who have long resided in Japan assign 20,000,000 as the highest and 15,000,000 as the lowest figures. Shikoku, Kiushiu, and the central provinces are thickly populated, especially along

the great roads. In the N. part of the main island the population is thin, and in the whole of Yezo, Karafuto, and the Japanese Kuriles, according to the native estimate, there are fewer than 60,000. In the Riu Kiu (Loo Choo) islands a population of 124,000 is claimed. Tokio (Yedo) contains 800,000, Kioto 567,334, and Ozaka 530,885 souls.—The coasts of Japan abound with promontories, and are much broken by bays and inlets; but there are many good harbors, of which the Japanese number 56 large and 290 smaller ones. There are many rocks along the coast, but the Japanese have excellent charts for the use of their junks and steamers, and the long continued work of foreign survey parties has reduced the danger of shipwreck by daylight to a minimum, while at night every great promontory on the coast is indicated by lighthouses or beacons of the most approved construction and equipment, which have been erected since 1869. The Japanese never give names to their straits or bays; all such names have been given by foreigners. Owing to the narrowness of the main island, and the smallness of the others, there are no very large rivers in Japan; most of them are mountain torrents, with short and rapid courses. *Kawa* or *gawa* is the native word for river. The Tonegawa is the longest and widest, being 172 m. long. The Yodogawa, the outlet of Lake Biwa, flows past Ozaka. The Kisogawa flows into the bay of Owari. The Tenriugawa is the outlet of Lake Suwa in Shinano. The current of the Oigawa is very swift, and that of the Fujikawa is still more rapid. The Sumidagawa flows past Tokio. The river called Logo by foreigners is properly named Rokugo. The chief lakes are Biwa, Inawashiro, Suwa, Hakone, and Chiuzenji. The three latter lie far above the level of the sea. Lake Biwa, or Otsu, is more than 60 m. long, and about 20 m. wide.—The most extensive plains are those of the Kuanto or plain of Yedo, Echigo, and the north of Oshiu. The provinces of Mino, Mikawa, and Owari are also very flat. The table land of Shinano lies about 2,500 ft. above the sea. The general trend of the mountain ranges is from N. to S., usually presenting a steep face to the E. and sloping on their W. side. The most noted peak is the volcanic cone Fusi-yama (properly Fujisan, or Fujino-yama, "Rich Scholar peak"), 14,000 ft. high, in the province of Suruga, 70 m. S. W. of Tokio. Thousands of pilgrims ascend it annually. Its craters and hollows only are snow-covered in summer. Hakuzan or Shiroyama, in Kaga, is 9,000 ft. high. Gassan, Mitake in Shinano, the Nikko range, Omine in Yamato, and Tateyama in Etchui, are also well known. There are some active volcanoes, such as Asamayama, Asoyama, Kirishima, and Yakeyama in Nambu. A perpetual pillar of steam rises from Asamayama; and in past times great destruction of life and property has been caused by eruptions of this and other volcanoes in Japan. The entire group of islands is volcanic, and earthquakes

are common, as many as 87 in one day having been counted. Scarcely a month passes without greater or less vibrations, and in some cases whole towns are destroyed by them. They are the frequent causes of fire in cities by overturning lights and braziers. An earthquake in Yedo in 1854 killed several thousand people, and threw down hundreds of houses. In general, however, the shocks are light, and the natives and resident foreigners care little about them. The houses are built with reference to resisting or neutralizing the shocks, mostly of timber, and their chief supports are set into sockets cut in round or waterworn stones. The roof is constructed of massive logs and beams covered with heavy tiles. The inertia of this mass secures stability, while the force of the shock is interrupted in its continuity, and greatly lessened by being broken at the sockets. Many temples, pagodas, and castles have thus withstood the shocks for centuries. The eastern half of the main island is most subject to earthquakes, and Shikoku and Kiushiu are far less so. Superstition attributes the cause of earthquakes to a huge catfish, whose head is under Oshiu and his tail under Kioto. His anger and struggles cause the seismic throes.—The surface of the whole empire is almost entirely a succession of hills and valleys. The soil is mainly diluvium and disintegrated lava, though every kind is known. It is in general fertile and well cultivated, but large tracts on the mainland and in Yezo lie uncultivated, being either not urgently needed, or, as in many cases, being useless from lack of scientific methods of improvement and fertilization. Japan could easily maintain double its present population. Rice land is made wherever possible, and after centuries of patient toil the largest part of the fertile land is laid out in the form of irrigated rice fields. In many places the mountain sides are terraced and tilled. The area under cultivation is not known, but is assessed at 31,620,000 *koku*. A *koku* is 5-13 bushels. Rice has hitherto been the standard of value. The amount which a given piece of land will produce is determined by threshing the rice grown on it and measuring the grain. The fertility of the soil varies greatly in different places, but rice land is worth five times more than arable land. Almost all agricultural labor is done by hand, and with the rudest tools.—The climate resembles that of our Atlantic seacoast states, though not so changeable as the latter. The meteorological records of one year (1864) in Yokohama were as follows, in monthly averages: January, 36°50'; February, 38°12'; March, 43°28'; April, 57°36'; May, 64°04'; June, 69°14'; July, 76°49'; August, 79°55'; September, 70°44'; October, 62°55'; November, 52°09'; December, 44°30'. Annual mean range of temperature, 58°02'. First frost, Nov. 26; first ice, Dec. 14. There were 205 fair, 61 cloudy, 92 rainy, and 8 snowy days. In 1864 71°44 inches of rain fell. The general

direction of the wind was N. in winter and autumn, and S. in summer. Rain and snow are rather more common on the W. coast than on the E. Rain falls abundantly in the spring and summer; June is considered the rainy month. In some years it rains constantly through September and October. Snow rarely remains on the ground longer than 24 hours in Tokio or S. of it. In the provinces N. of Kioto, on the W. coast, the snow lies for weeks at the depth of from 6 to 10 ft. Storms with thunder and lightning are much more rare than in the United States, but floods of rain and high winds are common. At least once if not oftener in the summer or early fall a cyclone or *tai-fun* (typhoon) visits the country, destroying life and property to an appalling extent. One which passed over Kobe July 4, 1871, dashed scores of junks and ships far up on land, demolishing houses, and killing more than 200 persons. In Fukui it blew down houses and damaged nearly every fence and roof in the city. Tidal waves after earthquakes are also to be looked for, and one on Dec. 22, 1855, destroyed part of the town of Shimoda, swept scores of the people into the sea, ruined the harbor by sweeping all the mud from the rocks, so that anchors were useless, and destroyed the Russian frigate Diana and a fleet of native junks.—Japan is rich in gold, silver, copper, lead, mercury, tin, coal, sulphur, and salt. Iron is also found in many of the provinces, but as it is in the form of magnetic oxide, the cost of smelting it is very great; hence Japan will not be able to produce enough native iron to supply her wants. The quality of Japanese iron, however, is very good, and often equal to the best Swedish. Tin is now more extensively mined than formerly, owing to the increasing use of tinned iron. Copper is so abundant that it was formerly of the same value as iron. Large quantities are still exported in the form of bars and blocks, old bells, idols, &c. Gold is obtained in many places, both by washing the earth and sands of rivers, and from the ore. Silver is extracted from its ores, but chiefly from argentiferous galena. Sado island, where most of the precious metals are mined, has a population of 3,000 native miners. The mines are worked under the supervision of two English miners, who have the most approved modern machinery. Many of the old mines throughout the country have been abandoned, but under an approved system of mining the mineral wealth of Japan will be increased. Blasting, introduced by Prof. Pumpelly, is now generally practised, and pumping, crushing, and washing are done by machinery. Graphite of excellent quality is mined in Satsuma, and used for pencils made by the natives. Bituminous coal of an inferior quality is dug in many places, but coal is largely mined in Yezo, Amakusa, Karatsu, and near Nagasaki, and sold for the use of steamers. Sulphur is abundant and of excellent quality. Petroleum is obtained in Echigo, Suruga, Yezo, and other

places, and used in the "Yankee lamps" now everywhere prevalent. Alum and green and blue vitriol are made by the natives. Granite, porphyry, obsidian, syenite, gneiss, freestone, and a great variety of the softer building stones are obtained in almost every province. Agates, carnelians, and jasper of great size and beauty are found. Small garnets are plentiful. Pearls are fished up along the coast, and the pearl fisheries may yet become a very important branch of industry. The rock crystals of Japan have long been celebrated for their great size and clearness. One at the Vienna exposition was a sphere, perfectly clear, and seven inches in diameter. The Japanese cut them into balls, and the native lapidaries are very skilful in their craft. Salt is produced by repeatedly saturating sand with salt water, drying it, and dissolving out the salt. Malachite and cinnabar are well known. Petrifications and fossils are often seen. Sulphurous, chalybeate, and mineral springs, the waters of which are variously impregnated, are very numerous throughout the empire.—There is perhaps no other country in the world of the same area that produces such a variety of conifers. They are everywhere abundant, the main roads are lined with them, and clipped hedges of *cryptomeria*, *retinospora*, *biota*, &c., are very general. Around the temples, where they are never cut down, they attain the greatest size and grandeur. They are often trained to spread out over bamboo frames, and particular limbs are propped up and grow to a great length. Timber is very plentiful, cheap, and of great variety. The mulberry tree grows wild, but the young trees that are reared for the food of the silkworm are not allowed to grow more than 6 ft. high. The varnish tree (*rhus vernicifera*), from which the famed lacquer is made, also produces oil and vegetable tallow, like its near ally the *rhus succedanea*. Large quantities of camphor are exported, being obtained from the camphor trees which attain great age and size in Japan. The chief fruit trees are the apple, pear, plum, apricot, peach, chestnut, walnut, persimmon, pomegranate, fig, orange, lemon, and citron. The grape is the best fruit in Japan. Strawberries grow wild, but are nearly tasteless. Loquats and kumquats, as in China, are common. The persimmons are often as large as apples, and very sweet. The cherry tree blossoms, but bears no eatable fruit. The bamboo is found almost everywhere from Karaffo to Riu Kiu, and is put to an astonishing number of uses. The box tree, juniper, ivy, palm, elm, and a black wood like ebony are also found. The camellia grows wild, often 40 ft. high, and is cultivated everywhere for the beauty of its blossoms, an immense number of varieties being produced. Beans, peas, white and sweet potatoes, carrots, lettuce, beets, yams, tomatoes, ginger, egg plant, gourds, cucumbers, mushroom, lilies (the bulbs of which are eaten), bamboo (the young sprouts are eaten), spinach, leeks, radishes, garlic, capsicum,

endive, fennel, pumpkins, squashes, beets, turnips, and asparagus are the principal vegetables for the table. Many of these were introduced by the Dutch, and some by Com. Perry. The *daikon*, an enormous radish, often 30 in. long and 4 thick, is a staple article of food in both the fresh and pickled state. The food of the people is mainly vegetables and fish. Rice, millet, and buckwheat are eaten in great quantities; maize and barley are also raised. Rape for oil, hemp for cordage and cloth, cotton for clothing, indigo, and tobacco which is very mild, are cultivated. Many specimens of the American flora are now common in Japan.—The poverty of the Japanese fauna is well known, but, like the flora, it corresponds more closely to that of the American than to that of the Asiatic continent. In the woods and wilds are bears, wild boars, wolves, deer, badgers, foxes, ground squirrels, and hares. The monkeys are so numerous as to be troublesome at times. Weasels, martens, and moles are very common. Wild ducks and geese, pigeons, woodcocks, snipes, pheasants, teal, herons, and storks are among the birds used for food. The hawk, buzzard, crow, eagle, cormorant, gull, sparrow, red-billed magpie, and ortolan are numerous. The canary is now well domesticated in Japan, and the *unguisu* or Japanese nightingale is noted for its music. Tame animals are now more numerous than formerly, owing to the increasing habit of eating meat. Venison, wild boar, and monkey meat have been eaten from ancient times; and beef, pork, and mutton, especially the first, are now eaten in all the large cities. Goats are found around Nagasaki, cows and bulls in every province, hogs in many places, and sheep in a few. The native horses are small and active. In Satsuma they are woolly, and in Tosa as small as Shetland ponies. Dogs are very numerous, but of gentle dispositions; and the highly prized variety of spaniel called *chin*, having a snub nose and silky fur, is supposed to be the original of the English variety called Prince Charles's spaniel. The cats are generally short-tailed; on the W. coast long-tailed cats are found, but most Japanese cats have tails from 1 to 3 in. long. Rabbits and guinea pigs are common pets. Among the domestic fowls, the turkey, peacock, goose, and swan are less common; but the bantam fowls, ordinary chickens, ducks, and pigeons are reared extensively for food. Fish is the staple animal food, and the great variety displayed in the markets, from river, lake, and sea, astonishes foreigners. The Japanese are especially fond of raw fish. A large proportion of the population are fishers. Many of the women are expert divers, often remaining for hours in the water; they can swim with bags full of heavy shell fish on their shoulders. Fishing is carried on with nets, hooks and lines, spears, bows and arrows, and with cormorants. Whales are pursued and killed whenever met with. Enormous squids with arms 25 ft. long, and crabs

whose outspread claws measure 14 ft. from tip to tip, are occasionally caught in the bay of Yedo. Sea otters and seals are shot in great numbers in Karafto and the Kuriles. The salamander is sometimes seen in the lakes and rivers. The reptiles and insects of Japan are varied and interesting.—The Japanese people are of middling size, in general active and vigorous; and in their mental characteristics they resemble Europeans more than the average Asiatic peoples. Their skins range through all colors from white to light brown, yellow copper color, dirty red, and almost black. The average hue is a pale copper on the body, and shades of yellowish brown in the face. The color depends greatly upon the degree of exposure; the ladies of the upper class, who rarely go out of the house, are often perfectly white and fair, while some of the coolies are almost as black as negroes. Their eyes are oblong, of a very dark brown, often deeply sunk in the head, and not so oblique as those of the Chinese. The upper lid toward the nose is folded so as to prevent the eyes from opening as widely as those of Caucasians. Their noses are flat, thick, short, depressed at the bridge, and round and open in front, instead of beneath. Their hair is not a true black, but of a very dark brown, sometimes distinctly red. Its blackness and coarseness are promoted by the universal practice of shaving the heads of the children from their birth. Usually it is made to appear very black and glossy with unguents and bandoline made from a mucilaginous plant. Some of the mountaineers, boatmen, and coolies are tall and muscular, but the average Japanese is flat-breasted, undersized, and weak in physique, compared with Caucasians. Both sexes have small hands and feet. The women are usually small and dumpy, though often very beautiful, and exceedingly neat in dress and coiffure. People of every age and sex bathe daily in hot water. In the public bath houses, so numerous in every street, the water is often intensely hot, which the bathers delight in, at the cost of half a cent. The heat of the water and the price of a bath are now regulated by government, which has also of late years prohibited the practice of promiscuous bathing. The married women, and those above 20 years of age, blacken their teeth with a mixture of galls and powdered iron, which forms a jet-like black, but is not more corrosive than common writing ink. The origin of this custom is now lost in obscurity. Formerly the emperor and court nobles blackened their teeth; they ceased to do so in 1868. The practice is now discouraged, and many women are forsaking it, following the example of the empress. Married women formerly shaved off their eyebrows, a custom now also falling into disuse. The Japanese maiden, wife, or widow may be distinguished by her coiffure. Among the men, the old percussion gun-hammer style of topknot or shaven scalp is rapidly giving way

to the foreign style of hair dressing. In character, the people are lively and volatile, quick of apprehension, frank, liberal, and hospitable. They are peculiarly fond of military life, and make excellent soldiers and sailors. They learn rapidly, and show much aptitude for the acquisition of European knowledge. In the schools of America and Europe they have won the highest praise, and in some cases honors, which have not tended to decrease their natural vanity. Regard for truth and chastity, or reverence for human life, cannot be said to characterize the Japanese. The youth seems to be a model of all that is frank, noble, impulsive, obedient, grateful, and polite. The same individual as an official often appears the incarnation of deceit, meanness, ingratitude, and untruth, though always outwardly polite. The people are very industrious, but social and pleasure-loving, fond of feasts and frolics, and have frequent national and religious holidays. Music, dancing, and the theatre are the favorite amusements of all classes. Mountebanks, conjurers, jugglers, tumblers, and strolling players and musicians were formerly often seen in the streets, and were highly popular, but are now much less so. Japanese jugglers and acrobats have appeared in America and Europe, and have fully sustained the reputation of the people in these matters. Dancing consists almost entirely in posturing and quick movements of the body, our idea of moving about while dancing not being understood. Education, consisting in the arts of reading and writing the native syllabary, perusing the popular story books, and reckoning on the abacus, is very general, but not so much so as former accounts would lead one to suppose. The higher classes can read the Chinese and Japanese classics, which are now giving place to the study of foreign languages and books. The women are carefully educated in household duties, but in the lower classes receive very little instruction in book learning. In the higher classes the young ladies spend much time in making fancy work, and in being taught the various books relating to the duties of a wife, mother, and housekeeper. The "Woman's Great Study" is a large book containing minute details of woman's duty and culture. The three great duties of a woman are: 1, obedience to her parents when a child; 2, obedience to her husband, when a wife; 3, obedience to her eldest son, when a widow. Politeness is a national characteristic. A vast and minute system of etiquette is the life study of the higher classes, and among the lowest class mutual courtesy is strictly observed. The foreigner in Japan is surprised to hear the politest phrases and to see mutual forbearance among the commonest coolies. The Japanese make no distinction between politeness and morals. They say that cheating, lying, &c., are not polite. Politeness is goodness and virtue in their eyes. The rules that govern social intercourse are formed into a regular system, which is taught in schools.

Formerly the education of a Japanese was one half in books of etiquette, and one half reading and writing. In the school at Fukui in Echizen, over the foreign department of which the writer presided, the course of native studies required seven years. Five of these were devoted entirely to theoretical and practical study of etiquette, the reading of the lives of illustrious men and women, exhortations to duty, the classics of Confucius, the histories of Japan and China, and the composition of private and official letters. Such schools however existed only for the higher classes. Lower schools for teaching the rudiments of reading, writing, and reckoning also existed. Even the language is unique in its courtliness of expression, which is shown in its very structure. The people are in general neat and clean in their houses, persons, and dress. Tea is a universal beverage, and is served on all occasions in cups holding about half a gill, which are drained many times during the day. Every man and boy carries in his girdle a pipe with a tube of bamboo, and mouthpiece and tiny bowl of brass. The mild fine-cut tobacco is used, and smoking is general among men and women. The visitor is always served with tea, sweetmeats laid on white paper on a tray, and a little bowl with a live coal in it to light his pipe with. It is etiquette to carry away the remnants of the cake or candy folded up in the paper and put in the wide sleeve. Chop sticks take the place of the knife and fork. Meat, venison, poultry, game, and large vegetables are cut or sliced before being brought on the table. Food is eaten out of lacquered wooden bowls and porcelain cups. A feast is accompanied by music and dancing, and the last of the many courses is rice and tea. *Saké*, or rice beer, is served throughout the feast; it is kept in tall bottles, which are first set in boiling water to heat the saké, which is always drunk hot. The cups used at a feast are very small, and are passed around or thrown across to each other by the guests, and filled by pretty damsels in waiting. At a banquet any one can introduce himself to another person by offering the cup; if he drinks and returns the cup, the introduction is made and acquaintance begins. The ordinary dress of both sexes and all ranks is somewhat similar in form, differing chiefly in the colors, fineness, and value of the materials, those of the higher orders being of silk, and of the lower orders of hemp and cotton cloth; it consists of a number of loose wide gowns worn over each other, and fastened by a girdle. Every class of the people is distinguished by certain peculiarities of dress. On the back and breast of the outer garment of the higher classes a family or clan crest is woven or worked. The sleeves are very long and wide, and serve for pockets. The Japanese display very good taste in their dress; but the women wear brighter colors than the men, and border their robes with gay embroidery and gold. On occasions of ceremony, a hempen jacket, open at the sides and projecting in

wings at the shoulder, and wide trousers of the same material, together forming the *kamishimo*, are worn. The *hakama* or loose trousers, like a long kilt, are the distinguishing mark of the dress of a *samurai*. Within doors socks or foot mittens, having a special compartment for the great toe, are worn. For outdoor use, clogs, heavy blocks of wood, or straw soles, having a double thong which fits between the great and second toe and binds over the top and side of the foot, are worn. Straw sandals are used by farmers, coolies, and travellers. Usually neither men nor women wear head coverings, except broad screens to shed the rain and to keep off the sun. In cold weather a cloth cap, covering all but the eyes and nose, is worn. Rain coats made of oiled paper, and cloaks made of straw or pieces of matting, are common in rainy weather. Their umbrellas are very large, the frames of bamboo, and the covering of oiled paper. The fan is carried by both sexes. Hitherto the custom of wearing two swords, one above the other on the same side of the body, was the distinguishing mark of the *samurai*; the lower classes were allowed to carry one sword. These customs are now nearly obsolete. European dress is becoming common among all classes, and the government officials are required by law to wear it. Even the court costume has been laid aside for black coats, white neckties and gloves, black pantaloons, and boots. The houses of the Japanese are low, and built of a frame of wood, with wattling of reeds or bamboo, the interstices filled with mud and covered with white plaster. The eaves are very broad, and a veranda extends around the house. The windows and doors are frames of wood, covered with paper, and sliding in grooves. Most of the partitions consist of sliding paper doors, which can be removed in a moment and a great hall extemporized. Outer shutters or "rain doors" protect the paper doors at night and in stormy weather. Almost every house, rich or poor, has a garden attached, which is usually a miniature landscape. Fire-proof warehouses are made by coating a strong frame of timber and bamboo with layers of mud amounting to a foot in thickness. The walls, doors, and windows are all of the same thickness and material. The merchant stores his goods and families put their valuables in these. Should a fire occur near by, a mud paste is quickly made, and several candles are lighted within the warehouse to convert the oxygen of the air into carbonic acid gas. The doors and windows are then closed, and the mud smeared over the cracks, to prevent any draft. After a fire these warehouses stand unharmed, like islands in a sea of ashes. Fires are frequent and terribly destructive. One in Tokio, April 3, 1872, destroyed 5,117 houses and made over 20,000 people homeless. It is estimated that the entire space of the city is burned over every seven years.—Polygamy is not allowed in Japan, but concubinage is very prevalent.

The emperor is allowed 12 concubines, though he rarely has so many. Usually a man does not take a concubine unless his wife is unfruitful; if the former bears a child, it is treated as legitimate, and becomes the father's heir, unless a child is born to the true wife. Divorces are common. Seven causes for divorce are enumerated in the "Woman's Great Study," viz.: barrenness, disobedience to husband or mother-in-law, gossiping, lewdness, leprosy, jealousy, theft. Prostitution is legalized, and is not specially disreputable. In the large cities the *yujomachi* or prostitutes' quarter is the most beautiful part of the city. Children are no longer bred to the trade from their infancy, as formerly, but young girls may voluntarily choose to be courtesans, and bind themselves to the brothel-keepers for a term of years. They are taught music and several other accomplishments, and often marry well, being better educated than the mass of the women. In the afternoon, at the brothel, they dress, paint, and powder themselves, put on splendid robes, and toward evening sit in a semicircle, motionless and waiting for the choice of some passer-by. The front of the raised room in which they sit is open to the street, or separated only by latticework for visitors to look through. Prostitution is in the cities confined to particular quarters, and is under strict governmental inspection. Prostitutes must wear a certain kind of dress, and tie their girdles in front instead of behind. Suicide is very common in Japan, and the ancient style of committing *kara-kiri* (belly-cut) is still in vogue, though evidently becoming obsolete. During the year 1872 at least 20 public instances of ripping up the belly took place. A proposition made in the supreme council to abolish the custom was not adopted. —The agriculture of the Japanese is conducted with diligence and skill. Irrigation is judiciously applied, and manure of all kinds, especially human, is carefully collected, and used in the production of generally good harvests. The grain principally raised is rice, which is of a superior quality, and is now an article of export. Next to rice tea is the great object of cultivation. Since the opening of the country an immense number of new tea plantations have been set out. The teas of Uji and Suruga are considered the best. Coarse sugar is obtained from Satsuma and universally used by the people, but the process of sugar refining is not yet fully understood. The gardeners of Japan have attained the art of dwarfing as well as enlarging vegetable productions. In the miniature gardens and at the flower shows they exhibit full-grown trees of various kinds 2 and 3 ft. high. Pine trees 3 in., bamboo 2 in., and blossoming plum trees 6 in. high are common. The pine, bamboo, and plum are usually planted together in pots, and called *shochikubai*, a word compounded of the three names. Trees and plants are also trained to grow so as to resemble birds, tortoises, quadrupeds, men, ships,

mountains, &c. In ornamental gardening the Japanese possess wonderful skill, and every kind of landscape is represented in their gardens.—The Japanese are admirable workers in metals. Iron, copper, and brass are wrought in every part of the country, and the swords of Japan have long been famous. They are made of the finest iron, with an edge of steel. The ornaments upon their hilts and handles, made of copper, silver, or gold, with inlaid work of various metals, are not only curiosities, but works of high art, often representing national heroes, mythology, &c. In alloying and coloring metals they are famous experts. They are skilful in carving wood and metal, in die-sinking, and in the casting of metal statues used for idols, lanterns, cannon, &c. A copper statue of Buddha (Jap. *Dai Butsu*) at Kamakura is nearly 50 ft. in height, and is a fine work of art. Their bronzes, which embody the national art, and express in metal their legendary lore and symbolism, have won admirers in every land, being sought after for their chaste proportions, exquisite beauty, excellence of mechanism, and fineness of metal. Their lacquering in wood excels that of all other nations. At the Vienna exhibition in 1873, not only their bronze and lacquer work, but their wood and stone carvings, mosaics, basket work, tortoise shell, inlaid and ivory work, fans, silk flowers, toys, cut crystal, and leather, were greatly admired and highly praised. The manufacture of glass is still in its infancy in Japan, and only the simplest articles are made, and these of inferior glass. They make a great variety of cotton goods; in crapes, camlets, brocade, and figured silk for girdles, they excel. Paper, which is applied to manifold uses, even for napkins and handkerchiefs, is made from the paper mulberry (*Broussonetia papyrifera*), and is noted for its silkiness, lustre, toughness, and softness. It is very abundant, and of all qualities. Paper shops are exceedingly numerous. Kioto, Tokio, and Ozaka are the chief seats of manufactures. Kioto is noted for its damasks, satins, camlets, crapes, silk fabrics of every sort, lacquered articles, screens, fans, paints, grindstones, porcelain, and earthenware. At Tokio nearly every kind of manufacture is carried on. The people show the greatest eagerness and aptitude for imitating all kinds of European manufactures. In nearly every house of the samurai class is seen a map or globe, thermometer, barometer, Yankee clock, or lamp. Most of the intelligent natives who can afford them wear watches. Telescopes, microscopes, knives, and spoons are made by the natives from European models, at a cheap rate. In all the cities and large towns shops filled with foreign articles are found, where looking glasses, clocks, watches, spoons, notions, boots and shoes, condensed milk, beer, colored engravings, fancy soap, canned fruit, pickles, brushes and combs, panes of glass, wine and brandy, rugs, carpets, underclothing, &c., are sold. All these things

are rapidly changing the manners, customs, and household habits of the Japanese people. Very good iron and brass cannon, shot and shell, breech- and muzzle-loading rifles, gun-powder, percussion caps, and many other articles of war material, are now made by unassisted native workmen.—The internal trade of Japan is brisk and constant. The roads are good and kept in excellent order, and hotels, warehouses, and stables for the accommodation of man, beast, and baggage are abundant, and their terms reasonable. Many of the merchants become rich, but there are not as yet five millionaires of any class in Japan. In the open ports there are probably a few score merchants who may each be worth \$50,000, but this is a large sum in Japan. Goods are conveyed on land by pack horses, oxen, and coolies. The principal carriage of merchandise is by water; for although the Japanese junks cannot make long sea voyages, they are well fitted to navigate the rivers, to coast from port to port, and to cross from island to island. The shores of the Japanese group afford great facilities for a coasting trade, from the abundance of harbors and shelters for vessels of small size, and these facilities are energetically used by the people, who keep afloat a vast number of vessels, from fishing boats to junks of 300 tons. At present the great bulk of the coasting trade is done by the steamers of the Pacific mail steamship company. Japanese trading companies also own steamers, which ply regularly between the large ports. Scores of small river and lake steamers, owned and manned by Japanese, now ply on the inland waters and seacoast. On Lake Biwa alone there are seven steamers. Commerce is comparatively free from tolls and duties, though the government seems to have a chronic tendency to meddle with the merchants, and privileged corporations help to fetter and restrict commerce. The inland trade is assisted by great fairs held at Kioto and other cities. Until the summer of 1859, for more than two centuries, the foreign commerce had been limited to the Dutch and Chinese at Nagasaki. The Dutch had a small factory at Deshima, on which 12 or 13 merchants lived, closely watched by the Japanese, and allowed very little liberty. Two ships were annually sent from Batavia, with cargoes consisting chiefly of sugar, ivory, bar iron, tinned iron, fine chintzes, broadcloths, shalloons, cloves, tortoise shell, drugs, spectacles, looking glasses, watches, various herbs and roots, and Dutch medicines. The writer in his travels through Japan has found two or three popular Dutch medicines advertised in Roman letters in nearly all the large towns and cities. The words in use among the natives for glass, tinned iron, table, Sunday, electricity, laudanum, and many other things, are corruptions of the Dutch names for the same. The chief articles of export by the Dutch were copper, camphor, lacquer ware, porcelain, and rice.

In 1854 American diplomacy succeeded in removing the barriers against foreign commerce, and many ports have since been opened to foreign residence and trade. The articles most in demand by the Japanese are tissues of all kinds, cotton prints, calicoes, flannels, cotton and woollen yarn, knit goods, chintz, velvet, woollens, blankets, glass ware, mirrors, drugs, ivory, cheap clocks, watches, petroleum and lamps, flour, rod iron, machinery, sugar, boots and shoes, hats, wine, spirits and beer, zinc, sail cloth, soap, leather, and tea lead. The most profitable exports are rice, silk, tea, camphor, vegetable oil and tallow, wax, lacquered ware, porcelain, sulphur, silkworms' eggs, and a variety of sundries that find a market in China. The value of the imports into Japan during the year 1872 amounted to \$26,188,441: of exports, \$24,294,532; total value of exports and imports, \$50,482,973. The local trade, imports and exports, between the open ports of Japan during 1871, was to the value of \$4,436,539; for 1872 it was valued at \$4,263,232. The declared value of imports in 1873 was 29,000,000 yens, or dollars, and the declared value of the exports, \$21,000,000. The total amount of duties collected, including for exports, imports, rent of warehouse, entrance and clearance fees, fines and penalties, and miscellaneous, was \$1,735,000. The value of cotton manufactures imported into Japan in 1871 was \$8,011,478, and in 1872 \$10,065,155. Of woollen manufactures, the value in 1871 was \$2,056,789, and in 1872 \$6,335,014. The export of raw silk in 1871 was \$8,416,712, in 1872 \$7,355,623; silkworms' eggs in 1871 \$2,184,688, in 1872 \$1,963,159; tea in 1871 \$4,651,292, in 1872 \$5,445,438; rice in 1873 \$2,988,548; copper in 1873 \$1,353,545. In 1872 the shipping returned at all the open ports was: British, 31 mail steamers, 351 ships, tonnage 204,077; American, 293 mail steamers, 69 ships, tonnage 683,401; other nations, 118 ships, tonnage 73,024. On the first opening of the ports to foreign commerce, the chief obstacle to profitable trade was the peculiar ideas of the Japanese government relating to currency. Little trouble is now experienced on this score, as the mint at Ozaka turns out gold and silver coins of satisfactory weight and fineness, which are graded in value according to the decimal system.—In science, the Japanese have particularly cultivated medicine, astronomy, and mathematics. The European system of medicine is now followed by nearly all the doctors of Japan, and dissection is openly practised in the great cities, and secretly in the smaller by private individuals. A great many Dutch books on therapeutics, medicine, and surgery have been translated of late years and diligently studied. The native doctors are highly respected by the foreign practitioners, and while they are very successful with local diseases, they do not hesitate to attempt very difficult cases, with average good success. Among their many inventions are acupuncture

and moxa (Jap. *mogusa*, burning grass), both of which, though now generally superseded, were long practised in Europe, into which they had been introduced from Japan. The Japanese people are troubled with a disease which is not known in other countries, called *kakke* (leg humor), which baffles the skill of both native and foreign physicians. Its diagnosis is as yet very obscure. It is especially prevalent in Tokio, and the summer of 1873 was noted for the mortality caused there by this disease. It begins in the feet; the legs swell, the patient has great difficulty in walking, and has to remain quiet; the legs continue to swell, and after headache, palpitation of the heart, and excruciating pains in the small intestines, death ensues. Their so-called "remarkable medical discovery," the *dosha* powder, which Titsingh asserted could restore flexibility to a stiffened human corpse, and cure disease in the living body, refresh the spirits, &c., is and always was a pious fraud. It is made of common quartz sand, drawn from certain bubbling springs in the provinces of Kii and Hitachi, by priests of the Buddhist Shin Gon sect, with long prayers to Buddha to give it efficacy. With this a few grains of mica are mixed. It is not now believed in except by the lowest and most ignorant people. In chemistry, botany, and astronomy, the Japanese have gained considerable knowledge by means of translations from the Dutch and English. In the fine arts they have made but little progress. Their music is very disagreeable to European ears, though the people take a passionate delight in it. The Japanese gamut is very rude, and most of the music is in the minor key. They have a considerable body of printed music, among which is a collection of very ancient classical pieces performed on public occasions. The bands for the army and navy are now trained by European instructors, in European style. The use of the *samisen* or three-stringed banjo is always a part of female education. The *koto* and the *biwa* are the principal other stringed instruments. They have a large variety of wind instruments, and several kinds of drums and cymbals. In the arts of design and painting they show great taste, but only a resident in the country itself can fully appreciate their delineations. There are several distinct styles or schools of drawing and painting, easily recognized by a connoisseur. The style used on fans, battledoors, story books, broadsides, caricatures, &c., is most popular and pleases the vulgar eye. Another style is used on the *kakemono* or hanging pictures and scrolls seen in every house; and still another on folding screens and pictorial scroll books. In this last style the coloring is very rich, and the details are minutely portrayed. In the second, the salient points are emphasized, but the pictures, while very suggestive, leave much to the imagination. The first named style combines the qualities of the second and third. Cultivated Japanese do not like foreign pictures, on ac-

count of their intense realism. Their delineations of birds, flowers, and fruits are exquisitely beautiful. Not only does their lacquered, porcelain, and inlaid work of all kinds show this, but the walls of the palaces in Kioto and Tokio, and the tombs at Nikko and Shiba, are renowned for the remarkable beauty and correctness of their carvings and paintings. They are not very successful in portraying the human form. They know little of the higher plastic art, and have scarcely a conception of that ideal human form which is such a passion with Europeans. Their best sculptured representations of sacred animals are fair specimens of clever chisel work rather than of ideals. Printers and booksellers are numerous, and keep the market well supplied with cheap books, many of them profusely illustrated with woodcuts. They print only on one side of the paper, using cut wooden blocks for type. Kioto was formerly the chief seat of the book trade, and was eminently the centre of literature, the fine arts, and religion. Tokio is now fast robbing it of all its glories, and becoming the manufacturing, fine-art, literary, and religious, as well as the political capital of the empire. All the people are fond of reading, and circulating libraries, carried on men's backs from house to house, are very common. Their dramas, of which the people are passionately fond, are nearly always founded on national history or tradition, or the exploits, lives, or adventures of Japanese heroes and gods. Many of them are designed to enforce and illustrate moral precepts. Their general tendency is elevating, patriotic, and decorous, though some of them are strongly tainted with the old national passion for revenge, and have horrible exhibitions of cruel punishments. The actor is most esteemed who can most frequently change parts in the same play. The female parts are usually taken by men or boys, though women are now becoming actresses. The best actors receive \$1,000 a season, which is a high salary in Japan. The theatrical stage is a turn-table, which can be turned and made to present a new scene in a moment. The scenes are perfectly true to Japanese life and fact, the actual scene of the play being always laid in Japan. The theatres as yet are very rude structures. The playing begins in the morning and lasts all day, the spectators bringing their food with them. The actors are looked upon as a very low class.—The two great religions of Japan are Shinto and Buppo, or Shintoism and Buddhism. Shinto is supposed to be the ancient religion of Japan. Buddhism was brought from Corea. The word *shinto* is Chinese. The Japanese name for the same is *kami no michi*, "the way of the gods." *Shin* means god; *to*, way, doctrine, cult. The essence of Shinto is ancestral worship and sacrifice to departed heroes. Mori says: "The Shintos believe in a past life, and they live in fear or reverence of the spirits of the dead." The number of Shinto deities is enormous, and variously estimated, but

the reputed divine ancestress of the mikado Ten Sho Dai Jin, or Ama Terasu o Migami, "great goddess of the celestial effulgence," or "the heavenly illuminating spirit," is the chief and supreme. The first name is Chinese, the second pure Japanese. The Shintoists have very obscure notions about the immortality of the soul, a supreme creator, or a future state of rewards and punishments. Their chief end, in opposition to the Buddhists, is happiness in this life. In its precepts Shinto lays great stress upon keeping the body pure with water and the heart by prayer to the *kami* or gods. Pilgrimages to sacred places and attendance upon the religious festivals are enjoined as duties. The Mecca of the Shintoists is the collection of temples in Ise, about 200 m. S. W. of Tokio, which are visited by the mikado, the recognized spiritual head of the Shinto system, hence called *tenno*, which means "heavenly king." The eating of flesh was formerly an abomination, but modern civilization, a knowledge of physiology, and experience of the taste of well cooked steaks, have overcome this prejudice, and the most devoted Shintoists now eat beef habitually. The great end and aim of Shintoism is obedience to the edicts of the government, as shown in the sermons of the lecturers and priests. The three great commandments, issued by the department of religion in 1872, intended to be the basis of a reformed Shinto and national religion, are as follows: "1. Thou shalt honor the gods and love thy country. 2. Thou shalt clearly understand the principles of heaven and the duty of man. 3. Thou shalt revere the emperor as thy sovereign, and obey the will of his court." In its higher forms Shinto is a cultured and intellectual deism; in its lower forms it consists in blind obedience to governmental and priestly dictates. The Shinto temples are called *miyas*, and are made of the pure wood called *hi no ki*, "sun wood." In a perfectly pure Shinto temple there is neither altar, image, nor picture. A mirror, the emblem of self-examination, and strips of white paper, symbols of purity of life, are always seen, but nothing else. Around or outside of the temple often hang votive tablets, pictures of horses and of ancient heroes, a stone lavatory, often a sculptured cow, or "two heavenly dogs." The sun is worshipped under the name of O Tenta Sama, "lord of the heavenly path;" and the moon under the title of O Tsuki Sama. The Shinto belief supposes the existence of an infinite number of spirits who exercise an influence over the affairs of the world, who are to be propitiated by prayers and the observance of certain rules of conduct, cleanliness of person, and purity and cheerfulness of heart. The inferior spirits, who are very numerous, are chiefly heroes canonized for their worthy deeds or illustrious qualities. The most prominent and popular of these minor deities is Hachiman, the god of war, who is an apotheosis of the 16th emperor of Japan. The worship paid to the spirits resi-

ding in the miyas is of a very simple character. The devotee approaches under the sacred gateways until within a short distance of the door. He then stops, flings a few coins in the box or on the floor, folds his hands in a posture of reverence, mutters his prayers, and departs. The Shinto priests are called *kannushi*, spiritual teachers. They form a high class of society, but have no ordination or special privileges. They marry and have families. They wear a peculiar costume when officiating. It is highly probable that Shinto never became a definite system of religion until after the introduction of Buddhism. Many of its legends and even titles are Chinese. Buddhism accepted its deities and caused them to be worshipped as Buddhist deities; and the two religions became gradually so mixed together, to the advantage of Buddhism and the loss of Shinto, that the existence of the latter has been little more than nominal during the past five or six centuries. On the accession of the mikado to his ancient supreme power, in 1868, a "purification" was begun, and all the Shinto temples throughout the empire were purged of Buddhist symbols, images, writings, &c.; the use of Chinese religious names, titles, and terms was discouraged, and that of pure Japanese encouraged, in the language of religion. But the attempts made by the government to proselyte all the people to the Shinto faith and to abolish Buddhism failed, and Buddhism is still, as it has been for more than ten centuries, the popular religion of Japan. It is said to have been introduced from Corea in the first century of the Christian era, but was not propagated extensively until the year 552, when the king of Hakkusai, a district of Corea, sent an embassy with a present of an image of Shaka (Buddha) and a set of Buddhist books of the sacred canon. Though at first violently opposed, it gradually made converts, until the son of the emperor, afterward regent of the empire, became a convert, after which the success of Buddhism in Japan was assured. Bands of zealous priests continued to pour into the empire, and, not content with their success in southern Japan, accompanied or followed in the wake of the conquering armies northward, who drove the aboriginal Ainos before them, or tranquillized and governed them. Long before the introduction of Christianity Buddhism was thoroughly established wherever the Japanese language was spoken, even in the Liu Kiu islands. In 1869 there were 168,000 Buddhist priests and 460,244 temples and monasteries. There were originally six sects which entered Japan. Now there are seven large and "orthodox" sects, with 30 subdivisions or offshoots, and 12 "irregular," "eclectic," or very small sects. Probably in no other country has there been a richer development of Buddhism than in Japan. Here the latest phases and developments of the wonderful doctrines of the Indian sage are found. Its effects on the civilization of Japan have been

as marked as those of Mohammedanism upon Turkey, or Christianity upon England. The chief deity in the Buddhist pantheon in Japan is Amida (Sanskrit Amitabha), and the essential part of the worship offered to Amida is the repetition of the prayer *Namu Amida Butsu*, "Save us, eternal Buddha." Next to the worship of Amida is that of Kuanon, the goddess of mercy. She is always addressed by those who are in sorrow or affliction of any kind. The most astonishing answers to prayers made to her are on record, and form the subject of a series of remarkable tableaux of life-size figures at the great temple of Asakusa in Tokio. There are 33 celebrated shrines to her honor, and pious pilgrims often make the tour of the empire, visiting and praying at every one of them. Yemma is the god of hell and the chief judge of the infernal regions. Jizo are six deities whose images are placed along the highways of the empire, and who are besought by those who suffer from the consequences of sin and lust. The *Go-hiakurakan*, or 500 original disciples of Shaka, are found in many temples devoted to their honor. Japan is a country of wayside shrines and images, and of temples without number. Some of the great temples in Kioto are enormous structures, capable of seating 5,000 persons, and some contain as many as 3,000 life-sized gilt images of sages, saints, and deities. Monasteries and nunneries are numerous, and were formerly well filled; but Buddhism has been so weakened by governmental fines and confiscations, and by the decay of belief incident to the study of foreign science, that it is slowly but surely decaying, and the number of its priests and nuns has greatly decreased. The Japanese Buddhist priests are called *bozu*, corrupted into the English word bonze, and are often very learned men. Sanskrit is their sacred language, but is little studied in Japan. A large body of Japanese, especially the higher classes, reject idol worship entirely, and found their rule of life on merely philosophical and abstract notions. They are followers of Confucius, and are called *Ju-sha*, or the school of philosophers. There is very little hostility between the various forms of religion in Japan, and many profess them all. The *Ju-sha* have no shrine or ritual, but they pay supreme homage to Confucius, to whose honor there is a temple built in Tokio, but they cannot be said to worship him. They religiously venerate their own ancestors. Indeed, the veneration, if not worship, of ancestors is common to all the religions of Japan. The Yamabushi sect of mountbank priests, once numerous, have been suppressed by the government since 1871. The authorities of the state are indifferent to mere doctrines, so long as the public peace is not disturbed. One reason why the several religions are tolerated by the government, and by each other, is because the divinity of the mikado (whom the officials call *tenno*, or heavenly king) is dogmatically taught and po-

litically insisted upon, and all people are commanded to obey and reverence him, as the descendant, representative, and vicegerent of the gods. The cause alleged before the foreign ministers of the persecution and punishment of the Christians of Urakami in 1868 and 1869 was, that they acknowledged Christ as the Lord of heaven, and that such a doctrine was a subversion of the dogma of the mikado's divinity, on which the government of Japan rests. In addition to those which have been described, the worship of Inari, the deified introducer of rice into Japan, and the patron of foxes, is common throughout the empire. Inari shrines and images of foxes, which are worshipped, are numerous everywhere, often alone, but usually attached to Shinto temples. Many superstitions in regard to the fox are popularly held. He deceives people, injures them, transforms himself into a beautiful woman, and lures men away by bewitching them or promising them sensual pleasure. He is also believed to enter the hearts of people and make them wicked and devilish. Sometimes he acts benevolently. Hence the people propitiate him, and worship Inari, who rules over the foxes, and whom they obey. The worship of the phallus, which must once have been very prevalent, judging from the immense number of phallic symbols and even shrines until lately seen in Japan, has now faded almost entirely away in the parts visited by foreigners, though it still lingers in the rural districts. The public sale of the phallic emblems, so very common in Yedo, Ozaka, Kioto, and other cities, prior to 1868, has been prohibited and entirely suppressed by the government.—The government of Japan consists of: 1, the emperor; 2, the *dai jo kuan* or supreme executive, consisting of the *dai jo dai jin*, or premier, and the *u dai jin* and *sa dai jin*, right and left junior prime ministers; 3, the *sa in*, or left chamber of the council of state, consisting of seven *sangi* or high counsellors, and the *u in* or right chamber of the council of state, consisting of all the ministers and vice ministers who are heads of departments, nine in number. There are also the prefectures of the *fu* or imperial cities, the *ken* or districts, formerly provinces, and the emigration department having control of the Hokkaido, or territory north of the main island, which are under the *dai jo kuan*, or supreme government of Japan. The departments are as follows: 1, *guai mu sho*, foreign office; 2, *o kura sho*, treasury department, having nine bureaus or subdivisions; 3, *riku gun sho*, war department, with four bureaus; 4, *kai gun sho*, navy department, with ten bureaus; 5, *mom bu sho*, education department; 6, *ko bu sho*, public works department, with nine bureaus; 7, *kio bu sho*, department of religion; 8, *shi ho sho*, department of justice, two bureaus; 9, *ku nai sho*, department of the imperial household, three bureaus. At the present time (1874) Japan has legations and ministers resident in the United States,

England, France, Russia, Austria, Italy, and Prussia, and consuls in China and several other countries. It has a foreign debt of over \$30,000,000, a system of national banks based upon that of the national banks of the United States, custom houses with American inspectors, and paper money consisting of both government and national bank notes. There is a mint at Ozaka, built and equipped in modern style under English supervision. It coined in the year ending July 31, 1873, \$25,162,614, and in 1872 \$14,488,981 in gold, and from 1871 to 1873 \$10,213,598 in silver. All the old gold and silver coinage of the empire has been called in, and the new round milled coins substituted. The new copper coinage appeared in 1874. The money system of the Japanese is decimal, the units being the *yen*, equal to the American dollar, and the *sen*, equal to the cent. The national postal service is under the control of the treasury department, and is based mainly on the American system, and Japan now has postal treaties with the chief countries of the world. The national revenue in 1872 was \$65,831,362, of which \$59,363,625 was from land taxes. The disbursements for the same year were \$62,371,574. The customs duties amounted to \$1,191,171. The expenses for feudal commutations amounted to nearly \$24,000,000. The army is organized on the French model. The country is divided into six military districts, in which are camps and garrisons as follows: Tokio, 7,140; Sendai, 4,460; Nagoya, 4,260; Ozaka, 6,700; Hiroshima, 4,340; Kumamoto, 4,780; total, 31,680 soldiers, constituting the army on a peace footing. Of these troops, 8 regiments of infantry (6,456 men), 1 squadron of cavalry (96 men), and 2 regiments of artillery (1,444 men) constitute the *konoye*, or imperial guard. The main army is divided into 14 regiments of infantry, 3 regiments of cavalry, 18 companies of artillery, and 10 companies of engineers. The estimates for the army on a war footing are not yet (May, 1874) made, but 90,000 is usually regarded as the number of soldiers that could easily be sent into the field in an emergency. The navy is organized on the English model, and consists of 2 ironclads, 10 men-of-war, 8 gunboats, and 4 transports. On these are 1,514 sailors and officers; 298 boys are on school ships, training to be officers, and there are nine companies of marines. The education department has in Tokio a medical college with 8 German professors and 300 students. The imperial university, consisting of the three departments English, French, and German, has 25 foreign professors and 600 students. The national scheme of education provides for 8 universities, 32 high schools or academies, 256 grammar schools, and 55,000 primary schools. Foreign languages and learning are to be pursued only in the two higher schools, but the method of study in all is to be closely modelled on the foreign system. In 1874 this scheme was about one sixth fulfilled. Chinese learning is neg-

lected, and foreign science and languages take precedence. An immense number of foreign books, many of them of a high character, have been translated. The department of religion takes charge of the Shinto shrines, and propagates the dogmas of Shinto and the three commands of the government, the chief of which is, "Thou shalt revere the mikado, and obey the will of his court." There is a railway 18 m. long from Yokohama to Tokio, completed in October, 1872; the average traffic receipts per week in 1874 were nearly \$10,000. The road between Kobe and Ozaka was finished May 11, 1874. The route for a trunk line from Kioto to Tokio, and from Ozaka, *via* Kioto, to Tsuruga in Echizen, has been surveyed. A system of 18 lighthouses of the finest kind, with buoys, beacons, &c., under the care of trained Europeans, with native assistants, and costing over \$1,000,000, has robbed the coast of Japan of its former terrors to mariners. There is a telegraph line from Nagasaki to Tokio, with branches, and the capital of Japan communicates directly with San Francisco, *via* Asia and Europe. The railway, lighthouse, telegraph, and mining bureaus follow the English system, and have British assistants. In 1872 there were 224 foreigners employed in the service of the government, on salaries ranging from \$480 to \$16,000, and one at \$36,000 per annum. Of these, 119 were English, 50 French, and 26 American. In 1874 Americans held the highest offices given to foreigners, in the treasury, emigration, education, and state departments. While American and British citizens hold the paramount foreign influence in Japan, they are all, except one American in the state department, who holds a commission as officer of the second rank, and one English officer, in the strictest sense of the word employees, and have neither title, rank, nor commission, but render service by contract. The emigration department has engaged a staff of American officials, who have surveyed and explored a great part of Yezo, built roads, and introduced scientific agriculture, American stock, &c. In 1874 there were about 2,500 foreign residents in Japan, exclusive of soldiers and sailors, of whom 300 were in Tokio. Yokohama, once a wretched fishing village, is now a splendid city, with most of the institutions of civilized cities in Europe, having a foreign population of about 1,500, and a native population of 50,000. Kobe is a similar instance of rapid growth and transformation. The British residents in Japan are mainly commercial and diplomatic, the Americans mostly professional. In May, 1874, there were 31 male and 10 female American Protestant, 12 British, 3 Russian, and about 30 French Roman Catholic missionaries. Nearly the whole of the New Testament has been translated into Japanese, and several native Christian churches have been established. Since 1864 Japanese have been visiting foreign countries, and while several thousand have passed through Europe or America, about 400 have

remained, chiefly in England and the United States, as students, during periods varying from one to six years. Among the reforms carried out by the mikado and his government are the abandonment of the old life of seclusion, and his conformance to the dress and public manner of life of European sovereigns; the elevation of the Eta or pariah class to citizenship; the abolition of the feudal system; the encouragement of a native press; the establishment of a national post; the reorganization of the army and navy on European models; the suppression of the sale of obscene pictures and phallic symbols; the adoption of foreign dress by Japanese officials; the abolition of the custom of wearing two swords; reform in the marriage laws; the reformation of the penal code; the adoption of railways, telegraphs, lighthouses, steam lines of transports, arsenals, and dockyards; a civil service of foreign employees; the abolition of the lunar and adoption of the solar calendar; the establishment of legations in foreign countries; the colonization of Yezo; the annexation of the Riu Kiu or Loo Choo islands; and the planning of an educational system on the foreign model, in which science has a high place.—The history of Japan, like that of other ancient nations, begins with a mythological period. According to the holy books of Shinto: "In the beginning the world had no form, but was like unto an egg. The clear portion (the white) became heaven, and the heavy portion (the yolk) became earth." Something like a reed then appeared and became a god, or *kami*; he was the father of a line of spiritual beings, who ruled the universe as it then was for millions of years, ending in a god and goddess Izanagi and Izanami (evidently the equivalents for the Chinese *ying* and *yang*, the male and female principles that pervade all creation). From their union sprang the islands of Japan, the mountains, seas, and other natural objects therein. Another legend is that Izanagi, taking his heavenly jewelled spear, stirred up the sea, and the drops which fell from the point of it congealed and became an island, upon which the two gods descended and took up their abode. Subsequently a daughter was born, whose body was so bright that she ascended to heaven and became the sun, and was called Ten Sho Dai Jin. Another daughter became the moon, O Tsuki Sama. These divinities are of no further importance in history than as serving to make a line of ancestry for the reigning family. At the time when, according to tradition, the genealogy merged into mortal men, the country was found to be peopled, and there is no attempt to show whence these people came, though described as hairy, uncivilized, and living in the open air. What seem to be the authentic annals of the country begin about 660 B. C., though there is no native documentary proof of this, and the Japanese have no writings that antedate the 7th century. At the time when Jimmu

Tenno, who is called the first emperor, set out upon his career, the people of the country are said to have been hairy and uncivilized, living under the rule of a head man in each village. The Japanese have to this day a great contempt for the people of Yezo, who may be thus described, and they allege that similar tribes occupied the whole of the islands, and that they were gradually driven back by the armies of Jimmu. It is more likely that they were conquered and gradually amalgamated with their conquerors, by the intermarriage of these with native females, and that in this way, and by the effects of the warm climate of the south, they lost that hirsute appearance which is so characteristic of the people of Yezo, who are called Ainos. There are two strongly marked varieties of feature in Japan, which are strikingly portrayed in their own pictures; these are the broad flat face of the lower classes, and the high nose and oval face of the higher. The difference is so marked as to be some argument in favor of a previous mixing of two different races, the one of which had extended southward from the Kurile islands and Siberia, hairy and broad-featured, while the other had originated from the south, with Indian features and smooth skins. Jimmu, setting out from Hiuga, on the east side of the island of Kiushiu, gradually overran that island, the adjoining one of Shikoku, and the west half of the main island, as far as Mino. His capital was a place near Kioto, which was finally selected after several changes. He began the civilization of the people, and established laws and a settled government. For many centuries his posterity reigned on the throne he had founded, bearing the title of mikado, and claiming to rule by divine right and inheritance. They exercised the most absolute power. Women were not excluded from the succession, and in ancient Japanese history there were many famous empresses. Jingo Kogo, the empress regent, conquered Corea and gave birth to a son, who succeeded her. At his death he was deified, and is now the Japanese god of war. A social revolution in Japan followed the conquest of Corea. Learned Coreans brought over to Japan the works of Confucius and other Chinese books, and the language and literature of China became the study of the higher classes. In A. D. 552 a Corean prince presented the emperor with Buddhist idols and books. The doctrines of Buddhism won their way in spite of all opposition. On the accession to the throne of the empress Suiko, the first female sovereign, in 593, full toleration was declared to the Buddhist faith. Written codes and official grades were now formed; the empire was resurveyed, and the provincial boundaries were fixed more exactly. The invention of native syllabaries or alphabets (the *hiragana*, the script or running hand, and *katakana*, or square letters) to facilitate the reading, understanding, and pronunciation of Chinese, was the work of the famous priest Kobo,

who died in 835. The abdication of the emperors after short reigns began at this time or a little earlier to be a regular custom; after abdication they would become priests. Among other notable events in Japan, Yezo was invaded and completely subdued about the year 658, the art of brewing saké was invented in 693, and gold was discovered in 749, after which money was coined and came into general use. In 788 a people from the west, supposed to be Mongols, attempted the invasion of Japan, but were driven away, and their army and fleets nearly annihilated by the valor of the natives and the fury of the elements. For three or four centuries the history of the empire may be written in the successive rise to power of individuals of the great families of the nobles, whose names, such as Fujiwara, Taira, Minamoto, and Tachibana, fill the pages of the Japanese annals, and are venerated at the present day. The imperial power began to decay, and the throne finally became the toy of leaders and the prey of contending factions. The real origin of the decline of imperial power is found in the basis of the system of succession. The looseness of the marriage tie produced weakness in the social structure and in the government. The mikado was allowed 12 concubines and one wife, so as to insure offspring; but no law existed defining the constitution of a legal heirship, or the rights of an heir to the throne. The succession did not depend upon birth, but wholly upon the arbitrary will of the sovereign. Every member of the imperial family was, under these circumstances, left free to promote his ambitious designs upon the throne as best he could. The natural consequences of such a rude system of inheritance are obvious, and the pages of Japanese history for nearly four centuries reflect the story of turbulence, intrigue, and bloody strife, as the different clans in turn got possession of the throne; and at one time there were two emperors. From the civil custody of the courtiers, the throne finally became the bauble of the military class, like the throne of imperial Rome. Meanwhile the vassal princes took advantage of the weakness of the imperial government to strengthen their own power, adding to the national confusion. To remedy these evils, the court of the mikado created the office of *shogun*, or governor generalissimo, and appointed Yoritomo to it. This man, one of the most renowned heroes in Japanese history, was the son of a court noble of the Minamoto family by a peasant woman. After quelling the turbulence of the great vassals, and restoring the authority of the throne, he gradually concentrated in his own hands the real power of the government, without however depriving the mikado of his nominal rank, dignity, and religious supremacy. The office of shogun was made hereditary in the family of Yoritomo, but did not finally remain so. Abnegating official titles and rank, he nevertheless held the fulness of sovereignty. He

chose Kamakura, about 35 m. from Yedo, for his capital, and made the court of the first shogunate one of great magnificence and dignity. From this date, 1195, the shogun was regarded as the lord of the land, and the influence and power of the emperor became nominal. The Mongols having invaded China in 1260, and conquered the greater part of it, their leader Kublai Khan sent envoys to Japan in 1268, and again in 1271 and 1273. On their arrival at Kamakura the first envoys were insulted, and those who came later were arrested and put to death. In 1274 an expedition was sent by the Mongol conqueror, which was defeated. In 1281 an immense fleet and army were despatched to Japan, which when off the coast of Chikuzen, were destroyed in a storm and by Japanese valor. From that time Japan has not been molested by invaders. From 1331 to 1392 occurred the civil wars between the factions of the northern emperor and the southern emperor, both of whom claimed the throne. The period from 1336 to 1573 is known as the "epoch of war," and the country was ruled by 13 shoguns of the Ashikaga family. About this time there rose into notice three of the greatest names that adorn the pages of Japanese history; they are Nobunaga, Hideyoshi, and Iyeyasu. Nobunaga conceived the idea of bringing the whole empire under his sway; and reducing first the weak clans, he gradually overawed the great clans, but was killed by a traitor before he finished his work. Hideyoshi hastened to complete it, and succeeded in bringing the whole empire under his absolute rule. Nobunaga hated the Buddhist priesthood, and persecuted them with sword and fire. Hideyoshi likewise hated them, and both pretended to welcome the Jesuit missionaries, in order to offset them against the Buddhists and diminish their power. Hideyoshi is usually called by the Jesuit fathers Faxiba (correctly Hashiba), a name chosen by himself in a trivial mood, and made up of the first and last halves of two different men's names. He is also called Taiko Sama by foreigners, but this was merely the title of his office, and there have been many taikos. Hideyoshi was not only a great warrior, but a consummate statesman and legislator, and the "laws of Taiko" have been venerated for centuries. Aspiring to conquer the vast empire of China, he sent by the way of Corea in 1592 an army 160,000 strong. Corea submitted, being entirely unprepared, but further advance was stopped by the death of Hideyoshi, and the expedition returned. The country was now distracted by two parties, one led by the adherents of the infant son of Hideyoshi, the other by Tokugawa Iyeyasu. The latter triumphed, and founded the shogunate of Tokugawa, the family which ruled over Japan from 1603 till 1867, during which period the country enjoyed profound peace. He made Yedo, then a small town, his capital, and in a few years it became a great city. Iyeyasu is regarded as

the greatest character in Japanese history. His system of government was that under which Japan continued during the period of her seclusion from the rest of the world, which has been so well described by Kämpfer, Titsingh, and Klapproth, and which so long excited the wonder of other nations. It was a normal outgrowth of peculiar circumstances. Having no foreign enemies, the feudal condition of the country necessitated a dual government and two capitals: a divine emperor, the fountain of honors and titles, to be venerated; and a strong hand of power, the shogun, with castles, wealth, and armies to be feared. The one dwelt amid a semi-sacred nobility and a host of learned priests, in a quiet capital filled with temples and colleges; and the other, from his moated castle ruling the turbulent vassals and enforcing military authority in every part of the land, resided in a bustling capital filled with wealth, luxury, and all the circumstance of actual power. Though the shogun was the *de facto* ruler of Japan, the mikado was by no means the empty shadow that Kämpfer and his copyists make him to be. Title and rank in Japan have a significance even greater than in Europe, and all high ranks and titles had to be obtained from the mikado. He was the true sovereign of Japan, and the shogun was a usurper, and in no sense of the word a king or emperor. He was but a military governor, a commander-in-chief. Properly he was a senior baron, *primus inter pares*. His family was but a clan like the others, which had obtained its supremacy by the genius and labors of Iyeyasu, and which held it by force and superior resources. Probably no greater diplomatic mistake was ever made in the history of the world than that of the foreign nations who made treaties with Japan, and accepted the seal of the shogun as surety, without having them ratified by the mikado. In fact, the foreign nations were content to make treaties with the lieutenant, or the mayor of the palace, through their ignorance of the facts, while the emperor's consent was actually withheld. The term *taikun* (or tycoon) means "great sovereign," and was an absurd title, to which the shogun had no right whatever, and which was invented to deceive foreigners. When the foreign ministers in Japan found out the true state of affairs, and that the mikado was and had always been *de jure* the true sovereign, they insisted upon and obtained his ratification of the treaties. The assumption of this title by the shogun helped to bring on the civil war of 1866-'9 which reduced his power to that of a daimio, and restored the emperor to his ancient power and rights. There never were two emperors in Japan, and the loose statements about a "secular" and an "ecclesiastical" emperor originated in deception.—The first European known to have written of Japan is Marco Polo, the Venetian traveller, who visited China, and in his narrative speaks of Zipangu, a modification of the Chinese name.

He gave such glowing accounts of the people and the wealth of the land, that Columbus seems evidently to have had the quest of that country in mind when he sailed westward, and on first landing in the Bahamas believed himself to be in Zipangu. After the circumnavigation of Africa by Vasco da Gama in 1497, the Portuguese rapidly extended their discoveries and conquests in southern Asia. In 1542 three Portuguese sailors arrived at Taneshima, and "breathed into the Japanese atmosphere the first breath of Christianity." About three years later a Portuguese adventurer, Fernam Mendez Pinto (whose name for a long time was a synonym for liar, but whose veracity has been reestablished by modern criticism), while cruising with some companions of his own nation in the vessel of a Chinese pirate, was driven by foul weather into a harbor in one of the smaller Japan islands. He was well received, and carried back to the Portuguese settlements in China such reports of the riches and magnificence of Japan, that great numbers of traders and adventurers flocked thither, and an active commerce sprang up. Missionaries speedily followed the merchants, and in 1549 Japan was visited by the celebrated "apostle of the Indies," St. Francis Xavier. Both merchants and missionaries were favorably received, and while the one class found a ready and most profitable market for their goods, the other rapidly converted vast numbers of the natives to Christianity. Three of the most powerful nobles, the princes of Bungo, Harima, and Omura, were among the converts. In 1582 the Japanese Christians sent an embassy with letters and presents to Rome to do honor to the pope, and assure him of their submission to the church. In the two years which followed their return (1591-'2), it is said that 12,000 Japanese were converted and baptized. Tempted by the success of the Portuguese, the Dutch East India company in 1598 despatched five merchant vessels to Japan, one of which reached it in 1600. In 1609 other Dutch ships arrived, and were well received by the Japanese, who conceded to them a port on the island of Hirado (called by them Firando) for a factory or settlement, with considerable privileges. Before the arrival of the Dutch, who were then at war with Portugal, the Japanese government had become distrustful of the Portuguese, whose astonishing success made them haughty and disdainful of the feelings and prejudices of the natives. The effects of the missionaries' labors had scarcely been perceived during the anarchy into which the country was plunged, and Nobunaga had utilized the enthusiastic energy of the new converts in the suppression of their common enemy, the Buddhist priesthood. His successor Hideyoshi found the native Christians disobedient and unyielding under his rude and arbitrary orders. He is said to have asked a subject of the double kingdom of Spain and Portugal how his king had managed to possess

himself of half the world. The Spaniard's reply, "He sends priests to win the people; his troops are then sent to join the native Christians, and the conquest is easy," made a deep impression upon Hideyoshi. The vicious habits and inconsistent conduct of the Portuguese Christians, mostly sailors and traders, the wild and offensive behavior of the converts toward the sacred temples of the Shinto deities and of the popular religion of Buddha, and the performance of pretended miracles by the missionaries, added to his political jealousy, excited the displeasure of Hideyoshi, who issued an edict for the banishment of the missionaries. The edict was renewed by his successor in 1596, and in 1597 23 priests were put to death in one day in Nagasaki. The Christians on their part took no measures to pacify the government, but defied it and began to overthrow idols and pull down heathen temples. This led to dreadful persecutions in 1612 and 1614, when many of the Japanese converts were put to death, their churches and schools were destroyed, and their faith was declared infamous and rebellious. The Portuguese traders were no longer allowed free access to the country, but were confined to the island of Deshima, at Nagasaki. In 1622 a frightful massacre of Christians took place near Nagasaki, and horrible tortures, endured with heroic constancy, were inflicted on multitudes in the vain effort to make them recant. In 1637 it was discovered by the Japanese government that the native Christians, driven to despair by their persecution, had entered into a conspiracy with the Portuguese to overthrow the imperial throne. The persecutions were renewed with increased rigor. Edicts were issued banishing the Portuguese for ever from Japan, and prohibiting any Japanese or Japanese ship or boat from leaving the country, under the severest penalties. By the close of 1639 the Portuguese were entirely expelled, and their trade was transferred to the Dutch, who, as enemies to the Portuguese and to the Roman Catholic faith, were not involved by the Japanese in their condemnation. In 1640 the oppressed Christians rose in open rebellion in the island of Amakusa, crossed over to the mainland, seized the castle of Shimabara, and made a long and gallant stand against the shogun's army. The Christians were at length subdued by the superior military skill of their opponents, who brought to their aid artillery, which the Dutch lent them. The Christian stronghold was finally carried by storm, and all within its walls, to the number of 31,000, were put to the sword. In the next year the Dutch were ordered to quit their factory at Hirado, and take up their residence under very strict inspection on the island of Deshima. There they remained for more than two centuries in undisturbed monopoly of the entire European trade of Japan. The occasional efforts of the Russians and English to obtain intercourse with the secluded empire were resolutely repulsed, and led in one case to the im-

prisonment for two years in Japan of the Russian Capt. Golovnin and several of his companions. During all this time the governmental system inaugurated by Iyeyasu, and perfected by his grandson Iyemitsu, worked smoothly and gave the country peace and prosperity. Under this dual system, the emperor, called the mikado (illustrious gate, or sublime porte), lived in Kioto, surrounded by the *kuge* or imperial nobles related to him. He was the centre and fountain of titles, honor, and power. The shogun never aspired to be mikado, but from his capital Yedo ruled the country as lieutenant of the emperor. The word *shogun* means commander-in-chief, and when the "barbarians" (foreigners) entered Japan, after Com. Perry's treaty, the mikado commanded the shogun to expel them. The foolish stories told about the mikado, who was also called *dairi*, by Kämpfer and others, were mainly the superstitious beliefs of the vulgar lower classes, though all Japanese believed him to be of divine descent. The daimios, or territorial nobles, resided in Yedo, and were divided into four classes: 1, the *kokushiu*, lords of provinces, princes; 2, the *kamon*, family doors, *i. e.*, relatives of the shogun's family; 3, the *tozama*, landed noblemen descended from those who assisted Iyeyasu; 4, the *fudai*, the vassals of original retainers of Iyeyasu. In 1865 there were 21 kokushiu, 10 kamon, 30 tozama, and about 200 fudai. To be a daimio ("great name"), one must belong to one of these four classes, and have a revenue of not less than 58,000 bushels of rice. The annual revenue of the richest daimio was more than 5,400,000 bushels of rice. The shogun's revenue was over 40,000,000 bushels. Only the fudai daimios were eligible to office, or could take part in official business; and their power over the large daimios thus grew to be almost absolute. The source of the *de facto* power in Japan until 1866 lay in the two councils of state in Yedo, the members of which were called respectively *toshi yori* and *waka doshi yori*, senior senators or elders and younger senators. The daimios were allowed to visit their palaces only at certain periods, and never permitted to take their wives and children out of the capital, they being kept as hostages. The daimios were always closely watched by the councils of state, by means of spies and informers, and were always kept poor by heavy contributions levied upon them, and by their luxurious habits fostered by the system under which they lived. They were so harassed by surveillance and restraint that they generally sought relief in abdication of their troublesome dignities as soon as they had sons of proper age to succeed them. To prevent opportunity for conspiracy, they were kept in constant motion, and the great princes rarely met alone with each other. A most cunningly devised and rigidly executed system of espionage held every one in dread and suspicion, from the most powerful daimio

to the meanest retainer. The ignoble quality of deception became to a large extent a national characteristic, which still clings to Japanese officials. Every Japanese head of a family was personally responsible for the conduct of his wife, children, servants, and guests. The whole population was divided into groups of five families, every member of which was responsible for the conduct of the others. No one of the common people could change his residence without obtaining a certificate of good conduct from the neighbors he was about to leave. Every one of the lower classes must also be registered at some temple, and have a wooden tablet or card officially certifying his name, occupation, residence, and temple. The result of this organization, which in a great measure still continues, is that a criminal has almost no hiding place, and robberies and other heinous crimes are reduced to a minimum. The Japanese people were formerly divided into eight classes: 1, the *kuge*, or Kioto nobility; 2, the *daimios*, or Yedo nobility; 3, the *hatamoto*, or lower daimio class, including the military literati, under the general name of *samurai*; 4, the priests, inferior officials, physicians, &c.; 5, the farmers and untitled landholders; 6, artisans; 7, merchants; 8, actors, beggars, &c. Beneath these were the *eta*, or tanners, skinner, and all workers in leather, who were the pariahs of Japan, and were obliged to live in quarters separate from the towns or villages; they were never allowed to touch any citizen, and had to execute and bury criminals. No samurai could be prosecuted or punished for killing one, nor would any help be offered to a drowning or starving *eta*. By a decree of the present emperor, published in 1871, all the social disabilities of these people were removed, and they are now citizens of the empire. Prostitutes and brothel-keepers were considered to be on the same social level as beggars. The first four classes had the privilege of wearing two swords, the others but one. About nine tenths of the population of Japan are included within the four lower classes. The chief causes for the recent changes in the government of Japan, and the social revolution among the whole people, are, first, the reverence of the people for the imperial throne and the true sovereign authority of the mikado; and second, the influence of western civilization.—In 1852 the United States government, in consequence of complaints made to it that American sailors wrecked on the coast of Japan had been harshly treated by the authorities of that country, despatched an expedition under the command of Commodore M. C. Perry, who was instructed to demand protection for American seamen wrecked on the coast, and if possible to effect a treaty by which American vessels should be allowed to enter one or more ports to obtain supplies and for purposes of trade. In February, 1854, Com. Perry, with a squadron of seven ships of war, entered the bay of Yedo, and anchored within a few miles

of the city. During the previous year he had entered the same bay, and delivered to the Japanese a letter to the shogun from the president of the United States. The proceedings of Com. Perry were characterized, throughout the difficult task of dealing properly with the Japanese, by consummate tact and diplomatic skill, and were finally crowned with success. By a treaty dated at Kanagawa, the nearest large town, though really signed at Yokohama, then a mere fishing village, March 31, 1854, the ports of Shimoda and Hakodate (usually written Hakodadi) were opened as harbors of refuge, supply, trade, and consular residence. In September a British squadron, under the command of Rear Admiral Sir James Stirling, entered the harbor of Nagasaki, and concluded a treaty with Japan, by which Hakodate and Nagasaki were opened to foreign commerce. The Russians made a similar treaty and obtained similar privileges, and were followed by the Dutch. On June 17, 1857, a new treaty was negotiated at Shimoda with the Japanese government by Mr. Townsend Harris, United States consul general to Japan, by which the port of Nagasaki was also opened to American trade. In 1858, in spite of all opposition, Mr. Harris succeeded in reaching Yedo, where he concluded a still more favorable treaty. During the same year a British squadron conveyed Lord Elgin to Yedo, where on Aug. 26 a new treaty was concluded between Great Britain and Japan, by which the ports of Hakodate, Kanagawa, and Nagasaki were to be opened to British subjects after July 1, 1859; Niigata, or some other convenient port on the W. coast of the main island, after Jan. 1, 1860; and Hiogo after Jan. 1, 1863; and various other commercial privileges were granted to British merchants. At the present date, 1874, Japan has treaties with the United States, Great Britain, Russia, Holland, Prussia, Portugal, France, Spain, Switzerland, Italy, Austria, Greece, Denmark, Sweden and Norway, Hawaii, Peru, and China, which are similar in most respects. In 1860 a Japanese embassy, the first ever sent from the country, visited the United States, and another embassy visited Europe in 1861. The signing of the treaties by the shogun, who was wholly unprepared for the advent of the American commodore, caused an intense excitement throughout the country, general dissatisfaction, and deep indignation at the imperial court in Kioto. The sympathy of many daimios was excited and developed in behalf of the emperor, and the tide of power and influence began to set toward Kioto and away from Yedo. The shogun having died in 1858, the premier and regent at this time, an insolent and haughty man, disregarding the popular choice, selected the infant daimio of the province of Kii, and by execution and imprisonment suppressed all the leaders of the party who opposed his will. On March 23, 1860, the regent, who had despatched the embassy to the United States, was

assassinated in the public streets of Yedo in broad daylight. After his death the custom of the shogun making personal visits to the sovereign at Kioto was revived, thus showing where the supreme power lay. Influences from Kioto now became so strong that the families of the daimios, long held as hostages, were withdrawn, and the custom of the daimios visiting Yedo was abolished. From this period Kioto became superior to Yedo, and while the power of the mikado daily increased, that of the shogun decreased, until the Yedo government was despised and openly defied. The cry of all the conservative and "patriotic" Japanese now was, "Honor the mikado, and expel the barbarians." In July, 1863, while the shogun's government was engaged in trying to persuade the foreigners to close the ports and leave Japan, the forces of the daimio of Choshu (Nagato), acting upon orders from the imperial court of Kioto, fired on the ships of the United States, France, Great Britain, and the Netherlands. These treaty powers afterward sent their ships of war to Shimonoseki, the port at which the batteries were erected. A complete victory of the foreigners was the result, and an indemnity of 3,000,000 Mexican dollars was demanded and obtained. This victory opened the eyes of the anti-foreign party to the power and resources of the "outside barbarians." Choshu had acted in disobedience to the express command of the shogun, who had obtained a rescission of the order of the imperial court to "expel the barbarians." The shogun made an expedition against Choshu to punish him for his disobedience, and to suppress his province. He set out with a large but motley force, equipped in the old style of armor, and armed with bows and arrows, spears, and swords. The forces of Choshu were well drilled in foreign style, armed with rifles, and lightly and tightly clothed. A most decided and disastrous defeat of the shogun's army was the result. Defeat, mortification, and disease together carried off the shogun, Sept. 19, 1866, and he was succeeded by the new shogun, the last of his line, Hitotsubashi. Seven of the most influential daimios were summoned to Kioto, and one, the prince of Tosa, boldly proposed the abolition of the shogunate, and suggested the unification of the power of the nation in the hands of the emperor. The shogun accepted the situation, and tendered his resignation. This however did not seriously alter the form of government, and left the machinery of power in very much the same order as before, the mikado merely taking the authority of the shogunate to himself. In the winter of 1867-'8 the party in favor of an utter abolition of the shogunate, and a return to the ancient imperial system of government, formed a conspiracy and resolved on a bold *coup d'état*. Iwakura, now junior minister and chief of the embassy to the United States and Europe in 1872, was a prominent leader as well as instrument of

the conspiracy. They created a government, under which the highest offices were filled by the *kuge*, or court nobles of the imperial family, those next in order by daimios and courtiers, and those of the third grade by able men selected from the *samurai* or gentry. All the power was thus thrown into the hands of a clique, composed almost entirely of the men of the four clans of Satsuma, Choshu, Tosa, and Hizen. These proceedings aroused the indignation of the ex-shogun, and he withdrew from Kioto to Ozaka with his followers. Under their influence, and by their persuasion, he undertook to reënter Kioto, with the view of driving out his opponents and of punishing the conspirators. At Fushimi, near Kioto, his vanguard was fired on, and his army, numbering nearly 30,000 men, after three days' fighting, were defeated by the opposing forces, chiefly from Satsuma and Choshu, and numbering but 6,500 men. The ex-shogun escaped to Yedo in an American steamer, and on his arrival, although surrounded by a large army and possessed of a splendid navy, he declared his intention never to oppose the mikado's will. A small party supported him in this resolve, but the daimios of the northeast entered the field against the imperial forces, and gallantly maintained the desperate struggle for six months. The commander of the ex-shogun's navy took the island of Yezo, and setting up an aristocratic republic held out against the imperial forces for many months, when, the greater part of the fleet being sunk and the forts silenced by the ram Stonewall, supported by a large land force, the imperialists obtained a complete victory and the submission of the enemy. The whole country was now at peace. A complete and marvellous change took place in the foreign policy of the mikado's party. Hitherto the court at Kioto had been the centre of the anti-foreign spirit, and the motive and grand object of the coalition that overthrew the power of the shogun was to centralize all power in the imperial throne, strengthen the empire, and then to sweep away the foreigners from the country. The immense superiority of foreign arms, war material, and discipline first opened their eyes, and since all the treaties bore the signature of the shogun they were afraid lest the foreigners should aid him, and, regarding them as rebels, should seriously endanger their future course. In their extremity they invited the foreign representatives, then temporarily at Hiogo, to a conference and an imperial audience in the very heart of the old anti-foreign Kioto. The conversion of the court nobles was thorough and instantaneous. Many of them had never seen a foreigner. The men from the western nations were found to be neither wild beasts nor demons. From this point the mikado's government was known and recognized by all foreigners as the only and supreme government in Japan. In the spring of 1869 the four clans, Satsuma, Choshu, Tosa, and Hizen, addressed a memo-

rial to the throne, in which it was argued that the fiefs of the daimios ought not to be looked on as private property. Other clans supported the memorial. The imperial court, after consulting the general opinion, abolished the titles of court and territorial noble (*kuze* and *daimio*), and replaced them by that of "noble families" (*kuazoku*). In the summer of 1871 the entire power of the empire was centred directly in Tokio (Yedo), which had received its new name in 1868. All public property throughout the empire came into possession of the imperial government, and the former daimios were given the alternative of travelling abroad or living in Tokio, one tenth of their former revenue being allowed them for support. In December, 1871, an embassy consisting of the ambassador and junior prime minister Iwakura, and the vice ambassador Kido, three ministers of the cabinet, and inferior officers and secretaries, numbering 49 persons in all, sailed from Yokohama to visit all the nations having treaties with Japan. They spent seven months in the United States, and about a year in Europe, reaching Japan on their return, by way of Suez, Sept. 13, 1873.—The principal writers on Japan are: Kämpfer, "History of Japan" (2 vols. fol., London, 1727); Golovnin, "Memoirs of Captivity in Japan," translated from the Russian (2d ed., 3 vols. 8vo, London, 1824); Meylan, *Japan voorgesteld in schetsen* (Amsterdam, 1830); Doeff, *Herinneringen uit Japan* (Haarlem, 1833); Titsingh, *Annales des empereurs de Japon* (Paris, 1834); Siebold, *Nippon* (20 vols., Leyden, 1832-'57); Mrs. Busk, "Manners and Customs of the Japanese," compiled and translated from Siebold and other Dutch authorities (London, 1841); Charles Macfarlane, "Japan" (London, 1852); Richard Hildreth, "Japan as It Was and Is" (Boston, 1855); Francis L. Hawks, "Narrative of the Japan Expedition" (3 vols. 4to, Washington, 1856); Laurence Oliphant, "Narrative of Lord Elgin's Mission to China and Japan" (2 vols., London, 1859); Capt. Sherard Osbourne, "A Cruise in Japanese Waters" (Edinburgh, 1859), and "Japanese Fragments" (London, 1861); Robert Fortune, "Visits to Japan and China" (London, 1863); Sir Ruthven Alcock, "The Capital of the Tycoon" (2 vols., London, 1863); Walter Dickson, "Japan, a Sketch of the History, Government, and Officers of the Empire" (Edinburgh, 1869); A. Berg, *Die preussische Expedition nach Ost-Asien* (4 vols., Berlin, 1854-'73, the first two volumes being devoted to Japan); Léon Pagès, *Histoire de la religion chrétienne au Japon* (2 vols., Paris, 1869); Aimé Humbert, *Le Japon illustré* (2 vols., Paris, 1870); English translation, London, 1873); Charles Lanman, "The Japanese in America" (New York, 1872); Bayard Taylor, "Japan," &c., compiled from Humbert, Alcock, and others (New York, 1872); *Das alte und das neue Japan*, by Steyer and Wagner, brought down to the present time by Ed. Hintze (Leipsic, 1873); A. Mori, "Edu-

cation in Japan" (New York, 1873); Mossman, "New Japan" (London, 1873); Adams, "History of Japan" (London, 1874 *et seq.*).

JAPAN, Language and Literature of. The Japanese language belongs to the polysyllabic branch of the Mongolian division. In a narrower sense, it has neither common descent with nor family relationship to the Chinese, and it is entirely different in its grammatical structure. Like other languages, it has undergone important changes, as may be seen upon comparison of the language as now spoken with that in the ancient books, which is only intelligible to those who make these books a special study. The native language is the same whether written or spoken, though the colloquial differs in several respects from the best literary style; the latter is more concise, and still retains some of the archaic forms of the verb and auxiliary words. The common colloquial abounds in interjectional and onomatopoeic words and particles, uses a more simple inflection of the verb, and makes a greater use of honorific and polite terms. The dialectical variations in different parts of the country consist mainly in the different pronunciation of some of the syllables, and in the use of provincialisms. The dialects of some of the more remote regions, as Satsuma, are not easily understood by the people of Tokio (Yedo); but these differences are not greater than are common in all the languages of Europe, and are by no means so great as in China.—The Japanese vocabulary has been greatly enlarged and enriched by the introduction of Chinese words, all taken from the Chinese written language, and not from the colloquial, which has never been spoken in Japan except by a few interpreters at Nagasaki. So extensively have these words been introduced, that for almost every native word the Japanese have an equivalent Chinese word. But in common usage the names of things, family relationships, and the words which express the wants, feelings, and concerns of every-day life, are for the most part native words; while the technical, philosophical, and scientific terms are Chinese. The Chinese words abound most in the higher class of literary composition, in letters, governmental documents, and philosophical works, as well as in the conversation of the higher and educated classes; while native words are more current in the literature intended for the common people, by whom, and especially by the women, the native tongue is spoken in its greatest purity. The grammatical structure of the language has not been affected by the introduction of Chinese words. The latter retain their integrity, undergoing no change or inflection of any kind, but are woven into a sentence by means of native words, or auxiliary words and particles, which indicate the cases of the nouns, form of the adjective, and moods and tenses of the verb. The Japanese have endeavored to preserve the Chinese sounds of the characters; but, as in transliterating these sounds they of necessity used their own syllables, the pronun-

ciation has in many cases been altered, but with no greater variation from the mandarin sounds of the characters than in many of the dialects of China. Unfortunately for the learner, three systems of pronunciation are used. One, called the *Go-on* (from that state in China which had the highest political influence at the time), was introduced when the Chinese language first became a subject of study by the Japanese, about A. D. 286. Another, called the *Kan-on*, was introduced in the 7th century; and another, called the *To-on*, in more recent times. The *Go-on* pronunciation is most current among the Buddhists and the common people, while the *Kan-on* is used mainly by the Confucianists, the government, and the literary classes. The Japanese have formed or invented many ideographs, after the manner of the Chinese, to designate things or words in their own language for which there were no equivalent characters in the Chinese. They also attach meanings to many of the characters different from the Chinese, and use them in a different way to suit the grammatical requirements of their native tongue. There are three general styles of literary composition in use. One is pure Chinese, in which none but Chinese characters are employed, and the grammatical construction is in accordance with the Chinese idiom. Frequently in this style marks or signs are used along the line of the characters to designate the order in which they should be read in translating the sentences into the Japanese language, or to suit the native idiom. Another, and the most common, is that in which the Chinese characters are used to a greater or less extent, mixed with native words written with their own letters, and where the structure and idiom are purely Japanese. Most of the literature intended for the unlearned and common reader is in this form. There is still another, written almost entirely in the native character, with little or no admixture of Chinese, intended for the use of women and children and uneducated persons. There is no reason to believe that the Japanese possessed letters or characters with which to write their own language previous to the time of the introduction of the study of Chinese into their country. The weight of evidence as well as of authorities is against the statement of some authors who advocate this opinion, and even produce an ancient alphabet, which however is too artificial in its form and structure to warrant the belief that it is anything more than the invention of some person of modern times. If they ever had an alphabet or syllabary more ancient than the present one, it has certainly not been used for many centuries, and there are no books now extant written in this character. It was after the Japanese had begun to study and read Chinese books that the syllabary now in use was formed, and when we may also believe they began to reduce their native language to writing. This syllabary was of gradual growth, and not the invention of any one

person. In their earliest writings the Chinese characters were used, in the same composition, in a double capacity: phonetically, to express merely Japanese syllabic sounds; and significantly, to express in the native language the idea contained in the character. As phonetics they were first used especially to write the names of persons, places, postpositions, and auxiliary words and particles. The characters were also first used in their entire form, unabbreviated; but being found too cumbersome and inconvenient, they were simplified in form, and rendered more easy to read and more expeditious in writing, in two ways: one, called *hira-kana*, by writing the whole character in a very abridged or contracted form and in a cursive style; the other, called *kata-kana*, by taking a part only of the character, consisting generally of two or three strokes, to express the sound of the whole. These two forms have no resemblance to each other. The *hira-kana* is the kind of letter commonly used, especially in books intended for the common people and the uneducated classes. The *kata-kana* has been little used, except in dictionaries to define the meaning of Chinese characters, or in scientific and philosophical works. In the *hira-kana* there are also several ways of writing the same letter, differing in being more or less contracted, as well as several different letters to express the same syllabic sound, making the acquisition of the written language extremely troublesome.—The Japanese letters are 48 in number. Each letter represents a syllabic sound, excepting the last or *n* sound, which is only used as a final consonant, and is not included by the Japanese in their syllabary, which they always speak of as containing 47 syllables. The syllabary or alphabet is called *iroha*, from the first three letters; and this is also the first word of a series forming three sentences in which the letters have been arranged to facilitate their acquisition. The *kata-kana* signs of the *iroha* are derived from Chinese characters, the latter, which are prefixed in the following table, being also used as capitals:

伊	イ	i.	和	ワ	wa
呂	ロ	ro	加	カ	ka
半	ハ	ha, fa	與	ヨ	yo
仁	ニ	ni	多	タ	ta
保	ホ	ho, fo	祇	レ	re
反	ヘ	he, fe	曾	ソ	so
土	ト	to	州	ツ	tu, tsu
千	チ	ti, tsi, chi	子	子	ne
利	リ	ri	奈	ナ	na
奴	ヌ	nu	良	ラ	ra
流	ル	ru	牟	ム	mu, m
乎	フ	wo			ン

宇	ウ	u	阿	ア	a
井	井	i, wi, yi	薩	サ	sa
乃	ノ	no	幾	キ	ki
於	オ	o	弓	ユ	yu
久	ク	ku	女	メ	me
也	ヤ	ya	三	ミ	mi
末	マ	ma	之	シ	si, shi
介	ケ	ke	惠	エ	e, we, ye
不	フ	fu	比	ヒ	hi, fi
已	コ	ko	毛	モ	mo
江	エ	ye	世	セ	se
天	テ	te	須	ス	su

The following is the iroha in hira-kana, with the Chinese characters from which the Japanese are derived prefixed:

以	い	i	宇	う	u
呂	ろ	ro	爲	ゐ	i, wi, yi
波	は	ha, fa	乃	の	no
仁	に	ni	於	お	o
保	ほ	ho, fo	久	く	ku
反	へ	he, fe	也	や	ya
止	と	to	未	ま	ma
知	ち	ti, tsi, chi	計	け	ke
利	り	ri	不	ふ	fu
奴	ぬ	nu	已	こ	ko
留	る	ru	江	に	yo
遠	を	wo	天	て	te
和	わ	wa	安	あ	a
加	か	ka	左	さ	sa
與	よ	yo	幾	き	ki
太	た	ta	由	ゆ	yu
礼	れ	re	女	め	me
曾	そ	so	美	み	mi
門	つ	tu, tsu	之	し	si, shi
禰	ね	ne	惠	え	e, we, ye
奈	な	na	比	ひ	hi, fi
良	ら	ra	毛	も	mo
武	む	mu	世	せ	se
(ん)	(ん)	(n)	寸	す	su

In the transcription the sounds of the consonants are the same as in English, and the vowel sounds as in Italian (*a* as in *father*, *e* like *a* in *fate*, *i* as in *machine*, *u* like *oo* in *moon*), except in the syllables *tsu*, *su*, and *dzu*, where the *u* is a close sound, like the French *u*. The

syllabary consists in full of 72 syllabic sounds, including the final *n*; but excluding this, and several others which, though having different letters to represent them, are really the same sound, and are constantly interchanged with each other by the natives, the number of distinct syllabic sounds is reduced to 68. These are divided by the Japanese into 44 pure (*sei-on*), and 24 impure (*daku-on*) syllables. The latter are not included in the syllabary, and are as follows: *ba*, *pa*, euphonic changes of *ha*; *bo*, *po*, from *ho*; *be*, *pe*, from *he*; *do*, from *to*; *ji*, from *chi* or *shi*; *ga*, from *ka*; *da*, from *ta*; *zo*, from *so*; *dzu*, from *tsu* or *su*; *gu*, from *ku*; *ge*, from *ke*; *bu*, *pu*, from *fu*; *go*, from *ko*; *de*, from *te*; *za*, from *sa*; *gi*, from *ki*; *bi*, *pi*, from *hi*; *ze*, from *se*. The impure syllables are represented by the characters for the corresponding pure ones, with diacritical marks added; thus *ba* is written by the letter *ha* with two dots over the right shoulder, and *pa* by the same letter with a small circle in the same place. In analyzing the Japanese syllables, we find they have 5 vowel, *a, e, i, o, u*, and 19 consonantal sounds, *b, ch, d, f, g, h, j, k, m, n, p, r, s, sh, t, ts, w, y, and z*. They have not the sounds of *l, qu, v, th, or x*, and the people find it very difficult to make them. All the syllables of the native words end in a vowel, except the future tense of the verb, which now ends in a final *n*, though anciently it was written with the character for *mu*, and there is reason to believe it was so pronounced. In all other cases the final *n* is only used in spelling Chinese words. The syllables commencing with the weak aspirates *h* and *f*, or with *y*, when preceded by another syllable, for the most part lose their consonants, and their vowels combine with the vowel of the preceding syllable, sometimes forming a diphthong; thus *a-hi* becomes *ai*, pronounced like the long English *i*; *a-fu* becomes *au*, pronounced like *ow* in *cow*. Sometimes the sound of the first vowel is reduplicated or lengthened; thus *nu-fu* becomes *nuu*, written *nū*; *i-hi* becomes *ii*; *yo-fu* becomes *yō*. In Chinese words, the vowel of the first syllable and the consonant of the second are often both elided in pronunciation; thus *chi-ya* is pronounced *cha*; *shi-yo*, *sho*. The syllable *tsu*, when preceding the consonants *k, s, p*, and *t*, is elided, and the consonant of the syllable following is doubled; thus *batsu-kun* is pronounced *bakkun*; *matsusugu*, *massugu*. *Ku*, when followed by a syllable beginning with *k*, loses its vowel; thus *baku-ka* is pronounced *bakka*; *koku-ka*, *kokka*.—The Japanese language has no article. The noun has no inflections; case, gender, and number are designated by words or particles either prefixed or affixed to the noun. The case is designated by postpositions, as follows: ·nominative, *wa* or *ga*, as *neko wa*, a cat; genitive, *no* or *ga*, as *neko no*, of a cat; dative, *ni*, *ye*, *ni oite*, as *neko ni*, to a cat; accusative, *wo*, as *neko wo*, a cat; vocative, *yo*, *ya*, *kana*, as *neko yo*, O cat; ablative, *kara*, *yori*, *de*, *nite*, *wo*

motte; as *neko de*, by a cat. The number is not designated except when it is emphatic. When the noun is used without any words to mark its number, it is to be taken in a generic or abstract sense; thus *kami* may mean one god or all the gods; *tsuki*, one month or many months. If the number is very great and indefinite, it is expressed by *sen*, 1,000, or *ban*, 10,000; thus, *ban-koku*, all countries; *ban-motsu*, everything. The plural is also designated by *su*, several, and *sho*, many or all. All these are Chinese. The plural is formed by duplicating the word, as *ware-ware*, we; *hito-bito*, people; *tokoro-dokoro*, places; also by the words *domo*, *tachi*, *ra*, *nado*, *nazo*, and for Chinese words *shu* and *to*, following the noun. Gender is designated, when it must be expressed, by the words *otoko*, male, and *onna*, female; as *otoko no ko*, a male child, boy; *onna-gami*, a female divinity, goddess; also in Chinese words by *nan*, *niyo*; as *nanshi*, a boy, *niyo-shi*, a girl. In the case of animals and birds the gender is designated by prefixing *me* and *o* (contractions of *mesu*, female, and *osu*, male), as *me-ushi*, a cow, *o-ushi*, a bull; *men-dori*, a hen, *o-tori*, a cock. By prefixing *ko* (a child), a class of diminutive nouns is formed; as *ko-bune*, a little boat; *ko-ushi*, a calf; *ko-ishi*, a pebble. Also *ō* (a contraction of *ōkii*, great, big) is used as an amplifying prefix; as *ō-bune*, a large boat, *ō-kaze*, a tornado; *ō-ame*, a storm of rain. Nouns expressing abstract qualities are formed by suffixing the particle *sa* (a contraction of *sama*, state, condition) to the root form of the adjective; as *shiro*, white, *shirosa*, the whiteness; *taka*, high, *takasa*, the height.—The root forms of verbs are also nouns; as *yorokobi*, joy; *urami*, hatred. The word *te*, hand, added to the roots of verbs, denotes the agent of the action expressed by the verb; as *kai-te*, the buyer, *uri-te*, the seller. Nouns are also formed by adding the word *kata*, side, mode, to the root form of verbs; as *shi-kata*, way of doing, *koshi-kata*, the past. The attributive form of the adjective is often treated as a noun. Many compound nouns are formed: 1, by joining together two nouns, as *karasu-hebi*, a black snake (literally, crow-snake); 2, by an adjective and noun, as *shiro-gane*, white metal, silver; 3, by a noun and verb, as *asa-ne*, morning sleep; and 4, by a verb and a noun, as *hiki-ami*, a seine. The Chinese nouns are declined or take the postpositions in the same way as the native words.—The words classed or used as pronouns are numerous, and may be divided into personal, demonstrative, interrogative, reflexive, indefinite, and distributive. There are no relative pronouns; where in English a relative pronoun is used, in Japanese the person or thing is put in direct subjection to the verb, which acts as an attributive adjective; as *tegami wo kaku hito*, a man who writes letters (literally, letter-writing-man). In conversation as well as in books personal pronouns seem to be carefully avoided, in this respect agreeing with the cus-

tom of the Chinese. In books especially it is often difficult to distinguish the speaker, the person spoken of, and the person spoken to. This is indicated mainly by the style of language employed, which varies with the rank or social position of the person addressed or spoken of. Most of the words used as personal pronouns are such as express humility on the part of the speaker, and honor the person addressed.—The ancient Japanese cardinal numbers are: 一, *ichi*, one; 二, *ni*, two; 三, *san*, three; 四, *yo*, four; 五, *itsu*, five; 六, *mu*, *muju*, six; 七, *nana*, seven; 八, *ya*, eight; 九, *koku*, nine; 十, *to*, once ten; 百, *so*, termination of tens; 千, *momo*, hundred; 万, *jo*, termination of hundreds; 十, *tsi*, thousand; 万, *yorodzu*, ten thousand. With the exception of these, the Japanese use the Chinese numerals, as well as the Chinese systems of weights, measures, and notation of time. The adjective is not inflected to indicate either case, gender, number, or comparison. But in order to express its relation to other words as an attributive, predicative, or adverb, it takes as suffixes to its root form the syllables *i* or *ki*, *shi*, and *ku*; thus, the form *samu*, cold, as an attributive is *samui* or *samuki*; as a predicative, *samushi*; and as an adverb, *samuku*. In the colloquial the terminal syllable *i* is used also to express the predicative form; as *fuyu ga samui*, the winter is cold. The comparative degree is denoted by means of the words *yori*, from, and *nao*, more, yet; as *yuki wa kami yori shiroshi*, snow is whiter than paper, or *nao yoi*, better. The superlative is expressed by the aid of certain adverbs: *mot-tomo*, indeed; *itatte*, exceedingly; *goku* or *shigoku*, superlatively; *hanahada*, *ito*, very; *dai-ichi-no*, or *ichi-ban*, number one. Chinese words take the attributive adjective form by means of the auxiliary words *naru* and *na*, as *kon-kiru naru hito*, a poor man; or when qualifying another Chinese word, merely by preceding it, as *guwai koku*, a foreign country. Adjectives are formed from nouns by the use of the postposition *no*; as *uso no hanashi*, a false story; *ishi no iye*, a stone house; also by suffixing to them the word *rashii* or *rashiki*, like, or *gamashii*; as *onna-rashii*, womanlike; *otoko-rashii*, manlike. They are formed from verbs by means of *shii* (a contraction of *shiki*, to spread); thus from *osore*, to fear, is formed *osoroshii*, fearful. Several forms of the verb act also as attributive adjectives, viz., the indicative present in *u* or *ru*, the preterite in *ta*, *taru*, and *shi*, and the negative indicative in *nu*, *zaru*, and negative preterite in *ji*. Many adjectives take the substantive verb *ari* as a suffix to the adverbial form, and are conjugated like a verb; thus *samuku*, the adverbial form of *samu*, and *ari*, to be, becomes *samukaru*, to be cold; preterite *samukatta*, was cold; future or dubitative, *samukarō*; negative present, *samukaradzu*, is not cold; negative preterite, *samukunakatta*, was not cold. In construction the attributive-adjective, and also the adver-

bial form, always precede the noun and the verb which they qualify.—The verb has no inflection to express either number or person; but in polite language, by the use of certain particles or auxiliary words prefixed or joined to the root form, the personal relations of the verb may be distinguished, as well as by the form and kind of verb used. The verb has transitive, intransitive, causative, passive, potential, negative, and desiderative forms; for example: transitive, *age*, to raise or lift up; intransitive, *agari*, to rise of itself or go up (contraction of the root *age* and substantive verb *ari*); causative, *agesaseru*, to cause another to raise (by joining *saseru*, the causative form of *suru*, to do, to the root *age*); passive or potential, *agerareru*, to be raised, or can be raised (from root *age* and passive of substantive verb *areru*, which is also a contraction of *ari*, to be, and *yeru*, to get, thus literally meaning, get-to be-raised); negative, *agenu*, not raise (from *age* and *nu*, a contraction of *naku*, not to be); desiderative, *agetai*, wish to raise (from *age* and *tai*, desirous). The verbs are divided into three conjugations, have past, present, and future tenses, and indicative, imperative, conditional, conjunctive, and concessive moods, and present participles. The action of the verb becomes reciprocal by joining the verb *au*, to meet, join, to the root; as *uchi*, to strike, *uchi-au*, to strike each other. In compound verbs, which are numerous, the first element takes the root form and is subordinate to the last, expressing the manner in which its action is performed; as *nusumi-toru*, to take by stealth; *tobi-oduro*, to jump down. In a sentence the subject as well as the object of the verb always precedes it.—Besides the adverbial form of the adjective, there is a large class of adverbs formed from nouns by the use of the postpositions *ni* and *de*, or by duplicating the word; as *nichi*, day, *nichi-nichi*, daily; *toki*, hour, *toki-doki*, hourly or often. The present participle is frequently used adverbially; as *hajimete*, at first; *kesshite*, positively. The adverb and an adverbial clause precede the verb which they qualify. What are called prepositions in English should in the Japanese be classed as postpositions, since they always follow the word to which they are related; as *Yedo ye yukita*, has gone to Yedo. This relation is also frequently expressed in Japanese by a compound verb; as *ido ni tobi-komu*, to jump into a well. Copulative and disjunctive conjunctions are numerous, but they are mostly expressed by the conjunctive, conditional, or concessive moods of the verb. There are a few verbs, such as *soro*, *keri*, *shiku*, and *sari*, the moods and tenses of which are used only as conjunctions. The colloquial especially abounds with interjectional, emotional, and onomatopoeic words, which, though impossible to define or translate, are very expressive and add grace and life to the language.—The most accessible Japanese grammar is that of J. J. Hoffmann (English ed., Leyden, 1868).—Lit-

ERATURE. No means exist for determining the precise age of the most ancient monuments of Japanese literature, but there is little doubt that both prose and poetical compositions existed previous to the introduction of the Chinese method of writing. This is asserted to have taken place in the 15th year of the mikado Ojin (A. D. 284) through the medium of a Corean named Ajiki, who gave some instruction to the heir apparent. The statement occurs in the *Nihongi*, one of the earliest historical works extant, which was composed about the year 720. The *Nihongi* contains so much that is evidently fabulous, especially in relation to the ages of the personages mentioned in it, that it cannot be relied on for the accuracy of its dates; and there is very good reason to believe that the introduction of the Chinese language took place considerably later than is usually supposed. It is stated, on the other hand, that the Japanese possessed from ancient times an alphabet of their own, which they abandoned for the Chinese ideographic writing; but this assertion, absurd enough by itself, is denied by the best authorities. It follows therefore that the most ancient compositions, namely, the verses of poetry given in the *Kojiki* and *Nihongi*, and the *norito* or liturgies read at the festivals of the native Shinto gods, were handed down orally. It happens unfortunately that at the period when they came to be written down the Chinese character was preferred to the *kana*, only recently introduced, and the real text is often difficult to ascertain. I. STANDARD HISTORIES. Japanese bibliographers make history the first division of their literature. The most ancient historical work, which is at the same time the earliest written document extant, is the *Kojiki*, in three volumes, composed at the command of the mikado in A. D. 711-'12, by Yasumaro. It is said to have been preceded by two similar works which were composed respectively in 620 and 681, but neither of these has been preserved. The book called *Kujiki*, which purports to be the former of these, and the work therefore of the celebrated Shotoku Taishi and Soga no Umako, is a forgery of later date, as is shown by the fact that it contains passages from the *Kogoshui*, a book composed in 808, and mentions the mikado Saga (809-842). The *Kojiki* begins by relating the foundation of the heavens and earth, and the first volume is entirely occupied by the events of the mythological period. The second and third volumes contain the history of the mikados from Jimmu Tenno down to the empress Suiko Tenno, whose reign ended in 628. It is written with Chinese characters, some of which represent whole Japanese words (*mana*), and others merely separate sounds of the syllabary (*kana*), and in general conformity with Japanese idiom. Old manuscripts of this work are extremely rare, and the earliest printed copy is dated *Kuanyei* (1624-'42). A most valuable com-

mentary on it was compiled by the learned Motoōri Norinaga toward the end of the 18th century, under the title of *Kojikiden*. The next most ancient work of the kind is the *Nihongi* or *Nihonshoki*, which was also composed at the command of the reigning mikado, and completed in 720, by a commission presided over by the prince Toneri Shinno. It differs very much from the *Kojiki* in being composed in a purely Chinese idiom, and the poetry which occurs here and there is all that it contains of Japanese. This fact explains the abundance of Chinese philosophical notions which are found in it throughout, but notably at the very commencement, where the pure Japanese tradition of the creation is preceded by one of Chinese origin. Still this book has always been much more read than the *Kojiki*, and all the ordinary histories are founded on it. The first two volumes contain the mythological period; the remaining bring the annals of the mikados down to the 11th year of the empress Jido Tenno (699). It is somewhat curious that, although the mythological part contains numerous references to "other documents," the remainder is a simple unsupported narration. The *Shoku Nihongi*, in 20 volumes, contains the history of the mikados from the first year of the reign of Mommu Tenno (672-686) down to the end of the 10th year of Kuammu Tenno (782-806), a period of 120 years. It was composed at the command of the mikado Kuammu, about the year 797, by Sugano no Mamichi, Fujiwara no Tsugunawa, and others. The *Nihon Koki*, in 10 volumes, was composed in 841 by Fujiwara no Fuyutsugu, at the command of the mikado Nimmio (833-850), and contains an account of the events between the years 792 and 823. About one half of it has been lost. The *Shoku Nihon Koki* was composed about 869 by Fujiwara no Yoshifusa, Harusumi, and Yoshinawa, at the command of the mikado Seiwa Tenno; it is in 20 books, and contains the history of Nimmio Tenno's reign. The *Montoku Jitsuroku* was composed about 879 by Fujiwara no Mototsune, Urabe no Yoshika, and Sugawara no Michizane, and contains the history of the reign of Montoku Tenno (850-858). The *Sandai Jitsuroku* was compiled about 901 by a number of persons, among whom was Michizane, by command of the reigning mikado Daigo Tenno; it consists of 20 volumes, and narrates the history of the reigns of Seiwa Tenno, Yozei Tenno, and Koko Tenno (858-876, 876-884, and 884-887). The above mentioned six works are called by the general name of the *Rikkokushū*, or "Six National Records." They are all written in the Chinese idiom, and contain no passages in Japanese, with the exception of the speeches ascribed to the mikados, some of which are, however, evidently corrupt. Sugawara Michizane compiled a work based on these original histories called *Ruijū Kokushū*, in 200 books, which has never been printed, and the greater part of

which has been lost. Of the *Honcho Seiki*, another history which contained the latter part of the reign of Uda Tenno (887-897), composed by the priest Shinsai Hoshi, all but one book has been lost. This author lived about the middle of the 12th century. The *Fuso Riakki* is a history commencing with the reign of Daigo Tenno (897-930) and concluding with that of Go-Toba Tenno (1184-1198); but of the whole 14 books about one third has been lost. The *Nihon Kiriaku* is a history of the mikados from 884 to 1028, but the reigns of Koko Tenno and Uda Tenno are wanting. It is moreover uncertain who were the authors of these last two works, and to what period they belong. Hayashi Razan (1583-1657), in conjunction with his son Gaho or Shunsai, compiled a general history of Japan in 273 books entitled *Honcho Tsugan*, beginning with Jimmu Tenno and ending with the 34th year of Goyozei Tenno. A supplement to this work was completed in 1703 by the great-grandson of Razan; it is entitled *Kokushū Jitsuroku*, and forms 79 books. Both of these works exist only in manuscript. The next historical work was the *Dai-Nihonshi*, in 243 books, which are bound up in 100 volumes. The first 73 books contain the history of the mikados from Jimmu Tenno to Go-Komatsu Tenno (1393-1413); 12 are devoted to notices of their wives and concubines, 14 to the princes of the imperial blood, 6 to the princesses, 73 to biographies of high officials of the government under different reigns, 8 to the shoguns from Yoritomo to Ashikaga Yoshimitsu, 5 to the relatives of the shoguns, 22 to retainers of the shoguns, 5 to notices of scholars, 4 to poets, 1 to examples of filial piety, 1 to the samurai noted for their loyalty and courage, 1 to celebrated women, 1 to men who retired from the world, 1 to artists, 3 to rebels, 1 to traitors, and the last 12 to the relations of Japan with other Asiatic states, such as various Chinese kingdoms, down to the time of the Mongol and Ming dynasties, Corea, Mantchooria, southern India, and Loo Choo. It is written entirely in classical Chinese, and the composition is said to have been corrected by Chinese scholars who fled to Japan during the troubles in their own country in the 17th century. The list of works made use of in compiling it contains 663 titles. It was composed by a number of Japanese scholars engaged for that purpose by the second prince of Mito (1622-1700), who was in reality the founder of the movement which culminated in the revolution of 1868. By his express wish the empress Jingo Kogo was transferred from the list of sovereigns to that of the mikados' wives, and Prince Ōtomo was placed among the sovereigns. He further vindicated the cause of legitimacy by treating the mikados of the *nancho* or "southern court" as the genuine sovereigns, and those of the *hokuchō* or "northern court" as usurpers. It was completed about 1715, but was first printed in 1851. The *Nihon Shunjiu* (in Chinese), in

50 books, by the Buddhist priest Nissho, is a work compiled on the same principles, but in somewhat different form, the same materials as those which were used for the *Dai-Nihon-shi* having been worked up into a continuous narrative. It only exists in manuscript, and copies are extremely rare. Arai Hakuseki (1657-1725) was the author of two valuable historical works. One of these is the *Koshitsu*, in 5 volumes, published in 1716; it seeks to explain in a rationalistic manner the legends contained in the *Kojiki*, *Nihongi*, and *Kujiki*. The other is the *Tokushi Yoron*, in 12 volumes, completed in 1724; a most valuable philosophical view of the different changes which have taken place at various times in the distribution of the governing power in Japan. The latest historical works of importance are those of Rai Sanyo (1780-1833). The *Nihon-guainshi*, in 22 volumes, was published by him in 1827, after 20 years of continuous labor. It commences with the rise of the Taira (Heike) and Minamoto (Genji) families in the 12th century, and ends with the establishment of the Tokugawa shogunate in the 17th century. The plan adopted is to narrate the history of each of the families which held the reins of power in succession after the decay of the authority of the mikados, a period which may be called that of the domination of the military class. Some of these families possessed not more than a fifth of the country at once, but others extended their sway over the whole. In the *Seiki*, published after his death, Rai depicts the history of Japan from the commencement of Jimmu Tenno's conquest in B. C. 667 (an uncertain date) down to the abdication of Goyzei Tenno in 1596, and discusses the character and conduct of each sovereign in turn. Both works are written in classical Chinese. A pupil of Rai's has also published a supplement to the *Nihon-guainshi*, in which the annals of various prominent military families are presented. All three of these are extremely useful works, and have contributed not a little to the formation of the political opinions which were current in Japan until the year 1868.

II. MISCELLANEOUS HISTORICAL WORKS. Most of these are by private authors, and are written either in hiragana, or in a mixture of Chinese characters and katakana or hiragana, and therefore in the Japanese idiom. The earliest of these is the *Okagami*, in 8 books, by Fujiwara no Tamchira, a court noble (*kuge*) who flourished in the middle of the 11th century. It contains notices of occurrences at the court between the years 850 and 1035. The *Midzu-kagami*, in 3 books, by Nakayama Tadachika (1131-'95), deals with the period between the accession of the semi-mythical Jimmu Tenno and the reign of Nimnio Tenno (833-850). The *Masu-kagami*, in 10 books, by Ichijo Fuyuyoshi (1464-1514), narrates events which occurred at the court between 1184 and 1338. These three works are called by the general title of *Mitsu-kagami*, or the "Three Mirrors." The

Yeigua Monogatari, in 41 books, is a more detailed work of the same kind, extending over the period from 889 to 1092. The name of its author and the date of its composition are both unknown, but it probably belongs to the 12th century. It is an excellent specimen of the classical form of the Japanese language. The subjects treated are chiefly detached incidents in the lives of the mikados and members of the families allied to them, and the only reason given for not placing the collection among the *monogatari* properly so called is that the stories related are true. The *Shoku Yotsugi*, in 10 volumes, is a history of the doings of the court between the years 1025 and 1170, written in pure classical Japanese. Like the *Yeigua Monogatari*, it contains a large number of Japanese songs. Another name for it is the *Imakagami*, or "Mirror of the Present." The *Hogen Monogatari* and *Heiji Monogatari*, each in 3 books, relate the strife between the Taira and Minamoto families in the years 1157 and 1159, in which the latter were entirely defeated and crushed for a while. The authorship of these two works is attributed to Hamuro Tokinaga, who must have lived about the end of the 12th century. They were originally printed in hiragana, but in the variorum editions, called *Sanko Hogen Monogatari* and *Sanko Heiji Monogatari*, the Chinese characters with katakana have been used. The *Hoken Taiki*, in 2 books, is a narrative of the wars of the Taira and Minamoto families between 1156 and 1192, by Kuriyama Gen (1671-1736); it was composed in the Chinese classical style, about the year 1689. The *Gempei Seisuiiki*, in 48 books, is a work of great literary merit, besides being of considerable value as a history of the times. As the title, "Glory and Fall of the Minamoto and Taira," indicates, it is a narrative of the struggle between these two families. It extends over the period between 1161 and 1182. The authorship is ascribed to Hamuro Tokinaga. The *Heike Monogatari*, in 12 books, is based on the *Gempei Seisuiiki* with some additions. It is said to have been composed by a certain Yukinaga in the reign of the mikado Go-Toba (1184-'98), and therefore not long after the events narrated in it. It is written chiefly in the hiragana, with a small proportion of Chinese characters; but the style is rather difficult, as the rules of grammar are disregarded in order to adapt the composition to music. Several different texts exist. The only annotated edition is the *Heike Monogatari Sho*, in 12 volumes, without date; from the appearance of the print it must be about two centuries old. The *Adzuma-kagami*, in 52 volumes, is a valuable mine of historical information about the period between 1180 and 1266. It relates the history of Yoritomo and his two sons and the three succeeding shoguns, and of their prime ministers the Hojo. The author's name is unknown, and the probability is that it is a mere compilation from the records of the Kamakura shoguns, which after the end of

the Hojo dynasty of ministers fell into the hands of the Uyesugi, who were ministers under the Ashikaga. It is written in very bad Chinese, but contains a number of official documents which are useful examples of the current style of writing. The first printed edition appeared in 1605, and a second in 1624, with an interlinear Japanese translation. A valuable work for comparison with the *Adzuma-kagami* is the *Gukuan Sho*, in 7 books, by the Buddhist priest Jichin Osho. It contains notices of the mikados from Jimmu to Juntoku Tenno (1211-20), and much information with regard to the existing Buddhist monasteries and the affairs of the Kamakura shogunate. It appears to have been written about the middle of the first half of the 13th century. The *Shokiiki* is a record of the rebellion of Hojo Yoshitoki, in 1221, against the ex-mikado Go-Toba, whom, with his son Tsuchi-mikado and the reigning mikado Juntoku, he banished to various parts of Japan. The *Horeki Kanki*, in 3 books, is an account of events which took place between the years 1156 and 1341, by an anonymous author. The *Jinko-shoto-ki*, in 6 books, by Kitabatake Chikafusa (1293-1359), contains the history of the mikados from the commencement of the mythological period down to the accession of Go-Murakami Tenno in 1339, which is the date also of its composition. It was written to prove that the "southern emperor" was the legitimate descendant of Tensho Daizin, and his rival, the nominee of the Ashikaga family, a mere usurper. On this account it is very highly thought of by Japanese, but in point of literary execution it is very inferior, and shows the extent to which the language had then been corrupted. It was first printed in 1649. There is a supplement to it in one book, which continues the history down to the reign of Go-Hanazono (1429-'64). Many other narratives of the same period exist, of which the most important is the *Taiheiki*, in 41 books, containing a minute account of the events between 1318 and 1367. Various authors were engaged upon it, and it was composed at different times between the years 1334 and 1382. About the end of the 14th century a clean copy was made by the order of the shogun Yoshimochi for some Chinese officials on a visit to Japan. There is a variorum edition called *Sanko Taiheiki*, by two Mito scholars, Imai Kosai and Naito Teigen, in 64 books. The most complete edition is that known as the *Taiheiki Komoku*, published in 1668 in 60 volumes, with many notes. It contains besides the usual text a list of the mikados and their chief ministers from Jimmu Tenno to Ogimachi Tenno (1558-'87), a treatise on the ancient court dress, notes on the division of the provinces at various periods, treatises on the duties of civilians and military men by Fugifusa, a servant of Godaigo Tenno (1319-'38), a treatise on war by Kusunoki Masashige, and a volume of legends relating to celebrated swords. The literary style of the *Taiheiki* is

no better than that of the *Jinko-shoto-ki*; it is wanting in unity of design, and is overloaded with references to Chinese and Indian history. The *Meitokki*, in 3 books, relates the history of the rebellion of Yamana Ugikiyo and Yamana Mitsuyoshi in 1390; and the *Oyeiki*, of the rebellion and destruction of Ouchi Yoshihiro in 1399. The *Chinyoki* is an account of the raising to the throne of Go-Hanazono Tenno in 1429, written by his father, the prince Dokin Shinno. The *Onin-ki* is an account of the civil war waged by Hosokawa Katsumoto and Yamana Sozen for the position of chief minister to the shogun Ashikaga Yoshimasa; it raged for six or seven years (1467-'73), and only came to an end through the death of both chiefs. The *Kamakura Ozoshi* is a collection of historical papers on events which occurred at Kamakura between 1379 and 1479. The style marks the transition from the pure Japanese of the *monogatari* to the modern language. The author is unknown. The *Odai Ichiram*, in 7 volumes, is the work of Hayashi Shunsai (1618-'80), and contains the history of the mikados from Jimmu Tenno down to Ogimachi Tenno (1558-'87). It was written about 1652 and printed in 1664. The style of composition is decidedly inferior, and it is scarcely worthy of notice but for the fact that a translation of it into French was published in 1840 by Klapproth. The best history of the life and achievements of Toyotomi Hideyoshi (Taikosama) is the *Taiko-ki*, in 21 books (11 volumes), composed about 1625 by an unknown author; it contains a number of contemporary documents of high value for philology. III. LAWS. Closely connected with history is the department of laws of all kinds. These are divided by Japanese writers into four branches, for which exact equivalents cannot easily be found in the English language. The preface to the *Konin Kaku* says: "The object of *ritsu* is to warn and correct; that of *rio*, to induce and persuade; the *kaku* are rules made for special emergencies; the *shiki* supplement the whole." Of these, *ritsu* seems to correspond to penal law, *rio* to administrative law; *kaku* are decrees and notifications explanatory of the *ritsu* and *rio*, and the *shiki* are supplementary directions for fulfilling the objects of the *rio*. According to native writers, the earliest attempt at framing a code was that made by Shotoku Taishi in the year 604 (12th of Suiko Tenno), who composed 17 chapters of laws, which are preserved in the 5th book of the *Shuugai Sho*; they are rather a collection of moral precepts than laws. In 668 (1st year of Tenji Tenno) 22 chapters of *rio* were compiled. In 701 Fujiwara Fubito and others drew up 6 books of *ritsu* and 11 of *rio*, which were again superseded in 718 by a new code of both in 10 books each. Of the former but a small portion has been preserved, and the fragments have been published by Hanawa Hokiichi in his great collection entitled *Gunsho Ruijū*. The supplement to the *ritsu*, with a commen-

tary by Nakahara Akito, has also been preserved under the title of *Kingioku Shochiusho* (date of compilation, 1207). It may here be remarked that the Japanese codes were from the earliest times based on those of the Chinese, and it was on the laws of the Tang dynasty (619-907) that the above mentioned *Yoro Ritsu* were modelled. The *Ling* (pronounced *Rio* in Japanese) of the chronological period called Kaiyuen (713-'41) are supposed to have been the source of the *Yoro Rio*. This code consists of 30 chapters divided into 10 books, and has been preserved complete in the commentary prepared in 833 called the *Rio no Gige*. An excellent annotated edition of the first eight chapters was published in 1864 by Kondo Yoshiki, under the title of *Hiochiu Rio no Gige Kohon*; it is stated that the remainder is in existence in a manuscript form. A work of equal interest is the *Ruijiu Sandai Kaku*, containing collections of decrees issued between the years 701 and 907, with commentaries thereon. The first, called *Konin Kaku*, in 10 books, dates from 819; the second, or *Joguan Kaku*, was formed in 868, in 12 books; and the third in 907, with the title of *Yengi Kaku*, in 10 books and a supplement. Of the whole 32 books fragments of only 6 have survived, which were rescued from oblivion in the year 1266. Besides the *kaku*, compilations of the *shiki* were made at each of these periods. The first two, named *Konin Shiki* and *Joguan Shiki*, have not come down to us, all that was of any value in them having been preserved in the *Yengi Shiki*. This compilation occupied ten years in formation, and was completed in 927. Of its 50 books, the first 10 are devoted to matters coming under the cognizance of the *Jingikuan*, or "office of the gods," and contain directions as to the ceremonies to be observed at certain festivals, the whole of the *Norito* or liturgies, and a complete list of the Shinto temples then existing in different parts of Japan. The remaining 40 books treat of the miscellaneous duties of the other departments of the government. It appears to have been first printed in 1648. The *Gishiki*, in 10 books, defines the rites performed at certain festivals, the coronation ceremony, and the general observances of the court throughout the year. The date and author are unknown. The *Dairi Shiki*, or "Court Ceremonies," is the title of a work in 3 books compiled by Fujiwara no Fuyutsugu early in the 9th century. Of the *Hoso Ruijin*, in 230 books, only two have survived; while nine remain of the *Seiji Yoriaku*, an equally voluminous work on administrative law. The *Saiban Shiyosho*, in one book, is a manual of the laws of Tempio (729-'48) and Konin (810-'23), by Sakanoye Akimoto (1138-1210). The *Hokuzan Sho*, in 11 books, by the Dainagon Kinto (966-1041), is said to be the best authority on the court ceremonies since the reign of Ichijo Tenno (986-1011); but it is surpassed in comprehensiveness by the *Goka no Shidai*,

in 21 books, by Oye no Masafusa (1041-1111). The first 11 books treat of the court business during the whole year; the 12th and 13th of Shinto and Buddhist religious festivals; the 14th and 15th of the coronation; the 16th of imperial progresses; the 17th of the mikado's coming of age, his beginning to learn to write, his marriage, the inauguration of the heir apparent and his education, and the selection of princes of the blood; the 18th of proclamations, the alteration of the chronological period (*nengo*), and other similar matters; the 19th of archery, horse racing, &c.; the 20th of certain festivals, the appointments of ministers of state, the education of the mikado's sons, &c.; and the 21st of miscellaneous proceedings of the court. This, as well as the *Shingai Sho* (1439), in 6 books, by the Sadaijin Sanehiro, are continually quoted by the historian Arai Hakuseki in his *Tokushi Yoron*, which is a sufficient guarantee of their value. The *Giogi Shikimoku*, in one book, by the priest Giogi, who died in 749, contains land regulations, sumptuary laws, an estimate of the population, and of the amount of rice and other cereals produced annually at that period. The *Joyei Shikimoku*, also called *Go Seibai Shikimoku*, in one book, was composed under the direction of Hojo Yasutoki, prime minister of the Kamakura shoguns, and is the code of that period. In later times it has been much used as a copy book for children, but it is of great assistance to the historian as a means of understanding the system of administration which was established by the military power after the decadence of the mikados. A good edition, with a commentary, was prepared in 1534 by Sei Soyu. A very interesting book is the *Nitchiu Giogi*, by the mikado Go-Daigo (1319-'39), which details the sovereign's manner of daily life and the duties of the palace attendants. There is also a large class of books called *Nenjiu Giogi*, which describe the festivals and ceremonies of the court for the whole year. The *Seito-tsu*, in 13 books, by Ito Nagatane, explains the ancient institutions of Japan by copious reference to those of China, on which they were for the most part based. Its preface is dated 1724. One of the works on offices most widely known is the *Shokugen Sho* of Kitabatake Chikafusa (1293-1359). It was composed in 1341, without reference to any other work, in bad Chinese, and has been illustrated again and again by various commentators. The best edition is that of Kondo Yoshiki, a Choshu samurai, entitled *Hiochiu Shokugen Sho Kohon*, in 6 volumes; the preface is dated 1854. The *Kuanshoku Biko*, in 8 volumes (1695), is the most complete account of the constitution of the court and government yet produced, and is one of the few works of the kind not written in Chinese. The *Reigi Ruiten*, in 510 books, is a work compiled by order of the second prince of Mito, from about 200 private records of noble families, and is concerned with the ceremonies and etiquette of the mi-

kado's court. There are 214 books devoted to the ordinary transactions of the year, the remainder to the *kagura*, or ancient pantomimic plays performed in honor of the "three divine emblems," praying for rain and fine weather, the accession and abdication of the sovereign, the harvest festival, imperial journeys, the ceremony called *gembuku* (coming of age) of the mikado, the commencement of his studies, his nuptials, births in the imperial family, the mikado's concubines, the change of style (*kaigen*), the forms used in imperial decrees and proclamations, appointment of ministers of state, memorials to the throne, and other kindred subjects. Probably the only copy in existence is that in the public library at Tokio. One president, 15 compilers, 28 scribes, 10 readers, 4 accountants, and 3 overseers were engaged upon it for six hours every other day during 24 years, from 1686 to 1710. Nearly all the works called *Kiroku*, or (family) records, are in manuscript. That of the five noble families called *Sekke* begins with the reign of Murakami Tenno (946-'67), and occupies 210 volumes. It is called the *Huiami no Ki*. There are many more, some of even older date, which would be valuable materials for the historian. The Japanese attach great importance to lineage, and there are several large works on genealogy, the earliest of which is the *Shinsen Shoji Koku*, prepared in 815; the best edition is that published at Kioto in 1807, in 4 volumes. IV. BIOGRAPHY. The earliest specimen of this kind of writing is the *Shotoku Taishi Denriaku*, in 2 books, by Taira no Motochika, written in 992. It is the life of M'ayado no Oji, eldest son of Yomei Tenno (573-621), who was the main instrument in the spread of Buddhism in Japan. An annotated edition, called *Taishi Denriaku Biko*, in 15 volumes, was published in 1678 by the priest Rioi. Of the famous statesman and historian Sugawara no Michizane (845-903), afterward deified under the name of Temman-Gu, many biographies have been written. The earliest is the *Kuanke Godenki*, a Chinese work in one volume, by his relative Nobutsune, which is certainly of not later date than 1118. The *Dazai-fu Temma-gu Kojitsu*, in 2 volumes, by Kaibara Tokushin (1630-1714), relates his life, deification, and subsequent history; it seems to have been written about 1685. The *Kuanke Jitsuroku*, in Japanese, by Matsumoto Guzan (3 vols., 1798), contains much introductory matter about his ancestry, with his life, exile, death, burial, and deification. But the most complete of all his biographies is the *Kitano Koso*, by Ishida Jihei (1840), containing 4 volumes of engravings from ancient drawings illustrative of events in his life, and 10 volumes of extracts from original documents. The *Saigio Monogatari* is a life of the poet Saigio Hoshi (died 1198), in Japanese, by an unknown author, and contains a large quantity of the verses made by him on various occasions. It was first printed in 1562.

The *Muso Koku* (3 vols.) is the life of the Buddhist priest Muso Kokushi (1275-1351), founder of the monastery of Tenriuji at Saga, near Kioto. Eight or nine priests seem to have shared its authorship, one of whom was the third abbot of Tenriuji, so that it cannot be of later date than the end of the 14th century. The *Genkio Shakusho*, in 15 volumes, is a work in Chinese, containing short biographies of over 400 priests, emperors, nobles, and other persons famous for their devotion to Buddhism, and embraces a period of more than 700 years, beginning with the introduction of Buddhism in the 6th century. It was compiled by the priest Koguan, and presented by him to the mikado in 1322. The *Fuso Zenrin Sohoden*, in 10 volumes (1675), by the priest Kosen, contains the lives of 117 priests of the Zen sect. Other works of a similarly comprehensive nature are: the *Hiakushoden* (2 vols.), containing accounts of famous warriors and chieftains from the mythological age down to Shibata Katsuiye and Toyotomi Hideyoshi, by Hayashi Doshun and his sons, Shunsai and Shuntoku; Utsunomiya Yuteki's *Nihon Kokin Jimbutsushi* (7 vols., 1668), containing notices of generals, famous families, faithful retainers, traitors, virtuous and intrepid samurai, Chinese scholars, physicians, women, and artists; the *Fuso Initsuden* (3 vols., 1664), in Chinese, by the priest Gensho (1623-'68), consisting of notices of 75 persons noted for strange and solitary habits; such as Yen no Shokaku, who lived in a cave for 30 years, and made spirits do his bidding; Fushimi no Okina, who lay on the ground for three years with his eyes directed eastward, during the whole of which time he never uttered a word; Kachio no Shonio, who became a monk at the age of seven, and lived for many years tasting food only once in five days, and never spoke; and the Shiradashi no Okina, an old man who was always 70 years of age, and had been so ever since the memory of the living; the *Honcho Retsujiden* (10 vols., 1655), by Kurozawa Hiroto, in 10 sections, devoted to famous women since the reign of Korei Tenno (290-215 B. C.); the *Honcho Hime-kagami*, in 20 vols., by the priest Rioi (1661), a collection of lives of famous women, written for his daughter in Japanese; the *Sentetsu Sodan* (9 vols., 1816), by Tojo Tagayasu, notices of 72 native Chinese scholars and authors of the 17th and 18th centuries, in Chinese; *Kinse Kijinden*, lives of about 80 poets and Japanese authors of the 17th and 18th centuries (5 vols., 1790), by Banno Kokei (1733-1806); *Shoku Kinse Kijinden* (5 vols., 1795), a supplement to the last named work, containing notices of nearly 100 writers, by Mikumi Shiko; and *Sentetsu Sodan* (4 vols., 1844), by Tokusai Gengi, in Japanese, containing the lives of 20 modern native Chinese scholars and authors. Besides these, the 9th volume of *Tamadasuké*, by Hirata Atsutane (1780-1843), is occupied by biographies of the famous Shinto revivalists

Kada no Adzumamaro, Mabuchi, and Motoōri Norinaga, written in excellent classical Japanese, and conceived on a proper method. The *Sanjiurokka-shiū Riakuden*, in 2 small volumes, by Kawagita Mahiko (1848), is a handbook of reference for the lives and productions of 36 native authors of the same period.

V. POETRY. In poetry the Japanese do not seem to have advanced much beyond the most elementary forms. With few exceptions their so-called poetry consists of songs in five lines of 31 syllables called *uta*. These songs seem in early times to have been spontaneous compositions, but about the middle of the 8th century they had hardened into a conventional form, and verse making became a mechanical accomplishment, of which dexterity in punning was the most important part. Assemblies were held by the amateurs of versification, at which lots were drawn for a certain number of subjects, and the greater part of the *uta* which are contained in the numerous selections originated in this manner. The most ancient songs are no doubt those which are given in the *Kojiki* and *Nihongi*, and next to them in point of time must probably be ranked the *naga-uta* in the *Manyōshū*. A *naga-uta* (or "long song") ought to consist of unrhymed lines of 5 and 7 syllables alternately, terminating in two lines of 7 syllables each; but this rule is by no means inflexibly adhered to. The first *naga-uta* in this collection will serve as a specimen; the numbers of the syllables are 5, 6, 5, 6, 5, 5, 5, 5, 4, 7, 5, 7, 5, 6, 5, 6, 7. In the shorter songs, ordinarily 31 syllables in length, an extra syllable is sometimes admitted; and if we are to believe the native commentators, it is also permissible to insert here and there, to make up the measure, odd syllables without any meaning. Another kind of short song, called *sedoka*, consists of six lines of 5 and 7 syllables, arranged in the following order: 5, 7, 7; 5, 7, 7. This, however, admits of certain modifications. The actual date of the compilation called the *Manyōshū* is disputed; the usual account is that it was commenced in the middle of the 8th and completed early in the beginning of the 9th century. It contains 4,315 of the 31-syllable songs and *sedoka*, and 250 *naga-uta*, arranged in 20 books. The critics classify them as follows: various songs; songs of the affections, chiefly amatory; pathetic songs; songs involving a simile; and songs of the four seasons. Great difficulties exist with regard to the proper reading of the *Manyōshū*, on account of its being written with Chinese characters, which sometimes stand for whole words and at others for single syllables. The first approach to a correct interpretation is believed to have been made by the priest Keichiu (1640-1701). He was followed by Kamo no Mabuchi (1698-1769), whose edition, entitled *Manyōko* (9 vols.), is highly esteemed, and by Kato Chikage (1734-1808), whose edition in 30 volumes, called *Manyōshū Riakuge*, is perhaps the best, though by no

means perfect. The earliest of all the songs in the *Manyōshū* is that ascribed to Yuriaku Tenno (457-'59); the best are contained in the 1st, 2d, and 13th books; then come those in the 11th, 12th, and 14th. The *Kokin Wakashū*, the second of the compilations made by order of the mikado, was commenced in 905 and finished about 922. The preface is one of the oldest specimens of Japanese compositions in hiragana, the Chinese character having been exclusively employed up to that time. The object of this collection was to preserve for posterity those verses which had not been considered worthy of a place in the *Manyōshū*, but it also contains many of later date. The whole number of songs is estimated at 1,099, classified as follows: spring, summer, autumn, winter, felicitations, parting, journeys, names of things, love, pathetic, miscellaneous, *naga-uta* (5), *sedoka* (4), *haikai*, and *o-naobi no uta*. The best commentary on this collection is the *Kokin Wakashū Uchigiki* (20 vols.), by Kamo no Mabuchi; the *Tokagami* (6 vols.), by Motoori Norinaga, is an explanation of the songs in the common colloquial dialect of Kioto. The *Gosen Wakashū*, in 20 books, was compiled about the middle of the 10th century; it contains 1,356 songs, classified much in the same way as those in the *Kokinshū*. The *Shiū Wakashū* dates half a century later, and contains 1,351 songs, among which are a few *naga-uta* and *kagura-uta*. These three together are known as the *Sandaishū*. There are innumerable other collections made at the mikado's command and by private persons, besides selections of 100 songs, each called *Hiakushū Kūi*. The best known of the latter works is the *Hiakuninshū*, which is the most popular classic of the Japanese; it was formed about the year 1235 by a court noble, commonly called Teika Kio. The commentaries on it are very numerous, but the best are the *Uimanabi*, by Mabuchi, the *Hitoyogatari* (1833), and the *Mine no Kakehashi* (1805). A translation of the *Hiakuninshū*, with notes, has been made by F. V. Dickins (London, 1866). A better work on Japanese poetry is the *Anthologie japonnaise* of Léon de Rosny (Paris, 1870), to which is prefixed an excellent treatise on the different kinds of Japanese poetry.

VI. ROMANCES. "The term *monogatari* is used to denote a class of composition which differs from history in that the author makes no attempt to sift the true from the fictitious, but simply records the current tradition respecting the hero or heroine." This definition, which is that of Mabuchi, is not applicable to all *monogatari*. In some cases individuals who actually existed at some time or other have been made the heroes of fictitious adventures, while others have not even that slight basis of fact. Certain of the *monogatari* are collections of verses, with short stories attached, which profess to give the circumstances under which they were composed; while others which bear the title are in reality his-

torical. But the *monogatari*, properly so called, is essentially a fiction, and the word "romance" is the closest English equivalent. The earliest of these is the *Taketori Monogatari*, the authorship of which is sometimes ascribed to Minamoto no Shitagau (911-'83), but some writers think it belongs to the first half of the 9th century. An old man finds a little girl only three inches high in a joint of bamboo, whom he adopts and educates. She grows up into a beautiful young woman, and is solicited in marriage by five noble suitors, upon whom she imposes various labors, in which they all fail to satisfy her. The mikado also falls in love with her, and offers to make her his concubine, but she refuses. Shortly afterward she makes known to her protector that she is an inhabitant of the moon, banished to earth for some offence, and that the period of her penance being about to expire, she must soon return thither. The old man's protestations are of no avail, and she is finally carried off by her father's messengers in a flying chariot, much against her own will, and in spite of 2,000 guards placed around the cottage and on its roof by the mikado. The parting is described in a most pathetic manner. She leaves behind her farewell letters to the old man and to the mikado, and the elixir of immortality. The mikado causes the elixir to be burnt on the top of a lofty mountain in Suruga, which thenceforward is called *Fuji no Yama*, "the immortal mountain." The *Utsubo Monogatari* is a collection of 14 stories which fill 20 volumes. It is also ascribed to the author of the previous work, and is evidently one of the earliest extant. In the *Toshikage no Maki*, one of these stories, are related the adventures of a young man who is shipwrecked in a strange country, where he falls in with animals who speak, giants, and the like, and he finally returns home with some magic harps. Two of these he bequeaths to his daughter when he dies. A young nobleman, attracted by the strange music which proceeds from her dwelling, passes a night there, and never returns. She bears a son who performs wonders of filial piety, and feeds her with roots which he digs in the mountains. On the approach of winter he removes her to a cave vacated for them by a family of bears, and the apes who inhabit the surrounding hills bring them food and water. At last she is rediscovered by the young nobleman, who is now grown up to ripe manhood, as he is hunting in the mikado's train, and they live together happily for ever after. The *Hamamatsu Chirunagon Monogatari* is the story of a nobleman who goes to China, has a child by the empress, and then returns to Japan. The *Sumiyoshi Monogatari* is the story of a young girl, the illegitimate daughter of a nobleman, who has two other daughters by his own wife. When the heroine is about eight years of age her mother dies, after earnestly praying her lover to send her child to the palace to become one of the mikado's wait-

ing women. He takes her to live in his own house, in separate apartments, and the affection he displays for her excites the hatred of her stepmother. After a while the heroine's foster mother also dies, and she is left alone with her foster sister, a girl two years older than herself, through whom she enters into a secret correspondence with a young nobleman who has fallen in love with her from report of her beauty. The father constantly speaks of sending her to the palace, which excites the jealousy of the stepmother, and her ruin is determined on. With a hypocritical affectation of concern the stepmother tells her husband that she has seen a priest get out of his daughter's window at dawn; and when he refuses to believe this, she conspires with a wicked maid servant and bribes a priest to come to the house and play the part of detected lover. Upon this he is convinced, upbraids his daughter, and orders her to marry a man of rank whom she does not know; but rather than disobey, she is ready to consent. When the stepmother finds that she has been so far unsuccessful, she plots again to have the object of her hatred stolen away by a horrid old man, whose lust is inflamed by the promise of a beautiful girl for his mistress; but the plan being divulged to the young girl and her foster sister by a friendly female servant, they make up their minds to flee to Sumiyoshi, where the late nurse of the dead foster mother is living as a nun. This they accomplish successfully, and the author takes advantage of this opportunity to introduce some very effective description of seaside scenery. The lover is desperate, and resolves to become a hermit, but the hiding place of the young lady is revealed to him in a dream and he proceeds in search of her. Having found her out, he disguises her as a peasant girl and brings her back to Kyoto, where they are secretly married and have two children. The father is disconsolate at the flight of his daughter, but after seven years is invited to a feast by the young noble, and discovers in his wife his long lost favorite. Upon this the wickedness of the stepmother is revealed, and she suffers the penalty of her misdeeds by dying in misery and want. All the partners of her guilt are duly punished by avenging fate, and the father retires from the world, while all the good people in the story have their reward. The *Ise Monogatari* is the history of the love adventures of a noble celebrated for his beauty, named Ariwara Narihira (825-'80), and contains a large number of verses written by himself and his numerous sweethearts. It is considered to be a model of good Japanese prose. The precise date of its composition and the name of its author are unknown, but Mabuchi thinks it belongs to the middle of the 10th century. A similar work is the *Yamato Monogatari*, in two books, the authorship of which is ascribed by some to Shigeharu, the son of Narihira, and by others to the mikado Kuazan-In (968-1008); but the

probability is that while both of them had a hand in it, it was brought into its present form by a third person. The *Ochi-kubo Monogatari* is the story of a young lady of rank who is persecuted by her stepmother, and kept out of sight in a sunken room, but is rescued by a nobleman, who marries her, and has by her a daughter who becomes empress. Minamoto no Shitagau is said to have been the author; Mabuchi is of opinion that even if this be not the fact, it must have been written about the reign of Reizei-In (967-'9). It is inferior to the *Sumiyoshi* in interest. Of all these romances the most celebrated is the *Genji Monogatari*, in 54 books, by the poetess Murasaki Shikibu, who flourished at the beginning of the 11th century, the composition of the work being referred usually to the year 1004. It relates the amorous adventures of Hikaru Genji, the son of the mikado's favorite concubine. The titles of the various books into which it is divided are chiefly taken from the names of the women whom he loved. In point of style it is considered to be far superior to all the other monogatari, being far more ornate; but the plot is devoid of interest, and it is only of value as marking a stage in the development of the language. The best edition is that entitled *Kogetsusho*, by Kitamura Kigin, a scholar of the 17th century. The *Sagoromo*, in 8 books, is a love story which takes its name from the hero. The author was Daini no Sammi, daughter of Murasaki Shikibu, and nurse to Ichijo-In (born 986), and it is thought to have been composed about 40 years later than the *Genji Monogatari*. The *Idzumi Shikibu Monogatari* is a diary of the amours of Idzumi Shikibu and the fourth son of Reizei-In, and contains all the verses which they sent to each other. Its date is about the end of the 10th century. The *Torikaibaya* is of later date than the *Sagoromo*, but the name of its author is unknown. A somewhat involved plot is founded upon the following incidents. A noble has two children, a girl and a boy, each of whom from a very early age displays the characteristics of the opposite sex, the boy being fond of playing with dolls and painted shells, averse to women, and of a retiring modest disposition, while the girl constantly seeks the society of young men, with whom she plays at foot ball, practises archery, blows the flute, and sings songs. The father is much troubled by the double perverseness of his children, and exclaims, "If I were to change them," which is the title of the romance. He puts this idea into execution, and brings up his daughter as a boy and his son as a girl. The consequences are of the same kind as those which follow upon Don Juan's introduction into the seraglio as a female slave. Of the *Ima Monogatari*, which was originally a large work, only one book now remains. It contains a number of uninteresting stories, invented no doubt to serve as settings to certain songs of no great value. The authorship is ascribed to Nobuzane, who flourished at the end of the

12th and beginning of the 13th century. The *Konjaku Monogatari* is a collection of Japanese, Chinese, and Indian stories by Minamoto no Takakuni (died in 1077), in 60 volumes, divided into customs, wonders, crimes, retributions, Buddhism, and miscellaneous. The *Uji Shivi Monogatari*, in 15 volumes, is a supplement to the above. The *Tsutsumi Chiunagon Monogatari*, in one volume, is a collection of ten short tales, ascribed to Fujiwara no Kanetsuke (877-933); and if this be correct, it is one of the earliest specimens of purely Japanese composition. The *Aki no Yonaga Monogatari* recounts the loves of a priest named Keikai and a young prince, the consequence of which was a war between the monasteries of Miidera and Hiyeizan, in the reign of Go-Horikawa (1222-'33). The boy drowned himself and the priest became a hermit. The style is overloaded with Buddhist terms, and it is evidently the composition of a priest. The *Matsuhō Monogatari* is a similar love tale with a tragic ending. Among these romances are many which still remain in manuscript, and of those which have been printed no copies older than the 17th century exist. The consequence is that the text of many is extremely corrupt, or at least doubtful; but in spite of this defect they are of great value for philological as well as for other purposes. VII. MISCELLANIES. There is a small class of books called *soshi* or miscellanies, which belong to the classical period. The earliest of these is the *Makura no Soshi*, by Sei Shonagon, a daughter of Kiyowara Motosuke, and waiting woman to Joto-Monin (988-1077). It is a medley of autobiographical fragments, observations on society, descriptions of natural objects, court ceremonies, and scattered notes of all kinds, impregnated with wit of the highest order. The *Boroboro no Soshi*, in one book, by Mioye Shonin (1174-1233), who is said to have first introduced tea into Japan, is the history of the two sons of a Kioto woman who was never seen except at night; after her death they become mendicant priests. This composition ought no doubt to be classed with the monogatari. The most famous of the miscellanies is the *Tsurezure-gusa* of Kenko Hoshi (1282-1350). It contains 244 short chapters on morals, offices, ancient customs, the seasons, the proper use of words, society, and anecdotes. In form it is an imitation of the *Makura no Soshi*, and its style is modelled on that of the *Genji Monogatari*, which in the 14th century was becoming obsolete. The commentaries on it are numerous, but that of Kitamura Kigin, entitled *Mondansho*, is the best. The *Shosho Daisei* is a variorum edition, and clumsily arranged. The *Otogi Zoshi*, in 23 volumes, is a collection of stories which belong to different periods, the latest being of the 17th century, and it ought properly to be classed with the monogatari. The *Oriorigusa*, by Tate Riotaï, a pupil of Mabuchi, is a collection of notes made by the author on his travels. VIII.

JOURNALS. The earliest of these is the *Murasaki Shikibu Niki*, composed by her after she was left a widow. It contains descriptions of various events at the court, written in a highly ornate style, and the title is scarcely appropriate. The *Kagero Niki*, by the mother of Michiami, is a record of her connection with Michikane, beginning with the year 954, and coming down to 974. The *Ben no Naishi Niki* is a record of events beginning with the abdication of Go-Saga no In in 1246, and ending with 1252, also by a woman. The *Hojoki*, by Kamo no Chomei (beginning of the 13th century), contains accounts of the great fire in 1177, the hurricane of 1180, the removal of the capital to Kioto in the same year, the famine of 1181, and the great earthquake of 948. The *Fuji Goran no Ki* is the journal of a visit made by the shogun Yoshinori (1429-71) to Fuji no Yama. The *Saiokuken Sochoki* and the *Socho kuku no Ki* are autobiographical notes by the priest Socho (born 1447, lived beyond 1526). IX. TRAVELS. The *Tosa Niki*, by Kino Tsurayuki, is a diary of his journey back from Tosa to Kioto in 935. The author conceals his personality by writing in the style then supposed to be exclusively employed by women. The *Suma no Ki* purports to be the diary of Sugawara Michizane on his way to exile in Chikuzen; but although its style is exactly that of the older literature, it is a manifest forgery, for it speaks of the heroine of the *Taketori Monogatari*, a book written some time after the death of Michizane. The *Matsushima Niki*, attributed to Sei Shonagon, is also condemned by the best judges as a recent forgery. The *Sarashina Niki*, by the daughter of a descendant of Michizane, is the record of a journey from Shimosa to Kioto by the *tokaido* in the year 1021, and a second journey from Kioto to Sarashina, in Shinshiu, a few years later. The *Izayoi Niki* is the journal of Teika Kio's widow on a journey to Kamakura to obtain justice for her son Tamesuke against his elder brother Tameuji. It is written in good style, and appears to be merely a vehicle for introducing verses made by the way at each post town. The *Fujikawa no Ki* is the journal of Ichijo Kaneyoshi (1402-81) as he was fleeing from Kioto to avoid the civil war of Onin (1467). The *Shoko Niki* is a diary of a journey from Kioto to Suruga in 1473. The *Shirin Ikoshuu*, in 6 volumes, is a collection of journeys by different persons, made by Miyagawa Issuishi. All these works belong to the purely ornamental literature. A magnificent collection of fragments of this kind is the *Fuso Shiyoshuu*, in 36 volumes, compiled by order of the second prince of Mito. There exists a supplementary collection called *Shinui Goyoshuu*, in 26 volumes, by Eda Seikio, which ranges over nearly eight centuries, from the beginning of the 10th down to near the end of the 17th. It has not been published. X. DRAMATIC. The Japanese drama is of three kinds: the *no*, a kind of historical play, generally of a tragical cast; the

kiogen, or low comedy; and the *yoruri*, a mixture of the two. The former have been collected, and are known as *utai*; they date from the time of the shogun Ashikaga Yoshimasa (1449-90), and are still played with the costumes of that period. There are five editions which slightly differ among themselves, a fact which is due to their having been separately preserved by as many families of hereditary actors, named Kanze, Hoshō, Komparu, Kongo, and Kita. The *kiogen* are in the colloquial language of the same period, and possess great philological value. Fifty of them were printed in 1662, under the title of *Kiogenki*. The *Mai no Hon*, also called *Kowaka Zoshi*, is a collection of 36 ancient plays which are no longer acted, but recited with musical intonations by a single performer, without scenery or costume. The *yoruri* are the modern plays, which are either acted on the stage by actors and a chorus, or recited by a single person to the accompaniment of the three-stringed lute or *shamisen*. XI. DICTIONARIES AND WORKS ON PHILOLOGY. The earliest dictionary is the *Wamio Ruijiu-sho*, in 20 books, by Minamoto no Shitagau (911-83). It contains a number of Japanese words, with the corresponding Chinese characters, definitions, and quotations from five or six works. The whole is divided into the following categories: 1, heaven; 2, earth; 3, water; 4, divisions of the year; 5, demons and gods; 6, social relations; 7, relatives; 8, parts of the body; 9, arts and accomplishments; 10, music; 11, offices; 12, provinces and departments; 13, dwellings; 14, ships; 15, vehicles; 16, kine and horses; 17, treasures; 18, scents and drugs; 19, lamps, &c.; 20, woven fabrics; 21, clothing; 22, utensils, weapons, instruments of punishment, &c.; 23, household utensils; 24, eating and drinking; 25, grain; 26, fruits; 27, vegetables; 28, winged tribe; 29, hairy tribe; 30, scaly tribe; 31, insects; 32, trees and plants. It is said to have been prepared at the command of one of the princesses. The *Shinsen Jikio* is a dictionary of Chinese characters, arranged according to the radicals, with the Chinese pronunciation according to the system of spelling called *hansetsu* (*fan tsieh*), and the Japanese equivalents, completed by the priest Shojiu in 892. Only one volume remains out of twelve. At the end there are collections of double characters and onomatopœiæ. As a general rule, however, the Japanese have contented themselves with reprinting the best known Chinese dictionaries, such as the *Yu-pien*, Kanghi's great lexicon, and the *Wache-yun-suy*. Of these the first has also been translated into Japanese. There is a useful dictionary in two volumes called *Shinso Jibiki*, with the Chinese characters in the square and cursive forms, and the Japanese equivalents in hiragana. Dictionaries of the Japanese language came to be made only after the revival of learning in the 17th century. The first of these is the *Nihon Shakumei* (1699), by Kaibara Tokushin (1630-1714), in which an

attempt is made to give the etymologies of words, arranged under 23 categories. The *Toga*, by Arai Hakuseki (1657-1725), is an etymological and explanatory dictionary of Japanese words, in 20 books, arranged according to categories. The author has abstained from attempting to give any derivations of which he did not feel sufficiently certain. The most valuable dictionary of the Japanese language is the *Wakan Shiori* of Tanigawa Shisei, who flourished during the latter part of the 18th century. The first portion (45 vols.) contains about 18,000 words, among which are to be found the greater part of those which occur in the ancient literature, with examples. The second portion (30 vols.) contains about 12,000 words, many of which are of Chinese origin. A third part was promised, but has never been published. The arrangement is according to the 50 sounds, which is a great improvement on the old arrangement according to categories. The *Gagen Shuran* (21 vols., of which only 9 have been printed), by Ishikawa Masamochi, is a dictionary of Japanese words, with multitudinous examples, but few etymologies or explanations. In 1872 the educational department of the mikado's government commenced the publication of a gigantic dictionary, which was to contain all the words in use from the earliest periods down to the present, with examples. Only 5 volumes, containing the words beginning with A, have appeared as yet, and it is feared that the project has been abandoned. The *Wakan Gorui Osetsuyoshū*, in 13 volumes, is an excellent dictionary of Japanese words with their corresponding Chinese characters, arranged first by categories, and then according to the *iroha*; but it contains neither definitions nor derivations. Owing to the Japanese generally writing their own language with Chinese characters, using the *kana* only for terminations and particles, they have as a general rule been always very ignorant of spelling. The earliest attempt at rectifying the mistakes which were committed by those who used the *kana*, chiefly for writing poetry, was the *Kanamoji-tsukai*, by Gioa, founded on the spelling of Teika Kio. A fuller edition of this was published in 1666 by Arakida Moriaki, under the title of *Ruiji Kanadzukai*. Neither of these works is a trustworthy guide. Keichū (1640-1701) compiled the *Waji Shoransho* (5 vols.), a spelling book, with examples from the *Rikkokushū*, *Kujiki*, *Kojiki*, *Manyōshū*, and other classical writings. The *Waji Tsureisho*, in 8 volumes, is an attack on the last named book, by Tachibana Narikazu. The *Kogentei* (1765), by Katori Nahiko, is an alphabetically arranged list of words showing the correct ancient spelling. It is considered a very good authority on the subject. The *Fion-kana-dzukai*, by Motoōri Norinaga, treats of the proper spelling of the pronunciation of Chinese characters, a subject about which there seems to be much difference of opinion among scholars. The *Kanji Sanonko*, by the same author, discusses

the origin of the *kan-on*, *go-on*, and *to-on*. Hirata Atsutane's *Koshi Honji Kio* (4 vols.) is a most elaborate treatise on the sounds of the Japanese language, and the various kinds of transformation which they undergo. The *Dobun Tsuko* (4 vols.), by Arai Hakuseki, is a valuable work on the origin of Chinese characters and the two *kana*. The *Watoku Yorei*, by Dazai Shuntai, is a similar work. A large number of grammatical works have been the result of the great impulse given to Japanese studies by the revival of learning, chiefly produced since the beginning of the 18th century. Aston's "Grammar of the Written Language" contains a pretty complete list of the more important writings of this class. It may be observed that the efforts of native grammarians do not go beyond the accident of the language. XII. TOPOGRAPHY. In the year 713 orders were despatched to the governors of all the provinces to give lucky names to the departments and villages, and to record the names of the metals, plants, trees, birds, beasts, fishes, and insects produced in each department; the quality of the land, whether fertile or otherwise; the origin of the names of mountains, rivers, plains, and moors; and the local legends. The last volume was completed in 734. It is a constant subject of regret with Japanese scholars that so much of this great work should have perished, for out of 66 volumes, only the volume on Idzumo and fragments of 44 others have survived the ravages of time and civil war. From this time up to the 16th century the subject seems to have been completely neglected. About 1580 was produced the *Nihon Kokubun Ki*, in 10 books, by an unknown author; it is an account of the productions of each province, with maps. Kaibara Tokushū compiled a "History of the Province of Chikuzen" (*Chikuzen no Kuni Shoku Fudoki*), in 28 books, and "Travels in various Provinces" (*Shōshū Meguri*, 7 vols.). Other works of this class are *Yōshū Fushi*, in 10 books, by Kurokawa Doyu, a history of Yamashiro in the Chinese language (1684); *Sanshū Meisekishū*, by Hakuyē, a description of Yamashiro (25 vols., 1702); *Yamashiro Meishoshi*, compiled from 713 works, all of which are quoted literally (30 vols. and 12 maps, 1705); *Yamashiroshi* (9 vols.), *Yamato-shi* (7 vols.), *Kowachishi* (3 vols.), *Idzumishi* (2 vols.), and *Setsushi* (4 vols.), by Nabikawa Nagashi, early in the 18th century; *Yamato Meishkōi* by Hayashi Soyu (15 vols., 1681); *Setsuyo Gundan*, a description of Setsu, by Okada Keishi (17 vols., 1698); *Shinsen Kamakurashi*, by order of the second prince of Mito (12 vols., 1685); *Dankaishi*, a description of Omi, with local legends, by an unknown author; and the *Shinano Chimeiko*, a history of the province of Shinano, by Yoshizawa Kōken (3 vols.). Besides these more serious works, there is a large class of illustrated topographical works of a popular nature, such as the *Tokaido Meishodzuyē*, *Nikkōanshū*, *Kiso Meishodzuyē*, *Yedo Meisho*, *Kioto Meisho*, *Kii Meisho*,

and *Ise Sangu Meishodzuyue*, which are in general repute for their accuracy and the excellent wood engravings in which they abound. XIII. LITERATURE OF THE SHINTO RELIGION. The best sources of the study of pure Shinto are the *Kojiki*, the *Nihongi*, and the *Norito*, already mentioned, with the works of Motoōri Norinaga and Hirata Atsutane on the same subject. The *Kojikiden* of the first is a monument of learning and industry; it contains the *Naobi no Mitama*, or "Spirit of Good," a summary of Motoōri's view. This having been attacked by an anonymous author in the *Maga no Hire*, he replied to his antagonist in the *Kuzuhana*, with further developments of his position, namely, that mankind are born with a capacity for distinguishing right from wrong, the test of which is the will of the mikado, and that the Chinese system of morals, which is an invention of immoral men for an immoral age, has corrupted the original perfection of the Japanese heart. The *Kenkio-jin* ("The Madman Fettered") is a polemic against the author of a book called *Shoko Haisu*, who had maintained that the age of the gods was a barbarous age, and had spoken disparagingly of the mikados. It is a pity that so much acuteness and erudition as Motoōri possessed should have been thrown away in defending views of which the logical effect would be to enslave the whole Japanese nation. His *Jindai Shogo* is the mythological part of the *Kojiki*, with additions from the *Nihongi*, in a mixture of Chinese characters and *kana*, with *kana* at the side, for the use of the young. The *Rekicho Shoshi-kai* is a collection of the speeches and proclamations of the early mikados, with a commentary, which from his point of view are part of the sources of Shinto. Mabuuchi had already explained the liturgies in his *Norito-kai* and *Norito-ko*. Hirata Atsutane followed Motoōri's lead with the *Koshi Seibun*, which presents the whole of the mythological books worked up into a continuous and consistent form, and he added a commentary in 100 volumes, entitled *Koshiden*. This work is distinguished by an almost painful elaboration of details, both mythological and philological, but is of great value to the student. In his *Zoku Shinto Taii* (4 vols.) Hirata has given an account of the various sects of corrupt Shintoists, which number 15 or 16. Besides the works of these men, there are certain collections of ancient Shinto books which are still considered orthodox. The earliest is the *Shinto Gobusho*, containing five separate works: 1. *Yamato-bime no Seiki*, said to have been composed in the reign of Temmu Tenno (672-'86), and afterward enlarged in that of Tenchi (765-'70). This princess was in the year 30 B. C. appointed guardian of the sacred emblems of Tenshokodajin, with which she travelled about in order to find a location for them. In 4 B. C. she settled down in Ise, and is said to have lived about 400 years after this. 2. *Gochinza Shidaiki*, an account of the establishment of

the two temples at Ise; date of composition unknown. 3. *Go chinza Honki*, an account of the establishment of the Geku, ascribed to the reign of Keitei Tenno (507-'31). 4. *Gochinza Denki*, a work similar to the second, said to date from the reign of Yuriaku (457-'79). 5. *Hoki Honki*, an account of the manufacture of the divine emblems, composed in the reign of Shomu Tenno (723-'49). There is a commentary on these five works entitled *Shinto Gobushosho*, by Okada Masanori (1721). The *Daijin-gu Gishikicho* (804) describes the ceremonial at these two temples throughout the year. The *Tenchi Reiki no Ko*, in 18 books, contains a mixture of Buddhism and Shinto; it is ascribed by some to Shotoku Taishi, by others to Kobo Daishi, who invented what is known as the Riobu Shinto, a harmony of that religion and Buddhism. This work, and two others of the same nature, the *Jim-betsuki* and *Tenshoki*, are now asserted to be modern forgeries by Buddhist priests. The *Kogoshiui*, by Imube no Hironari (807), professes to have been written to preserve fragments of ancient traditions which had not been recorded in any of the earlier books; but the author's main object was to prove the descent of his own family from the gods. Nevertheless, the work is of great value, and was largely used by Hirata in compiling the *Koshi Seibun*. The *Yuitsu Shinto Mioho Yoshuu* (2 vols.) is a work designed to prove that Shinto and Buddhism are identical in their essence. The majority of treatises on Shinto prior to the 17th century maintained this view. An exception is the *Gengenshiu* (8 vols.), by Kitabatake Chikafusa. It treats of the origin of the world, of the coming into existence of the two races of gods, the heavenly and the terrestrial, the creation of Japan, the delivery of the sacred emblems by the sun goddess to her grandson before his descent upon earth, the foundation of the temples of Ise, and other articles of the Shinto faith. The *Nijiu-issha Ki* is an account of 21 principal Shinto temples, by Fujiwara no Korechika (Gidosanshi, 973-1010). The *Koro Kojitsuden* contains information about the ceremonial at the temples of Ise, the old costumes preserved therein, the messengers of the gods (the fox, crow, common cock, serpents), &c. These two works are also considered good sources of information by rigid Shintoists. The *Shinto Shiu* (8 vols.) is one of those now condemned on account of its confusing the two religions; it treats of the origin of Shinto, the gods of Hachiman, Shinto archways (*torii*), &c., and gives a list of the Shinto gods in various provinces who were disguised under Buddhistic names. The *Riobu Shinto Koketsusho*, by Minamoto no Yoshiyasu (6 vols., 1716), is a defence of the sect called Riobu against those who maintain that it is the same as the Yuitsu, the latter being infected with Confucianist doctrines. The *Shinto Miomoku Ruijiusho* (6 vols., 1699) is a description of the accessories

of Shinto worship, such as robes and utensils, and the functions of the ministers, by Watarae no Nobuyoshi. The *Honcho Jinjako*, by Hayashi Doshin (6 vols.), contains the names of all the chief Shinto temples and of the gods worshipped therein; it is considered a good authority on these matters. The *Mosoki*, in one volume, describes burial according to Shinto rites. In the *Jiuniku Ron*, Kenko Hoshi has shown that there is no reason why the flesh of wild boars and deer should not be offered up to the gods, and that down to the reign of Seiwa Tenno (858-76) such meats ordinarily formed part of the mikado's own diet. It was owing to the influence of Buddhism that they came in the middle ages to be looked upon as forbidden food. The *Nakatomi no Harai* is a liturgy ascribed to Tokiwa no O-muraji (middle of the 6th century); but Nobuyoshi and Suiga (the latter of whom has given his name to a separate form of Shinto) assign it to Amenotaneko no Mikoto, a person belonging to the mythological age. However this may be, it seems to have received its present form in the reign of Mommu Tenno (696-707). To Tokiwa no O-muraji is also ascribed the *Rokkon-shajo no Harai*, a work which is repudiated by the pure Shintoists as bearing the distinct traces of Buddhist influence. XIV. BUDDHIST LITERATURE. Buddhism first gained a sure footing in Japan in the reign of the empress Suiko (593-628), and the whole canon has been imported at various times and reprinted. The native works on Buddhism in the Japanese vernacular are not very important. The *Shasekishiu* (10 vols., 1279) is a book on morals by the priest Mujiu, in which he endeavors to make his subject more palatable to the vulgar taste by introducing funny stories. This is a general characteristic of Buddhist teaching in Japan. The *Hosshinshiu*, by Kamo no Chomei, is a collection of stories of converts. The *Sambu Kanasho* (7 vols.), by Koa Shonin of the Jodo sect (1265-1345), consists of three works entitled *Kimei Honguansho*, *Saiyosho*, and *Fushi Sokosho*. Most of the Japanese Buddhist literature, of which there is a considerable quantity, is in the Chinese language, and therefore not easily accessible. The *Shingaku Michi no Hanashi*, *Kiuo Dowa*, and *Teshima Dowa* are collections of sermons by priests who belong to a modern eclectic sect, which professes to derive its doctrines from Confucianism, Shinto, and Buddhism. Three of Kiuo's sermons have been translated by A. B. Mitford ("Tales of Old Japan," London, 1871). XV. MODERN FICTION. This is divided into three classes: *kesaku bon*, which may be called standard novels; *ninjo bon*, or novels of an erotic cast; and *kusa zoshi*, which are popular romances printed in the hiragana, and form the chief reading of women. The most famous author of the first kind of fiction is Bakin. His works are 20 in number, ranging from 5 to 40 volumes each. Bakin was a man of great learning, and his style is almost classi-

cal. Among the *ninjo bon* the most celebrated are the *Hiza Kurige* (90 vols.), containing the history of the travels of Yajirobei and Kidahachi, and the *Misawo Tsuge no Ogushi* (9 vols.), by Jippensha Ikku; and the *Musume Setsuyo*, which describes the love of Kosan and Kingoro, with its tragical ending, by Kiokusanjin. Riuti Tanehiko wrote the *Inaka Genji* (76 vols.) and *Irohobunko* (45 vols.), belonging to the class of *kusa zoshi*. A short romance by the same author, entitled *Ukiyo Rokumai Biobu*, has been twice mistranslated, into German by A. Pfitzmaier (1840), and into English by S. C. Malan (1871). To the class of *kesaku bon* may be added such works as the *Yofu Kogiden* (10 vols.), the *Yehon Chiushingura* (20 vols.), the *Yehon Sangoku Yofuden* (15 vols.), the *Yehon Kokanden* (10 vols.), and the *Honcho Kiushiku Dandzuye* (5 vols.); all of which, though purporting to be founded on historical facts, are in reality pure romances. XVI. MISCELLANEOUS LITERATURE. There are many works which cannot be classed under any of the foregoing categories, and the Japanese therefore mass them together in their library catalogues under this heading. The following are the principal bibliographical works on the native literature: *Honcho Shojaku Mokuroku* (1 vol., 1294); *Nihon Shojakko* (1 vol.), by Hayashi Doshin, containing notices of 120 works by different authors from the earliest times; *Wakan Shojakko* (5 vols., 1702), by Kojima Soi, a list of Japanese and Chinese books printed in Japan between 1595 and 1702, giving the authors' names, and notices of the contents; *Bengi Sho Mokuroku* (3 vols.), on books with the same title, books with two titles, and those which only exist in manuscript, and containing various other information for the book hunter; *Gorui Shojaku Mokuroku Taizen* (12 vols., 1801), containing lists of books printed in Japan, beginning with those engraved by Muso Kokushi (1275-1351), and ending with the period Meiwa (1764-7); *Kokucho Shomoku* (3 vols., 1787), containing the titles of books arranged under different headings, partly chronologically and partly according to the *iroha*; *Wakan Gunsho Sakusha Mokuroku* (4 vols.), containing the names of Chinese and Japanese authors and their works, beginning for the latter with the period Yoro (717-'23), and ending with Kuansei (1789-1808); and *Kindai Meika Chojutsu Mokuroku* (1811), containing the works of the most famous authors of the 17th and 18th centuries arranged according to the *iroha*. The *Wakan Sansaidzuye* is a cyclopædia in 105 books, each of which treats of a separate class of subjects, with an index arranged according to the *iroha*. The *Teijo Zakkai*, in 16 books, is a work of the same nature, arranged in categories, but extending over a narrower field. Being written in the Japanese language, it is more useful to students than the *Sansaidzuye*. The author was Ise Sadatake, and it was published after his

death in 1843. The *Gioku Sekizasshi* (1843), and its supplement (1848), in 20 volumes, by Kurihara Nobumitsu, contain much antiquarian information not to be found elsewhere. The *Shiuko Jisshiu* is a magnificent collection of engravings of antique objects, in 80 folio volumes, arranged under the following headings: copper utensils, seals, inkstones, musical instruments, armor, saddlery, swords, bows and arrows, flags, inscriptions on bells and on tombstones, pictures, and autographs. The *Shincho* (6 vols.), *Monshiu*, *Kanzen Yawa* (5 vols.), and *Inaka Chawa* (5 vols.) are collections of modern tales. The *Sozan Chomon Kishiu* is a work on ordinary Japanese superstitions. The *Honcho Rigen* (10 vols., 1714), by Izawa Nagahide, and *Kotowaza-gusa* (7 vols., 1700), by Kaibara Koki, are collections of proverbs and common sayings, with explanations and derivations. The *Wajishi* and *Kanjishi* (6 vols.), by Kaibara Koko (1697), are works of reference for the introduction of inventions, the origin of customs, &c., in Japan and China respectively. The *Zokusetsu-ben* (1715-'22), by Izawa Nagahide, which with its supplements extends to 51 volumes, is a work on popular errors with respect to mikados, princes, nobles, samurai, women, priests, modern times, houses, topography, persons, offices, arts and accomplishments, books, utensils, music, pictures, seasons of the year, Buddhism, plants and trees, animals, fishes, and insects. Most worthy also of notice is the collection of rare books formed by Hanawa Hokiichi (1746-1821), containing 636 separate works in 530 volumes. These consist of works connected with the Shinto religion (28), history of the mikados (15), appointments of officials (16), genealogies (4), biographies (6), offices (5), laws (4), court ceremonies (35), costumes (10), prose (16), letters (8), Japanese poetry (16), romances (13), diaries (7), travels (14), music (12), foot ball (3), hawking (2), games (6), eating and drinking (5), wars (30), history of the military class (25), Buddhism (21), and miscellaneous (84). Hanawa restricted his labors to works of not over three books each. Thirty years were occupied in collating manuscripts and in the engraving of the blocks, which number about 40,000, and the cost was over \$10,000. In addition to the collections already printed, he got together about as many more books, making a total of about 1,300. So great a work was perhaps never achieved before by any private individual, under similar circumstances. He was blind from infancy.—The history of Japanese literature may be divided into four periods. The first will commence far back in the age which preceded the introduction of Chinese literature and writing, and extend down to the end of the 9th century A. D. During this period the only purely Japanese literature consisted of poetry and sacred liturgies, the Chinese language being adopted as the vehicle of all other forms. The beginning of the second period is marked by the preface

to the *Kokinshiu*, and ends with the later romances, extending thus from the early years of the 10th to the end of the 13th century. This is the age of classical prose. The *Tsurezuregusa*, though composed in the 14th century after earlier models, belongs properly to this period. Up to this time learning was confined to the immediate vicinity of the court. During the 14th, 15th, and 16th centuries the domination of the military class put an effectual stop to its cultivation except by a few priests. This was the dark age of Japan. With the 17th century begins the fourth and modern period of general culture, inaugurated by Iyeyasu, the first of the Tokugawa shoguns, who, after firmly establishing the power of his family, and reducing the other military chiefs to the position of vassals, devoted his later years to collecting manuscripts. Though the art of printing seems to have been introduced in the 13th century, it had not yet been turned to much use, and the rapid multiplication of books by its aid dates from his time. Chinese literature began to be ardently cultivated by a succession of scholars, of whom Hayashi Razan (also called Doshin, 1583-1657) and Ishikawa Jozan (1583-1672) were the earliest. Among their successors the most distinguished were Hayashi Shunsa (1618-'80), Hayashi Shuntoku (1624-'61), Nakaye Tojiu (1608-'48), Yamazaki Ansai (1618-'82), who under his other name of Suiga is known as the founder of a separate school of Shinto, Kumazawa Banzan (1619-'91), Ito Jinsai (1627-1705), Nakamura Tekisai (1629-1702), Kaibara Tokushin (1630-1714), Arai Hakuseki (1657-1725), Ogiu Sorai (1666-1728), Miwa Shissai (1669-1744), Ito Togai (1670-1736), Dazai Shuntai (1680-1747), Hattori Nankuaku (1683-1759), Ando Toyu (1683-1719), Yamagata Shiunan (1687-1752), Hirano Kinkua (1688-1732), Usami Junsui (1710-'76), and Rai Sanyo (1780-1832). These writers all belong to the class called *jiusha*, or Chinese scholars, but they also wrote in the Japanese language. Arai Hakuseki's *Tokushi-Yoron*, *Toga*, *Gejiriaku*, *Koshi-tsu*, *Seiyo Kibun*, *Sairan Igen*, and *Seiyo Dzusetsu*, Sorai's *Seidan* and *Keizai-ron*, and Dazai's *Keizai-roku*, are all works of great merit in the vernacular. Sorai also did great service by translating Chinese standard works, not the least important of which is the penal code of the Ming dynasty. About the same time the ancient literature of Japan began to be studied with great attention by men who received little countenance and encouragement from the shoguns. The leaders in this movement were the priest Keichiu (1640-1701), Shimokawabe Choriu (1622-'84), and Kadan Adzumamaro (1669-1736), the last of whom may be fairly regarded as the founder of the modern school of pure Shinto. Keichiu is the first who made any real progress in interpreting the ancient poems of the *Manyoshiiu*, but he made no original contributions to the literature of his country. To these men succeeded Kamo no Mabuchi, whose commentaries on

the *Manyōshū*, on the *Norito*, and the *Ise Monogatari*, and lexicon of *Makura-kotoba* (entitled *Kuanji-ko*), are most valuable. His original works are the *Niimanabi*, on the study of Japanese literature, and various archaeological essays. From his time the study of Shinto and philology went on hand in hand under the name of *koku-gaku*, "national learning," in antithesis to *kan-gaku*, "Chinese learning." Mabuchi's mantle fell on the shoulders of Motoōri Norinaga (1730-1801), whose greatest work is the commentary on the *Kojiki*, already mentioned. His original contributions to literature are: the *Giojin-gaigen*, against the Chinese philosophy; the *Tama-kushige*, a work on the philosophy of government, written for the prince of Kishiu; the *Uiyama-bumi*, a treatise on the art of study, with special reference to Shinto; the *Tama-arare*, an essay on the faulty composition of common writers; the *Tama no Ogushi*, a critical work on the *Genji Monogatari*; and the *Tama-katsuma*, a collection of miscellaneous papers, which contains some interesting fragments of autobiography. His style is a model of clearness and ease, and shows what the Japanese language might have become if it had not been deformed by the introduction of Chinese words and idioms. That of Mabuchi, on the other hand, though equally correct, is painful on account of his close imitation of the ancient classic literature, which is not a convenient medium for argument. Motoōri was succeeded as the leader of modern Shintoism by Hirata Atsutane (1776-1843), whose principal writings have already been named. His *Shutsu-jo Shogo* (7 vols.) is an extremely amusing attack upon Buddhism, written in a style closely approaching the colloquial, a style which if it were universally adopted would be an immense relief to the intellectual powers of the Japanese; for the ability to translate thought into the literary style requires years of patient study to acquire, and is a barrier to all freedom of expression. Other writers of the same school as these men are Fujitani Nariakira (1735-'76), Ozawa Koan (1723-1801), Kato Chikage (1734-1808), Tachibana Tsuneki (1704-'62), Murata Harumi (1746-1811), Arakida Hisaoye (1746-1804), Katori Nahiko (1723-'82), Motoōri Haruniwa (1763-1828), Ozaki Masayoshi (1752-1827), Hashimoto Keirio (1760-1806), and Shimidzu Hamaomi (1776-1824). Most of them confined their efforts to poetry, but Fujitani is known as the author of two celebrated works on grammar, the *Ayui-sho* and the *Kazashi-sho*. Motoōri Haruniwa produced the *Kotoba no Yachimata*, a valuable treatise on the Japanese verb. Ozaki Masayoshi is the author of the *Hiakunin-shū Hitoyo-gatari*, which, besides explanations of the poems in that collection, contains a large number of biographical notices of eminent persons of the second age of literature, written in the very best style.—Of contemporary Japanese literature little is to be said. The 20 years following 1853 have been a period of

political disturbance and of the influx of European ideas; and original composition has been abandoned for translations of foreign elementary works, chiefly on scientific subjects. Translations of such works as Smiles's "Self-Help" and Mill's "Essay on Liberty" have found an immense sale. Together with this rage for foreign books has grown up a corrupt literary dialect, formed on Japanese word-for-word translations of the Chinese, which bids fair to become permanent, in spite of its awkward inelegance.

JAPAN CLOVER (*Lespedeza striata*), a plant indigenous to China and Japan, a few specimens of which were noticed by botanists in the southern states before 1860, but which has since spread with such vigor as to kill out Bermuda grass and other plants considered difficult to extirpate. It has received various names, such as "little wild clover" and "Japan pea," but it is most generally known as Japan clover. It

Japan Clover.

belongs to the *hedysarea*, in a different tribe of the family (*leguminosæ*) from clover. The plant is a perennial, a foot or more high, not very abundantly furnished with trifoliate leaves, in the axils of which are borne single inconspicuous flowers, each of which is followed by a small one-seeded pod. Southern agriculturists differ as to the value of this plant, but as it is liked by stock of all kinds, and will grow in soil too poor to produce any other forage, the weight of testimony is in its favor. It seems to come in almost everywhere without any sowing; and though the old plant is woody and indigestible, the young shoots are readily eaten by cattle.

JAPANNING, the process of ornamenting wood, leather, paper, or metal by covering it with a brilliant hard varnish, in which are often introduced gilt or colored designs. The art is supposed to have been acquired from the Japanese, whence its name. It is still practised

by them and the Chinese in great perfection, and specimens of it are seen upon the fancy workboxes, tables, and other small articles of furniture imported from eastern Asia. The articles thus ornamented are first made perfectly smooth, and primed with a mixture of ox gall and rotten stone. Being then again smoothed, they are next covered with a thin coat of varnish, obtained from the juice of certain trees, which, at first appearing like cream, changes by exposure to the air to a deep black. This being dried in the sun or by artificial heat and rubbed, another coat of varnish is applied, and another polishing succeeds; and thus these processes are repeated, it may be 18 times, using toward the last the finest quality of varnish, until a perfectly smooth and brilliant surface is obtained. The ornamental design is then drawn with a pencil dipped in varnish of boiled oil and turpentine, and before this is quite dry the gold or silver leaf is laid upon it, and finally secured by another coat of varnish. The method in use of imitating this lacquered ware does not differ from the preparation of similar works in spirit or oil varnishes, except that every coat of color or varnish is dried by placing the object in a japanner's stove, which is heated by flues to as high a temperature as the articles and varnish can bear without injury. For colored grounds, the colors in ordinary use, as Prussian blue, vermilion, flake white, lampblack, and various others, are employed, well incorporated with linseed oil or turpentine, and mixed with copal or animé varnish, more commonly the latter. For black japanned work, the application is of ivory black mixed with dark-colored animé varnish. After thorough drying in the stove the application is repeated; and if the article is intended to be finally polished, several coatings and dryings are required to give firmness for resisting the friction. After the general color of the ground has been laid on, the ornamental devices are painted in the usual manner, the colors being dried in and finally protected by several coats of varnish, made without drying ingredients, which also adds to their brilliancy. To produce a gold ground, the work is varnished with gold size, upon which, when partially dried, gold dust is laid with a piece of wash leather. Subsequent varnishing gives great brilliancy to this coating. Engravings, especially prepared for the purpose upon fine paper washed with solution of isinglass or gum, are sometimes transferred to japan work with beautiful effect.—It is apparent that wood designed for japanning must be thoroughly dried, so that there shall be no risk of its cracking, shrinking, or warping by the stove heat to which it is to be exposed. After undergoing the usual process of seasoning, it is therefore, when sawn into nearly the shapes required, baked for several days in the japanner's stove; and when after this the finished shapes are given to the articles, they are again baked, and any defects that appear are remedied by the

application of white lead or putty, or otherwise. An artificial ground, prepared by a priming of size and whiting laid on with a brush, and after drying a day or two smoothed down with rushes and a wet cloth, is sometimes employed by japanners; but it is objectionable from its liability to crack. The practice of japanning has been greatly extended of late years to a multiplicity of articles, especially to those in papier maché, sheet iron, and leather. The product of the process applied to the last named material is the so-called patent leather. (See LEATHER.) Besides the introduction of the ordinary colors and of gold leaf, mother-of-pearl is often profusely scattered through the work in the first two materials. A display of gaudy colors appears to be the chief object aimed at; and as works of taste most of the articles of this sort furnished for our markets are far inferior to some of the cheapest productions of the eastern nations.

JAPETUS, one of the Titans of Greek mythology, a son of Uranus and Ge, and brother of Cronos (Saturn), Oceanus, Hyperion, Rhea, and others. According to one tradition, he became by Asia, the daughter of Oceanus, father of Atlas, Prometheus, Epimetheus, and Menœtius. According to other traditions, his wife was Clymene, another daughter of Oceanus. Tethys, Asopis, and Libya are also associated with him in the varying forms of the myth. The Greeks regarded Japetus as the progenitor of the human race, through his son Prometheus. His fate in the war with the gods is variously stated. Homer represents him as imprisoned with Cronos in Tartarus; another tradition is that he was buried under the island of Inarime.

JAPHETH, one of the three sons of Noah, by most critics regarded as the eldest. It is said of him (Gen. ix. 27): "God shall enlarge Japheth, and he shall dwell in the tents of Shem; and Canaan shall be his servant." He was the progenitor of extensive tribes inhabiting the northern parts of the Mosaic world. His sons (Gen. x. 2) were Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras. Gomer is now generally identified with the Cimmerians of the ancients; Magog probably represents Turanian Scyths about the Caucasus; Madai is the Hebrew name for Media; Javan for Ionia and Greece; Tiras probably for Thrace. Meshech and Tubal, who in the Scriptures always appear coupled together, are identified with the equally associated Moschi and Tibareni of the Greeks, and Muscai and Tuplai of the Assyrian inscriptions (or Muski and Tabali, as Schrader renders the names), the former of whom, according to Rawlinson (Herodotus, book i., essay xi.), "are regarded on very sufficient grounds as the ancestors of the Muscovites, who built Moscow, and who still give name to Russia throughout the East; and these Muscovites have been lately recognized as belonging to the Tchud or Finnish family, which the Slavonic Russians conquered, and which is a known Turanian race." This statement is made still more prob-

able by the Hebrew text of Ezekiel xxxviii. 2, 3, and xxxix. 1, which connects Meshech and Tubal with Rosh; the latter word, rendered "chief" in the English version, being now regarded by Gesenius and others as a proper noun corresponding to the *Pōç* of the Byzantine historians, and the people *Rūs* (on the Volga) of the Arabian Ibn Foslan, and thus containing the earliest historical trace of the Russian name. Thus Japheth, as a family name, embraces a large number of primitive nations, in modern ethnology partly designated as Turanian and partly as Indo-European. This agrees with the tradition of the Arabians, which assigns to Japheth 11 sons, progenitors of as many nations, among whom are Jin (the Chinese), Gomari (Cimmerians?), Turk (Turks), Khozar (Khazars), and Ros (Russians). The name Japheth is from a Hebrew root meaning expansion, wide-spreading (Gen. ix. 27). Another derivation, meaning fair, comely, denoting the white-colored races, is less pertinent. It has also been compared with the *Japetus* of Greek mythology. Japhetic is often used by ethnologists instead of Indo-European.

JAPURA, or **Caquetá**, a river of South America, rising in the Pasto mountains of Colombia, and flowing generally S. E. to its junction with the Amazon by several mouths, the central one of which is in lat. 3° 20' S., and lon. 65° 40' W., opposite the town of Ega, while the extreme easterly and westerly mouths are 350 m. apart. From lon. 73° 32' it forms the boundary line between Brazil and Ecuador, and from the same point to its principal embouchure is entirely a Brazilian river. The whole length of its course is about 1,000 m. Among its tributaries are the Messai and the Apaporis, both considerable streams. It was explored in 1865 by order of the Brazilian government, and found to be navigable by large vessels as far as the cataract of Santa Cruz, lon. 72° 15', a distance of over 400 m.

JAPYGLIA. See **APULLA**.

JARDIN, Karel du. See **DUJARDIN, KAREL**.

JARNAC, a town of France, in the department and on the river Charente, 16 m. W. by N. of Angoulême; pop. in 1866, 4,243. It has a small port and an active trade in grain, wine, and brandy. It is renowned for a battle fought here on March 13, 1569, between the Catholics under the duke of Anjou (afterward Henry III.) and the Huguenots under the prince of Condé, in which the latter were defeated and their leader captured and assassinated.—One of the lords of Jarnac, Gui de Chabot, a gentleman of the royal court, acquired notoriety in 1547 by fighting a duel with the permission of Henry II., in which he was about to fall when he gave a sudden thrust to his adversary; whence the expression *coup de Jarnac*. This was the last duel in France fought with the sanction of the king.

JAROSLAV. See **YAROSLAV**.

JARROW, or **Yarrow**, a town of Durham, England, on the Tyne, 5 m. E. of Newcastle, and

240 N. N. W. of London; pop. in 1871, 18,179, chiefly Irish. It was till within a recent period only a small colliery village, and its rapid growth is due to the establishment of iron ship-building yards, and chemical and other works. There are new docks, a large mechanics' institute, and many schools and places of worship. A famous monastery was established here by St. Benedict Biscop in 681; it was destroyed by William the Conqueror in 1070, but there are still some remains of it. St. Paul's church is renowned for its relics of the Venerable Bede, said to have been buried here.

JARVES, James Jackson, an American author, born in Boston, Mass., Aug. 20, 1818. On account of ill health he went to the Hawaiian islands in 1838, was for some years United States consul at Honolulu, where he published the first newspaper ever printed there, called "The Polynesian," and travelled extensively in California, Mexico, and Central America. During a visit to the United States he published a "History of the Hawaiian or Sandwich Islands" (8vo, Boston, 1843), "Scenes and Scenery of the Sandwich Islands" (12mo, 1844), and "Scenes and Scenery in California" (1844). He finally left the Hawaiian islands in 1848, and has for many years resided in Europe, chiefly in Florence, where he was engaged in making the large collection of pictures which was exhibited in this country under his name, and which now forms part of the art gallery of Yale college. Besides the works above mentioned, he has published "Parisian Sights and French Principles" (12mo, New York, 1855; second series, 1856); "Art Hints" (London and New York, 1855); "Italian Sights and Papal Principles" (1856); "Kiana, a Tradition of Hawaii" (1857); "The Art Idea: Sculpture, Painting, and Architecture in America" (1865); "Confessions of an Inquirer" (three parts, 1857-'69); and "Art Thoughts" (1869).

JARVIS, I. Abraham, an American bishop, born in Norwalk, Conn., May 5, 1739, died May 3, 1813. He graduated at Yale college in 1761, was ordained deacon in London in February, 1764, and priest a few weeks later. Returning home, he was settled as rector of Christ's church, Middletown, Conn. On the death of Bishop Seabury he was unanimously elected his successor, and in October, 1797, was consecrated at New Haven. **II. Samuel Farmar**, an American clergyman, son of the preceding, born in Middletown, Conn., Jan. 20, 1786, died March 26, 1851. He graduated at Yale college in 1805, was admitted to deacon's orders in the Protestant Episcopal church in March, 1810, was ordained priest in April, 1811, took charge of St. Michael's church, Bloomingdale, N. Y., and in 1813 became rector of St. James's church, which was near by, holding the associate rectorship of those parishes until May, 1819. He was also professor of Biblical criticism in the general theological seminary of the Episcopal church. In 1820 he became rector of St. Paul's church, Boston. In 1826 he resign-

ed his parish, and went to Europe. Returning to the United States in 1835, he was for two years the professor of oriental literature in Washington (now Trinity) college, Hartford, and in 1837 became rector of Christ's church, Middletown. In 1838 he was appointed by the general convention historiographer of the church. He published a "Discourse on the Religion of the Indian Tribes of North America" (Svo, New York, 1820); "Chronological Introduction to the History of the Church" (New York and London, 1844); "Reply to Dr. Milner's End of Controversy" (12mo, New York, 1847); and "The Church of the Redeemed, or the History of the Mediatorial Kingdom" (vol. i., Boston, 1850).

JARVIS, Edward, an American physician and statistician, born in Concord, Mass., Jan. 9, 1803. He graduated at Harvard college in 1826, and received the degree of M. D. there in 1830. After practising his profession in several places, he settled in 1843 in Dorchester, Mass., where he now resides. He has obtained distinction by his knowledge and treatment of insanity, but is most widely known for his acquaintance with the statistics of human life. Since 1843 he has published a large amount of valuable matter relating to population, vitality, health, longevity, insanity, education, employments, &c., mostly in the form of addresses, reports, memorials, and articles in periodicals, which if collected would make several octavo volumes. His principal publications are: "Memorial of the Statistical Convention in respect to the Errors of the Sixth Census" (1846); two reports on the "Sanitary Survey of the State of Massachusetts" (1848-'9); "The Production of Vital Force" (1849); "Report of the Legislative Committee on New Hospitals" (1855); "Report on the Insane and Idiots" (1856); "Report of the Committee on the Memorial of the Sanitary Association" (1861); "Report of the Worcester Hospital" (1862-'3); "Report to the United States on the Mortality of the Eighth Census" (1865); "Physiology and the Laws of Health" (1 vol. 12mo, 1865); "Increase of Human Life" (1869); two reports for the United States board of education on the "Relation of Education to Mental Disease" (1872), and the "Relation of Common Education to Common Labor" (1873); "Provision for the Insane" (1872); "Infant Mortality," and two articles in the report of the Massachusetts state board of health (1873); and "Political Economy of Health" (1874).

JASHER, Book of (Heb. *Sepher hayashar*), a work cited in Joshua x. 13 and 2 Sam. i. 18, but no longer extant. Its contents are known to us only by two short extracts, both in poetic form. The quotation in Josh. x. 13 is a poetic apostrophe to the sun and moon, bidding them stand still in the heavens till the discomfiture of the enemy should be complete. In 2 Sam. i. 19-27 is another quotation, the beautiful elegy of David on Saul and his son. The 18th

verse should be rendered, "also he bade them teach the children of Judah The Bow" (the elegy so named, in allusion to "the bow of Jonathan" in v. 22, a tender reminiscence of the poet's friend); "behold it is written in the book of Jasher." Hence it is very naturally conjectured by Gesenius that it was an anthology of ancient songs written in praise of just men (so esteemed for their patriotic zeal and devotion), and called "Book of the Just." Bishop Lowth had before inferred, from the poetical character of the citations, that it was a collection of national songs. This being all that is known of it, the field is open for the wildest conjectures and the most absurd legends and forgeries; and the following specimens will show that it has not been neglected. Theodoret supposed the whole book of Joshua to be an extract from Jasher; Jerome that it was identical with the book of Genesis, an opinion also expressed, among others, in the Talmud; others, that it included the whole Pentateuch, that it was a treatise on archery, and that it contained a series of biographies of just men, *yashar* meaning just. Dr. Donaldson sees in a portion of the Old Testament narratives a careless elaboration of materials taken from the dismembered book of Jasher, which he attempts to restore to their original order. (See Donaldson, *Jashar, Fragmenta Archetypa Carminum Hebraicorum in Masorethico Veteris Testamenti Textu passim Tessellata* (London, 1854; revised and enlarged, 1860).—A treatise on Jewish laws written by Rabbi Jacob Tam in the 13th century, and printed at Cracow in 1586, bears the title of "Book of Jasher." With this was afterward confounded a later treatise on ethics under the same title, of which there are several editions. Another mediæval work in Hebrew bears the same title, and purports to have been discovered at the destruction of Jerusalem in possession of a concealed old man, brought thence to Spain, and preserved at Seville. It was first printed at Naples, afterward at Venice (1625), at Cracow (1628), and at Prague (1668). It contains the histories of the Pentateuch, Joshua, and Judges, intermixed with many legendary statements, taken from the Talmud, Midrash, Josipon, and other sources. A German translation, with additions, was published at Frankfurt in 1674; and an English translation, under the direction of Mordecai M. Noah, at New York in 1840. In 1751 Jacob Ilive, a Bristol type founder, published a forgery entitled "The Book of Jasher, with Testimonies and Notes Explanatory of the Text; to which is prefixed Various Readings; translated into English by Alcun of Britain, who went a pilgrimage into the Holy Land." This clumsy fraud was revived at Bristol, 1827, and at London, 1833, edited by C. R. Bond.—An article on "The Book of Jasher" is among the "Literary Remains of the late Emanuel Deutsch" (New York, 1874).

JASMIN, Jacques, a French Provençal poet, often called the barber poet and the last of the

troubadours, born in Agen, March 6, 1798, died there, Oct. 4, 1864. He was the child of a hunch-backed tailor and a lame mother, from whom he inherited little besides poverty, and the prediction, founded on the experience of many generations, that the Jasmins must inevitably die in the almshouse. His childhood, the events of which are described in his piece entitled *Mous soubenis* ("My Souvenirs"), was one of privation and hunger; but these he might have endured with cheerfulness, of which he possessed an unfailling supply, had he not been tormented with an eager thirst for education. At about the age of 12 he gained admittance to a priests' seminary, where for 2½ years he made rapid progress, until an act of youthful indiscretion caused his dismissal in disgrace. A few months later he was apprenticed to a barber and hair dresser in Agen. At 18 he was married and set up in business for himself. His leisure hours continued to be devoted to the acquisition of knowledge; and from reading plays and romances he took to verse writing, which so alarmed his wife that she persistently removed his pens and paper, and otherwise hindered him. Jasmin obeyed the hint so far as to stick to his calling, which he steadily practised; but no discouragement could induce him to give up his passion for reading and writing verses; and gradually his rural songs, written in an idiom of the *langue d'oc*, the former tongue of the southern troubadours, which is still spoken by the peasantry of southern France, found warm admirers among his friends and neighbors. In 1825 he ventured upon the publication of a burlesque poem, *Lou chalibari* ("The Charivari"). During the next ten years he produced his "Ode to Charity" (1830), "The Third of May" (1830), *Soubenis* (1832), and "Stanzas to the Scattered Remains of the Polish Nation" (1833). These were collected in 1835 and published in 2 vols. under the title of *Las papillotos de Jasmin* ("The Curl Papers of Jasmin"). His next piece, *L'Abu-glo de Castel-Cuillé* ("The Blind Girl of Castel Cuillé"), founded on a pathetic legend of Guienne, is perhaps the most popular of all he wrote. During his only visit to Paris he recited it 26 times in 15 days, on the last occasion in presence of Louis Philippe and the royal family at Neuilly. The poem is familiar to English readers through the translation by Longfellow. *Françonette*, produced in 1840, is his longest and most ambitious piece. Among his remaining works are a second series of the *Papillotos* (1843), *Lous dus frays bessous* ("The Two Twin Brothers," 1847), *Maltro Vinnoucento* ("Mad Martha"), and many minor pieces.

JASMINE, or Jessamine. I. The name of shrubs, sometimes twining, of the genus *jasminum*, which with three other genera some botanists place in the order *jasminaceae*, while others regard it as belonging to the olive family. The species are all natives of warm countries; they have compound leaves, which are sometimes reduced to a single leaflet and appear simple; the

axillary or terminal, yellow or white flowers have a tubular corolla with a spreading limb, two stamens, and a two-lobed ovary; the fruit is berry-like. The flowers of most species are deliciously fragrant, and the plants are favorites in the greenhouse, and where the climate

Jasminum officinale.

will allow are cultivated in the open air. The best known species is the common jasmine (*J. officinale*), which was introduced into England from the East in 1548, and is there cultivated for covering walls and arbors. It cannot be considered as properly hardy in the climate of New York, though in some sheltered situations it lasts for several years. It has become thoroughly naturalized in the south of Europe, and is also cultivated there for the sake of its perfume, which is obtained by stratifying the flowers with cotton impregnated with bene oil (*sesamum*), and allowing them to remain in a closed vessel for 24 hours; the flowers are then removed and replaced by fresh ones, and the process repeated until the oil is strongly impregnated with the odor; the oil is removed from the cotton by pressure, and is used to perfume pomades; when the oil is treated with alcohol that takes up the odor of the flowers, it forms the essence of jasmine. Perhaps the hardiest species is *J. nudiflorum*, which has yellow flowers, appearing very early in spring, but they are without odor; *J. odoratissimum* has also yellow flowers, and is one of the most fragrant; the same may be said of *J. revolutum*. One of the finest greenhouse species is *J. grandiflorum*, which is in Europe known as the Malabar, and by American florists as the Catalonian jasmine; its long weak stems allow it to be trained upon frames or trellises, and it produces its exceedingly fragrant flowers, which are tinged with pink on the outside, in clusters of two or three. The sambac (*J. sambac*), an East Indian species, is a fine shrub for a warm greenhouse; it has leaves of a single leaflet, and large flowers in small clusters, which are

very fragrant, especially in the evening; there are several florists' varieties of this species, some of which have double flowers, and are much prized by bouquet makers. The leaves of *J. floribundum* are exceedingly bitter, and are used in Abyssinia to destroy the tapeworm. The jasmines are multiplied by means of cuttings in the same manner as other greenhouse shrubs. **II. Cape Jasmine**, a popular name for plants of the genus *Gardenia*, not related to the true jasmines. This genus belongs to the madder family (*rubiaceæ*), and consists of tropical and subtropical shrubs. The cultivated species have large terminal and very fragrant white flowers. The genus was dedicated by Ellis to Dr. Alexander Garden of Charleston, S. C., who commenced in 1755 a correspondence with Linnæus and other European botanists, and did much to make American plants known to science. The best known spe-

Cape Jasmine.

cies is *G. florida*, which does not come from the Cape, but was introduced into England from China in 1754. The double variety is the one most generally cultivated, and is a popular greenhouse plant; it also succeeds in window cultivation; in the southern states it is hardy, and is used for the decoration of cemeteries, dooryards, and the like. The fruit is a large, oblong, orange-colored berry, which is said to be used in China for dyeing yellow. A smaller species, *G. radicans*, is also cultivated, and there are forms of both with variegated leaves. Those who have no greenhouse can enjoy the Cape jasmine by treating it as a bedding plant, allowing it to grow in the open border during summer, and removing it to a dry frost-proof cellar for the winter. **III. Carolina or Yellow Jasmine**, a climbing vine, found from Virginia southward, where it grows in great profusion, festooning the trees and shrubs, and in spring covered with funnel-shaped bright yellow flowers, about an inch across, which have a fra-

grance similar to that of the true jasmine; when the plant is abundant the odor is almost overpowering. It is the *gelsemium sempervirens*, of the family *Loganiaceæ*, and not closely related botanically to the jasmine. The shining leaves are very nearly evergreen, and make the plant an attractive one when not in flower. Within a few years this plant has come into use as a remedial agent, the root having been accidentally discovered to possess remarkable sedative powers.

JASON. See ARGONAUTS.

JASPER, a variety of the quartz family occurring in the form of rocky masses, which often make up the greater portion of hills of considerable size. It is of various shades of red, yellow, brown, and green, the colors sometimes arranged in stripes, when it is called ribbon jasper. The hues are derived mostly from iron in different degrees of oxidation, and the stripes are sometimes found to be the marks of former stratification of the rock, which are retained in the metamorphic product, and sometimes presented in a brecciated appearance resulting from the forcible breaking up of the strata. From the extreme hardness of the stone and its susceptibility of taking a high polish, it is much used for ornamental purposes, having similar applications to porphyry. Bloodstone or heliotrope is a deep green variety of quartz with blood-red spots of jasper sprinkled through its mass. Lydian stone or touchstone is a velvet-black, flinty variety, used for testing the purity of alloys of gold. The alloy is rubbed upon the stone so as to leave upon it a metallic streak, and the quality is estimated by the color produced on applying nitric acid. The fitness of the stone for this use arises from its easily abrading the metal, not being itself affected by the acid, and presenting a dark smooth ground best adapted for exhibiting shades of color. Jasper was highly prized by the ancients; and was much used for cameos. It was the twelfth stone in the breastplate of the high priest, according to the English version of the Old Testament, and is frequently referred to in the Apocalypse in describing the New Jerusalem. Mr. Atkinson, in his work on "Oriental and Western Siberia," speaks of the jasper in the upper valleys of the Ural, and found himself some beautiful specimens of it in a ravine on the banks of the river Irtysh, some of the rocks there being jasper of a dark reddish brown and others of a deep purple. He observed blocks of a beautiful green jasper on the banks of the Mein, in the neighborhood of the Tcherny (Black) Beryl, and in several other localities; also jasper of a deep red color in the valley of the Eremil. The principal deposit of jasper is the gorge of the Korgon. The labor of cutting out the large blocks is enormous; the workmen drill holes five inches apart the whole length of the block, and to the depth required; into these they drive dry birch-wood pins, which they keep wet till they swell and burst off the mass. The workmen arrive at the Korgon in

May, and remain there until September, when they return to their homes, some of which are at a distance of 400 to 500 m. Small stone huts are built against the precipices at the bottom of the ravine, where they live, stowed away in filth and wretchedness, feeding upon black bread and salt, and receiving the lowest of wages. Several cases of this jasper were exhibited in the London crystal palace in 1851, and a medal was awarded to them. The most beautiful variety of jasper is the Egyptian pebble, found where its name indicates, in small translucent nodules of olive brown with darker markings, and ranked among the lesser gems.

JASPER, the name of seven counties in the United States. **I.** A central county of Georgia, bounded W. by the Ocmulgee river; area, 480 sq. m.; pop. in 1870, 10,439, of whom 6,555 were colored. The surface is uneven and the soil moderately fertile. Gold, iron, granite, jasper, and garnets are found in the county. The chief productions in 1870 were 22,274 bushels of wheat, 185,870 of Indian corn, 15,543 of sweet potatoes, 79,099 lbs. of butter, and 5,937 bales of cotton. There were 977 horses, 1,091 mules and asses, 1,729 milch cows, 2,800 other cattle, 1,885 sheep, and 8,196 swine; 4 carriage factories, and 3 saw mills. Capital, Monticello. **II.** A S. E. county of Mississippi, drained by affluents of Leaf river; area, 650 sq. m.; pop. in 1870, 10,884, of whom 4,898 were colored. The surface is uneven and the soil fertile. The chief productions in 1870 were 255,858 bushels of Indian corn, 42,225 of sweet potatoes, 48,814 lbs. of butter, and 4,273 bales of cotton. There were 1,704 horses, 841 mules and asses, 3,621 milch cows, 1,335 working oxen, 5,034 other cattle, 4,104 sheep, and 18,418 swine. Capital, Paulding. **III.** A S. E. county of Texas, bounded W. by the Neches and Angelina rivers, here navigable by steamboats; area, 918 sq. m.; pop. in 1870, 4,218, of whom 1,759 were colored. The surface is undulating and hilly and well timbered. The soil is thin, but in the neighborhood of the streams very fertile; a large part of it is devoted to pasturage. The chief productions in 1870 were 90,377 bushels of Indian corn, 25,559 of sweet potatoes, 1,928 bales of cotton, 10,998 lbs. of tobacco, and 6,850 of rice. There were 884 horses, 2,088 milch cows, 7,832 other cattle, 2,173 sheep, and 10,775 swine. Capital, Jasper. **IV.** A N. W. county of Indiana, bounded N. by Kankakee river, and drained by the Iroquois; area, about 675 sq. m.; pop. in 1870, 6,354. The surface is mostly a level prairie, diversified with tracts of timber, and composed partly of the Kankakee marshes or wet prairies. The soil is suitable for pasturage. The chief productions in 1870 were 31,711 bushels of wheat, 111,882 of Indian corn, 79,606 of oats, 20,673 of potatoes, 22,928 lbs. of wool, 126,132 of butter, and 23,129 tons of hay. There were 3,119 horses, 3,192 milch cows, 11,272 other cattle, 7,038 sheep, and 5,078 swine. Capital, Rensselaer. **V.** A S. E.

county of Illinois, intersected by Embarras river; area, 484 sq. m.; pop. in 1870, 11,234. It has a level and in some places marshy surface, about two thirds of which is occupied by prairies. Much of the soil is fertile. The St. Louis, Vandalia, Terre Haute, and Indianapolis railroad touches the N. W. corner. The chief productions in 1870 were 87,808 bushels of wheat, 461,345 of Indian corn, 149,214 of oats, 21,755 of potatoes, 43,465 lbs. of wool, and 10,739 tons of hay. There were 4,170 horses, 2,946 milch cows, 5,173 other cattle, 17,350 sheep, and 12,503 swine. Capital, Newton. **VI.** A S. E. central county of Iowa, traversed by Skunk river and the N. fork of that stream; area, 720 sq. m.; pop. in 1870, 22,116. It has an undulating surface, occupied in great part by fertile prairies, thinly timbered. Coal is abundant. The Chicago, Rock Island, and Pacific and the Des Moines Valley railroads cross it. The chief productions in 1870 were 773,429 bushels of wheat, 2,102,366 of Indian corn, 270,631 of oats, 185,736 of potatoes, 570,285 lbs. of butter, 40,865 of wool, and 28,454 tons of hay. There were 8,506 horses, 6,658 milch cows, 10,244 other cattle, 15,836 sheep, and 31,263 swine; 12 manufactories of carriages, 4 of furniture, 1 of machinery, 11 of saddlery and harness, 3 flour mills, and 7 saw mills. Capital, Newton. **VII.** A S. W. county of Missouri, bordering on Kansas, and drained by Spring river; area, about 550 sq. m.; pop. in 1870, 14,928, of whom 138 were colored. It has an undulating surface and a good soil. The chief productions in 1870 were 87,658 bushels of wheat, 528,591 of Indian corn, 133,016 of oats, 33,418 of potatoes, 38,753 lbs. of wool, 209,967 of butter, and 11,054 tons of hay. There were 4,795 horses, 3,429 milch cows, 7,927 other cattle, 11,444 sheep, and 14,249 swine; 2 manufactories of saddlery and harness, 3 of tin, copper, and sheet-iron ware, 1 of pig lead, and 5 saw mills. Capital, Carthage.

JASPER, William, an American revolutionary soldier, born in South Carolina about 1750, killed at the assault on Savannah, Oct. 9, 1779. At the commencement of the revolution he enlisted in the 2d South Carolina regiment, in which he became a sergeant. In the attack upon Fort Moultrie by a British fleet, June 28, 1776, he distinguished himself by leaping through an embrasure to the ground, under a shower of cannon balls, and recovering the flag of South Carolina, which had been shot off. On this occasion Gov. Rutledge presented him with his own sword, and offered him a lieutenant's commission; this, however, Jasper, who could scarcely read or write, refused, saying, "I am not fit to keep officers' company; I am but a sergeant." His commander, Col. Moultrie, appreciating his bravery and coolness, gave him a roving commission to scour the country with a few men, and surprise and capture the enemy's outposts. His achievements in this capacity equal any recorded in the revolutionary annals. Prominent among them was

the rescue by himself and a single comrade of some American captives from a party of British soldiers, whom he overpowered and made prisoners. At the assault upon Savannah he was in the column which under D'Estaing and Lincoln attacked the Spring Hill redoubt, and received his death wound while fastening to the parapet the standard which had been presented to his regiment by Mrs. Elliott. His hold, however, never relaxed, and he bore the colors to a place of safety before he died. His last words were: "Tell Mrs. Elliott I lost my life supporting the colors she presented to our regiment." A county of Georgia and a square in Savannah have been named after him.

JASSY, or **Yassy** (Roum. *Yash*), a town of Roumania, capital of Moldavia, on the Bakhlui, a tributary of the Pruth, 205 m. N. N. E. of Bucharest; pop. about 90,000, of whom 35,000 are Jews. It is built partly on a hill and partly in a valley; and as many of the houses are surrounded by gardens, it covers a comparatively large space. It has few spacious streets, but a great number of churches and convents, among the more remarkable of which are the metropolitan church of St. Nicholas, the churches of Sokolla and Galata, and the convent of Trisveletch, containing the tombs of the archbishops. There are also several palaces belonging to distinguished boyar families, and in the vicinity of the city the princely summer residence Copola attracts the attention of travellers. It is the seat of a Greek metropolitan, and has a university, a theological seminary, a lyceum, schools of art and music, about 70 Greek churches, a Catholic, an Armenian, and a Protestant church, a magnificent hospital, a large bazaar, and public baths. The trade of the city is in great part in the hands of the Jews. The manufactures are limited, but the trade is important, and a large business is done in the public fairs. The place was materially injured by the Russo-Turkish war of 1853-'6, but since the consolidation of Roumania (1861) has revived and is now flourishing.—Jassy is the Jassiorum Municipium of the Romans, so called from the Jassii, a people of Dacia. Trajan built here a residence, which was destroyed by fire in the last century. Conflagrations frequently visit the city; one of the most disastrous happened in 1822, and another in 1843 destroyed a large number of the wooden houses. A peace was concluded here in 1792 between the Russians and Turks. In the wars of these nations, including the last, Jassy was often the headquarters of the contending armies. In April, 1866, on the election of Prince Charles of Hohenzollern to the throne of Roumania, Jassy was the scene of an insurrection, which was soon suppressed.

JÁSZBERÉNY, a town of Hungary, capital of the united districts of Jazygia and Cumania, on the Zagyya, 38 m. N. E. of Pesth; pop. in 1870, 20,233. It is pleasantly situated, and the islands formed by the river in the middle of the town have been converted into promenades. Attila is popularly believed to have been buried

in a fort of which there are remains in the public square. The most conspicuous public buildings are a fine Catholic church and gymnasium, and a Protestant church. Much wine is produced in this vicinity, which also contains extensive stone quarries; and horses, cattle, and sheep are reared in great numbers.

JATS, or **Jants**, a race inhabiting India, principally the N. W. portion, between the Indus and Ganges. They have been variously regarded as descendants of the Getæ, Dacians, Sacæ, Indo-Scythians, Yuechi, Avars, Huns, and many other lost races. They are to all appearance a northern race whose advent is more recent than that of the Rajpoots. They are tall, strong, and active, good tillers of the soil, and if need be good fighters. They form perhaps the finest rural population of India. The Jats of the southern part of the Bari Doab, near Lahore, and of the Malwa district are mostly Sikhs; but perhaps not one third of the whole population between the Jhylum and Jumna have as yet embraced the tenets of Nanak and Govind (see **SIKHS**), and the other two thirds are about equally divided between Mohammedanism and Brahmanism. Capt. Burton mentions that a wandering predatory tribe bearing the name of Jats are found about Candahar, Herat, and Meshed. The Jats of the lower Indus appear to be of the same race as the Brahoos of Afghanistan. (See **IRANIAN RACES**, and **INDIA**, **RACES** and **LANGUAGES** OF.)

JAUBERT, **Pierre Amédée Émilien Probe**, a French orientalist, born in Aix, June 3, 1779, died in Paris, Jan. 28, 1847. A graduate of the school for the oriental languages, he was in 1798 appointed assistant interpreter in the French expedition to Egypt. After the 18th Brumaire he was appointed secretary interpreter of the government, and professor of the Turkish language in the oriental school in Paris. After other official journeys in the East, he started in 1805 on a mission to Persia, was stopped on his way by the pasha of Bajazid, who wanted to appropriate the splendid presents sent to the shah, and was for nearly four months incarcerated in a cistern. Having finally accomplished his mission, Napoleon granted him a pension and several offices and honorary rewards, and shortly before his fall appointed him chargé d'affaires to Constantinople. In 1818 he travelled again through the East, and brought to France a herd of the Thibetan goats whose hair is used in the manufacture of shawls. He was made a member of the academy of inscriptions in 1830, and under Louis Philippe became a peer, professor of the Persian language at the collège de France, and director of the oriental school. His most important publications are: *Voyage en Arménie et en Perse* (8vo, Paris, 1821); *Éléments de la grammaire turque* (4to, 1823); and a French translation of Edrisi's Arabian geography (2 vols. 4to, 1836-'40).

JAUER, a town of Prussia, in the province of Silesia, on the Wüthende Neisse, an affluent of

the Katsbach, and on the Schweidnitz and Liegnitz railway, 12 m. S. S. E. of Liegnitz; pop. in 1871, 9,964. It has a Protestant gymnasium, a hospital, and manufactories of leather, buckskin, and carpets. From 1314 to 1392 it was the capital of a principality of Jauer, which had an area of 1,200 sq. m., and contained the present circles of Jauer, Bunzlau, Löwenberg, Hirschberg, and Schönau.

JAUJA, an inland town of Peru, in the department of Junin, 108 m. E. by N. of Lima; pop. about 15,000. It is delightfully situated in the valley and near the left bank of a river of the same name, which, afterward known as the Mantaro, is one of the principal branches of the Apurimac. The town has a fine cavalry barrack and several churches and schools, and in the vicinity are numerous weaving factories. The chief commerce is in horses of excellent breed and horned cattle. In the district of Jauja are the celebrated missionary convent of Ocapa and ruins of ancient Indian towns and castles. The climate, though somewhat cold, is very salubrious. This is one of the most ancient towns in Peru, and was the capital of the viceroyalty until Jan. 18, 1835.

JAUNDICE (Fr. *jaunisse*, from *jaune*, yellow), a morbid affection known by the yellowness of the eyes, skin, and urine, the color of the skin sometimes becoming yellowish green or brown, the stools being usually whitish, and the course of the bile obstructed. Epidemics of jaundice have been observed, especially during and after military campaigns, during sieges, &c.; and the disease is sometimes endemic, as in damp localities exposed to high temperatures. The attack is usually preceded by symptoms of disorder of the liver and digestive organs, such as loss of appetite, irregular bowels or constipation, colic pains, nausea, headache, languor; uneasiness in the region of the stomach and liver; thirst, unpleasant taste in the mouth, tongue loaded at the base; feeling of sinking, &c. Sooner or later the yellowness of surface appears; sometimes this is the first symptom, and it usually takes in order the eyes, the face, neck, chest, and then the whole body. At first a light yellow, it deepens to a golden or orange hue, sometimes greenish. The color may appear in parts of the surface only, in a palsied side, the face, or a single eye; or while yellow in some parts, it may be green or almost black in others, constituting what is known as the black jaundice. The yellow tinge of visible objects, showing that the coloring matter has diffused itself through the humors of the eye, undoubtedly occurs, but is somewhat rare. The perspiration is yellowish. Fever, with quick or hard and full pulse, appears in cases of active congestion or inflammation of the liver; in others the pulse may be natural or irregular. From the time of the appearance of the yellow hue, however, many of the preliminary symptoms may diminish. The attack is often sudden; when following violent emotion, almost instantaneous. The course

and duration are various, the disease disappearing or proving fatal as early as the fourth day, or lasting for months or years. The darker forms are most rapid and oftenest fatal. Favorable crises occur in the form of bilious diarrhœa, profuse perspiration, hæmorrhage, or menorrhagia; or improvement begins more quietly, the color fading from the surface in the reverse order of its appearance. Jaundice, properly speaking, can hardly be called a disease. It is rather a symptom, the yellow color of the skin and excretions depending simply upon the retention in the circulation of the yellow coloring matter of the bile. Hence it may be a very serious or a trifling affection, according to the nature of the causes which give rise to it. When the coloring matter of the bile alone is retained in the circulation or reabsorbed from the liver, but little injury results, and a patient deeply tinged with the color of jaundice from this cause may still be able to walk about and attend to his ordinary business without much discomfort. On the other hand, when all the ingredients of the bile, or the substances from which they are formed, accumulate in the circulation owing to a suspension of the physiological action of the liver or intestines, the disease becomes one of great gravity, and is usually fatal if not relieved within a period of about ten days. Death is generally preceded in these cases, as in those of poisoning by urea from suspended action of the kidneys, by signs of disorder in the nervous system, and at last by a condition of coma or profound insensibility. Attacks of jaundice belonging to the former class often pass off without any other treatment than a mild laxative and judicious regimen; those of the second class often pass on to a fatal termination notwithstanding the use of the most active remedies.

JAVA, an island of the Indian archipelago, the most important colonial possession of the Netherlands in the East Indies, and the most fertile and prosperous tropical island in the world, situated between lat. 5° 52' and 8° 46' S., and lon. 105° 11' and 114° 33' E. It is bounded N. by the sea of Java, which separates it from Borneo; E. by a strait 2 m. wide, which separates it from the island of Bali; S. by the Indian ocean; and W. by the strait of Sunda, which separates it from Sumatra. Its length from E. to W. is 666 m., and its breadth varies from 56 to 135½ m.; area, 49,197 sq. m., or including the adjacent island of Madura, 51,336 sq. m. It is the fourth island of the archipelago in point of size, being exceeded in area by Borneo, Sumatra, and Celebes. The coast line of Java is about 1,600 m. in extent, and is remarkably destitute of harbors, especially on the S. side, where there are but two ports, Pachitan and Chalachap. On the N. coast the chief harbors are those of Batavia and Surabaya, but there are many open roadsteads with good anchorage, and the want of landlocked harbors is little felt in the calm waters of the

Java sea, where hurricanes are unknown, and storms occur only at the change of the monsoons. On the S. side there is no safe anchorage, the coast being bold and the ocean very deep, while a heavy and dangerous surf rolls continually on the shore.—The geological formation of Java is highly volcanic. A range of mountains runs from one end of the island to the other through the centre, with peaks varying in height from 4,000 to 12,000 ft. The highest is Semiru, 12,235 ft.; Slamet is 11,329 ft.; six other peaks are each over 10,000 ft. high, six others over 9,000 ft., and ten others from 5,000 to 9,000 ft. Among these peaks are 38 volcanoes, some of which are in constant activity. The most remarkable of these is in the Tenger, “wide” or “spacious” mountains, in the E. part of the island. It rises from a very large base in a gentle slope with gradually extending ridges. The summit, seen from a distance, appears less conical than that of the other volcanoes, and is about 8,000 ft. high. The crater is more than 1,000 ft. below the highest point of the mountain. It is the largest crater on the globe, with perhaps the single exception of that of Kilauea in the Hawaiian islands. The shape of the crater is an irregular ellipse with a minor axis of $3\frac{1}{2}$ and a major axis of $4\frac{1}{2}$ miles, and it forms an immense gulf with a level bottom covered with sand, which the Javanese call Laut Pasar, or “sandy sea.” From its centre rise three cones several hundred feet in height, one of which, called Brahma, is in almost constant activity. South of the great central range is another range of mountains from 3,000 to 8,000 ft. in height, which skirts the S. coast. It is composed of volcanic materials, chiefly basalt, and is called by the Javanese Kandang, or “war drums,” from the peculiar columnar form of its rocks. The volcano Papandayang in this range threw out in a single night, in 1772, ashes and scoræ spreading over an area of 7 m. radius a layer 50 ft. thick, destroying 40 native villages and 3,000 people. On July 8, 1822, the volcano Galunggung, a few miles N. E. of Papandayang, destroyed everything within a radius of 20 m. Five days later a second eruption followed, and the total loss of life in both was 20,000 persons. The S. shore of the island is in many places bounded by steep piles of trap. Low ranges of limestone occur in the eastern part, and in the extreme west a few granite boulders are occasionally found. Hot springs are numerous at the bases of the volcanoes, and some of them are impregnated with carbonic acid. In the lowlands there are mud volcanoes, which furnish muriate of soda. The principal elevated plains of Java are those known as Solo and Kediri, which comprise the central districts, and in the west that of Bandong. These plains are fertile and well watered by streams from the mountains, which afford an abundant supply for irrigation. There is also a long alluvial tract running along the N. side of the island, which may be

regarded as a continuous plain, and many of the mountain valleys are also spacious and fertile.—There are a few small and beautiful lakes among the mountains, and some extensive marshes, which in the rainy season become lakes, and are navigated. The largest of these is in the province of Banyumas, and is close to the S. shore. The island, however, is abundantly watered. The rivers on the N. side are very numerous, but are none of them navigable for large vessels, being all more or less obstructed by bars of mud or sand at their mouths. They are, however, of great use for irrigation, and contribute largely to the immense agricultural capacity of the island. The largest river in Java is the Solo, which rises in one of the low ranges on the S. side of the island, and after a winding course of 356 m. empties by two mouths into the narrow strait which separates Java from the W. end of the island of Madura. This river is navigable all the year by small boats, and by large ones in all the months except August, September, and October. The second river in size is called by the natives the Brantas, but is known to Europeans as the river of Surabaya. It rises like the Solo in the low southern range of mountains, receives many affluents, and empties by five mouths into the Madura strait, after passing by the city of Surabaya and contributing to form its harbor.—The seasons in Java are divided into the wet season, which begins with October and ends with March, and during which westerly winds prevail, and the dry, which includes the rest of the year, and is characterized by easterly winds and fair weather. These periodical winds, the N. W. and S. E. monsoons respectively, set in somewhat irregularly, and even during their prevalence there is sometimes dry weather in the wet season and wet weather in the dry. At the equinoxes the weather is generally tempestuous, and thunder storms at that period are frequent and sometimes destructive. The temperature of the island is equable, the thermometer in the lowlands seldom rising above 90° or falling below 70°. Snow never falls even on the highest mountain peaks, but in the coldest weather ice a few lines thick is sometimes seen at great elevations, where the thermometer falls to 27°. At the height of 4,000 ft. in the mountain valleys there is a delightful climate, healthful to the European constitution, and favorable to the growth of northern fruits and vegetables. The general climate of the island is in point of salubrity equal to that of any tropical country; and in places where malaria formerly prevailed, as in Batavia and Cheribon, the evil has been clearly traced to the neglect of water-courses, and has been ameliorated by proper attention to drainage.—The metals found in Java are inconsiderable in quantity and value, and no veins are worked. The uncultivated portions of the island, with the exception of a few small tracts and shore districts, are covered with forest, and at all seasons a luxuriant ver-

dure overspreads nearly the whole land. The chief variety in the vegetation is caused by differences of elevation. On the low coast are found coconut palms, bananas, *aroidæa*, *amaranthaceæ*, poisonous *euphorbiaceæ*, and leguminous plants. At the height of 1,000 ft. ferns preponderate and magnificent forests of slender bamboos grow spontaneously. At a greater height are forests of fig trees, with tall trunks, spreading branches, and thick foliage; and the ferns here increase in number and size, and often grow to the height of several feet. Above the region of fig trees is that of oaks and laurels, with abundant melastomas and orchidaceous plants. At the height of 6,000 ft. the tropical character of the vegetation disappears, and is succeeded by *rubiaceæ*, heaths, conifers, and a vegetation closely allied to that of the temperate zone. Cryptogamous plants are extensively multiplied; mushrooms are abundant, and mosses and lichens cover the ground.—The animal life of Java is as varied and abundant as its vegetation. Among the 100 species of mammalia enumerated as inhabiting the island are nine species of quadrupeds, the Bengal tiger, leopards, a peculiar species of rhinoceros (*R. Sondaicus*), the wild ox (*bos Sondaicus*), the wild hog, several species of deer, and 22 species of bats. Among the domestic animals are the ox, the buffalo, the horse, the goat, and a few sheep. Of birds there are known to be upward of 170 distinct species, among which are the peacock, the green jungle cock, partridges, quail, and many species of pigeons and herons. There are but two species of Javan parrots. Birds of prey are numerous, including falcons, owls, and carrion crows. Serpents are frequently met with, and more than 20 species are regarded as venomous. Other reptiles of common occurrence are crocodiles, lizards, the green frog, the toad, and the land tortoise. Sea turtles are found in the waters adjacent to the island. Fish are plentiful along the coast, but those of the rivers are of inferior quality as food.—Though in reality Java is wholly possessed by the Dutch, two native kingdoms, comprising together not more than $\frac{1}{4}$ of the island, have been suffered to retain a nominal existence, under the control of the Dutch officials. These are the dominions of the *seanan* or emperor of Surakarta, and the sultan of Jokjokerta. The rest of the island, with Madura, is divided into 23 provinces, called residencies. The principal cities are Batavia, the capital, Bantam, Buitenzorg, Cheribon, Samarang, Surabaya, Surakarta, and Jokjokerta. The native population of Java comprises two distinct nations, the Sundese and the Javanese. The Sundese occupy the western end of the island, and are greatly inferior in number to the Javanese, as well as less advanced in civilization. They speak a distinct language, the Sundese, while nine tenths of the entire native population speak Javanese. Both classes are of the Malayan race. They are generally about two inches shorter than the men of the

Mongolian and Caucasian races, with round faces, wide mouths, high cheek bones, short and small noses, and small, black, deep-seated eyes. The complexion is brown with a shade of yellow, and is never black. The hair of the head is thick, black, lank, and harsh, and is either scanty or altogether wanting on other parts of the body. A few short, straggling hairs compose the beard. The natives are not active, and make but poor runners or wrestlers. They are described as peaceable, docile, sober, simple, industrious, straightforward, and truthful. Java is one of the most densely peopled countries of the world, the population, inclusive of Madura, amounting, according to a census taken at the end of 1872, to 17,298,200, being 337 persons to the square mile. Of these, 28,926 were Europeans, 185,758 Chinese, and 22,032 Arabs and other foreign orientals. The Javanese are almost entirely occupied in agriculture. There is a small class of fishermen on the N. coast, and a few artisans in the towns, but the great bulk of the people live directly or indirectly by the cultivation of the land, in which they have made greater progress than any other Asiatic nation except the Chinese and Japanese. The chief cereal is rice, of which with the aid of irrigation, industriously and almost universally applied, two crops are raised in a year. Java is one of the principal coffee-growing countries of the world. The coffee plantations are situated at an elevation of 2,000 ft. and upward, and are conducted under the supervision of the colonial government. The cultivation of sugar is next in importance; indigo, cotton, pepper, tea, and tobacco are also raised. The mechanic arts among the Javanese are not so far advanced as their agriculture. About 30 crafts are practised among them, of which the principal are those of the blacksmith or cutler, the carpenter, the sheath maker, the coppersmith, the goldsmith, and the potter. Bricks and tiles are largely made. The carpenters are skilful in house and boat building. They make boats of all sizes, from fishing canoes up to vessels of 50 tons, and under European superintendence build large ships. The ordinary dwellings of the people are built of a rough frame of timber, thatched with grass or palm leaves, and with walls and partitions of split bamboo. The Javanese excel all other nations of the Indian archipelago in the working of metals. They are especially skilful in the manufacture of the national weapon, the kris or dagger, which is worn by every man and boy above 14 years as part of his ordinary costume, and by many ladies of high rank. They make also excellent gongs of brass, and these with other musical instruments of the same metal have long been exported to the neighboring countries. The only native textile material woven by the Javanese is cotton, of which they make a stout durable calico, and this is purely a domestic manufacture, carried on exclusively by the women. From raw silk imported from China,

the silkworm not being reared in Java, a coarse cloth is woven also by the women. Paper of the nature of the ancient papyrus is a manufacture peculiar to the Javanese. In science the people have made little progress, possessing only a rude notion of astronomy and a slight knowledge of arithmetic. Their architecture at the present day hardly deserves the name, though the country abounds with remarkable remains of temples built many centuries ago by the ancestors of the present inhabitants. In number and beauty these structures are probably unsurpassed by the architectural remains of any country in the world, but the action of tropical vegetation is rapidly destroying them. The most extensive and interesting of these ruins are at Brambanam, near the centre of the island, at Borobodo, 80 m. westward, and at Gunong Prau, 40 m. southwest of Samarang. At Brambanam are the "thousand

have made the greatest progress. They are passionately fond of it, and have generally fine musical ears. Their melodies are wild, plaintive, and interesting, and more pleasing to the European ear than any other Asiatic music. They have wind and stringed instruments, but their most common instruments are drums and gongs. In religion the Javanese are Mohammedans, which faith was established by Arab conquerors in the 15th century, and has entirely displaced Brahmanism and Buddhism, the ancient religions of the country, except among a few people in the Tenger mountains. During the rule of the Portuguese in the 16th century, the Catholic missionaries formed some native congregations, of which a few remnants are still left. The Dutch government showed itself decidedly opposed to all missionary labor, and Protestant missions were therefore not begun until the island passed in 1811 under the

Temple of Borobodo.

temples," consisting of 296 small temples arranged in five concentric parallelograms, and forming a quadrangle of 540 by 510 ft., exactly facing the cardinal points. The celebrated temple of Borobodo is a vast domed structure erected on an inconsiderable elevation. It is a connected series of terraced walls, composed of seven tiers one above another, and all surmounted by a triple circle of 72 towers surrounding the dome. It is 620 ft. square, and rises to a height of about 100 ft. The walls are profusely ornamented with sculpture. Wallace says that the amount of human labor and skill expended on the great pyramids of Egypt sinks into insignificance when compared with that required to complete this sculptured hill temple in the interior of Java. The temples on the mountain of Gunong Prau are reached by four flights of stone steps from different directions, there being more than 1,000 steps in each flight. Of the other fine arts, music is the one in which the Javanese

rule of England. After the restoration of the Dutch administration, all missionaries but the Dutch were in 1842 forbidden to perform missionary labors, but the Dutch missionary societies were allowed to establish missions. The results of their labors are as yet of no great importance. The number of missionaries in 1872 did not reach 20, who partly belonged to the Reformed and partly to the Mennonite church. The Roman Catholics have a vicar apostolic at Batavia, and 16 priests.—The commerce of Java is transacted chiefly at

the ports of Batavia, Samarang, and Surabaya. Among the principal exports are coffee, sugar, rice, indigo, tea, tobacco, spices, India rubber, birds' nests, camphor, and rattans. In 1871 the value of the merchandise and specie exported was £7,604,691, and that of the imports was £4,489,693. About one half of the rice exported and four fifths of the other exports go to the Netherlands. In June, 1872, the length of railroads in operation was 161 m., and in January, 1873, the number of telegraph offices was 38. There was regular connection with the other islands of the archipelago by means of 15 steamers belonging to the Netherlandish India steamboat company.—The most important feature of Javanese society is the village, which forms a complete body politic, with considerable powers of self-government. Its officers are elected by the people, and are charged with the collection of the taxes and the maintenance of public order. At the time of the conquest two native sovereigns, a sultan and an emperor,

ruled the island, one in Java and the other in Sunda. When the Netherlands government acquired the Dutch East India company's title to its possessions in the East, it appropriated to the crown all unoccupied lands, and secured to the descendants of the native sovereigns and their vassal rulers their titular rank and the rights of regents; but placed with each a Dutch resident, whose "recommendations" have always been obeyed as orders. The governor general acts as viceroy, receiving his directions from the Hague, and is assisted by a vice president and a council of four appointed by the king of Holland. The governors of Amboyna, Borneo, Celebes, and Sumatra, and the army and navy in the Dutch possessions in the archipelago, are under his orders. In Batavia there is a high court of appeal for criminal and civil cases among the Europeans, and the Javanese have native courts, presided over in some instances by Europeans. There are government primary schools in all the large towns, and in each residency there are salaried vaccinators and physicians. While the native rulers, who receive large annuities from the government, have the name of regents, the residents or assistant residents, with a controller, all of whom must be natives of the Netherlands, superintend the government plantations, directing what seed shall be sown, the wages to be paid, when the harvest shall be gathered, and the prices of products. This culture system, introduced in 1832, satisfies and employs the natives, defrays the entire expense of the local administration, and returns an annual revenue of \$5,000,000 to the treasury at the Hague. In 1872 the total revenue of the colony was 121,258,300 guilders, and the total expenditure 108,164,690 guilders, leaving a surplus in guilders of 13,093,610 for that year. The culture system involves the forced labor of the natives in the cultivation of coffee and sugar, but the legislature of Holland has enacted a law by virtue of which the forced cultivation of the sugar cane will cease in the year 1890. The title to the greater part of the land in the country is in the government.—The history of Java previous to the 11th century of our era is involved in fable and obscurity. It is only certain that long before that period the Javanese had acquired a considerable degree of civilization. About the 11th century, or, according to some conjectures, several centuries earlier, Java was visited by the Hindoos, either as emigrants or conquerors, who founded kingdoms and converted the natives to Brahmanism. Java was first made known to the western world in the latter part of the 13th century by Marco Polo, who, however, did not visit the island. Luigi Barthema (Vartomanus) was the first European who landed at Java. He passed 14 days there in 1506; and he represents the natives as cannibals who even sold their children to be eaten by the buyers. The Hindoos and their religion remained dominant in the island from the end of the 13th to

that of the 15th century, when Mohammedanism, which had for a century or two been zealously propagated by Arabs, Persians, Malays, and Hindoo Mohammedans, who came as merchants or settlers, gained a complete ascendancy over Brahmanism. In 1475 a Mohammedan prince raised himself to supreme power over nearly the whole island, and founded a dynasty which still exists in the small kingdoms which are permitted by the Dutch to remain in nominal independence. Bantam, the last of the Hindoo states, was conquered in 1480. The Portuguese visited Java in the 16th century, and entered into commercial negotiations with the natives. The Dutch first came to Java about 1595 as traders. In 1610 they obtained permission to build a fort at the native village of Jacatra, near the site of the present city of Batavia. Both the Portuguese and the English, who had established a factory at Bantam, yielded to their supremacy. They soon became involved in war with the native rulers, and in 1677 obtained a considerable territory. From that period to 1830 they carried on four great wars with the natives, the first of which, begun in 1674, lasted for 34 years; the second, which began in 1718, for 5 years; the third, which began in 1740, for 15 years; and the fourth, which began in 1825, for 5 years. The third was begun Sept. 26, 1740, by a dreadful massacre of the Chinese settlers at Batavia, of whom 10,000 were killed in two days. In 1749 the principal Javan monarch conferred the sovereignty of the island upon the Dutch, by an official deed to the Dutch East India company. In 1811 the British, being at war with Holland, then a portion of the French empire, sent a fleet and army against Java, which was conquered without much opposition and held till 1816, when it was restored to Holland. By a decree of the Dutch government, slavery was totally abolished on Sept. 20, 1859, in all their colonies in India. It had never prevailed among the native Javanese, and the number of slaves in the island amounted only to a few thousands, mostly natives of other islands of the archipelago and of Africa, and held by European masters. In 1860 the Swiss auxiliary soldiers, aided by natives, mutinied; they were soon reduced to submission, and many were executed.—Sir T. Stamford Raffles's "History of Java" (2 vols. 4to, London, 1817) is a standard work. The natural history of Java has been treated by Blume, *Flora Javae necnon Insularum Adjaentium* (3 vols. fol., Brussels, 1826-'36), and by Dr. T. Horsfield in his "Zoölogical Researches in Java and the Neighboring Islands" (London, 1824). Junghuhn is the author of several works on the natural history and geography of Java, the most important of which was published in Amsterdam in 1850 (3d Ger. ed., Leipsic, 1852). Interesting recent descriptions of Java are given by Albert S. Bickmore, in "Travels in the East Indian Archipelago" (New York, 1869); by A. R. Wallace,

in "The Malay Archipelago" (London and New York, 1869; and in W. H. Seward's "Travels around the World" (New York, 1873).

JAVA, Language and Literature of. Javanese, spoken in Java and several small adjacent islands, belongs to the Malayan division of the Malayo-Polynesian group of languages, and is most closely related to Malay proper. It has the peculiarity of employing special forms and flexions for addressing superior or inferior persons. The manner of speaking to subordinates is called *bāsā nōkō*, or simply *nōkō*, commanding speech; and that to superiors *bāsā krāmā*, or only *krāmā*, humble speech. A third mode of conversing, namely, between equals, or as a condescension toward a person of lower rank, is called *bāsā madyā*, middle speech. In the presence of the sovereign or his ambassadors still another form of speaking is observed, called *bāsā kratōn*, the court language. The ancient Javanese literature, the beginnings of which can be traced to the first century of our era, is written in a language thoroughly impregnated with Sanskrit elements, and bearing the name of *Kawi*, the poet's tongue. The Sunda language, spoken in the western portion of the island, is somewhat related to Javanese, but is clearly distinguished from it by many peculiarities. The Javanese alphabet consists of 20 consonants and 6 vowel sounds; but the latter are not considered by the natives to form part of it, as they are only supplementary characters, as in Arabic. The graphic system is derived from the Indian Devanāgarī.

The Javanese employ at the end of words abridged forms of the regular characters, as given in the second column of the alphabet. These twenty letters represent the native sounds only. There are besides the *haksārā gēdē* or *haksārā murda*, large or capital letters, which are intended to be used in rendering Indic words, but rarely employed. Arabic sounds are indicated by a diacritic sign, consisting of three dots, above the letters. The foreign elements of the language are mutilated, nevertheless, in as great a degree as

Chinese is distorted by the Japanese. The sounds *f* and *ch* are wanting. Consonants have an inherent *o*, for which reason many Indian words possessing the vowel *a* are pronounced with *o*, without necessarily a change in the orthography. The gender and number of nouns are indicated by accompanying adjectives. The genitive case is formed by inflection, but the other relations of words are either expressed by prepositions or left to be inferred. Adjectives admit of no distinction of gender, number, or case, and of comparison only by extrinsic means. Pronouns are equally invariable. There is none for the third person singular or plural, none for the second person plural, and only *haku* in *Nōkō* for the first person singular, *kitā* and *kami* for the same in the plural, and *kōvē* for the second person singular. The suffix pronouns in *Nōkō* are *-ku*, I; *-mu*, thou; *-hē*, he; the last is rendered *-na* in *Krāmā*, and the second person singular *-ta* in *Kavi*. It is customary, however, to omit pronouns, and when possible to use instead the titles of the person addressed. There are other pronominal forms, but not properly such, which are used profusely in humble and ceremonial forms of speech. The simple form of the verb indicates present time, but for clearness or emphasis some word signifying now or still is introduced. Past time is expressed by the particle *sampun* in *Krāmā*, *hēmpun* in middle, and *wis* or *wus* in *Nōkō*, meaning past or already. The particle *badē* in *Krāmā*, *bakal* in *Nōkō*, or the word *harsā* in the former, *harēp* in the latter, meaning to will, or the will, indicates the future tense. The active and passive voices are distinguished, but the latter is not properly such, and rather a nominal form. Thus the verb *tanḍak*, to seize, is conjugated as follows: *haku nandak*, I seize; *haku wis nyandak*, I have seized; *haku bakal nyandak*, I shall seize; and *dak tanḍak*, by me has been seized. Verbs obtain a passive meaning also by inserting *in*, as *rayah*, to rob, *rina-yah*, to be robbed. The infix *um* forms neuter verbs. For the numerals see the comparative table in the article on the Malayo-Polynesian languages. Most of the parts of speech can be changed one into another by the use of prefixes, suffixes, or infixes, either singly or combined.—While the language is very copious in some respects, it is exceedingly meagre in others. There are two and even three names for some metals, but there is no equivalent for metal or mineral; so there is no word for animal, while there are five words for dog, six for hog, and seven for horse. There are expressions for 10 ways of standing, and 20 of sitting; and there are 50 for the different modifications of sound. Thus in unimportant trifles the Javanese language has a store of endless distinctions, while useful words, or such as seem to us absolutely necessary, are utterly wanting.—LITERATURE. There is a multitude of chronicles and historical works written in Javanese. Other ancient books are religious, Buddhistic,

astronomical, astrological, &c. Most interesting to oriental scholars are the adaptations and elaborations of Indian materials. Thus the *Rāmāyānā* is based on the old Hindoo *Rāmāyana*, the *Brāh̄mā-yudā* on the *Mahābhārata*, and the *Sastrā mandāvā* on Manu's book of laws. There is also an abundance of romantic literature. Peculiar are the carefully prepared texts for the puppet shows, which are generally epopees with heroes borrowed from the Hindoos. Several histories of Java have been written, and others specially treat the history of the domains of various native princes. Missionaries have introduced works on the Christian religion. Winter translated into Javanese "The Thousand and One Nights" and several other works, and a Javanese newspaper has recently been established.—See Crawford, "History of the Indian Archipelago" (Edinburgh, 1830); Wilhelm von Humboldt, *Ueber die Kavisprache* (3 vols., Berlin, 1836-'9); the grammars by Gericke (Batavia, 1831) and Roorda van Eysinga (Amsterdam, 1855); and Gericke's *Javaansch-Nederduitsch handwoordenboek* (new ed. by T. Roorda, Amsterdam, 1871 *et seq.*).

JAXARTES, the ancient name of the Sir Darya, a river of central Asia. The Naryn, its main upper branch, rises, according to Fedchenko's map (*Petermann's Mittheilungen*, June, 1874), in Russian Turkistan, about lat. 44° 30' N. and lon. 76° 30' E. Taking a western course, and increased by many small streams, it enters, about 20 m. below its junction with the Jungal, the khanate of Khokan, which it traverses in a S. W. direction. Jointly with the waters of several small rivers of S. and E. Khokan, it forms the Sir Darya a little S. of the town of Namangan. The Sir Darya continues the S. W. course, enters the recently formed Russian province bearing its name, and turns soon after abruptly to the north. Reaching about lat. 45° N. and lon. 67° E., it assumes a W. course and falls into the sea of Aral, at the N. E. side. The Jaxartes figures in the history of Cyrus, Alexander, and other conquerors, but till a time long after the Christian era was spoken of as emptying into the Caspian.

JAY, the popular name of many conirostral birds of the crow family, and subfamily *garrulinae*, inhabiting Europe, Asia and its archipelago, and America. One of the handsomest of the genera is *cyanura* (Swains.), of which the type is the blue jay, and all the species, about 20 in number, belong to America; in this genus the head is crested, the bill rather slender and curved at the tip, which is slightly notched, the wings and tail blue with transverse black bars; the circular nostrils are concealed by bristles; the wings are rounded, with the fourth, fifth, and sixth quills the longest; tail about as long as the wings, lengthened, and graduated; the toes strong, with the hind claw large and longer than the toe. The blue jay (*C. cristata*, Swains.) is too well known to need description; it will be sufficient to say that the general color above is light

purplish blue, with the wings and tail ultramarine; the under parts are whitish, with a black crescent connected with a half collar on the neck above; besides the black bands on the wings and tail, the lateral feathers of the latter are tipped with white. This lively, impertinent,

Blue Jay (*Cyanura cristata*).

and noisy bird is one of the most graceful and beautiful inhabitants of our woods; it is found all over the United States, as far west as the Missouri, and as far north as Canada, remaining often through the winter in New England. It has a very mischievous disposition, robbing the farmer's corn crib, sucking eggs of other birds, and tearing the young to pieces; it possesses considerable imitative power, and seems to take delight in uttering the cry of the sparrow hawk to terrify the small birds and make them rush to cover; it is very quarrelsome, and in an aviary will soon destroy other birds of its size. When eggs and tender birds fail, they eat nuts, fruits, grain, and insects; they breed in all parts of the United States, though in Florida they are in a great measure replaced by the *cyanocitta floridana*, and west of the Rocky mountains by Steller's jay. Their usual note is a harsh scream, uttered by all in the neighborhood at the approach of any rapacious bird or quadruped or human enemy, and on this account a jay is often a nuisance to the sportsman in quest of nobler game. The length is about 12 in., and the extent of wings 14.—The genus *cyanocitta* (Swains.) includes the jays without a crest, with no bands on the wings and tail, and with shorter wings. In *C. californica* (Strickl.) the belly and under tail coverts are dull white; in *C. floridana* (Bonap.) the belly is brownish ash; in *C. ultramarina* (Strickl.) the blue color is very rich, with the under tail coverts white. The prevailing color is blue in all these jays. The Canada jay (*perisoreus canadensis*, Bonap.) is about an inch less than the blue jay, of a general cinereous color above, smoky gray below, with a whitish breast and neck and brown nuclear patch. It is found throughout the northern parts of America, even into New York and

New England. The habits are much the same as those of the blue jay, its common name of carrion bird indicating its carnivorous propensities; the young are sooty brown, and are often called "whiskey-jacks." Several other jays are described by Baird and Brewer. The jay of Europe (*garrulus glandarius*, Linn.) is a handsome bird, about as long but not so thick as a pigeon, of a light reddish brown color, the fore part of the head whitish with black spots, and the feathers elongated so as to form an erectile crest; the blue wing coverts are banded with black; the quills of the wings and tail, and broad band from the base of the bill under the eye, black; the female differs but little from the male. It is common in England, southern Scotland, and other parts of Europe; shy and suspicious like all the crow family, it frequents wooded districts, feeding principally on nuts, worms, and insects, in summer visiting gardens for the sake of their fruits and leguminous vegetables; it also plunders the nests of other species, and sometimes pounces on field mice and small birds. The flight is direct and quick, and performed with great dexterity through the thickets; the ordinary notes are harsh and loud; its power of imitation, especially in captivity, is considerable, embracing the sounds of birds and domestic mammals, and any noise which may come to its ears. The eggs, from five to seven, are $1\frac{1}{4} \times \frac{3}{8}$ inch, pale bluish green, with faint freckles of purplish and yellowish brown.

JAY, an E. county of Indiana, bordering on Ohio, and drained by the head waters of Salamonie and Wabash rivers; area, 370 sq. m.; pop. in 1870, 15,000. The surface is undulating, and the soil of various qualities, but mostly fertile. The Pittsburgh, Cincinnati, and St. Louis railroad passes through the S. W. corner, and the Cincinnati, Richmond, and Fort Wayne line intersects it. The chief productions in 1870 were 282,935 bushels of wheat, 216,090 of Indian corn, 96,139 of oats, 18,946 of flax seed, 24,106 of potatoes, 78,866 lbs. of wool, 290,459 of butter, 45,003 of maple sugar, and 10,852 tons of hay. There were 6,046 horses, 4,192 milch cows, 4,352 other cattle, 24,938 sheep, and 16,866 swine; 4 carriage factories, 1 woollen factory, 1 flour mill, and 7 saw mills. Capital, Portland.

JAY. I. John, an American statesman, first chief justice of the United States, born in New York, Dec. 12, 1745, died at Bedford, Westchester co., N. Y., May 17, 1829. He was descended from Augustus Jay, a Huguenot merchant of Rochelle in France, who after the revocation of the edict of Nantes in 1685 emigrated to America, and settled first in Charleston, S. C., and afterward in New York. Peter Jay, the father of John, was a merchant. While still an infant John Jay was removed with the rest of the family to a country seat at Rye, Westchester co., on the shore of Long Island sound. He received his early education at the grammar school of New Rochelle, and at

King's (now Columbia) college, where he graduated in 1764. He studied law in the office of Benjamin Kissam at the same time with Lindley Murray, the grammarian. In 1768 Jay was admitted to the bar, and formed a partnership with Robert R. Livingston, afterward chancellor of the state of New York. The revolutionary movement called him actively into the field of politics. While he deemed the course of the British ministry dangerous to the rights and liberties of his countrymen, his sentiments as to the mode of resistance and redress were moderate. When intelligence of the passage of the Boston port bill reached New York, a meeting was held, May 16, 1774, and a committee of 51 formed to correspond with the other colonies. Jay was appointed a member of this committee, and at their first meeting, May 23, a sub-committee of four was nominated to draft an answer to the Boston committee, who had recommended the general adoption of a non-importation and non-exportation agreement until the act for blocking up their harbor was repealed. He was a member of this sub-committee, and is supposed to have been the author of the reply to the Boston address, in which the proposition to enter into an agreement of non-intercourse was pronounced premature and inexpedient, and a general congress of the colonies recommended. Though the moderation of this document gave much offence to the more ardent patriots, the suggestion of a congress was concurred in, and Philip Livingston, Isaac Low, John Alsop, and John Jay were unanimously elected delegates to it, and were soon afterward adopted as their delegates by the city of Albany and by some towns in Westchester and Dutchess counties. The congress met on Monday, Sept. 5, 1774, at the Carpenters' hall in Philadelphia. Jay, though the youngest member but one, took a leading part in its proceedings. He was at this time strongly opposed to any attempt at independence, but desired to see the difficulties between the colonies and the mother country adjusted on terms satisfactory to both parties. When convinced, however, by the course of events, that independence had become a necessity, he embraced the measure with zeal and lent it hearty and efficient support. He participated in most of the debates that arose, and made his first speech upon the question of the mode of voting in the congress. On Sept. 6 he was appointed one of a committee of two from each colony to state the rights of the colonies in general, the violation of those rights, and the proper mode of redress. On Oct. 11 he was appointed one of a committee of three to prepare a memorial to the people of British America and an address to the people of Great Britain. The latter document, written by Jay, gave its author a great reputation throughout the country. In the second continental congress, which met at Philadelphia May 10, 1775, Jay was one of a committee of three appointed to draw up an address

to the people of Canada soliciting their cooperation in the contest which had now become inevitable, and the paper reported by the committee was from his pen. On Sept. 22 he was appointed on a committee with Franklin, Rutledge, Randolph, and others, to consider the state of the trade of America. Their report led to an animated debate, in which Jay advocated the policy of continuing the trade with Great Britain and the British West Indies from New York, North Carolina, and Georgia, in opposition to those who maintained that, as the rest of the colonies had been excluded from this trade by the "restraining act" of parliament, the three colonies excepted should voluntarily relinquish it. On Dec. 4 Jay, Dickinson, and Wythe were appointed a committee to confer with the assembly of New Jersey, and endeavor to dissuade that body from sending a petition to the king of Great Britain, separate from the petition of united America presented by congress. The remonstrances of the congressional committee prevailed with the assembly, and the design of petitioning the king was abandoned. On Nov. 29, 1775, congress appointed Harrison, Franklin, Johnson, Dickinson, and Jay a committee to correspond with the European friends of American liberty. A secret agent of the French government had shortly before given to a committee, consisting of Jay, Franklin, and Jefferson, indirect assurances that the revolted colonies might rely on receiving aid from France. The committee of correspondence at once entered into negotiations with friends of the American cause in England, France, and Holland, the result of which was that in the spring of 1776 Silas Deane was privately sent as a political agent of America to the court of France. His letters from Paris were addressed to Jay. In addition to his labors in congress, Jay was at this time much occupied with the affairs of New York, where the Tories were numerous, and the provincial congress was suspected of being lukewarm in the cause of freedom. It was difficult at this time to induce men of standing and character to accept commissions in the militia of the state. Jay, as an example to others, allowed himself to be commissioned as colonel of the second regiment of foot in the city of New York, though his duties in congress kept him from the field. In April, 1776, he was chosen a member of the provincial congress of New York, and at the special request of that body he returned from Philadelphia to assist in its deliberations. He was thus prevented from becoming a signer of the Declaration of Independence, which passed the continental congress while he was serving in the congress of New York. He however gave that measure his cordial approval and support. In the next New York congress, or convention as it was called, he took a leading part, serving on the most important committees, and was also actively engaged in taking measures to repel the incursions of the enemy up the Hud-

son, and to suppress the conspiracies of the Tories. To arouse the people from the gloom occasioned by the reverses of the army, he drew up an address which was issued by the convention, Dec. 23, 1776. This document was deemed of such importance that the continental congress specially recommended it to the perusal of the people of the United States, and ordered it to be translated into German and printed and circulated at the national expense. When the convention undertook in August, 1776, to form a government for the state of New York, he was appointed one of the committee to frame a constitution and bill of rights. The report of the committee, made March 12, 1777, was written by him, and the constitution was chiefly his work. The convention, just before its dissolution, May 13, appointed a council of safety invested with dictatorial powers consisting of 15 members, of whom Jay was one. The convention also appointed Jay chief justice of the state until the legislature should meet, and the constitutional power of appointment be organized, and he presided at the first term of the supreme court at Kingston, Sept. 9. On the next day the legislature met, and Jay was duly reappointed chief justice under the constitution. On Nov. 4 he was elected by the legislature a delegate to the national congress, on the ground that the withdrawal of Vermont from the jurisdiction of New York furnished a special occasion for requiring his services at Philadelphia. He took his seat Dec. 7, 1778, and on the 10th was elected president of congress, Laurens, the former president, having resigned. On Sept. 27, 1779, he was appointed minister to Spain, and reached Cadiz Jan. 22, 1780, and Madrid on April 4. His mission had two objects, to obtain a loan of \$5,000,000, and to secure the right to the free navigation of the Mississippi. The Spanish court received him coldly, and many months passed in fruitless negotiations. Congress, without waiting to hear even of his arrival in Spain, had directed its treasurer to draw on him at Madrid for \$500,000. When these bills arrived, rather than let the credit of the country be damaged by their going to protest, he accepted them at his own risk. He was afterward enabled to meet them when due, partly by remittances from Franklin at Paris, and partly by some smaller sums reluctantly given by the Spanish government. He quitted Madrid, May 20, 1782, and proceeded to Paris to assist in the negotiation of a treaty of peace with Great Britain, congress in 1781 having appointed him a commissioner for that purpose, together with Adams, Franklin, Jefferson, and Laurens. He arrived in Paris June 23. Of his colleagues, Franklin alone was there, Jefferson being detained in America by the delicate health of his wife, Laurens a prisoner in the tower of London, and Adams in Holland negotiating a loan. On Franklin and Jay therefore the primary formation of the treaty devolved. To the value of Jay's ser-

vices in this important negotiation we have the testimony of Adams, who says that all his colleagues were very able and attentive, "especially Mr. Jay, to whom the French, if they knew as much of his negotiations as they do of mine, would very justly give the title with which they have inconsiderately decorated me, that of *le Washington de la négociation*; a very flattering compliment indeed, to which I have not a right, but sincerely think it belongs to Mr. Jay." Jay quitted Paris in May, 1784, and arrived in his native city, July 24, after an absence from it of eight years. The freedom of the city was presented to him in a gold box, with an address by the corporation. He intended on leaving Europe to resume the practice of his profession, but on reaching New York he learned that congress had appointed him secretary for foreign affairs. He was also, in the succeeding autumn, elected by the state legislature a delegate to congress. He took his seat in congress Dec. 6, and held it till Dec. 21, when he accepted the secretaryship for foreign affairs, and performed its duties for five years, till the adoption of the federal constitution in 1789. In the conflict of opinion with regard to the constitution that should be formed, Jay shared in Hamilton's preference for a strong central government. When the constitution was formed, however, he urged its adoption with earnestness and ability, and wrote in its defence in "The Federalist," in conjunction with Hamilton and Madison. In April, 1788, occurred the riot in New York, known as the doctors' mob, occasioned by violations of the grave for the purpose of procuring subjects for dissection. Several physicians had been lodged in prison to protect them from the popular fury. The mob attempted to force the prison, and were resisted by Hamilton, Jay, and a body of citizens. In the conflict Jay received a wound in the temple, which confined him for some time to his bed and interrupted his contributions to "The Federalist." About the same time he was elected by a nearly unanimous vote a delegate to the New York state convention called to adopt or reject the proposed federal constitution. The convention assembled at Poughkeepsie, June 17, 1788. Of its 57 members, 46 were opposed to the constitution; but its adoption was advocated by Jay, Hamilton, and Robert R. Livingston, and after a warm debate of more than five weeks, New York gave her assent to the Union by a vote of 30 to 27. President Washington tendered to Jay a choice of the offices in his gift. He preferred the chief justiceship of the supreme court of the United States, and was confirmed by the senate, Sept. 26, 1789. The first term of the court was held at New York in February, 1790. In 1792, at the April election, Jay was the federal candidate for governor of New York, in opposition to George Clinton. Clinton was declared elected, the legislative committee rejecting on technical grounds the returns of three counties where

Jay had large majorities. The federalists were greatly exasperated, and at many public meetings Jay was declared to be the rightful governor of the state; but he counselled submission to the letter of the law. In 1794 the difficulties between the United States and Great Britain, growing out of unsettled boundaries and the attacks of the latter power on American commerce, became so serious that war was imminent. Washington wished to appoint Hamilton as special minister to England; but such was the animosity against Hamilton in the senate, that he finally nominated Jay, who embarked at New York May 12, and reached London June 15. He immediately entered into negotiations with Lord Grenville, the minister for foreign affairs, and a treaty was agreed upon, Nov. 19, 1794. It provided for constituting three boards of commissioners: one to determine the eastern boundary of the United States, by fixing on the river intended by the treaty of 1783 as the St. Croix; another to ascertain the amount of losses experienced by British subjects in consequence of legal impediments to the recovery of pre-revolutionary debts, that amount, when ascertained, to be paid by the United States; and a third to estimate the losses sustained by Americans from illegal captures by British cruisers, those losses to be paid by the British government. The amount subsequently recovered by Americans under this clause was \$10,345,000. The western posts occupied by the British were to be surrendered on June 1, 1796. There was to be a reciprocity of inland trade and intercourse between the North American territories of the two nations, including the navigation of the Mississippi, the British also to be admitted into all American harbors, with the right to ascend all rivers to the highest port of entry; but this reciprocity did not extend to the admission of American vessels into British North American harbors or rivers. These articles were declared to be perpetual; the following were limited to two years after the termination of the war in Europe: American vessels were to be admitted into British ports in Europe and the East Indies on terms of equality with British vessels; Americans might trade to the British West Indies in vessels not exceeding 70 tons burden, but without the right to transport from America to Europe any of the principal colonial products; British vessels were to be admitted into American ports on the same terms as those of the most favored nation. Privateers were to give bonds to respond in any damages they might commit against neutrals. The list of articles contraband of war was to include, besides ammunition and warlike implements, all articles serving directly for the equipment of vessels, except unwrought iron and fir plank. No vessel entering a blockaded port was to be captured unless she had first been informed of the blockade and turned away. Neither nation was to allow enlistments within its territories by any third nation at war with the other; nor

were the citizens or subjects of either to be allowed to accept commissions from such third nation, or to enlist in its service. The rest of the articles were similar to these, and were intended to preserve neutrality upon the ocean, and its observance in the American ports, so that neither French nor British privateers should be exclusively favored or supplied. A provision was made for the mutual surrender of fugitives from justice charged with murder or forgery. Jay returned to New York May 28, 1795. The treaty was submitted to the senate on June 8, and on the 24th that body advised the president to ratify it, with the exception of the articles relating to the West India trade. It was published in Philadelphia on July 2, and caused a prodigious storm of popular excitement, clamor, and misrepresentation. It was denounced as a pusillanimous surrender of American rights, and a shameful breach of our obligations to France. Meetings were held against it in all the principal cities. Copies of it were publicly burned by mobs in New York, Philadelphia, Charleston, and other places. An attempt was made at Philadelphia to burn Jay in effigy on the 4th of July. Washington, though he considered the crisis the most important and dangerous that had yet occurred in his administration, ratified the treaty on Aug. 14. This, however, did not quiet the agitation. Some of the Boston democrats paraded the streets of that town with an effigy of Jay, which they finally burned; they also attacked the house of a federalist editor, but were fired on and repulsed. On the other hand, the treaty, Jay's treaty as it was familiarly called, was defended with energy by Hamilton and other federalists. Many public meetings also were held in support of the ratification of the treaty, and the Boston chamber of commerce passed a resolution in favor of it, with only one dissenting voice, while a memorial taking the same ground was numerously signed by the merchants of Philadelphia. In the house of representatives Fisher Ames made his greatest speech in defence of the treaty, and in favor of passing the laws necessary to give it effect. After a long struggle the resolution that it was expedient to pass the laws necessary for carrying the treaty into effect was agreed to by a vote of 58 to 51, only four New England members voting against it, and from the states south of the Potomac only four for it. Jay himself, amid all this excitement and obloquy, relied upon the ultimate judgment of his countrymen.—During his absence in England his friends had put him in nomination as candidate for governor of New York, without his knowledge. He was elected by a large majority, and the result was officially declared two days before he reached New York. His administration, by reëlection, lasted six years, during which time he dismissed no one from office on account of his political opinions. In 1799 the legislature passed an act for the gradual abolition of slavery, a measure which Jay had strenu-

ously urged in 1777 upon the convention which formed the constitution of the state. In 1785 he became the president of a society formed in New York "for promoting the manumission of slaves, and protecting such of them as have been or may be liberated." He continued at the head of this society till he became chief justice of the United States, when, thinking it possible that questions might be brought before him in which the society was interested, he deemed it proper to dissolve his official connection with it. In November, 1800, as the end of his second term approached, he was solicited to become a candidate for reëlection, but declined. In December he was nominated by the president and confirmed by the senate to his former office of chief justice, made vacant by the resignation of Oliver Ellsworth. He firmly declined the honor, and at the age of 55 bade adieu for ever to public life, and retired to his paternal estate at Bedford, Westchester co., where he lived for upward of 28 years. He was very regular and exact in all his habits, was a member of the Episcopal church, and took great interest in the religious movements of his day, being president of several religious societies. In 1827 he was seized with a severe illness, and, after two years of weakness and suffering, was struck with palsy, May 14, 1829, and died three days afterward. In character Jay was eminent for the elevation and purity of his principles and conduct both in public and in private life. He had a high sense of justice and of humanity, and a profound feeling of religion. His mind was vigorous, exact, and logical, and characterized rather by judgment and discrimination than by brilliancy. The Bible was his constant study, and Cicero his favorite author. His public reputation as a patriot and statesman of the revolution was second only to that of Washington. **II. William**, an American jurist and philanthropist, son of the preceding, born in New York, June 16, 1789, died at Bedford, N. Y., Oct. 14, 1858. He received his early education at Albany, and graduated at Yale college in 1807. He studied law at Albany, but having injured his eyes by intense study, relinquished the practice of the profession and retired to Bedford, where he assisted in the management of the large landed estate which descended to him on the death of his father in 1829. In 1815 he began his career of philanthropic effort in the founding of the American Bible society, and was its recognized champion against the attacks of Bishop Hobart and other members of the Episcopal church, to which Jay himself belonged, during a controversy which lasted many years. As president of the Westchester Bible society he delivered a long series of annual addresses. He organized a society for temperance reform in 1815. He also took an active part in the tract, missionary, and educational movements of the day, and was frequently president of the Sunday school and agricultural societies of his county.

In 1818 he was appointed a judge of the court of common pleas, and in 1820 was made the first judge of Westchester co., which office he held till 1842, when he was superseded on account of his anti-slavery opinions. In 1835, when the legislature had in contemplation a law restricting freedom of speech on the subject of slavery, he advised the grand jury that it would be the duty of every citizen to resist such a law as a violation of the constitution. The same year, on behalf of the executive committee of the American anti-slavery society, he prepared a reply to the current charges against the abolitionists, and published a work entitled "An Inquiry into the Character of the American Colonization and Anti-Slavery Societies." In 1838 he published "A View of the Action of the Federal Government in behalf of Slavery." In 1843-'4 he visited Europe, and proceeded thence to Egypt, where he made the acquaintance of Sir Gardner Wilkinson, in conjunction with whom he investigated the subject of Egyptian slavery. He was for some years president of the American peace society, and in 1848 published a volume entitled "War and Peace: the Evils of the First, with a Plan for supporting the Last," which was reprinted by the London peace society. His plan consisted in treaty stipulations for the settlement of differences by arbitration. The committee on foreign relations of the United States senate, to whom a memorial on the subject was referred, reported in favor of his plan; and Mr. Cobden wrote to him: "If your government is prepared to insert an arbitration clause in the pending treaties, I am confident that it will be accepted by our negotiators." By his will he left a bequest of \$1,000 for "promoting the safety and comfort of fugitive slaves." His publications on all subjects were 43 in number, many of which were widely circulated and exercised much influence on public opinion. His largest work was the "Life and Writings of John Jay" (2 vols. 8vo, New York, 1833). He left in manuscript an elaborate commentary on the Bible. **III. John**, son of the preceding, born in New York, June 23, 1817. He studied and practised law, became prominent in the anti-slavery and other political movements, was active in the affairs of the Episcopal church, was for many years a manager and corresponding secretary of the New York historical society, and has published numerous pamphlets, addresses, and reports relating to these subjects. He was one of the founders and for some time president of the Union league club of New York. In 1869 he was appointed minister to Austria, which post he still holds (1874).

JAY, William, an English clergyman, born at Tisbury, Wiltshire, May 8, 1769, died in Bath, Dec. 27, 1853. The son of a stone-cutter, he began life as his father's apprentice, and was employed in building Beckford's mansion at Fonthill. His talents attracted the attention of the Rev. Cornelius Winter of the Marlborough dissenting academy, under whose pro-

tection and direction he prepared for the Congregational ministry. He began preaching in his 16th year. His first important sphere of labor was at Hope chapel, near Bristol. From thence he removed in 1789 to Argyle chapel in Bath, where he was settled as pastor Jan. 31, 1791, and officiated till he retired from the active ministry in January, 1853. His published sermons have passed through several editions. He also wrote an "Essay on Marriage," "Memoirs of the Rev. Cornelius Winter," "Memoirs of the Rev. John Clark," and "Lectures on Female Scripture Characters" (1854). His most popular work, however, was his "Morning and Evening Exercises" (4 vols., 1854), which has had a very wide circulation. His earlier works were collected in 12 vols. (Bath, 1845-'9; republished in 3 vols., New York). His autobiography, with a supplement by the Rev. Dr. Redford and the Rev. J. A. James, appeared in 1854.

JAYADEVA, a Hindoo poet, born at Kenduli, a town of doubtful position, but according to tradition near the Ganges, about the middle of the 12th century. The only poem of his extant is entitled *Gita Govinda*, in honor of Govinda or Krishna, the eighth avatar or incarnation of Vishnu. It is a species of pastoral drama, in which the loves of the god and his innamorata Râdha are described in very impassioned language. This poetry has always been greatly admired by the Hindoos, and most of the commentators contend that it is to be understood in a figurative and allegorical sense, the loves of Krishna and Râdha describing the attraction between the divine goodness and the human soul. There is an English translation of it by Sir William Jones, who admits the allegorical meaning, though others think it merely an amatory poem.

JAZET, Jean Pierre Marie, a French engraver, born in Paris, July 31, 1788. Under the direction of his uncle Debucourt he became famous by aquatint engravings of some of the most celebrated works of Vernet, Gros, Delaroche, and other eminent painters, and was still at work in 1864, though then in his 76th year. —His son **EUGÈNE**, who excelled in the same art, met with a tragic end in 1856; and another son, **ALEXANDRE JEAN LOUIS**, executed a popular engraving of Trumbull's "Declaration of American Independence" (1861).

JAZYGES, a tribe belonging to the numerous nationalities comprehended during the earlier period of the Roman empire under the name of Sarmatians, who dwelt originally on the northern shores of the Black sea and sea of Azov. In the time of the emperor Claudius, being pressed by their neighbors, they divided into three bodies, which established themselves respectively on the Don, between the Dnieper and the Dniester, and in the marshy region between the Theiss and the Danube. The two former divisions became tributary to the Goths; the third, because of their position between Pannonia and Dacia, lived under

the protection of Rome, and were called *Jazyges Metanastæ*, or transplanted. Their name disappeared in the great invasion of the Magyars. They reappeared as a Magyarized tribe (Hun. *Jászok*, bowmen) at a later period, when their possessions between the Danube and Theiss formed a separate central district of Hungary under the name of *Jazygia (Jászság)*. This fertile region was united with Cumania, and down to 1848 was under the special administration of the palatine, who also bore the title of captain of the *Jazyges* and *Cumanians*. It embraces among others the towns of *Jászberény*, the capital of the united districts, *Árok-Szállás*, and *Apáthi*, and has an area of 400 sq. m., and a population of 60,000 (area of *Jazygia* and *Cumania* together, 1,825 sq. m.; pop. in 1870, 215,526). (See *CUMANIA*.)

JAZYGIA. See *JAZYGES*.

JEAFFRESON, John Cordy, an English author, born at Framlingham, Suffolk, in January, 1831. He studied medicine for a while, afterward entered Pembroke college, Oxford, where he graduated, in 1852 entered Lincoln's inn as a law student, and in 1859 was admitted to the bar. While an undergraduate he contributed frequently to magazines and newspapers. His first novel was "Crew Rise" (1854). This was followed by "Hinchbrook" (1855) and several other novels, such as "Isabel, the Young Wife and Old Love," "Miriam Copley," "Sir Edward's Daughter" (1860), "Olive Blake's Good Work" (1862), and "Live it Down" (1863). Among his other works are "A Book about Doctors" (1860), "A Book about Lawyers" (1866), "A Book about the Clergy," "Annals of Oxford" (1870), and "A Woman in Spite of Herself" (1872).

JEANRON, Philippe Auguste, a French painter, born in Boulogne, May 10, 1809. He is a self-taught artist, and became known in Paris in 1830 by his "Little Patriots" and other genre pictures, especially the "Twelve Episodes in a Proletarian Life," executed for Ledru-Rollin, who placed him in 1848 at the head of all the national museums, from which office he retired in 1850, after making great improvements in the Louvre and other institutions in Paris and elsewhere. He afterward became director of the museum of Marseilles. One of his best works is "The Abandoned Port of Ambleteuse," in the Luxembourg. He has written *Histoire de l'école française* (1852), and *De l'art de la peinture* (1865).

JEBAIL, or Jebell, a town of Syria, built on an eminence near the Mediterranean, at the

foot of Mt. Lebanon, 20 m. N. of Beyrout; pop. about 600. It is walled on the land side, contains large gardens, a strongly built castle, an old Maronite church, and a mosque. It is supposed to be the Byblus of the ancients, often mentioned as a city of Phœnicia, between Tripolis and Berytus, the modern Tarabulus and Beyrout. In the Scriptures it is called Gebal, a word signifying mountain. Its territory is called the land of the Gibletes (*Josh. xiii. 5*); and its inhabitants are mentioned among the builders of the Phœnician king Hiram, who assisted King Solomon in building the temple of Jerusalem. Its elders and wise men are mentioned as calkers of Tyre, in the time of its glory (*Ezek. xxvii. 9*). It is said to be the birthplace of Adonis, and just S. of the town the river Adonis falls into the sea. The harbor of Jebail was destroyed during the wars of the crusaders, who captured the town and kept it as long as they maintained their power in Syria. It was taken from Mehemet Ali by the English in 1840.—Another Gebal is mentioned in the Scriptures, a mountainous region S. of the Dead sea, the Jebal of the Arabs, the Gebalene of the Greeks, and probably the Syria Sobal of the crusaders.

JEBEL SHOMER. See *SHOMER*.

JEDBURGH, the chief town of Roxburghshire, Scotland, on the left bank of the river Jed, 42 m. S. E. of Edinburgh; pop. in 1871, 3,321. It is a well built and picturesque town, with manufactures of woollens, iron and brass wares, and machinery; but its history and antiquities give it its chief celebrity. The prin-

Jedburgh Abbey.

cipal architectural remains are the ruins of the ancient and once magnificent abbey, built during the 12th century, and the castle, a favorite residence of the early Scottish kings, now used as a prison.—Jedburgh was the scene of many desperate conflicts during the

border wars, when it was strongly fortified, and was regarded, with the dense forest near by, as one of the chief Scottish strongholds. The great abbey was burned by the earl of Surrey in 1523, and again partially destroyed by the earl of Hertford in 1545. The town was also the scene of incidents in the life of Mary Stuart. It is the birthplace of Sir David Brewster and Mrs. Mary Somerville.

JEFFERSON, the name of 23 counties in the United States. **I.** A N. county of New York, bordering on Lake Ontario and the river St. Lawrence; area, 1,868 sq. m.; pop. in 1870, 65,415. Black river intersects it, and it is watered by other streams. The land rises gradually from the lake to a height of 1,000 ft. There are low ridges in the N. E. parallel with the St. Lawrence, and marshes in the S. W. The soil is generally fertile. Iron ore, lead, and copper are found. The Rome, Watertown, and Ogdensburgh railroad and Cape Vincent branch traverse it. The chief productions in 1870 were 228,772 bushels of wheat, 221,551 of Indian corn, 1,058,227 of oats, 415,704 of barley, 86,602 of peas and beans, 507,349 of potatoes; 104,459 lbs. of wool, 262,738 of hops, 35,850 of flax, 529,109 of maple sugar, 4,883,508 of butter, 2,545,654 of cheese, and 223,343 tons of hay. There were 15,564 horses, 72,980 milch cows, 23,525 other cattle, 26,390 sheep, and 13,930 swine, 6 manufactories of agricultural implements, 9 of cheese boxes, 35 of carriages, 79 of cheese, 21 of clothing, 4 of confectionery, 1 of cotton goods, 21 of furniture, 10 of iron castings, 1 of blooms, 11 of machinery, 4 of malt, 6 of paper, 3 of pumps, 34 of saddlery and harness, 8 of sash, doors, and blinds, 1 of sewing machines, 1 of steel springs, 24 of tin, copper, and sheet-iron ware, 6 of woollen goods, 36 saw mills, 5 breweries, 19 tanneries, 9 currying establishments, and 40 flour mills. Capital, Watertown. **II.** A W. county of Pennsylvania, drained by Mahoning and Red Bank creeks; area, 950 sq. m.; pop. in 1870, 21,656. The surface is hilly and well timbered, and the soil generally fertile. Iron ore and anthracite coal are abundant. The chief productions in 1870 were 78,618 bushels of wheat, 64,678 of rye, 200,484 of Indian corn, 390,151 of oats, 46,632 of buckwheat, 54,596 of potatoes, 56,621 lbs. of wool, 497,951 of butter, and 18,914 tons of hay. There were 4,855 horses, 5,391 milch cows, 6,029 other cattle, 20,029 sheep, and 8,889 swine; 2 manufactories of agricultural implements, 8 of carriages, 8 of furniture, 4 of iron castings, 1 of machinery, 7 of saddlery and harness, 4 of woollen goods, 11 tanneries, 7 currying establishments, 1 distillery, 3 planing mills, and 44 saw mills. Capital, Brookville. **III.** The N. E. county of West Virginia, separated from Maryland on the N. E. by the Potomac river, bounded N. W. by Opequan creek, and S. and S. E. by Virginia, and intersected by the Shenandoah; area, 260 sq. m.; pop. in 1870, 13,219, of whom

3,488 were colored. It has a rolling surface and a fertile soil resting on a bed of limestone. The Blue Ridge lies on the S. E. border. The Baltimore and Ohio and the Winchester and Potomac railroads pass through it. The chief productions in 1870 were 468,841 bushels of wheat, 336,287 of Indian corn, 44,077 of oats, 24,305 of potatoes, 28,699 lbs. of wool, 120,374 of butter, and 5,753 tons of hay. There were 3,694 horses, 2,489 milch cows, 3,313 other cattle, 6,521 sheep, and 9,151 swine, 4 manufactories of woollen goods, 5 of tin, copper, and sheet-iron ware, 1 of paper, 4 of cooperage, 1 of cement, 1 tannery, 6 flour mills, and 8 saw mills. Capital, Charlestown. **IV.** An E. county of Georgia, intersected by Ogeechee river and Brier creek; area, 634 sq. m.; pop. in 1870, 12,190, of whom 7,943 were colored. It has a level surface, and contains buhrstone, agates, chalcidony, and carnelian. The soil was originally fertile. The Georgia Central railroad passes through it. The chief productions in 1870 were 11,949 bushels of wheat, 211,528 of Indian corn, 22,514 of sweet potatoes, and 6,885 bales of cotton. There were 643 horses, 1,023 mules and asses, 1,508 milch cows, 3,432 other cattle, 4,440 sheep, and 8,686 swine. Capital, Louisville. **V.** A N. county of Florida, bordering on Georgia and Appalachee bay, and bounded E. by the Ocella river; area, 470 sq. m.; pop. in 1870, 13,398, of whom 6,374 were colored. The surface is undulating and the soil fertile. The Jacksonville, Pensacola, and Mobile railroad and Monticello branch traverse it. The chief productions in 1870 were 238,728 bushels of Indian corn, 15,163 of sweet potatoes, 24 hogsheads of sugar, 21,773 gallons of molasses, and 6,051 bales of cotton. There were 494 horses, 1,025 mules and asses, 1,635 milch cows, 3,378 other cattle, 956 sheep, and 7,004 swine. Capital, Monticello. **VI.** A central county of Alabama, drained by Black Warrior and Cahawba rivers; area, 1,040 sq. m.; pop. in 1870, 12,345, of whom 2,506 were colored. It has a hilly surface and a fertile soil. Coal, iron, and timber are abundant. The Alabama and Chattanooga and the South and North Alabama railroads traverse it. The chief productions in 1870 were 45,219 bushels of wheat, 251,184 of Indian corn, 24,195 of sweet potatoes, 31,566 lbs. of butter, and 1,470 bales of cotton. There were 1,754 horses, 3,094 milch cows, 1,414 working oxen, 3,852 other cattle, 5,437 sheep, and 13,753 swine. Capital, Elyton. **VII.** A S. W. county of Mississippi, separated from Louisiana by the Mississippi river; area, 630 sq. m.; pop. in 1870, 13,848, of whom 10,633 were colored. It has a fertile soil, and the E. part is occupied by pine woods. The chief productions in 1870 were 204,464 bushels of Indian corn, 31,386 of sweet potatoes, 33,235 lbs. of butter, and 13,719 bales of cotton. There were 1,681 horses, 1,964 mules and asses, 3,215 milch cows, 1,584 working oxen, 4,825 other cattle, 2,118 sheep, and 7,620

swine. Capital, Fayette. **VIII.** A S. E. parish of Louisiana, extending from Lake Pontchartrain to Barataria bay, and crossed by the Mississippi; area, 384 sq. m.; pop. in 1870, 17,767, of whom 11,054 were colored. The surface is level and partly occupied by marshes and lakes. The soil is fertile. The New Orleans, Jackson, and Great Northern, the New Orleans, Mobile, and Texas, and Morgan's Louisiana and Texas railroads pass through it. The chief productions in 1870 were 67,460 bushels of Indian corn, 8,071 of Irish and 7,640 of sweet potatoes, 456 bales of cotton, 269,620 lbs. of rice, 2,196 hogsheads of sugar, and 136,200 gallons of molasses. There were 195 horses, 828 mules and asses, 533 cattle, and 336 sheep; 4 manufactories of brick, and 7 of molasses and sugar. Capital, La Fayette. **IX.** The S. E. county of Texas, separated from Louisiana by Sabine lake and pass, bounded N. E. by the Neches, and S. by the gulf of Mexico; area, 900 sq. m.; pop. in 1870, 1,906, of whom 498 were colored. The surface consists chiefly of vast savannas, which pasture large herds of horses and cattle. The chief productions in 1870 were 15,282 bushels of Indian corn, 8,880 of sweet potatoes, and 15,150 lbs. of rice. There were 1,758 horses, 743 milch cows, 15,307 other cattle, 642 sheep, and 535 swine. Capital, Beaumont. **X.** A S. E. county of Arkansas, traversed by Arkansas river, which is here navigable by steamboats; area, about 900 sq. m.; pop. in 1870, 15,733, of whom 10,167 were colored. The surface is level and the soil fertile. The chief productions in 1870 were 303,125 bushels of Indian corn, and 18,390 bales of cotton. There were 2,211 horses, 1,936 mules and asses, 3,231 milch cows, 4,315 other cattle, 1,079 sheep, and 17,093 swine; 1 manufactory of agricultural implements, 1 of carriages, and 6 saw mills. Capital, Pine Bluff. **XI.** An E. county of Tennessee, bounded N. W. by Holston river and drained by the French Broad; area, 356 sq. m.; pop. in 1870, 19,476, of whom 2,910 were colored. It has a hilly and well wooded surface, and contains iron ore. The soil is fertile. The East Tennessee, Virginia, and Georgia, and the Cincinnati, Cumberland Gap, and Charleston railroads pass through it. The chief productions in 1870 were 135,764 bushels of wheat, 527,853 of Indian corn, 132,453 of oats, 22,892 lbs. of wool, 75,583 of butter, and 3,923 tons of hay. There were 3,210 horses, 3,097 milch cows, 4,828 other cattle, 11,598 sheep, and 11,971 swine; 4 manufactories of agricultural implements, 1 of paints, 1 flour mill, and 3 saw mills. Capital, Dandridge. **XII.** A N. county of Kentucky, separated from Indiana by the Ohio river; area, 330 sq. m.; pop. in 1870, 118,953, of whom 19,146 were colored. The surface is diversified and the soil fertile. The Louisville and Nashville and the Louisville, Cincinnati, and Lexington railroads pass through it. The chief productions in 1870 were 102,820 bushels of wheat, 1,059,729 of Indian corn,

368,328 of oats, 49,975 of barley, 377,382 of Irish and 104,862 of sweet potatoes, 35,263 lbs. of wool, 312,233 of butter, and 11,228 tons of hay. There were 6,360 horses, 1,369 mules and asses, 6,263 milch cows, 3,071 other cattle, 7,089 sheep, and 34,575 swine. There were altogether 801 manufacturing establishments, chiefly in Louisville, the county seat; capital invested, \$11,129,291; value of products, \$20,364,650. **XIII.** An E. county of Ohio, separated from West Virginia by the Ohio river; area, 396 sq. m.; pop. in 1870, 29,188. The surface is uneven, the soil rich, and coal abundant. The Pittsburgh, Cincinnati, and St. Louis railroad and the river division of the Cleveland and Pittsburgh railroad pass through it. The chief productions in 1870 were 215,694 bushels of wheat, 630,196 of Indian corn, 430,384 of oats, 44,263 of barley, 122,530 of potatoes, 664,512 lbs. of wool, 561,047 of butter, and 28,569 tons of hay. There were 5,577 horses, 5,429 milch cows, 6,837 other cattle, 154,668 sheep, and 11,627 swine; 15 manufactories of carriages, 3 of brick, 1 of cars, 11 of clothing, 1 of rectified coal oil, 4 of coke, 1 of glassware, 8 of iron, 3 of machinery, 1 of printing paper, 5 of woollen goods, 6 tanneries, 2 currying establishments, 1 distillery, 2 breweries, 5 flour mills, and 5 saw mills. Capital, Steubenville. **XIV.** A S. E. county of Indiana, separated from Kentucky by the Ohio river; area, 362 sq. m.; pop. in 1870, 29,741. It has a diversified surface and a rich soil. The Jeffersonville, Madison, and Indianapolis, and the Ohio and Mississippi railroads pass through it. The chief productions in 1870 were 207,909 bushels of wheat, 466,246 of Indian corn, 131,321 of oats, 40,028 of barley, 98,952 of potatoes, 35,707 lbs. of wool, 408,565 of butter, and 20,933 tons of hay. There were 6,406 horses, 5,289 milch cows, 7,006 other cattle, 18,921 sheep, and 19,757 swine, and numerous manufacturing establishments, chiefly in Madison, the county seat. **XV.** A S. county of Illinois, drained by the head streams of Big Muddy river; area, 576 sq. m.; pop. in 1870, 17,864. The surface is diversified by prairies and tracts of timber, and the soil is moderately fertile. The St. Louis and Southeastern railroad passes through it. The chief productions in 1870 were 100,553 bushels of wheat, 887,981 of Indian corn, 285,949 of oats, 52,309 of potatoes, 99,469 lbs. of tobacco, 52,957 of wool, 150,298 of butter, and 10,460 tons of hay. There were 6,006 horses, 1,878 mules and asses, 3,908 milch cows, 6,484 other cattle, 22,759 sheep, and 24,805 swine; 4 manufactories of carriages, 5 of saddlery and harness, 1 of woollen goods, 8 flour mills, and 5 saw mills. Capital, Mount Vernon. **XVI.** A S. E. county of Wisconsin, drained by Rock, Crawfish, and Bark rivers, and by Koshkonong lake, an expansion of Rock river; area, 576 sq. m.; pop. in 1870, 34,040. The surface is generally level or undulating, and is well timbered, particularly

in the E. part. The soil is good, the valley of Rock river being of remarkable fertility. The La Crosse and St. Paul, the Prairie du Chien, and the Madison divisions of the Milwaukee and St. Paul railroad, and the Wisconsin division of the Chicago and Northwestern railroad traverse it. The chief productions in 1870 were 678,715 bushels of wheat, 34,374 of rye, 579,233 of Indian corn, 470,466 of oats, 50,310 of barley, 296,103 of potatoes, 203,408 lbs. of wool, 206,755 of hops, 908,119 of butter, 84,201 of cheese, and 50,055 tons of hay. There were 8,409 horses, 11,701 milch cows, 11,969 other cattle, 49,118 sheep, and 14,965 swine; 5 manufactories of agricultural implements, 8 of brick, 25 of carriages, 5 of cheese, 16 of cooperage, 12 of furniture, 4 of iron castings, 2 of cotton and woollen machinery, 10 of saddlery and harness, 3 of sash, doors, and blinds, 9 of tin, copper, and sheet-iron ware, 2 of woollen goods, 2 tanneries, 14 breweries, 15 flour mills, and 11 saw mills. Capital, Jefferson. **XVII.** A S. E. county of Iowa, drained by Skunk river and Big Cedar creek; area, 380 sq. m.; pop. in 1870, 17,839. The surface is occupied by rich rolling prairies and forests of oak, ash, hickory, maple, &c. The Burlington and Missouri River railroad and the Southwestern branch of the Chicago, Rock Island, and Pacific traverse it. The chief productions in 1870 were 234,779 bushels of wheat, 1,100,560 of Indian corn, 242,364 of oats, 72,637 of potatoes, 107,394 lbs. of wool, 403,782 of butter, and 26,335 tons of hay. There were 9,150 horses, 6,365 milch cows, 11,330 other cattle, 29,300 sheep, and 32,845 swine; 4 manufactories of carriages, 2 of furniture, 1 of machinery, 7 of saddlery and harness, 2 of woollen goods, and 3 saw mills. Capital, Fairfield. **XVIII.** An E. county of Missouri, separated from Illinois by the Mississippi river, and drained by Maramec river and its branches; area, 500 sq. m.; pop. in 1870, 15,380, of whom 763 were colored. The surface is diversified, and the soil is of various qualities. Rich mines of lead are worked, and copper and cobalt are also found. The St. Louis and Iron Mountain railroad passes through it. The chief productions in 1870 were 149,298 bushels of wheat, 534,705 of Indian corn, 134,279 of oats, 76,278 of potatoes, 25,235 lbs. of tobacco, 18,152 of wool, 152,934 of butter, 6,426 gallons of wine, 29 bales of cotton, and 5,675 tons of hay. There were 4,639 horses, 1,374 mules and asses, 4,739 milch cows, 1,235 working oxen, 5,999 other cattle, 10,722 sheep, and 24,882 swine; 3 flour mills, 1 manufactory of kaolin and ground earths, and 3 of pig lead. Capital, Hillsborough. **XIX.** A N. E. county of Kansas, bounded S. by Kansas river, and intersected by Grasshopper river; area, 550 sq. m.; pop. in 1870, 12,526. The surface is undulating, and the soil fertile. Timber and limestone are abundant, and coal has been found in several parts. The Kansas Pacific and the Atchison,

Topeka, and Santa Fé railroads pass through it. The chief productions in 1870 were 32,302 bushels of wheat, 1,257,790 of Indian corn, 210,040 of oats, 142,405 of potatoes, 261,161 lbs. of butter, and 18,925 tons of hay. There were 6,313 horses, 6,215 milch cows, 13,633 other cattle, 4,072 sheep, and 21,818 swine; 3 flour mills, 6 saw mills, and 1 woollen factory. Capital, Oskaloosa. **XX.** A S. E. county of Nebraska, bordering on Kansas, and intersected by Little Blue river; area, 576 sq. m.; pop. in 1870, 2,440. The soil is fertile. The chief productions in 1870 were 24,847 bushels of wheat, 72,230 of Indian corn, 15,199 of potatoes, 19,850 lbs. of butter, and 2,182 tons of hay. There were 528 horses, 507 milch cows, 905 other cattle, 791 sheep, and 712 swine. Capital, Fairburg. **XXI.** A central county of Colorado, situated partly in the foot hills and partly in the plains; area, about 800 sq. m.; pop. in 1870, 2,390. It is watered by small tributaries of the Platte, which afford good water power. The soil is fertile and easily irrigated. In the west are found copper, iron, coal, fire and potter's clay, and gypsum. The Colorado Central railroad terminates at the county seat. The chief productions in 1870 were 54,746 bushels of wheat, 8,625 of Indian corn, 45,523 of oats, 9,060 of barley, 15,890 of potatoes, 47,470 lbs. of butter, 8,860 of cheese, and 1,957 tons of hay. There were 433 horses, 1,026 milch cows, and 1,684 other cattle; 3 flour mills, 8 saw mills, and 2 manufactories of stone and earthenware. Capital, Golden City. **XXII.** A S. W. county of Montana, bounded E. by the Missouri river; area, 2,720 sq. m.; pop. in 1870, 1,531, of whom 122 were Chinese. It contains a large area of rich farming land, and is well adapted to stock raising. There are gold mines on the branches of the Missouri and Jefferson rivers. The chief productions in 1870 were 4,194 bushels of wheat, 11,584 of oats, 6,605 of barley, 11,693 of potatoes, 70,165 lbs. of butter, and 2,422 tons of hay. There were 572 horses, 2,484 milch cows, and 3,614 other cattle; 6 saw mills, and 8 quartz mills. Capital, Radersburg. **XXIII.** A W. county of Washington territory, bounded E. and N. E. by Hoods's canal and Admiralty inlet, and W. by the Pacific ocean; area, 1,670 sq. m.; pop. in 1870, 1,268. The interior is mountainous, and the surface is mostly covered with forests of pine and fir, but there is much land suitable for agriculture. The chief productions in 1870 were 7,650 bushels of wheat, 3,038 of oats, 4,373 of barley, 13,698 of potatoes, and 13,356 lbs. of butter. The value of live stock was \$37,674. There were 2 saw mills, producing \$326,050 worth of lumber during the year. Capital, Port Townsend.

JEFFERSON, a city and the county seat of Marion co., Texas, situated on Big Cypress bayou, 4 m. above its entrance into Soda lake, which empties into Red river, and on a branch of the Texas and Pacific railroad, 260 m. N. E. of Austin and 40 m. N. W. of Shreveport, La.;

pop. in 1860, 988; in 1870, 4,190, of whom 1,825 were colored. In the vicinity are deposits of coal and iron ore. The river is navigable to this point by large steamers, and the city is the shipping point for a large extent of fertile country, the principal articles being cotton, cattle, hides, beef, tallow, wool, and Osage orange seeds. The principal manufactories are a foundery, saw mills, planing mills, sash and door factories, and brick-making establishments. There is also an extensive foundery about $4\frac{1}{2}$ m. from the city. There are a national and a savings bank, ten schools, three newspapers, and seven churches. Jefferson was first settled in 1843.

JEFFERSON, Thomas, third president of the United States, born at Shadwell, Albemarle co., Va., April 2, 1743, died at Monticello, July 4, 1826. His father was Col. Peter Jefferson, a planter of great force of character and high position; his mother, Jane Randolph, daughter of Isham Randolph of Dungeoness in Goochland. At five years of age he was placed at an English school, and at nine commenced the study of Greek, Latin, and French under Mr. Douglass, a Scottish clergyman. Upon his father's death in 1757, he was sent to the classical school of the Rev. Mr. Maury, where he continued for two years, passing thence at the age of 17 to the college of William and Mary at Williamsburg. He soon became popular with his companions and the college professors, and is described at this time as ardent and impulsive in demeanor, with a tall, thin, and angular person, ruddy complexion, red hair, and bright gray eyes flecked with hazel. Among the friends whom he made was Francis Fauquier, the popular governor of the colony. After remaining in college two years, he studied law with George Wythe, and commenced practice in 1767 at the bar of the general court, attending also the county courts of his district. He is said to have been but slightly acquainted with the practice of the profession, and an infrequent speaker; yet during the first two years of his practice he was employed in about 200 suits, his fees amounting to at least £600, at a time when fees were very moderate. The record of the two succeeding years shows a regular increase, and in 1771 Robert Carter Nicholas, an eminent lawyer, intrusted to him all of his unfinished business. In 1769, at the age of 26; he was chosen to represent his county in the house of burgesses, where he at once took a prominent stand with the opponents of parliamentary encroachment, drafting the resolutions to be used as heads in framing a reply to Governor Botetourt's address, and signing the non-importation agreement. At this his first session he introduced a bill empowering the owners of slaves to manumit them if they thought proper; it was defeated, and its policy not fully embraced till 1782. Jefferson returned to his practice, and in the following year removed from Shadwell to a new residence but partially finished, which after-

ward became famous as "Monticello." On Jan. 1, 1772, he was married to Martha Skelton, widow of Bathurst Skelton, and daughter of John Wayles, an influential lawyer of Charles City. This lady, then 23 years of age, and remarkable for the beauty of her person and the grace of her manners, brought him a very considerable fortune. She had inherited 135 slaves and 40,000 acres of land, the value of the whole being about equal to Jefferson's own patrimony. The two combined formed an ample estate, and Jefferson's practice added largely to his income. In the spring of 1773 he was appointed by the house of burgesses a member of the "committee of correspondence and inquiry for the dissemination of intelligence between the colonies," the plan of which he had aided in devising. The house was dissolved by the governor; its members were reelected and resumed their seats in the spring of 1774; and it was again dissolved after adopting a resolution drafted by Jefferson and a few associates at a private meeting, recommending the observance of June 1 as "a day of fasting, humiliation, and prayer," in consequence of the passage of the Boston port bill in parliament. The members met privately, and recommended the election of deputies from the counties to a convention to meet on Aug. 1. Jefferson was chosen a member of this convention, but was taken sick just before the assembling of the body, and could not attend. He had however drawn up a paper to serve for instructions to the delegates to the general congress which the committee of correspondence had been directed to propose to all the colonies, and this he sent to Peyton Randolph, the president of the convention. The document was afterward ordered by the burgesses to be printed under the title of "A Summary View of the Rights of British America," and, as Jefferson believed, procured the enrolment of his name on a bill for treason brought into parliament. It was a bold, elaborate, and eloquent exposition of the right of the colonies to resist taxation, and contained the germ of the subsequent declaration of independence. The paper was offered, but not adopted, being regarded as too much in advance of public sentiment. The people were not yet ripe for resistance by force, and even the leaders still believed in the possibility of renewing the old amicable relations with Great Britain. Such a restoration of good feeling was warmly hoped for by the planters generally. A "redress of grievances" was all that the foremost leaders aimed at thus early, and the tone of the appeal for redress was the point at issue. The "Summary View" was printed in England as well as in Virginia, and extensively made use of by opposition speakers in parliament. Its influence upon the fortunes of Jefferson was marked; it placed him before the public as a courageous and uncompromising advocate of constitutional freedom, and above all as a most accomplished and eloquent writer. He attended the second convention, which met

in March, 1775, and was placed upon the committee to report a plan of defence, which was soon drawn up. The convention then proceeded to elect delegates to congress, and Jefferson was chosen as the alternate of Peyton Randolph, who might be retained by his office of president of the house in Virginia. This was the case when Gov. Dunmore summoned the burgesses to meet on June 1. Jefferson was present, and at the request of his associates drew up before leaving Williamsburg the reply of the Virginia assembly to Lord North's "conciliatory proposition." This bold and forcible paper he carried with him to Philadelphia soon afterward. Eight days before his arrival Washington had been appointed by congress commander-in-chief of the armies of the colonies. America was thus in open resistance against the crown. Jefferson's arrival was anxiously expected, as he was known to be the bearer of the reply of Virginia to Lord North's proposal; and when the reply was delivered to congress, it met with the warmest approbation. As the author of the paper, and of the "Summary View" in the preceding year, Jefferson took his position among the leaders of the body. He had "the reputation of a masterly pen," says John Adams, and "writings of his were handed about, remarkable for the peculiar felicity of expression." He was silent upon the floor, but in committee was so "prompt, frank, explicit, and decisive," says the same authority, that he won the cordial regard as well as respect of his associates. He was at once placed upon the committee to draw up the declaration of the cause of taking up arms, and aided John Dickinson in drafting the paper, of which congress approved. The body then proceeded to act upon Lord North's proposition; and Jefferson, as author of the answer of Virginia, was requested by the committee, of which he was a member, to prepare that of congress. He did so, nearly in the words of the former paper. Congress adopted it, and then adjourned. In November the news arrived of the rejection of the last petition. On May 15, 1776, Virginia instructed her delegates to propose a declaration of the independence of the colonies; and congress now solemnly approached that great event. Early in June a committee to draw up the declaration was appointed, with Jefferson for its chairman. He was "unanimously pressed to undertake the draft" by his associates of the committee, and did so, Franklin and Adams only making two or three verbal alterations in it. It was laid before congress on June 28. On July 2, the resolution to declare the colonies independent, which had been introduced by Richard Henry Lee, in accordance with the Virginia instructions, passed the body, and the draft of the declaration was taken up. The debate upon the paper, as to its tone, its statements, and the propriety of adopting at that time a measure so extreme, lasted for nearly three days, and was very hot. It was so powerfully

opposed by some of the members, that Jefferson compared the opposition to "the ceaseless action of gravity, weighing upon us by night and by day." Its supporters, however, were the leading minds, and urged its adoption with masterly eloquence and ability. On July 4 the declaration with the amendments was agreed to; and thus commenced the republic of the United States of America. The paper has justly secured a renown more extended perhaps than that of any other state paper in existence. Two questions have however arisen as to its originality: the first upon the substance of the document; the second in regard to its phraseology, in connection with the alleged Mecklenburg declaration of May, 1775. It is more than probable that Jefferson made use of some of the ideas expressed in newspapers, conversation, and by public speakers at the time; and that his study of the great English writers upon constitutional freedom was of service to him. But an impartial criticism will not base upon the fact a charge of want of originality. It should rather be regarded as the peculiar merit of the writer that he thus collected and embodied the conclusions upon government of the leading thinkers of the age in Europe and America, rejecting what was false, and combining his material into a production of so much eloquence and dignity. The "Summary View" of 1774 will however be found to contain the complete germ of the "Declaration;" and as the originality of the former has not been impeached, the merit of the latter is in every fair sense due to Jefferson. The second charge, that he made use of the alleged Mecklenburg paper, has excited volumes of controversy. Jefferson distinctly denied that he had ever seen it at the time, and John Adams declared that he had not himself met with it. Jefferson was rechosen a delegate to congress, but resigned the appointment. "The laboring oar," he wrote, was at home in Virginia. His aim now was to carry out radical changes in the laws of his native state. The new era could not commence there until fundamental reforms had taken place, and the practicability of such reforms had long engaged his attention. The first movement in the proposed direction had been the formation by the convention of a constitution for the commonwealth. Just before the composition of the declaration, Jefferson had drawn up a preamble and outline sketch of the proposed instrument, and sent it to Edmund Randolph, president of the convention then sitting. George Mason had however framed a constitution upon which the final vote was about to be taken. Jefferson's draft was not proposed, but his preamble was prefixed to the work of Mason. The great reforms in the organic laws were still unattained, and to these Jefferson ardently addressed himself. He was elected to represent his county, and declining the appointment by congress to become one of the commissioners to negotiate the now important treaties of commerce and

alliance with France, he took his seat in the Virginia house in October, 1776. He commenced at once by obtaining leave to bring in bills for cutting off entails, and for a general revision of the laws of the commonwealth. A committee of revision was appointed, and Jefferson placed at the head of it, with Edmund Pendleton and other distinguished lawyers for colleagues. The work employed the committee for more than two years, and was arduous in the extreme. To Jefferson were allotted the common law and statutes to the 4th of James I.; and he applied himself with zeal to the revision. To the more important bills which he brought in, the opposition was resolute and bitter. The explanation of this fact may be found in a few sentences of his memoir: "I considered four of these bills as forming a system by which every fibre would be eradicated of ancient or future aristocracy. . . . The repeal of the laws of entail would prevent the accumulation and perpetuation of wealth in select families. . . . The abolition of primogeniture, and equal partition of inheritances, removed the feudal and unnatural distinctions which made one member of every family rich and all the rest poor. . . . The restoration of the rights of conscience relieved the people from taxation for the support of a religion not theirs, for the establishment was truly the religion of the rich." The latter reference is to the bill "for establishing religious freedom." On the adoption of this, and the proposition to cut off entails and abolish the right of primogeniture, took place the determined stand which has been mentioned. From the peculiar character of Virginia society at the period, no measures could have been more revolutionary. The dominant class was essentially aristocratic, and the law of primogeniture represented their deliberate views of social order; the establishment was dear to them as the church of their ancestors, and as the bulwark of Protestant Christianity against heresy and superstition. The contest was prolonged for years, and enlisted all the ability of the commonwealth. The advocates and opponents of the measures fought with the desperation of men who were contending for the dearest prizes of existence. The bills all finally passed, and the reorganization was complete. When Jefferson drew up the epitaph to be inscribed upon his tomb, he added to the words, "author of the Declaration of Independence," those others, "and of the statute of Virginia for religious freedom." In addition to these radical measures, Jefferson was the author of others of importance, for the establishment of courts of law, and a complete system of elementary and collegiate education. He continued to sit in the house in 1777 and 1778. In the former year he strongly opposed the alleged scheme for appointing Patrick Henry dictator. In the latter year he proposed and procured the passage of a bill forbidding the future importation of slaves. In the spring of 1779 he was busily employed in ameliorating

the condition of the British prisoners at Charlottesville. On June 1 he was elected governor of Virginia. He entered upon office at a gloomy period in the history of the country. The last campaign had not been encouraging to the American arms, and the enemy were about to carry the war into the south. Jefferson found the commonwealth almost defenceless. Virginia had nearly 10,000 troops in the army of the United States, and the steady drain upon her other resources had so greatly enfeebled her that there was little prospect of her being able to resist an enemy. The southern campaign began in Georgia and the Carolinas, and the resources of the colonies were laid under a heavy tax for raising supplies. Virginia was so profuse in contributions of men, arms, horses, and provisions, that she was soon completely exhausted. Her extended coast and the banks of her great rivers were wholly unfortified. A few small vessels and gunboats, imperfectly manned and equipped, were all that she could oppose to the approach of an enemy's fleet. Gen. Leslie easily took possession of Hampton and Portsmouth, and Arnold ascended James river almost unresisted with fewer than 2,000 men. He entered Richmond, which had recently become the capital, on Jan. 5, 1781. The public functionaries, including the governor, retired before the enemy; but Jefferson remained until they entered the lower part of the town, and afterward busied himself in their immediate vicinity in attempts to protect the public stores. Arnold ravaged the place, burned some buildings, and then dropped down the river again. In April Gen. Phillips ascended the river and threatened Richmond; but receiving orders from Cornwallis, who had entered Virginia from the south, he joined the main army, then advancing in pursuit of Lafayette toward the Rapidan. Lafayette escaped, and Cornwallis determined to capture or disperse the legislature, which had adjourned to meet in Charlottesville. Tarleton was despatched upon this enterprise, and by a forced march he fell upon the body almost before they knew of his approach. They were dispersed, but without any captures; and Tarleton detached several of his troop to take the governor prisoner at Monticello, which was in sight of the town. Jefferson received intelligence of their approach, and hastily sent off his family. Having secured his more important papers, he followed on horseback, just in time to escape the party sent to take him. Tarleton rejoined Cornwallis, burning and ravaging on his way. Among other estates laid waste was Elk Hill, belonging to Jefferson, where a large amount of property was wantonly destroyed. The events attending this inroad of the enemy formed subsequently the basis of violent diatribes against Jefferson, who was declared to have received warning of the danger from Washington, but to have wantonly disregarded it, and neglected to put the state in a posture of defence. Additional charges were made,

discrediting his personal courage, on the ground of his withdrawal from Richmond and Monticello. But that he had the continued approbation of Washington in exhausting Virginia for the benefit of the general cause is certain; that the commonwealth, thus drained of her resources, could have been defended, is at least doubtful; and the circumstances of his withdrawal from Richmond and Monticello do not support the accusation of a want of personal courage. An error of judgment is thus all which might be justly chargeable upon Jefferson. His term of office had expired two days before Tarleton entered Charlottesville, and in his memoir he says that he had determined to decline a reelection, "from a belief that under the pressure of the invasion, under which we were then laboring, the public would have more confidence in a military chief." At the next session of the house a young member demanded an inquiry into his conduct; but it was never made, though Jefferson, who had gone to the assembly to meet it, rose in his place and also demanded it. On the contrary, the house resolved "that the sincere thanks of the general assembly be given to our former governor, Thomas Jefferson, for his impartial, upright, and attentive administration while in office." But the charges against his administration wounded him deeply, and he did not appear in the spring session of 1782.—From his retirement at Monticello, which had been recently rendered doubly gloomy by the death of his wife, he was summoned by congress to act as one of the plenipotentiaries to England, to negotiate the terms of the treaty of peace. The business was so far advanced before he was ready to sail that congress recalled the appointment; but taking his seat in that body in the winter session of 1783, he reported, as chairman of the committee to which it had been referred, the definitive treaty of peace with England. At the succeeding session Jefferson proposed and secured the adoption of the present system of United States coinage, doing away with the old *£. s. d.*, and substituting the dollar and its subdivisions, down to the hundredth part, to which, in order to describe its value, he gave the present name of cent. At the same session he drafted the report of the committee appointed to "prepare a plan for the temporary government of the western territory." Virginia held this great extent of country under charter from James I. In 1780 she ceded to the confederation the whole territory N. W. of the Ohio, but the cession was not then formally consummated. Jefferson's plan of a government for this territory was adopted with a few amendments; these consisted of an omission of the names suggested for the districts, and of the clause providing "that after the year 1800 of the Christian era there shall be neither slavery nor involuntary servitude in any of the said states, otherwise than in punishment of crimes, whereof the party shall be duly convicted to have been personally guilty." The

cession was finally consummated in 1788.—In May, 1784, Jefferson was appointed minister plenipotentiary to Europe, to assist John Adams and Benjamin Franklin in negotiating treaties of commerce. He sailed in July with his eldest daughter, and was joined by his associates in Paris. They succeeded in negotiating treaties with Prussia and Morocco, the ships of which latter government had made depredations on American commerce. By the treaties blockades were abolished, the flag covered the cargo, and contrabands were exempted from confiscation. With England all negotiations failed. At this time Jefferson printed and distributed among his friends a small edition of his "Notes on Virginia." The substance of this work had been prepared in 1782, at the request of M. de Marbois, French secretary of legation, in hours of confinement produced by a fall from horseback. An incorrect copy had been printed, and the author now published it in an accurate form. In the same year he furnished, at the request of the Virginia directors, a plan for the capitol at Richmond, on the model of the *maison carrée* at Nimes, and another for a penitentiary, similar to a building which he had examined in England. Both plans were adopted with some alterations. In 1785 congress appointed Jefferson minister plenipotentiary to France, in place of Franklin, who had resigned. He combated the intrigues of Vergennes and Calonne, the French ministers, in opposition to the desired treaties of commerce, with energy and effect. Among other objects which he attained were the abolition of a number of monopolies, and the admission into France of tobacco, rice, whale oil, salted fish, and flour. In the midst of these duties he found time to make excursions into Germany, Italy, and the French provinces. In Paris he became intimately acquainted with Condorcet, D'Alembert, Destutt de Tracy, and other liberal thinkers. This seems to have been one of the happiest periods of his life; and his sympathies toward France remained ever afterward unshaken. He left the country before the excesses of the revolution, and always regarded it with a strong feeling of preference, especially in comparison with England. His diplomatic functions were performed with marked ability. The adoption of the American constitution did not meet his full approval. He did not know, he wrote, whether the good or the bad predominated in the instrument, and some portions "staggered" him. He afterward formed a more favorable opinion of it.—In 1789 he obtained leave of absence for a time, and returned to America. Soon after his arrival he was offered the post of secretary of state in Washington's cabinet, and, in spite of his desire to return to France, accepted it, thus terminating his ministerial career. With the entrance of Jefferson into the cabinet in March, 1790, commenced the struggle between the federalists and republicans, under the banners of their two most distinguished leaders. Alexander Hamilton, secretary of the

treasury, stood at the head of the former. Jefferson was a democrat by nature and training; strongly opposed to England and the English system, against which he had struggled from the moment of his entrance into public affairs; and an unyielding advocate of state sovereignty and decentralization. His visit to Europe had strengthened these convictions of the danger of strong governments, and the uprising of the French people had secured his cordial sympathy. In the cabinet of Washington he now represented the principles of the republican party, who opposed a strong government as tending to monarchy, advocated state sovereignty as the only true republicanism, and espoused the cause of France in opposition to England. In all the great measures Hamilton defeated his rival. The entire system of finance, including the establishment of a bank of the United States, proposed by the secretary of the treasury, was adopted in spite of the protest of Jefferson, and of Randolph the attorney general. In February, 1791, Jefferson wrote an able report upon the cod and whale fisheries, recommending congress to protect those valuable branches of trade. Later in the same year he conducted an important correspondence with Mr. Hammond, the British minister, in relation to alleged violations of the treaty of peace with England. Jefferson complained of non-compliance with that article of the treaty which contained stipulations against carrying away negroes or destroying property, and provided for the evacuation by Great Britain of all posts within the limits of the United States. Mr. Hammond replied, and Jefferson rejoined, when the correspondence closed; and the questions were not reopened for discussion until the more important differences occurred which were terminated by the treaty of 1794. In the spring of 1792 Jefferson drew up an elaborate report upon the relations of the United States with Spain. These involved the determination of boundaries, the exclusion of American citizens from the navigation of the Mississippi below our limits, interference with the Indian tribes, the restitution of fugitives from justice and of property carried off, and the terms of a commercial treaty. The negotiations were indefinitely protracted, and it was not until many years afterward that they were even partially successful. In the spring of 1793 arose the paramount question of the neutral policy and rights of the United States, in view of the declaration of war just made by France against Holland and Great Britain. Upon this question was put forth the entire strength of the two great leaders of the federal and republican parties in the cabinet. The republican party was enthusiastic in its sympathy for France in the struggle with her great enemies, and a disposition was immediately shown to fit out privateers in American ports to cruise against English vessels. This was energetically opposed by the federal leaders, who were anxious that no

cause of hostilities should be given to England, and held that the true policy of America was to preserve peace and friendship with all nations, but form entangling alliances with none. The president, who had just entered upon his second term, issued his proclamation warning the citizens of the United States against carrying to the hostile powers any articles deemed contraband of war, or performing other acts inconsistent with the duties of a friendly nation. This was advised by Jefferson, as by his colleagues. He however advocated the propriety of receiving a minister from the French republic, which was determined upon. This was followed by the appearance of Genest as minister, to succeed the former royal functionary, who had been recalled. Genest authorized the fitting out and arming of privateers, and empowered the French consuls throughout the United States to erect courts of admiralty to try and condemn prizes brought into American ports. The president ordered that his privateers should leave the ports immediately, notwithstanding which he armed a prize and ordered her to sail as a privateer. A violent debate took place in the cabinet in Washington's absence. Hamilton, supported by Knox, advocated the erection of a battery to prevent the vessel from sailing, and denounced Genest as an agent sent to embroil America with England. Jefferson opposed the scheme of a battery on the ground that the vessel would not sail, and that the matter was too trifling to cause hostilities with France. Washington arrived and addressed a heated note to Jefferson; but explanations were made. In spite of all, the vessel sailed. Genest then grew so insolent that the question arose whether he should not be ordered out of the country. It was determined, however, to request his recall. Jefferson says that he was in favor of "expressing that desire with great delicacy," but that "the others were for peremptory terms." Genest was finally recalled, and this affair terminated. It had aroused to the utmost extent all the bitterness in the hearts of the two great rivals, and the meetings of the cabinet were stormy. The last act of Jefferson as secretary of state was an elaborate report on commercial intercourse with foreign nations, with the measures necessary for regulating and improving it. In this paper he first enumerates the articles of export, with their value, and then states the various restrictions imposed upon them, calling attention to the best method of modifying or removing them. This report gave rise to long and animated discussions, and the measures secured the favor of a great majority of the national legislature; but a vote was not immediately taken, and the subject was lost sight of.—On Dec. 31, 1793, Jefferson resigned his place in the cabinet, and, returning to his home at Monticello, devoted himself to his private affairs, which had become somewhat embarrassed. In September, 1796, Washington announced that he would not

again be a candidate for the presidency, and thereupon the two great parties fixed upon John Adams and Thomas Jefferson as their nominees. In February, 1797, the votes were opened and counted in presence of both houses; and the highest number appearing in favor of Adams, with the next in favor of Jefferson, the former was declared, in accordance with the existing law, president of the United States, and the latter vice president. On March 4, 1797, Jefferson took the chair as president of the senate, and delivered a short address, in which he expressed his attachment to the laws, and his anxious wish to properly fulfil his duties. The greater part of the next four years was spent at Monticello, but Jefferson was a close observer of public events, and largely participated in affairs, through his wide correspondence. The reaction of public feeling, resulting from the excesses of the reign of terror, had almost overwhelmed the American sympathizers with France. The aggressions of the French directory, and the insulting reception of our envoys, paralyzed the enemies of the federalists. The "war message" of Adams in the spring of 1797 threw the country into unheard-of agitation. The general indignation against France swept all opposition before it. Congress declared all treaties annulled; merchant vessels were authorized to resist search; large sums were voted for defence; and these measures were soon followed by others still more energetic. The alien and sedition laws were passed; the former empowered the president to order out of the country such aliens as he considered dangerous, on pain of heavy penalties; the latter declared that printing or uttering false and malicious charges against the president or congress should be deemed seditious, and punished by fine and imprisonment. These measures were vainly opposed by the republican party. The whole nation was urgent for war, and Washington offered to take his place at the head of the army. Nothing was left for the republicans but to make an issue on the constitutionality of the alien and sedition laws, and even this was impossible in congress. "Finding themselves of no use there," they determined to resort to the state arenas; and the result was the Kentucky and Virginia "resolutions of '98." The former state was closely connected with Virginia, and Jefferson drafted the Kentucky resolutions, denouncing the obnoxious laws, and intimating a determination on the part of the states to proceed to armed resistance. They were followed in Virginia by similar resolves, drawn up by James Madison, opposing the consolidation measures of the federal party, and calling on the states to maintain their liberties inviolate. The spring of 1799 brought a revulsion in favor of the republicans. Adams sent envoys to France; Washington retired again to Mount Vernon; and the war spirit rapidly subsided. Washington died before the close of the year, and the brief pause

in political strife which succeeded the intelligence of his death was followed by more violent commotions than before. The elections in New York in the spring of 1800 were bitterly contested, but terminated in a republican triumph, which extended throughout the Union. The result was largely attributed to the intrigues of Aaron Burr, who became the republican candidate for vice president, with Jefferson for president. The federalists supported Adams and Pinckney. When the votes were opened, it was found that Jefferson and Burr were elected, but by an equal number of voices. The dilemma was serious, as the constitution did not require the specification of the office to which each was elected, and the decision devolved upon the house of representatives. Many weeks of violent struggles on the part of the supporters of the two candidates took place; but on the 36th ballot Jefferson was elected president and Burr became vice president. Jefferson took his seat March 4, 1801, at Washington, to which the capital had been removed some months before, and delivered an inaugural address which lucidly and eloquently summed up the principles of republican government. He had come in upon a swelling tide of popularity, and he carefully avoided all acts which would tend to diminish it. Few removals were made, and these chiefly of those who were appointed by Adams in the last hours of his administration. A general amnesty was granted to the federalists, and they seemed to gradually become merged in the masses, which every day grew more "republican." The old régime appeared to have suddenly passed away. A change in dress and manners followed the political success of the republicans. The reaction against the stately dignity and ceremony of Washington's era was headed by the new president, who would have no formal address from congress, and sent in his message by a common messenger. Everywhere the new philosophy of life was received with acclamations which swelled still higher the flood of Jefferson's popularity. In 1800 Louisiana had been ceded by Spain to France, and in 1802 the president opened a private correspondence with the French government, which resulted in the succeeding year in the purchase of the entire territory for the sum of \$15,000,000. The question of the constitutionality of that measure was evaded, and so great was the advantage which it secured that all opposition soon disappeared. In 1804 Captains Lewis and Clarke, under the auspices of Jefferson, set out to explore the continent to the Pacific, with instructions drawn up by the president's own hand. The expedition returned two years afterward with a mass of valuable information, which exhibited the skill of their instructions. In 1803 Commodore Preble vindicated American rights in the Mediterranean against the emperor of Morocco; Decatur in a small schooner entered the harbor of Tripoli, and burned the frigate Philadelphia,

under the guns of the enemy, returning without the loss of a man, and the Tripolitans were compelled to sue for peace. The acquisition of Louisiana, the naval victories, and the general prosperity throughout the nation, greatly increased the popularity of the administration; and Jefferson was reelected, with George Clinton of New York for vice president, for the term commencing March 4, 1805, by a majority of 148 out of 176 electoral votes. In 1806 Jefferson was called upon to arrest Aaron Burr for treasonable operations in the southwest. (See BURR.) The former position of the accused, and his prominence before the country, rendered the trial one of deep interest. It soon took a political complexion, and the opponents of the administration bitterly inveighed against the anxiety displayed by the president to procure a conviction. At the same time the country was powerfully excited by the loss of its profitable foreign trade as a neutral, through the British orders in council and Napoleon's Berlin decree, blockading European ports; and still more by the "right of search" asserted by Great Britain, under color of which American vessels were boarded, and their sailors impressed as subjects of the king. This wrong had been persistently opposed, but the claim was never relinquished. When, in June, 1807, the American frigate Chesapeake was fired upon by the British ship Leopard, and four of her crew were seized as deserters, the country was in a flame, and the president issued his proclamation, interdicting the entrance of British armed vessels into the ports or waters of the United States. In consequence of the continued hostile policy of France and England, congress in December passed an act laying an embargo upon American vessels, which were forbidden to leave any port of the United States. This law was violently opposed by the federal party, but it was declared by the friends of the president to be intended as only temporary; and in February, 1809, congress repealed it from and after the 4th of the ensuing March, substituting an act of non-intercourse with France and England.—At this point in the history of the country Jefferson retired from office, and terminated his political career. He remained in retirement ever afterward, employing his time in the performance of his various duties as the head of a large plantation. In 1817 he took an active part in the measures then set on foot to establish the "central college" near Charlottesville, now the university of Virginia. In 1819 he superintended the erection of the building, and in the same year was chosen rector. The leading part which he took in founding this great institution was a subject of peculiar pride with him, and he directed "Father of the university of Virginia" to be inscribed upon his tombstone. In the spring of 1826, his fortunes having become greatly embarrassed by the generous scale of his expenditures and the profuse hospitality at Monticello, he was em-

powered by the legislature to dispose of his estates by lottery, with a view to the discharge of his liabilities. But the project was suspended, and then abandoned. His health had long been failing, and in June he rapidly declined. As midnight approached on July 3, he was evidently dying, but retained his memory, and muttered, "This is the fourth of July." He lived until past noon on the succeeding day, July 4, 1826, when he expired, a few hours before John Adams. On the same day and nearly at the same hour, just half a century before, these two great men had attached their signatures to the Declaration of Independence; and the coincidence of their death made a deep impression on the country.—Jefferson was an original thinker in every department of human concern, and essentially a reformer. He had no respect for claims of right founded only upon prescription, and attached no decisive weight to authority. In the old house of burgesses he opposed parliament upon abstract grounds which were clearly defined, and which became the bases of the subsequent struggle, inaugurated by the formal exposition of the same principles in the Declaration of Independence. In the general assembly of the state he attacked the time-honored system of aristocratic and religious intolerance, as in conflict with natural right, and for that reason wrongful, however fully acquiesced in and respected by preceding generations. He carried the rule of subjecting everything to the test of abstract reason into matters of religion, venerating the moral character of Christ, but refusing belief in his divine mission. In politics he was an opponent of strong government, and maintained that the world was governed too much. He was in favor of the free development and exercise of human power, so far as was consistent with the good order of society, and a jealous advocate of individualism. His aim in Virginia was to overthrow the old domination of the ruling classes, and raise the people. He carried the same principles to the study of the federal compact. Once convinced that the state rights doctrine of restriction was the true theory of the government, he fought for it with persistent energy. Thus commenced, on the threshold of his entrance into the cabinet, the long struggle against Hamilton, the federal champion. The first measure of that great leader, the funding law, had passed; and it was followed by the assumption of state debts, and by the United States bank, in spite of Jefferson's protest against the constitutionality of the measure. He did not waver, however, and the republican party, long suffering a series of defeats, never found its leader wanting, and finally in 1801 bore Jefferson triumphantly into the presidency. His devotion to state rights was so ardent that it led him to regard Shays's insurrection as a mere trifle, which the government made itself ridiculous by opposing. He could never get rid of the idea that Hamilton wished to create a mon-

archy in America. Such was Jefferson as a statesman and leader of a party under the old régime, which was ruled by his enemies. Under the new order of things, with his own party in power, the case was altered. The force of his opinions of the rights of individuals suffered a marked diminution when Aaron Burr openly bearded his authority. He threw the weight of his great office against Burr, and advised that one of his counsel, Luther Martin, should be indicted as an accomplice, in order to "put down this impudent and unprincipled federal bulldog." In the same manner, his state rights doctrines became modified. The executive authority had to be stretched to cover the purchase of Louisiana; and he became convinced on other occasions that the federal government, to use his own expression, must "show its teeth." In social life he faithfully carried out his democratic principles. He discarded every advantage which his birthright gave him, and mingled familiarly with the common people, as their equal. He was naturally a democrat, and held as a radical doctrine of his philosophy the principle that one man is no better than another. He was easily approached, and the natural amiability of his character rendered his society delightful to all classes. His dislike of all the trappings of authority was excessive. Not content with eradicating all traces of past authority and influence, he inaugurated a crusade against the old forms and ceremonies which had accompanied it. Washington had held levees, and awaited the two houses, standing in full dress to receive them. Jefferson abolished the practice, and sent his first message by an unofficial hand to avoid the address which was customary. A committee had been usually appointed to inform the president of his election; but Jefferson declared it was more in consonance with the simplicity of republican institutions to communicate the intelligence through the common post office. To all titles of honor he was strongly opposed. "Excellency," "Honorable," and even "Mr.," were distasteful to him. He could wish, he declared, that the last, too, might disappear. It was always "Thomas Jefferson," or "T. J.," not "Mr. Jefferson," who presented his respects to "the president," not "your excellency." These apparent trifles were in reality strong indications of the character of the man, and contributed powerfully to his popularity with the people. He was regarded as the epitome and incarnation of democracy, as opposed to the old world of aristocracy. These social traits were supported by consummate partisan ability. He never made a formal public speech, but his adroitness in politics was unsurpassed, and his management of persons and events for the accomplishment of the ends which he aimed at was masterly. The objects which he had in view were in a large measure attained by his elaborate correspondence. Monticello became the centre of a vast system of political nerves, extending their ramifications throughout the nation. In his retirement Jef-

erson was thus as powerful as in office. His hand was often felt as decisively, and his opinions, instilled into active minds holding high positions, became not seldom the ruling influence in public affairs. Slavery he regarded as a moral and political evil; but in opposing it he did not advocate a change in the agricultural character of the south. He wrote that the people would "remain virtuous as long as agriculture is our principal object, which will be the case while there remain vacant lands in America. When we get piled upon one another in large cities, as in Europe, we shall become corrupt as in Europe." At home he was a tender husband and father, a mild master, a warm friend, and a delightful host. His knowledge of life, extensive travels, and long familiarity with great events and distinguished men, rendered his conversation highly attractive to mere social visitors. His scientific acquisitions, and the deep interest which he took in all branches of natural history, made his society equally agreeable to men of learning. Many such visited him, and were impressed as deeply by his general knowledge as they were charmed by the courtesy of his demeanor. De Chastellux, De Liancourt, and other noblemen and foreigners of distinction, came away from Monticello with an enthusiastic opinion of their host, and informed all Europe that the country gentleman of Virginia was the most accomplished man of his epoch. In entertaining this diverse society, in reading, writing, riding, and attending to his farms, passed the intervals of his absence from public affairs, and the long period of retirement which extended from the termination of his presidency to his death.—Of his "Notes on Virginia" many editions have been published; that issued at Richmond in 1853 was revised from his own annotated copy. His "Manual of Parliamentary Practice" is used by congress and other legislative bodies in America. A portion of his manuscripts were purchased by congress in 1848, edited by H. A. Washington, and published under the title, "The Writings of Thomas Jefferson; being his Autobiography, Correspondence, Reports, Messages, Addresses, and other Writings, Official and Private," &c. (9 vols. 8vo, Washington, 1853-'55). Among the biographical works relating to Jefferson, the most important are: "Memoirs, Correspondence, and Private Papers," edited by his grandson, Thomas Jefferson Randolph (4 vols., New York, 1829); "Life, and part of his unpublished Correspondence," by George Tucker (2 vols., Philadelphia, 1837); "Life," by Henry S. Randall (3 vols., New York, 1858); "Domestic Life," compiled from family sources, by his granddaughter Sarah N. Randolph (New York, 1871); and "Life," by James Parton (Boston, 1874).

JEFFERSON CITY, the capital of Missouri and seat of justice of Cole co., situated on the S. or right bank of the Missouri river, 143 m. above its confluence with the Mississippi, opposite the mouth of Cedar creek, and 125 m. W.

of St. Louis, with which it is connected by the Missouri Pacific railroad; pop. in 1860, 3,082; in 1870, 4,420, of whom 716 were colored; in 1874, about 7,500. It is built on elevated and uneven ground, commanding a fine view of the beautiful scenery on the N. bank of the river. The principal public edifices are the state house, a handsome building of stone, the governor's residence, the state penitentiary, several hotels, and eight churches of various denominations. The city has flour mills, manufactories of wooden and iron ware, carriages, furniture, &c., a state bank, two national banks, and two daily and two weekly newspapers. The state library contains about 12,000 volumes. There are graded public schools, divided in 1872 into 10 departments, including a high school, and having about 650 pupils, besides several denominational schools. The United States district court for the W. district of Missouri holds its sessions here.

JEFFERSONIA, a vernal plant of the natural order *berberidaceae*, occurring in rich woods

Jeffersonia.

from western New York to Wisconsin and southward, named in honor of Thomas Jefferson. It is popularly known as twin-leaf, from its two-parted leaves, a character recognized in its specific name, *J. diphylla*; the long-petioled leaves arise in a tuft from the matted fibrous roots, and among them are naked flower stems, each terminated by a handsome white flower an inch in diameter, not unlike that of the bloodroot, and appearing in April and May. The calyx falls as the flower opens; petals and stamens eight; pistil single, which when ripe becomes a pear-shaped pod, which opens by a horizontal slit extending half way around it. In England the jeffersonia is valued as a plant for the spring border; well established clumps flower profusely, though the bloom is of short duration. Medicinal qualities have been attributed to the plant, which has in some localities the name of rheumatism root.

JEFFERSONVILLE, a city of Clarke co., Indiana, situated at the head of the falls on the Ohio river, nearly opposite Louisville, Ky.; pop. in 1850, 2,122; in 1860, 4,020; in 1870, 7,254. It is built on high ground on the site of old Fort Finney, and commands a magnificent view of the river and of Louisville. The streets are wide, well paved, and laid out at right angles with one another. It is the S. terminus of the Louisville division of the Ohio and Mississippi railroad, and of the Jeffersonville, Madison, and Indianapolis railroad, and is connected by a branch of the latter with New Albany, 5 m. below. The Ohio is here crossed by one of the finest bridges in the country, which connects these railroads with the lines diverging from Louisville. The Ohio is 1 m. wide in this part of its course, and in a distance of 2 m. has a fall of 26 ft., which affords unrivalled motive power. The depth of water is sufficient at all seasons for craft of large size, and steamboat building is an important branch of industry. There are a large manufactory of locomotives and cars, machine shops, mills, &c., and two national banks, with an aggregate capital of \$550,000. Jeffersonville is the seat of the southern state prison, with an average number of 395 convicts, and has a system of graded schools, embracing 18 departments, including a high school, with about 1,300 pupils; a weekly and two daily newspapers, and 11 churches.

JEFFREY, Francis, a Scottish critic, born in Edinburgh, Oct. 23, 1773, died at Craigerook, Jan. 26, 1850. He was the eldest son of a depute clerk in the court of session, and was educated at Edinburgh, Glasgow, and Oxford. At Glasgow he distinguished himself as one of the most acute and fluent speakers, and formed the habit of accompanying all his studies by collateral composition. He took little pleasure in his residence at Oxford, and after one session returned to Edinburgh, and attended the law classes at the university. At the same time he was busy with literature and poetry, and was admitted, Dec. 11, 1792, into the speculative society, in which for nearly ten years he trained his powers of speaking and writing, having among his competitors Walter Scott, Lord Henry Petty (marquis of Lansdowne), Henry Brougham, Francis Horner, John A. Murray, James Moncrieff, and Henry Cockburn. He was admitted to practice Dec. 16, 1794, but suffered under the disadvantages of being as devoted to literature as to law, and of having proclaimed himself a whig, while the effect of the revolutionary excesses of France not only debarred Scottish whigs from hope of preferment, but almost placed them under a social ban. In 1801 his professional income had amounted in no one year to £100. In that year he married, with "all the recommendations of poverty," and took up his residence in a third story in Buccleugh place. There several of his young whig associates, prominent among whom were Sydney Smith, Brougham, and Horner, were wont to visit him, and it was at

these social meetings that the "Edinburgh Review" was suggested and planned. The first number appeared Oct. 10, 1802, containing besides others seven articles by Sydney Smith, four by Horner, four by Brougham, and five by Jeffrey. Its learning, talent, spirit, and eloquence caused it to be hailed at once by the liberal party as the dawn of a brighter day, and by thoughtful men, indifferent to party, as an organ of the highest order for able and fearless discussion of every matter worthy of inquiry. A first and a second impression of 750 copies were rapidly exhausted; at the issue of the third number the regular sale was 2,500 copies, and in 1813 it exceeded 12,000. Jeffrey became its official editor with the fourth number, and continued to edit it for 26 years, during which period he was its most popular and effective contributor; and he wrote for it at intervals till near the time of his death. The whole number of his contributions is 200, of which 79 were selected for republication (2d ed., 3 vols., London, 1846; 1 vol., 1853). In the larger part of them he appears as literary critic, but several are devoted to metaphysics and to politics. The thoroughness and ability with which he analyzed literary productions, pointed out their beauties, and chastised their defects, was unprecedented in periodicals. His attack on the "Odes and Epistles" of Moore (1806) led to a harmless duel with Moore, and came near causing one between Moore and Byron. Against Wordsworth, Southey, and Coleridge he waged a long war, which he subsequently admitted to be unjustifiable. Yet even in his harshest critiques it was his custom to select the finest passages for quotation. In 1813, after having been a widower eight years, he visited New York to marry Charlotte Wilkes, a grandniece of the celebrated politician John Wilkes. In 1815 he took up his residence at Craigcrook, two miles from Edinburgh, where he passed his summers until the year of his death. His reputation at the bar increased with his success as a reviewer. He rose to the highest eminence as a pleader, was elected in 1821 lord rector of the university of Glasgow, and in 1829 dean of the faculty of advocates, was appointed lord advocate in 1830, entered the house of commons in 1831, and was elevated to the Scottish bench in 1834. He took part in the reform debates in parliament, but did not maintain there the reputation for eloquence which he enjoyed at the bar. As a judge he was a model of courtesy and patience, and remarkable for the rapidity of his decisions and the vivacity and clearness of his statements. He was most highly esteemed in private life, and as a brilliant converser, abounding in wit, fancy, and amiability. His biography was written by Lord Cockburn, with a selection from his correspondence (Edinburgh, 1852).

JEFFREYS, George, lord, an English judge, born at Acton, Denbighshire (Wales), in 1648, died in the tower of London, April 19, 1689.

His family was good, though not rich. He was educated at Shrewsbury, at St. Paul's school, London, and at Westminster school, under Dr. Busby. He became a member of the Inner Temple, May 19, 1663. Of his boyhood and youth but little is known, and that is not to his credit. He was called to the bar Nov. 22, 1668, 18 months before which he had married Mary Nesham, daughter of a clergyman, under romantic circumstances. On the death of this lady, in 1678, he married Anne, widow of Sir John Jones, who had been lord mayor of London. His rise at the bar was rapid, but his practice was in the Old Bailey and other London courts, always beneath the other tribunals in conduct, and in that age scarcely better than dens of torture and murder. So quickly did he rise that in March, 1671, he became common sergent of the city of London. At that time he belonged to the "country party," and laid the foundations of his fortune by affecting to be a patriot and a Puritan; but he intrigued secretly for court favor, and was made solicitor to the duke of York, Sept. 14, 1677, and knighted. This startled his associates, but he insisted that the office was strictly professional, and in 1678 men of both parties united to elect him recorder of London. He then went boldly over to the court party. In the days of the popish plot he was one of the most active against the accused, acting both as judge and as counsel, in different courts; and it was by his advice that the government placed itself at the head of the patrons of the plot, whereby its inventors were prevented from turning it to the profit they had expected. He was appointed chief justice of Chester and made king's sergent in April, 1680, and in 1681 created a baronet. Having offended the house of commons, he was reprimanded on his knees. The office of recorder he gave up Dec. 2, 1680. When the Oxford parliament was dissolved in 1681, and Charles II. resolved to destroy the whigs, Jeffreys became the most efficient agent of government. He labored against the city of London, and helped to extinguish its liberties. He was of counsel for the crown on the trial of Lord Russell, and was made chief justice of England, in order to effect the destruction of Algernon Sidney. He was deeply concerned in several other judicial murders of the same kind, and in the assaults on the municipal corporations. He presided at the trials of Oates and Baxter. On May 15, 1685, James II. made him a peer, by the title of Baron Jeffreys of Wem. In the summer of that year he was placed at the head of a special commission to try persons accused of having taken part in Monmouth's rebellion. Of the prisoners brought before him, 320 were hanged, 841 ordered to be transported and sold into the slavery of the tropics, and others punished with scourgings, imprisonment, &c. Jeffreys boasted that he had hanged more traitors than all his predecessors since the conquest. His

cruelty was all the more offensive because he traded in pardons, and thus enabled rich offenders to escape. The king called his judge's doings "the chief justice's campaign in the west," and rewarded him by making him lord high chancellor of England, Sept. 28, 1685, which office he held until the downfall of the Stuarts. In the house of peers he made a bad figure. Attempting to bully the peers, he was firmly met, and so humiliated that he wept. The court of high commission having been revived, Jeffries was appointed its president, and took part in its worst acts. It was by his advice that the seven bishops were imprisoned and tried. When the king was frightened into a change of policy, Jeffries became his agent for good purposes. He carried back its charter to the city of London, and was hooted by the people. When James fled from London, Jeffries made arrangements to sail for Hamburg, but landed for the indulgence of drunkenness, and was recognized and seized. The mob wished to tear him in pieces, but the authorities succeeded in placing him in the tower, Dec. 13, 1688. There he remained for upward of four months, when he died of the stone. It is asserted that James II. was so well pleased with him, that he was to have received promotion in the peerage by the title of earl of Flint. Lord Campbell says that "when quite sober he was particularly good as a *nisi prius* judge." Macaulay says: "His enemies could not deny that he possessed some of the qualities of a great judge. His legal knowledge, indeed, was merely such as he had picked up in practice of no very high kind. But he had one of those happily constituted intellects which, across labyrinths of sophistry, and through masses of immaterial facts, go straight to the true point." His biographer, Mr. Woolrych, says: "His bright sterling talents must be acknowledged; that intuitive perception which led him to penetrate in a moment the thin veil of hypocrisy, and show things as they were, must have its meed." In spite of these eulogies, few will dissent from the declaration of Mr. Justice Foster, that he was "the very worst judge that ever disgraced Westminster hall." Though Jeffries was the father of 12 children, his family became extinct at an early day, and his title disappeared from the peerage in 1703.

JEFFRIES, John, an American physician, born in Boston, Feb. 5, 1744, died there, Sept. 16, 1819. He graduated at Harvard college in 1763, subsequently attended the medical schools of London, and in 1769 received from the university of Aberdeen the degree of M. D. Returning to Boston, he entered upon a lucrative practice, which continued until the evacuation of the town by the British troops, whom he accompanied to Halifax. After serving as surgeon general of the troops in Halifax, he was appointed in 1779 surgeon major of the forces in America, and was present for a short time with the army in Savannah. In the succeeding year he established himself in London

in the practice of his profession, and with so much success that he declined the lucrative post of surgeon general to the forces in India. He also occupied himself much with scientific studies, and in the prosecution of his experiments in atmospheric temperature undertook, together with François Blanchard, Jan. 7, 1785, a remarkable voyage in a balloon from Dover cliffs across the British channel, landing in the forest of Guines in France. This was the first successful attempt at aërostation on an extended scale, and Dr. Jeffries in consequence received many attentions from the learned and scientific societies of Paris and from various eminent personages. In 1789 he returned to Boston, where he practised his profession until the close of his life. He announced a course of lectures in Boston on anatomy, but such was the prejudice against dissection that on the evening of the second lecture a mob broke into his anatomical room and bore away the subject, the body of an executed felon presented to him by the governor. The course was never resumed, and the single lecture delivered is said to have been the first public one on anatomy given in New England.

JEHOSHAPHAT, fourth king of Judah, born about 950 B. C., succeeded his father Asa about 915, and died about 890. He fortified himself at first against Ahab, king of Israel, but afterward was connected with him by alliance in war and the marriage of their children. He was however zealous in punishing idolatry and improving the administration of justice. He took tribute from the Philistines and Arabians, and maintained a large standing army. He was Ahab's ally at the fatal battle of Ramoth-Gilead, but escaped without hurt. In alliance with Ahaziah, king of Israel, he built a fleet for an expedition to Ophir, but it was wrecked. He was successful against the Moabites and Ammonites, accompanied Jehoram of Israel in his campaign against Moab, in which they were joined by the king of Edom, and maintained the supremacy of Judah over the latter country. In his last years his son Jehoram was associated with him in the government.—The name Jehoshaphat signifies "Jehovah judgeth," and the prophet Joel (ch. iii. 2, 12) predicts the judgment of the heathen in the "valley of Jehoshaphat;" not any actual valley, but an ideal scene of Jehovah's righteous judgments on the nations, called in verse 14 "the valley of decision." But in later times the prophecy has been applied to the final judgment, and the valley of Jehoshaphat has been localized as the ravine between Jerusalem and the Mount of Olives. This application of the name appears in the 4th century, and the belief that the final judgment will take place there has led the Jews and the Moslems for centuries to use the sides of the valley as a place of burial.

JEHOVAH (*Yehovah*), the Hebrew name of the Supreme Being. The pronunciation and derivation of this name are matters of con-

troversy. The Jews of later periods, either from religious awe, or from a misunderstanding of Ex. xx. 7, Lev. xxiv. 16, abstained from pronouncing it, and, wherever it occurred in reading, substituted the word Adonai (the Lord), unless it followed that word, when they substituted Elohim (God); and it is now generally believed that the interlinear vowel signs attached to the Hebrew tetragrammaton Yhvh belong to the substituted word. The practice antedates the Greek version of the LXX., who everywhere substitute *κύριος*. Many believe Yahveh or Yuhaveh to be the original pronunciation; but even Gesenius admits that "those who regard Jehovah as the true pronunciation are not without some apparent grounds." The name is derived by some modern critics from names of Egyptian divinities, supposed to have been nationalized by Moses; by others it is compared with the Jove of the Romans. Its resemblance to two other Hebrew words for the Divinity, Jah (*Yah*) and Ehyeh, in part strengthens and in part weakens these suppositions, which have been exhaustively treated by Tholuck (*Literarischer Anzeiger* for May, 1832; translated for the "American Biblical Repository," No. xiii., pp. 89-108). What is certain is the connection of the word, in its original or adapted form, with the Hebrew root *havah* or *hayah*, to be, and its meaning throughout the Scriptures "the Being" or "the Everlasting."

JEJEEBHOY, Sir **Jamsetjee**, a Parsee philanthropist, born in Bombay, July 15, 1783, died there, April 14, 1859. His parents were poor, and in early life he made several voyages to China. In one of these the ship in which he sailed was captured by the French, and he thus lost his property; but he died worth \$4,000,000. As early as 1822 he released the debtors confined in jail by paying their debts; and his donations to public objects were estimated at about \$1,500,000. In 1842 he was knighted by the queen of England, and in 1843 a gold medal bearing the image of Victoria set in diamonds was presented to him by the British government. Among his charities is the great hospital in Bombay bearing his name, and opened in 1845. Connected with it, and also endowed by him, is the Grant medical college. In various parts of the country he built comfortable places of refuge for the convenience of travellers. An establishment at Bombay for the education and support of poor Parsee children he endowed at an expense of \$250,000. In one gift he devoted to education \$150,000, besides the schools which bear his name, and also contributed \$50,000 for a school of design. He established benevolent institutions in Bombay, in Surat, in Nowsaree, in the Baroda territories, where his parents lived, and in many other places. He built the causeway which unites the islands of Bombay and Salsette, the water works at Poonah, the bridges at Earla, Parta, and Bartba, and many other public works. In June, 1856, at a public meeting, a statue was voted to him. His

statue, that of the first native Indian placed by the side of the monuments of Elphinstone, Malcolm, and Forbes, was set up in the town hall of Bombay, and exposed to public view, Aug. 1, 1859. He was advanced to the dignity of a baronet of the United Kingdom by letters patent of Aug. 6, 1857.—His title descended to his eldest son **CURSETJEE** (born Oct. 9, 1811), who is a magistrate of Bombay. Under an act of the legislative council of India he assumed his father's name, Sir Jamsetjee Jejeebhoi, which is to be that of all his successors.

JELALABAD, a town of Afghanistan, capital of a province of the same name, 75 m. E. of Cabool, near the Cabool river. The stationary population is little more than 2,000, but is increased to 20,000 in the cold season by the influx from the neighboring mountains. It is wretchedly built and filthy, but has a considerable commerce and a large bazaar. It is renowned for the heroism displayed here by a single English brigade under Gen. Sale, who, after sustaining a long siege, defeated in March, 1842, a large Afghan force. (See **AFGHANISTAN**).—**JELALABAD** or **JULLALABAD** is also the name of another town in Afghanistan, formerly Dooshak or Deshtak, capital of Seistan, near the mouth of the Helmund, 240 m. W. by S. of Candahar; pop. about 10,000. It is well built, chiefly of brick, and is the residence of a prince called king of Seistan.

JELF. **I. Richard William**, an English clergyman, born in London in 1798, died in Oxford, Sept. 19, 1871. He graduated at Oxford in 1820, was elected fellow of Oriol college, and became tutor. In 1826 he was appointed preceptor of Prince George, afterward king of Hanover. He became canon of Christ church in 1831, and in 1844 Bampton lecturer and principal of King's college, London. He published a number of works, mostly theological, among which are: "Sermons, Doctrinal and Practical" (1835); "The Means of Grace" (Bampton lectures, 1844); and a new edition of the "Works of Bishop Jewel" (8 vols., 1847-'8). **II. William Edward**, brother of the preceding, born in Gloucester in 1811. His education was received at Eton and at Christchurch, Oxford, where he graduated in 1833. He became tutor and censor of his college, and afterward public examiner and proctor of the university. During two years (1846-'8) he was one of the select preachers at Whitehall, and he was appointed Bampton lecturer in 1857. His principal work is "A Grammar of the Greek Language" (2 vols. 8vo, 1842-'5; 3d ed., enlarged and improved, 1861). He has edited Aristotle's "Ethics," with English notes, and published a volume of sermons (1848), "Sermons on Christian Faith" (Bampton lectures, 1857), and "Supremacy of Scripture," a reply to Dr. Temple (1861).

JELLACHICH DE BUZIM, **Joseph**, baron, an Austrian general, born in Peterwardein, Oct. 16, 1801, died in Agram, May 19, 1859. He was a colonel at the commencement of the Hun-

garian revolution in 1848, when his popularity among the Croats and their discontent at the advantages gained by the Magyars made him a convenient instrument for a reactionary movement. Being appointed by the emperor Ferdinand ban of Croatia, Slavonia, and Dalmatia, and general-in-chief in the southern districts, he carried on with vigor the consolidation of the Slavic tribes, convoked a diet, disregarded all adverse orders extorted from the court of Vienna by the Hungarian ministry, and finally invaded Hungary in September. Repulsed at Pákozd (Sept. 29), he joined Windischgrätz before Vienna, defeated Perczel at Moor (Dec. 29), and fought at Kápolna (February, 1849). Removed to the southern theatre of war, he was completely beaten by Guyon at Kis-Hegyess (July 14). His subsequent career was of little importance. His *Gedichte* were published at Vienna in 1850, and his soldier songs were popular.

JELLY FISH, the popular name of the acalphan class of radiated animals, or *medusæ*,

Adult Sun Fish (*Aurelia*).

including the orders *hydroidæ*, *discophoræ*, and *ctenophoræ*. The body is transparent and jelly-like, disk-shaped, with the mouth downward and in the centre of the enclosed cavity, from which hang down appendages varying in number, length, and purpose. In the genuine medusæ, of which the sun fish (*aurelia*), so common on our beaches after storms or floating in our waters in the summer, is a good example, the body is so largely made up of water that on drying it is reduced to a mere film of membrane; they would hardly be seen in the water were it not for their beautiful colors. The digestive cavity is more complex than in the polyps, being excavated in the substance of the body with branches ramifying in various directions; the stomach seems to perform the office of a heart, distributing the products of digestion over the system, and the food, arriving at the periphery, escapes by as many openings as there are traversing tubes; on the free margin are

generally numerous minute tentacles, forming beautifully delicate appendages, which absorb water into the marginal canal in contact with the food; digestion is rapidly performed; the circulation of the digested materials is irregular, sometimes in one direction and sometimes in another. The bunches of colored eggs generally hang outside the tentacles which surround the mouth; in some, red specks between the tentacles have been conjectured to be eyes. The common jelly fishes move by the alternate contractions and dilatations of the gelatinous disk; others, like the Portuguese man-of-war (*physalia*), have a large vesicle which supports the whole community at the surface of the ocean, motion being effected by the numerous contractile tentacles and the contractions of the air bladder; others (the *ctenophoræ* or beroid medusæ) move by means of vertical series of swimming appendages resembling the fins of a crab. This class presents the curious phenomena of alternate generation, illustrated by Steenstrup, Sars, and others, noticed also in other classes of the animal kingdom, especially the helminths or entozoa. The *tubularia*, common in pools left by the tide, a hydroid growing in tufts like small shrubs, hangs like a flower from a slender tube, with the mouth surrounded by tentacles, each animal connected with the rest of the community, and each mouth receiving nutriment for the whole; the young of this hydroid do not resemble the parent, but are little, delicate, translucent jelly fishes, like tiny cups from which hang down four long threads, and a proboscis at the end of which is the mouth; by the side of the buds branching out from the parent hang bunches of little spheres from which the jelly fishes are produced; along the proboscis of the floating cup are other spheres or eggs, from which are produced little pear-shaped bodies, which become attached and grow into the first men-

1. Early stage of Jelly Fish (*Aurelia*). 2. Strobila, more advanced stage. 3. Strobila, ready to be detached, and form the adult (*Ephyra*).

tioned branching hydroid. It will thus be seen that the grandchild resembles the grandparent, and the hydroid is reproduced through a generation of jelly fishes into a hydroid again; if the first be a *coryne*, the jelly fish would be a *sarsia*. Some small single hydroids, not

more than half an inch high, produce some of the largest jelly fishes; as the one which by subdivision into saucer-like contractions forms the *ephyra*, with a marginal fringe of tentacles. In our common white sun fish, the four crescentic rosy figures, forming a cross by their union in the centre, are accumulations of eggs. Some of the jelly fishes in our waters formed from these self-dividing hydroids are as large as the largest wash tub, with tentacles extending 20 or 30 ft.; these are of a deep claret color, and possess in a remarkable degree the stinging or nettling property which has given the scientific name to the class. In the Portuguese man-of-war, some of the community move the whole establishment, some secure prey with their lasso cells and eat and digest for the family, and some produce the buds from which the young jelly fishes arise; and none of these take up or interfere with the work of the others. In the same way the hydroid *campanularia* produces the jelly fish *tiaropsis*, with its edge beautifully fringed. Some very handsome jelly fishes do not originate from any hydroid, but reproduce themselves in the usual way by eggs. For the greater part of the year the eggs remain torpid, then a polyp-like vegetation arises, with buds which flower-like become rapidly developed into more highly organized free jelly fishes; these animal flowers, as they have been called, are so sensitive that they are instantly killed by a change from salt to fresh water. They are very voracious, feeding upon minute fishes, crustaceans, almost any small marine creatures, decaying animal or vegetable matters, and even their own species; they move with the rapidity and elegance of birds of prey, securing their victims with precision by means of their nettle-armed tentacles, and performing these acts in a manner which would hardly be expected in a transparent mass of jelly. A nervous system is present; and the form is in many capable of remarkable changes. For details on their structure, see Forbes's work on the British naked-eyed medusæ; two papers by Prof. Agassiz in the "Memoirs of the American Academy of Arts and Sciences," vol. iv., part 2, 1850; and vol. iii. of Agassiz's "Contributions to the Natural History of the United States" (4to, Boston, 1860). The well known phosphorescence of the ocean is largely due to the light emitted by jelly fishes, shining like globes of fire, sparkling like stars, or diffusing a pale luminousness; this is most remarkable when the water is agitated by a vessel's keel, and on the coast line or amid breakers, where these creatures often serve to mark the course of the mariner. The number of these jelly fishes, often very minute, is beyond calculation or expression, especially in northern waters, where they form the food both of the small crustaceans and other animals upon which the right whales feed, which also devour the jelly fishes in immense numbers.

JEMMAPES, or *Gemappe*, a village of Belgium, in the province of Hainaut, on the river Haine

and on the canal from Mons to Condé, 3 m. W. of Mons; pop. in 1867, 11,405. The place contains several breweries, tanneries, forges, flour mills, a salt refinery, and extensive soap works. It is noted for a battle, Nov. 6, 1792, between the French under Dumouriez and the Austrians under Duke Albert of Teschen. The republican forces numbered about 40,000; the Austrian army was equally strong, but it was so posted that only its centre, consisting of 18,000 men, could be brought into action. These troops were entrenched, however, between Jemmapes and Mons, and their position was defended by 14 redoubts, mounting nearly 100 pieces of artillery. The battle began at daybreak with an attack by a French column under Beurmonville, who turned the Austrian flank and carried the redoubts on the left. A simultaneous attack on the centre was also successful, and the victory was complete. The Austrian loss was about 5,000, the French 6,000; but the consequences of the battle, the first regular engagement won by the republican forces, were very important to both parties. Most of the cities of the Netherlands surrendered to the victors without opposition; and when Belgium was annexed to the French republic Jemmapes gave its name to a department comprising nearly the whole of Hainaut.

JENA, a town of Germany, in the grand duchy of Saxe-Weimar-Eisenach, on the Saale, 12 m. S. E. of Weimar; pop. in 1871, 8,197. It is partly surrounded by steep barren mountains, and consists of the town proper, through which flows the little river Leutra, and several suburbs. It is the seat of a supreme court of appeals for the grand duchy, and for several neighboring duchies, and the principalities of Reuss, and contains a ducal palace, three Lutheran churches, a Roman Catholic church, three hospitals, a lunatic asylum, &c. The country around Jena is so beautiful that Charles V. is said to have placed it in that respect next to Florence. The foundation of its celebrated university was laid by the elector John Frederick the Magnanimous in 1547, when as a prisoner of Charles V. he was removed to Jena, where he was to meet his three sons. The university of Wittenberg having been wrested from him, his object was to establish in its stead a seat of learning at Jena which should become a nursery of science and of the doctrines of the reformation. The institution was sanctioned by the emperor Ferdinand I. in 1557, and inaugurated Feb. 2, 1558; and its 300th anniversary was celebrated Aug. 15-17, 1858. In connection with it are a philological and a theological seminary, a clinique, an anatomical theatre, an obstetric and pharmaceutical establishment, an institution for natural and mathematical sciences, one for agricultural science, and another founded in 1849 for political science, a botanical garden, an observatory, a museum of mineralogy, natural curiosities, archaeology, and oriental coins, and a library with more than 200,000 volumes. Jena holds a

high position in German literature, particularly in philosophy. Reinhold, Fichte, Schelling, and Hegel were all connected with it. Among the eminent scholars and poets who have held office in the university were Voss and the brothers Schlegel; among naturalists, Oken; in chemistry, Götting and Döbereiner; in theology, Danov, Griesbach, Eichhorn, and Paulus; in jurisprudence, Feuerbach and Thibaut. In the middle of the 18th century the attendance of students fluctuated between 2,000 and 3,000; at the end of that century there were still about 1,000. The student associations (*Burschenschaften*) and political agitations in 1815-'19, as well as the fact that the student Sand happened to be at Jena shortly before his assassination of Kotzebue, and the competition of the new universities, greatly injured the prosperity of Jena, and the attendance has since declined to 580, although the different duchies which support it have increased in their solicitude for its welfare. The number of professors in 1874 was 65, among whom were some of the first scholars of Germany, as Hase and Hilgenfeld in the theological, and Kuno Fischer and Haeckel in the philosophical faculty. The first literary periodical in Germany was established in Jena in 1785. After its removal to Halle, it was followed from 1804 to 1842 by the *Jenaische Literaturzeitung*, and since by the *Neue Jenaische Literaturzeitung*, which after being discontinued for some time was revived in 1874. Jena has also several private educational institutions, a musical union, and a society for the study of Thuringian history and archæology, founded in 1852.—A memorable battle was fought near Jena, Oct. 14, 1806, between the Prussian and Saxon army and the French. Napoleon's victory at Jena, says Schlosser, destroyed one half of the Prussian army, while Davoust gained on the same day a much more glorious victory over the other at Auerstädt. Prince Hohenlohe commanded the Germans at Jena, and Duke Ferdinand of Brunswick at Auerstädt, where he received a mortal wound shortly after the opening of the battle. This double defeat brought about the complete prostration of Prussia.

JENGIS KHAN. See GENGHIS KHAN.

JENISEL. See YENISEI.

JENNER, Edward, an English physician, born at Berkeley, Gloucestershire, May 17, 1749, died there, Jan. 26, 1823. He was the third son of the Rev. Stephen Jenner, vicar of Berkeley, and, having evinced a taste for the study of natural history and medicine, he was apprenticed at the age of 14 to a surgeon in Sudbury, near Bristol, with whom he remained seven years. At the age of 21 he went to London and became a pupil of John Hunter, then rising into eminence as a surgeon and physiologist, with whom he remained two years, and between whom and himself a lasting friendship was established. In the interval he was employed, at the recommendation of Sir Joseph Banks, to arrange the specimens of natural his-

tory brought back by Capt. Cook from his first voyage of discovery; and he received the appointment of naturalist to the expedition which sailed in 1772. He declined this offer, and in 1773 returned to Berkeley, where he established himself as a surgeon. In 1792 he procured from the Scottish university of St. Andrews the degree of M. D., and thenceforth devoted himself to the practice of medicine. As early as during his apprenticeship at Sudbury his attention had been directed to the subject of a preventive of smallpox, by hearing a young countrywoman, who had come to his master's surgery for advice, say that she could not take that disease because she had already had the cowpox. Upon inquiry he ascertained that in Gloucestershire persons engaged in milking cows frequently had the cowpox, a mild disorder of the eruptive kind appearing on the udder of the animal, and communicated in a similar form to their hands; that it had never been known to prove fatal when thus communicated; and that the belief was common among the agricultural classes that whoever had taken the disease was secure against the infection of smallpox. He immediately commenced a serious examination, and was soon led to conjecture that cowpox, as the milder disease, might advantageously supersede the inoculated smallpox, which had been introduced about 50 years before; and that as the latter is rendered less virulent by inoculation, so the former, introduced in the same way, might be milder than the casual complaint, and yet retain its protecting power. Upon going to London in 1770 he communicated this conjecture to Hunter, who made public mention of it in his lectures, but advised his pupil "not to think, but try." Upon returning to Berkeley he pursued the subject for many years, making a thorough study of varioloid eruptions. It was not until after frequent experiments that he ascertained that only one form of the eruption on the cow's udder had the property of protecting from the smallpox, and such was his faith in his discovery that several of these experiments were made upon his own son, a boy under six years of age. During all this time he met with little encouragement from physicians. Having satisfied himself of the efficacy of inoculation with the virus of the cowpox to prevent the smallpox, he next ascertained with equal certainty that the former disease could be communicated from one human being to another, without having recourse to the original vaccine matter. On May 14, 1796, he vaccinated a boy eight years of age with virus taken from a pustule on the hand of a milkmaid, who had been infected by her master's cow. On July 1 the boy was inoculated for the smallpox, and, as Jenner had predicted, without the slightest effect; and he lived to be inoculated 20 times for the smallpox, with the same result in each case. For two years afterward he continued his experiments in this direction, and in 1798 went to London. His reception was disheart-

ening in the extreme. Not only did the doctors refuse to make trial of the process, but the discoverer was accused of an attempt to "bestialize" his species by introducing into their system diseased matter from a cow's udder; vaccination was denounced from the pulpit as "diabolical;" and the most monstrous statements respecting its effects were disseminated and believed. At the end of three months he returned to Berkeley, and published his "Inquiry into the Causes and Effects of the Variolæ Vaccinæ," giving details of 16 cases of the casual and 7 of the inoculated disease. The facts described were incontrovertible; but the first impulse toward the adoption of the new practice was given by the successful vaccination of several persons in London by Mr. Cline, a surgeon, with whom Jenner on his return to Berkeley had left some vaccine lymph; and so sudden was the reaction in favor of Jenner, that in less than a year after his departure from London a manifesto expressive of confidence in his discovery was signed by 73 of the most eminent practitioners of the metropolis. Several of his medical brethren undertook to rob him of the merit of his discovery; and one of these, a Dr. Pearson, in coöperation with Dr. Woodville, physician to the smallpox hospital, brought vaccination into temporary disrepute by using and distributing matter from persons who had been inoculated with smallpox a few days after vaccination, and before the vaccine matter had taken a sufficient hold. Jenner promptly exposed this mistake in his "Continuation of Facts and Observations relating to the Variolæ Vaccinæ" (1800). In 1800-'1 the "Inquiry" was translated into the principal continental languages, and within the next five years flattering testimonials from crowned heads and scientific bodies poured in upon him in abundance, and his discovery was hailed as an incalculable benefit to the human race. In 1802, not without considerable opposition, a parliamentary grant of £10,000 was voted to him; and so encouraging did his prospects appear that in 1803 he took a house in London, with a view of commencing practice there. He was however deceived in his expectations, and returned in the succeeding year to Berkeley, where he continued as before to vaccinate gratuitously all poor persons who applied to him on stated days. The royal Jennerian society for the encouragement of vaccination was established in 1803, with himself as president, but was subsequently merged in the national vaccine establishment. So inadequate had been the parliamentary grant to compensate him for his outlays and sacrifices in the prosecution of his discovery, that in 1807 a further grant of £20,000 was voted him, and he subsequently received between £7,000 and £8,000 from India. He died suddenly of apoplexy. His statue was placed in Trafalgar square, London, in 1858. His life by Dr. John Baron, with his correspondence, was published in 1827 (2 vols. 8vo; 2d ed., 1838).

JENNER, Sir William, an English physician, born in Chatham in 1815. In 1848 he was appointed professor of pathological anatomy in University college, London, in 1857 professor of clinical medicine, and in 1861 physician to the queen, in which capacity he attended Prince Albert in his last illness. He was created a baronet in 1868, and made K. C. B. in 1872 for his services during the illness of the prince of Wales. He is a fellow of the royal college of physicians and of the royal society. He published in 1852 his "Gulstonian Lectures," but his most important works relate to the "Identity and Non-Identity of Typhus and Typhoid Fevers."

JENNINGS, a S. E. county of Indiana, drained by tributaries of Muscatatuck river; area, 375 sq. m.; pop. in 1870, 16,218. The surface is diversified, and the soil is moderately fertile. The Jeffersonville, Madison, and Indianapolis, and the Ohio and Mississippi railroads intersect at Vernon. The chief productions in 1870 were 147,879 bushels of wheat, 402,268 of Indian corn, 88,242 of oats, 41,236 of potatoes, 48,293 lbs. of wool, 232,299 of butter, and 12,903 tons of hay. There were 4,837 horses, 4,012 milch cows, 6,246 other cattle, 17,085 sheep, and 20,295 swine; 8 manufactories of carriages, 1 of iron castings, 2 of brick and stone masonry, 1 distillery, 4 flour mills, and 14 saw mills. Capital, Vernon.

JENNINGS, William, an English miser, born in 1701, died in 1797. His father was an aide-de-camp to the duke of Marlborough and on terms of intimacy with William III., who officiated as godfather at the baptism of the son. In early life William Jennings was a page to George I. On attaining his majority he retired to a magnificent country seat in Suffolk, left unfinished by his father, where he passed the greater part of his life. He never attempted to complete the building, but lived on the basement floor in a style of penury rivaling that of his neighbor John Elwes, equally celebrated for parsimony. The remainder of his life was devoted to the accumulation of property, and at his death he possessed upward of £1,000,000. Like Elwes he also frequented Brookes's and other gambling clubs in London, but less for the purpose of play than to lend money to the unlucky at enormous interest; and so profitable was this business that, until too infirm to pursue it, he was in the habit of spending the fashionable season in London. He died a bachelor, leaving a will sealed but not executed; and the disposition of his immense property has ever since formed a subject of inquiry among those of his name.

JENYNS, Soame, an English author, born in London in 1704, died there, Dec. 18, 1787. He finished his education at Cambridge. His first production was a poem on the "Art of Dancing" (1730). In 1742 he was returned to parliament as a member for Cambridgeshire, and in 1755 appointed one of the commissioners of the board of trade and plantations. In 1757

he published his "Free Inquiry into the Nature and Origin of Evil," which Dr. Johnson severely criticised. In 1776 appeared "A View of the Internal Evidence of the Christian Religion," in which he avowed his early skepticism and recent conversion. A complete edition of his works was published in 1790 (4 vols. 8vo, London).

JEPHTHAH, the ninth judge of Israel, natural son of Gilead. He was exiled by his half brothers after the death of his father, and dwelt in the land of Tob. There he gained renown as leader of a band of border rovers, and was at length chosen by the Gileadites to be their commander in a defensive war against the Ammonites. He, however, chose to attack the enemy in their own country, first making an oath that if victorious he would sacrifice to the Lord whatsoever should first come forth from his house to meet him on his return. He conquered the Ammonites, and when he returned his daughter, an only child, issued from his house to greet him with timbrels and with dances. It is stated that at her own request "he did with her according to his vow;" but some commentators suppose that he only consecrated her to perpetual virginity. Jephthah ruled Israel six years. The sacrifice of his daughter is the subject of oratorios by Handel (1751) and Reinthaler (1855).

JEQUITINHONHA, a river of Brazil, rising in the Serro Frio, about 9 m. W. of the town of Serro, and S. S. W. of the peak of Itambé, in the province of Minas Geraes, and falling into the Atlantic near the town of Belmonte in Bahia, lat. 15° 50' S., lon. 39° W. It has a course of about 750 m., the first 130 m. being N., and the remainder generally N. E., and the area of its basin is estimated at 19,800 sq. m. Its bed is obstructed by many dangerous rapids and cataracts, and a magnificent series of cascades with an aggregate fall of 300 ft. occurs near the boundary line between Minas Geraes and Bahia; so that the river to that point is only navigable by canoes. Further down it widens, but, being shallow, is only available for small steamers; while the entrance, owing to numerous sand bars, is difficult for even the smallest coasters. The Poassú, however, opening on the left bank, and communicating with the Pardo, virtually forms the main channel of the Jequitinhonha; and the maize, cotton, and other products, sent down in large quantities from Minas Geraes and the lower river, are not taken to Belmonte, but to Cannavieiras, at the mouth of the Pardo, 40 m. N. Of the numerous tributaries of the Jequitinhonha, the principal is the Arassuaí, a stream of considerable magnitude from the south. Diamonds are plentiful in all the streams.

JERBOA, the principal old-world representative of the rodent subfamily *dipodinae*, characterized by greatly developed hind legs for taking long leaps, diminutive fore legs, long hairy tail, and large infra-orbital foramen. The best known species is the Egyptian jerboa

(*dipus Egyptius*, Licht.). The incisors are slender and sharp, the upper ones grooved, two above and two below; the molars, $\frac{3}{3}-\frac{3}{3}$, are complex, furnished with roots; the head is large, with prominent eyes, moderate pointed ears, and silken whiskers 6 in. long. In external conformation it somewhat resembles the kangaroo, having an elongated body thickest behind, the posterior limbs very much larger than the anterior; the neck is very short, and the six lower vertebræ are frequently found united together; the metatarsus consists of a single bone; there are five toes on the short fore feet, and three on the posterior, armed with obtuse claws; the tail is long, with hairs set in two rows, and tufted at the end; it is not thick at the base, as in the kangaroo, though it is used to sustain the body in the act of leaping. The body is about as large as a rat's, of a fawn color above and white below, the black tuft of the tail white tipped. From its generic

Egyptian Jerboa (*Dipus Egyptius*).

name, which signifies two-footed, it has been supposed that the jerboa walks entirely on the hind feet; but the animal walks upon four feet, resorting to its prodigious leaps only when alarmed; when about to spring, it raises itself on the end of the hind feet, with the support of the tail, the fore feet close to the breast; the body comes down on the fore feet, but is elevated again so quickly that it appears constantly in the air. All the species are clavicolated, and carry their food to the mouth with the fore paws; they pass the winter in burrows in a state of lethargy; they are difficult to keep in captivity, even in their own climates; the females are generally the largest, and have six or eight young. The Egyptian species lives in troops in northern Africa, most abundantly in the sandy regions and ruined places of Egypt; it extends into Syria and Arabia, and as far north as the Caspian sea; it is restless and timid, and can be taken only by surprise. The Arabians take jerboas alive in

their burrows; their flesh is eaten by the Egyptians, and their soft and shining fur is valued by them. The food of the jerboas is exclusively vegetable, and they are said never to drink. The largest species is the *scirtetes jaculus* (Wagn.), about 9 in. long, found in the steppes between the Donetz and the Don and in the Crimea; this is the *alak-daagha* of the Mongols. The fur is soft, yellowish fawn varied with grayish brown above; the under parts, interior of limbs, end of nose, and crescent on the nates are white. The general appearance and habits are as in the common species; they become lethargic both under slight cold and great heat; the food consists of succulent plants, roots, fruits, insects, and, it is said, of small birds and of each other; they dig very rapidly into the earth, and live in burrows with many openings; their swiftness is such that it is difficult to overtake them even on horseback; their flesh is also esteemed as food.—To this family also belong other jumping rodents, often called jerboas. Among them is the jumping hare of South Africa (*pedetes Cafra*, Illig.), with molars $\frac{4}{2}$ without roots, long ears, five toes on the fore feet and four on the hind, with long claws; the posterior limbs and tail are long, the latter tufted. It moves by great leaps, and sleeps by day; it is as large as a rabbit, of a fawn color, with the end of the tail black. In North America is the jumping mouse (*jaculus Hudsonius*, Zimm.), about 10 in. long, of which the tail is more than half; the color is red-brown, darker on the back, the sides and under parts white. It is found as far north as the Great Slave lake. The molars are $\frac{4}{2}$; the hand has four fingers with a rudimentary thumb, hind feet five-toed, hind legs and tail very long, the latter thinly haired; upper incisors grooved longitudinally in front. For full details on this genus, see vol. viii. of the reports of the Pacific railroad survey.

JEREMIAH, the second of the great Hebrew prophets, son of Hilkiah, one of the priests of Anathoth, prophesied under the reigns of Josiah, Jehoahaz, Jehoiakim, Jehoiachin, and Zedekiah, and after the conquest of Jerusalem by the Babylonians, from about 627 to 575 B. C. He was but a youth when he began his prophetic career in his native city. The persecutions of his townsmen drove him to Jerusalem, where, in spite of opposition and imprisonment, he remained true to his mission, keeping firmly in view the religious and political rectitude of the state. After the death of Josiah he was assailed by priests and prophets, and was cast into prison, where he wrote some of his predictions, which were read to the people by Baruch, but burned by King Jehoiakim. After the capture of Jerusalem by Nebuchadnezzar he was spared by the conqueror, in consideration of his having advocated submission to Babylon, and he went first to Mizpah, and afterward to Egypt. There are various traditions concerning his last years and his death. A grotto is still pointed out at Jerusalem where

he is said to have composed his Lamentations, and his grave is shown at Cairo. His extant writings embrace the book containing his prophecies, and, according to general belief, the metrical book of Lamentations. While the canonicity of the book of Jeremiah in general is not doubted by any, the genuineness of some portions have of late been disputed by Movers, Ewald, Hitzig, and others. An elegy on the death of King Josiah, ascribed to him, is lost. Among the more recent commentators on Jeremiah are Hitzig (Leipsic, 1841), Umbreit (Heidelberg, 1843), Neumann (Leipsic, 1856), Graf (1862), and Cowley (New York, 1869). There are English translations and commentaries by Blayney (Oxford, 1784; new ed., Edinburgh, 1810), by Noyes (Boston, 1837), and by Henderson (London, 1851; revised, 1868).

JEREZ (or **Xerez**) **DE LA FRONTERA** (anc. *Asta Regia*), a town of Andalusia, Spain, in the province and 13 m. N. E. of the city of Cadiz, 3 m. from the right bank of the Guadalete; pop. about 50,000. Situated in one of the most fertile plains of the peninsula, it comprises two distinct divisions, the old and the new town. The streets in the latter are spacious, regular, clean, and well paved and lighted. There are three fine squares. The houses are well built, are generally white, and have tasteful courtyards. The cathedral, completed in 1695, though lofty and spacious, is heavy and devoid of taste; it has a library and a curious numismatical collection. Of the 11 parish churches, only those of San Dionisio, San Miguel, and Santiago are noteworthy; in them the Gothic style prevails, and among the rich decorations of the interiors are numerous paintings, statues, and bassi rilievi. There are seven convents, and a larger number of monasteries. Of the five hospitals, one is for foundlings; and there are besides a female orphan asylum, a college, and several free schools. But the most remarkable of the public buildings is the old Moorish castle (Alcazar), contiguous to the Alameda, and surrounded by turreted walls, one of the best specimens of a palatial fortress in Spain. Jerez derives its celebrity from its wines, which are by far the best in the country, and consist of the aromatic pajorete and the far-famed sherry, a name Anglicized from that of the town. Many of the cellars are capable of containing 14,000 butts. (See SPAIN, WINES OF.) Some olive oil is made, and there are a few woollen factories, soap-boiling establishments, and tanneries. The town has railway communication with Cadiz and Seville. The export trade, mainly consisting in wines, is chiefly carried on through the port of Santa Maria, 7 m. S. W.—Near the walls of Jerez, which are still standing though much dilapidated, Roderic, the last king of the Visigoths in Spain, was defeated by the Moors, shortly after their landing in 711, in a battle which is said to have lasted a week. Alfonso the Wise recovered the town from the Moors about the middle of the 13th century.

JERICOH, a flourishing commercial city of ancient Palestine, in the valley of the Jordan, on the W. side of that river, near its entrance into the Dead sea. It was one of the oldest and richest cities of Canaan, surrounded by groves of palms and balsam trees. It was conquered and destroyed by Joshua on his entrance into the promised land, and a curse was pronounced upon whosoever should rebuild it, its territory being allotted to the tribe of Benjamin. It was, however, rebuilt upon a site near by, became the centre of the trade between Arabia and Palestine, was fortified by King Ahab, and was the seat of a school of prophets. Mark Antony presented its plain of palm trees to Cleopatra. It was embellished by Herod the Great, who built there one of his residences; under Vespasian it was destroyed, and under Hadrian again rebuilt; it was overthrown during the Mohammedan conquest, revived under the caliphs, and completely destroyed during the crusades. The village of Riha, supposed to occupy the site of the second city, was destroyed by Ibrahim Pasha in 1840, and there only remain a few huts and a Saracenic tower.

JERICOH, Rose of. See ROSE OF JERICOH.

JEROBOAM. I. Founder of the kingdom of Israel, son of Nebat, of the tribe of Ephraim, died about 953 B. C. He was selected by Solomon to be a superintendent of the public works at Jerusalem. Informed by the prophet Ahijah that he was to rule the ten tribes which should revolt from the house of David, he immediately engaged in plots against Solomon, and fled to the court of Shishak, king of Egypt, to escape punishment. On the death of Solomon he returned, headed the deputation of the chiefs of tribes which met Rehoboam at Shechem and whose demands were rejected, and was then elected by ten of the tribes to reign over them, with the title of king of Israel, Judah and Benjamin alone remaining to Rehoboam (975 B. C.). He resided at Shechem, which he fortified, built temples at Dan and Bethel, where golden calves were made the symbols of the Divinity, to which his subjects might resort rather than to Jerusalem, and was generally successful in his wars against Judah, though he was defeated in a great battle by Abijah. The leading aim of his government was to raise a barrier against any reunion of the tribes. **II.** Thirteenth king of Israel, son of Joash, reigned 823-782 B. C. His reign of 41 years was prosperous, although licentious and oppressive. He captured Damascus from the Syrians, and reconquered Ammon and Moab. In Scripture he is mentioned only in 2 Kings xiii.-xv., 1 Chron. v., and in the prophecies of Hosea and Amos. Wherever the name occurs elsewhere, it refers to Jeroboam I.

JEROME, king of Westphalia. See BONAPARTE, JÉRÔME, vol. iii., p. 26.

JEROME, Saint (SOPHRONIUS EUSEBIUS HIERONYMUS), one of the four great doctors of the Latin church, born at Stridon, on the confines

of Pannonia and Dalmatia, about 340, died in Bethlehem Sept. 30, 420. His own writings furnish an almost complete autobiography. His father Eusebius was a wealthy Christian. In 363 he was sent to Rome with his countryman Bonosus, and studied Greek and Latin literature and eloquence. In 365 he was baptized and took the name of Hieronymus. He afterward visited with Bonosus the southern and northern provinces of Gaul and the coast of Britain, and studied for some time at Treves. Returning to Italy, Jerome became the inmate of a monastery at Aquileia, and under the direction of Valerianus, bishop of that city, devoted himself to the study of Scripture and theology. While there he transcribed a commentary on the Psalms and a treatise on synods by St. Hilary of Poitiers, and published his first known treatise, addressed to Innocentius, *De Muliere septies Percussa*. There he formed the acquaintance of Rufinus, afterward his most determined theological opponent. In 372 he was called to Stridon to reclaim one of his sisters, and this incident seems to have determined him to leave Italy for ever. After a brief stay in Rome, he set out for Syria with several friends, travelled on foot through Thrace and Asia Minor, and stopped at Antioch to follow a course of lectures on Biblical exegesis by the future heresiarch Apollinaris, bishop of Laodicea. He afterward withdrew into the desert of Chalcis near Antioch, where he spent four years in a hermit's cell, assiduously studied the Hebrew language, and wrote a letter on Manichæism and two letters to Pope Damasus, one of which was in relation to the schism reigning in the church of Antioch, where there were at that time three rival bishops. The pope having advised him to acknowledge Paulinus as bishop, Jerome returned to Antioch, and in 376 consented to receive priestly orders, on the condition that he should not be forced to accept any pastoral charge. He immediately applied himself to acquire an accurate knowledge of Biblical topography and a thorough familiarity with the Hebrew and Chaldee, visiting the most celebrated scenes of Bible history, and consulting everywhere the most learned Jews. To perfect himself in Greek and to have the Bible interpreted to him by the best living masters, he went to Constantinople about 380, and became the disciple of St. Gregory Nazianzen, whom he calls his father and master. In that city he wrote a commentary on the 6th chapter of Isaiah, and translated 14 homilies of Origen and the chronicle of Eusebius. His version only follows the original to the siege of Troy; in the second part Jerome confesses to his having arranged the matters in his own way as far as the 20th year of Constantine, the remainder being entirely his work down to the death of Valens (378). Being called to Rome by Pope Damasus in 382, he acted as notary to the council held there in that year, and afterward remained as secretary or *referendarius* to the pope until the death of

the latter in 384. Jerome resided in a monastery, and at the pope's request began his revision of the old Latin or Italic version of the Bible. He produced the translation of the Psalms called *Psalterium Romanum*, and another of the Gospels dedicated to the pope, wrote a commentary on the parable of the prodigal son, a letter on the hierarchy, and a treatise against Helvidius, who denied the perpetual virginity of Mary the mother of Christ. His love of monastic seclusion induced him to win converts by voice and pen to this mode of life. A large number of noble persons, particularly Roman ladies, forsook all worldly pursuits, and placed themselves under his direction. This, and Jerome's denunciation of the worldly lives led by the generality of Roman Christians, made him many enemies, lay and clerical; while his frequent instructions on the Scriptures and Christian virtues to his numerous female converts afforded an opportunity for spreading malignant reports against him. So long as Pope Damasus lived he supported Jerome against his slanderers; but after the election of Siricius, Jerome, taking with him his younger brother Politian, set out once more for the East. In order to find the most perfect models of monastic life, he visited the monasteries of Upper and Lower Egypt, and finally fixed his abode at Bethlehem, the birthplace of Christ. Thither he was soon followed by some of his distinguished Roman converts, who devoted a portion of their wealth to the erection of monasteries. One of these, for men, was placed under Jerome's direction, and to it he soon added a hostelry and hospital for pilgrims, and for the numerous refugees who fled from Rome after its sack by Alaric in 410. There he completed his Latin version of the Scriptures, which became in the western churches what the Septuagint was in the East, and served as a basis for nearly all the earlier translations of the Scriptures subsequently made into the vernacular tongues of Europe. From Bethlehem Jerome also issued treatises against the heretics of his time, such as Jovinian, Vigilantius, and Pelagius. He combated the doctrines of John, bishop of Jerusalem, and of his old friend Rufinus, who was propagating Origenism. In 416 the Pelagians, who were in the ascendancy in Palestine, burned his establishment at Bethlehem, and compelled him to fly for his life. Having remained in concealment for more than two years, he returned to Bethlehem in 418, exhausted by privations, anxiety, and infirmities. He was buried amid the ruins of one of his monasteries; but his remains were afterward taken to Rome, and placed in the basilica of Santa Maria Maggiore, near the tomb of Sixtus V. His feast is celebrated on Sept. 30.—The personal character of St. Jerome has been the subject of much censure and much praise. His writings show him to have been a man of ardent nature, invincibly attached to what he conceived to be the truth and the right; but his very impetuosity was apt to hurry him

into extremes. He advocated evangelical poverty and self-denial under the form of monasticism among the Roman patricians, as a remedy for the low morality which everywhere prevailed; but no one denounced with greater energy than he both false monks and false penitents. Biblical scholars are unanimous in acknowledging the incomparable services which his labors rendered to the church. His complete works comprise a volume of letters, several biographical series, topographical and grammatical dissertations about Hebrew history and geography, commentaries on the books of the Old and New Testaments, translations of works of several ecclesiastical writers, and finally his Latin version of the Bible. Of all his works this is the most useful and most widely known, though in a corrupted form, under the name of the Latin Vulgate. (See BIBLE.) We have now the text of the New Testament from MSS. of about the middle of the 6th century, the *Codex Amiatinus*, edited by Tischendorf in 1853 and again in 1855, and the *Codex Fuldensis*, edited by Ranke in 1868, which rank with the oldest and best Greek MSS. in determining the true reading of the sacred text. The readings of the former in the Old Testament have been added by Heyse and Tischendorf to the Clementine Vulgate Latin, with emendations and various readings by Vercellone (1873). The principal editions of his works are those of Erasmus and Æcolampadius (9 vols. fol., Basel, 1516, reprinted in 1526 and 1537, and at Lyons in 1530); of Marianus Victorinus (9 vols., Rome, 1566-'72; Paris, 1578, 1608, and 1643); of Tribbechovius (12 vols. fol., Frankfort and Leipsic, 1684); of the Benedictines Pouget and Martianay (5 vols., Paris, 1693-1706); and that of Vallarsi and Maffei (11 vols., Verona, 1734-'42; Venice, 1766-'72; reproduced by Migne, *Patrologie latine*, vols. xxii.-xxx., Paris, 1845-'6). His life has been written by Martianay (Paris, 1706), by Stilling in the *Acta Sanctorum* for September, and by Alban Butler, "Lives of the Saints," Sept. 30. See also Collombet's *Histoire de St. Jérôme* (Lyons, 1844), and Zöckler, *Hieronymus, sein Leben und Wirken* (Gotha, 1865).

JEROME OF PRAGUE, a Bohemian religious reformer, born in Prague about 1375, burned at Constance, May 30, 1416. After graduating at Prague he visited the universities of Cologne, Heidelberg, Paris, and Oxford. Returning to Paris, he preached boldly in favor of reforms in the church, defending his views in a disputation held with Gerson, chancellor of the university. He was employed by Ladislas II. of Poland to organize the university of Cracow. About 1402 he began to disseminate secretly the doctrines of Wycliffe in Bohemia, and in 1408 openly identified his views with those of Huss. He was imprisoned for a time at Vienna, and only released through the earnest entreaty of his Bohemian friends. When Huss was imprisoned at Constance in 1414, Jerome

went thither in accordance with a promise to defend him; but because of the rumor that Huss would only be tried to be executed, he fled to Ueberlingen, whence he intimated his willingness to appear before the council under a safe-conduct. An equivocal answer being given, he prepared to return to Prague, but was arrested by order of the count palatine of Neuburg-Sulzbach, and delivered over to the council, May 23, 1415. He was several times brought to trial, but his learning and power of debate enabled him to answer all arguments urged against him. On his third examination, Sept. 23, he made a qualified recantation of his views as to the sacrament. After being imprisoned for several months, he was again brought before the council, May 26, 1416, and solemnly retracted his late admission of error. This hastened his condemnation, and he was burned at the stake, meeting his fate with courage. His life has been written by Heller (Tübingen, 1835), and by Becker (Nördlingen, 1858).

JERROLD. I. **Douglas William**, an English author, born in London, Jan. 3, 1803, died there, June 8, 1857. His father was manager of a theatre in Sheerness, but Jerrold himself manifested a dislike for the stage, and obtained in 1813 a commission as midshipman. The hard life in service did not suit him; and when paid off, Oct. 21, 1815, he did not attempt to reënter the navy. His father had been ruined as manager, and the family went to London, where in 1818 the boy was apprenticed to a printer, and devoted his leisure to study and reading. His first literary effort was a comedy, "More Frightened than Hurt," written at the age of 15; it was sent to a London theatre, where it remained unread for two years, but met with great success when brought out at Sadler's Wells in 1821. He was afterward employed as a writer for the newspaper on which he had worked as a printer, and in 1825 married and was engaged at a salary to write for the Coburg theatre. In 1829, having quarrelled with the manager of this establishment on account of a play, "Black-Eyed Susan," written several years before, Jerrold left his situation, and went with the MS. to Elliston at the Surrey theatre. It had a run of over 300 nights, and brought in many thousands for the manager, though the author only received about £70. In 1830 the success of a new play, "The Devil's Ducat," at the Adelphi theatre, introduced him to Drury Lane, where he produced "The Bride of Ludgate" and "The Rent Day;" the latter, founded on two pictures by Wilkie, was also strikingly successful. From 1831 to 1836 he wrote "Nell Gwynne," "The Housekeeper," "The Wedding Gown," and "Beau Nash," all of which were successful. In 1836 he undertook the management of the Strand theatre, but failed in the speculation. He had already produced many striking pieces in different magazines. He was in Paris when "Punch" was started in 1841, and on returning he became one of its most popular contributors. His "Q."

papers, "Story of a Feather," and the "Cauld Lectures" made his name widely known. In 1843 he started the "Illuminated Magazine;" this was discontinued after two years, and followed by his "Shilling Magazine," which was also a failure. More successful was his connection with "Lloyd's Weekly Newspaper." He was very witty in conversation. "Douglas Jerrold's Wit and Humor," and "The Life and Remains of Douglas Jerrold," by his son, were published in 1858. A partial collection of his works, with the life, has been issued (5 vols., Philadelphia, 1869). II. **William Blanchard**, son of the preceding, born in London in 1826. He was educated partly at Brompton grammar school and partly in France; studied art, contributed to various periodicals, and wrote several tales, farces, and other works, among which are "Swedish Sketches" (1852) and "Imperial Paris" (1856). In 1857 he became editor of "Lloyd's Weekly Newspaper," succeeding his father, whose life he wrote in 1858. In 1863 he went to Paris, as commissioner of the "Morning Post," to study the institutions for the relief of the poor, and the results of his investigations were embodied in "The Children of Lutetia" (1864). He made trips in various parts of France and Spain, and published "At Home in Paris," "A Trip through the Vineyards of Spain" (1864), "Passing the Time" (1865), "On the Boulevards" (1867), and several other works. In 1869 he made a journey in the Netherlands to examine the poor-law administration. In 1871 he published "The Story of Madge and the Fairy Content," "At Home in Paris: at Peace and at War," and "The Cockaynes." His comedy, "Cupid in Waiting," was produced at the Royalty theatre in July, 1871, and his "London," illustrated by Doré, was published in 1872.

JERSEY, a W. county of Illinois, bounded W. by Illinois river, and separated from Missouri on the S. by the Mississippi; area, 352 sq. m.; pop. in 1870, 15,054. The surface is diversified with prairies and woodlands, and the soil is generally fertile. The main line and the Jacksonville division of the Chicago and Alton railroad, and the Rockford, Rock Island, and St. Louis railroad, traverse it. The chief productions in 1870 were 558,367 bushels of wheat, 519,120 of Indian corn, 71,770 of oats, 39,330 of potatoes, 13,226 lbs. of wool, 180,078 of butter, and 11,650 tons of hay. There were 4,531 horses, 2,978 milch cows, 7,977 other cattle, 4,552 sheep, and 16,056 swine; 2 manufactories of boots and shoes, 3 of carriages, 2 of boats, 7 of cooperage, and 8 flour mills. Capital, Jerseyville.

JERSEY, the largest and most important of the Channel islands, lying in the English channel, 15 m. from the coast of France, and belonging to Great Britain. It is about 12 m. long from E. to W., and 7 m. wide, and contains an area of 45 sq. m.; pop. in 1871, 56,627. The coast is indented with numerous excellent harbors, and save toward the south

is in general bold and precipitous. The surface is an alternation of wooded hills and fertile valleys. The highlands in the north consist chiefly of granite, and the reddish white syenitic granite which forms the cliffs on the N. coast is quarried extensively for exportation. In the south schist is found overlying the granite formation. The island contains neither limestone, chalk, marl, nor gravel. The climate is mild and healthful. Agriculture has recently been greatly improved. Land is held at a high rent, the holdings averaging but 15 acres. Alderney cows, small sturdy horses, sheep chiefly of the Southdown stock, and a few varieties of feathered game are the most important animal productions. Nearly all forest trees common to this latitude are found to thrive; wheat, potatoes, parsnips, and lucern are cultivated, and much attention is devoted to apple orchards, for which the soil and

the principal rendezvous for the vessels. Near it is Mount Orgueil castle, a picturesque structure on a headland between St. Catharine and Grouville bays. It was once the principal fortress on the island, and it was the residence of Charles II. during a part of his exile.— Jersey has a legislature of its own, called the "states," or insular parliament. It consists of the governor and the baili of the royal court, who are appointed by the crown; the 12 judges of the royal court, who are chosen for life by the rate payers; the rectors of the 12 parishes, who are appointed to their livings by the governor; and 12 constables (one from each parish), elected for three years by the inhabitants. The *vicomte*, or high sheriff, and the two *dénonciateurs*, or under sheriffs, occupy seats as officers of the assembly. The crown officers may take part in the debates, but not vote. The governor in special cases may confirm or annul the decrees of the states. The royal court is the supreme tribunal in civil and criminal cases; appeal lies from it to the sovereign in council. The language of the upper classes is generally French, but the masses still speak a dialect of the old Norman and preserve a number of Norman feudal customs. The capital is St. Hélier.

Mount Orgueil Castle, Jersey.

climate are particularly favorable; as many as 30,000 hhd. of cider have been made in good years. One of the most remarkable products of Jersey is its Chaumontelle pears, a single one of which frequently weighs a pound. The most important manufactures are shoes and hosiery. Great numbers of ships are also built, as timber and cordage are duty free. The chief exports are cattle, potatoes, and oysters; the principal imports are woollens, hardware, soap, glass, earthenware, and coal. The oyster trade employs about 3,000 persons and 400 or 500 vessels. The principal beds are on the E. side of the island, the best being nearer to the French coast than to Jersey. Between the months of February and May about 200,000 bushels of oysters are sent from the Jersey beds to England, where most of them are deposited in "parks" along the coast of Essex and the Thames, to be withdrawn according to the demand of the London market. The harbor of Gorey on the E. shore of the island is

opposite the city of New York, with which it is connected by five ferries, and 50 m. N. E. of Trenton. It is bounded N. by North Bergen, West Hoboken, and Hoboken, S. by Bayonne, and W. by Newark bay, Hackensack river, and Penhorn creek, and extends about 5 m. N. and S. by 3 m. E. and W. It is in the main regularly laid out, with wide streets crossing each other at right angles, but some streets do not conform to the general plan. There are numerous handsome residences, and many substantial business structures and public buildings. Among the latter may be mentioned the city hall, court house and jail, a large market, the public school buildings, of which 14 are of brick, and the churches. There are four small public squares, of which two, Van Vorst and Hamilton, are provided with fountains, laid out in grass plots, and adorned with trees. Washington square is divided into four smaller squares by intersecting streets, and Bergen square, which is unimproved, is used as a

parade ground. The population in 1850, as returned in the census, was 6,856; in 1860, 29,227; in 1870, 82,546, of whom 705 were colored and 31,835 foreigners, including 17,665 natives of Ireland, 7,151 of Germany, 4,008 of England, and 1,176 of Scotland. The number of families was 16,687; of dwellings, 9,867. The city is an outgrowth of New York, and has been built up by the overflow of its population; but the extraordinary ratio of increase is partly due to the absorption of contiguous municipalities. The township of Van Vorst, which had 4,617 inhabitants in 1850, was annexed in 1851; the cities of Hudson and Bergen, with 7,229 and 7,429 inhabitants respectively in 1860, were merged in 1870 (before the census); and in 1872 the township of Greenville was annexed. The population of Greenville in 1870 was 2,789, so that the population at the last census of the city as at present constituted was 85,335.—Jersey City is the terminus of the Morris canal and of six lines of railroad, viz.: the Erie, the Pennsylvania, the Central of New Jersey, the Northern New Jersey, the New Jersey Midland, and the New York and Newark. Besides these, the Morris and Essex division of the Delaware, Lackawanna, and Western railroad, which has its terminus at Hoboken, passes through the north part of the city. The ferry boats to New York are commodious and well appointed, and ply every few minutes throughout the day and night. Horse cars run to different parts of the city and to Hoboken. Jersey City forms part of the New York customs district, and its commerce is not separately returned. It is one of the termini of the Cunard steamship line between the United States and Great Britain. The immense quantities of coal and iron brought by the canal and railroads create an important business. Manufacturing is extensively carried on, the principal establishments being the United States watch company, large glass works, three crucible works, three steel works, zinc works, three boiler works, a machine shop, three foundries, a foundry and machine shop, three railroad repair and supply shops, locomotive works, two sugar refineries, three breweries, two planing mills, and manufactories of chains and spikes, medals, car springs, pottery, soap and candles, saleratus, castor and linseed oil, copper articles, drugs and chemicals, jewelry, fireworks, hydrants and lathes, rubber, oakum, black lead and lead pencils, stove polish, &c. The crucibles made here are used exclusively in the mints of Europe as well as of this country. The business of slaughtering live stock for the New York market was formerly carried on very extensively at Communipaw, in the S. part of the city, bordering on New York bay; but the stock yards have been removed, and an extensive abattoir, with stock yards, has been built in the N. part of the city near the river front, where cattle and sheep are slaughtered. This establishment was opened in the

spring of 1874; it is connected by a branch with the Pennsylvania railroad, and drains into the river. Hogs are now only slaughtered on the Hackensack meadows beyond the city limits.—Jersey City contains three national banks with an aggregate capital of \$1,150,000, two state banks, eight savings banks, a trust company with \$200,000 capital, and four insurance companies. It is governed by a mayor and a board of 12 aldermen (two from each district), but the chief functions are exercised by the boards of police commissioners (five members), of public works (three), and of fire commissioners (five), chosen by the state legislature, and by the board of finance and taxation (five members), chosen by the board of aldermen. The county board of health has supervision of all contagious diseases. For police purposes the city is divided into five precincts, and the force consists of a chief of police, an inspector, 5 captains, 19 sergeants, and 155 men. The fire department has under its control 10 steam engines, three hand engines, five hook and ladder trucks, and a fire alarm telegraph, and the force consists of a chief engineer, an assistant, two district engineers, and 325 men, of whom 91 are permanently employed and 234 required to respond at call. The streets are well paved and sewerred, and the city is supplied with gas by two companies, which have a united capital of \$1,050,000. The water works are at Belleville, on the Passaic river, 6 m. N. W. of the city. The water is pumped into the receiving reservoir by five engines, whence it is brought in pipes to the distributing reservoir within the city; another distributing reservoir is in course of construction. These works also supply Hoboken. The assessed value of property in 1871 was \$61,330,987; in 1872, \$68,496,855; in 1873, \$62,292,138, the decrease being due to the non-assessment of railroad property, which under recent laws is exempt. The estimated expenditures for the year ending Nov. 30, 1874, are \$1,376,480, of which \$317,000 (\$185,000 for lamps and lights) is on account of the board of public works; \$60,000, of hospital, dispensaries, poor, &c.; \$265,000, of schools; \$219,500, of police; \$149,430, of fire department; \$228,000, of interest; the rest miscellaneous. The bonded debt, April 1, 1874, amounted to \$13,082,775, including \$422,000 held by the commissioners of the sinking fund, of which \$5,286,500 consisted of assessment bonds, \$4,530,300 of water bonds, and \$3,265,975 of general debt. The principal charitable institutions are the city hospital, the home for aged women, and the children's home. There are two young men's Christian associations, a city mission and tract society, and numerous temperance societies, masonic and odd fellows' lodges, &c. The public schools are under the charge of a superintendent, who is appointed by the board of education, which consists of 12 members, two being elected from each aldermanic district. According to the report of the superintendent

for the year ending June 30, 1873, there were 16 school houses owned by the city and 5 buildings leased, affording 10,850 seats. The schools were divided as follows: 1 normal, 1 high, 15 grammar, 20 primary (2 colored), and 7 evening. The number of children of school age (5 to 18) was 30,758; enrolled in day schools, 16,762; average attendance, 8,320; number of teachers, 250 (18 males and 232 females); value of school property, \$674,416 72. The number enrolled in the evening schools was 2,812; average attendance, 792. The normal school is held on Saturdays for the instruction of teachers and candidates for employment as such. The expenditures, which are met partly by a state and partly by a city tax, were \$235,142 75, of which \$180,446 14 were for salaries. The number of private schools was 30 (10 denominational and 20 secular), with 5,973 pupils. Since the date of the report another school house has been opened. There are two daily and three weekly (two German) newspapers. The post office has two sub-stations. The number of churches is 59, viz.: 6 Baptist (1 German), 2 Congregational, 10 Episcopal, 2 German Evangelical Lutheran, 14 Methodist (1 German and 2 colored), 6 Presbyterian, 2 United Presbyterian, 8 Reformed, 8 Roman Catholic (1 German), and 1 Universalist.—Although the peninsula upon which Jersey City stands was granted by letters patent from Sir William Kieft, director general of the Dutch West India company, in the year 1638, it was used for farming purposes solely for more than 150 years, and it was not till the beginning of the present century that it began to be settled. In 1802 the whole population of the place, then called Paulus Hook, consisted of 13 persons, occupying but one house and out buildings. In 1804 the "associates of the Jersey company" were chartered by the legislature of New Jersey, and laid out the whole of Paulus Hook into blocks and streets. In 1820 "the city of Jersey" was incorporated with a board of selectmen; in 1838 it was re-incorporated under the name of "Jersey City," with a mayor and common council.

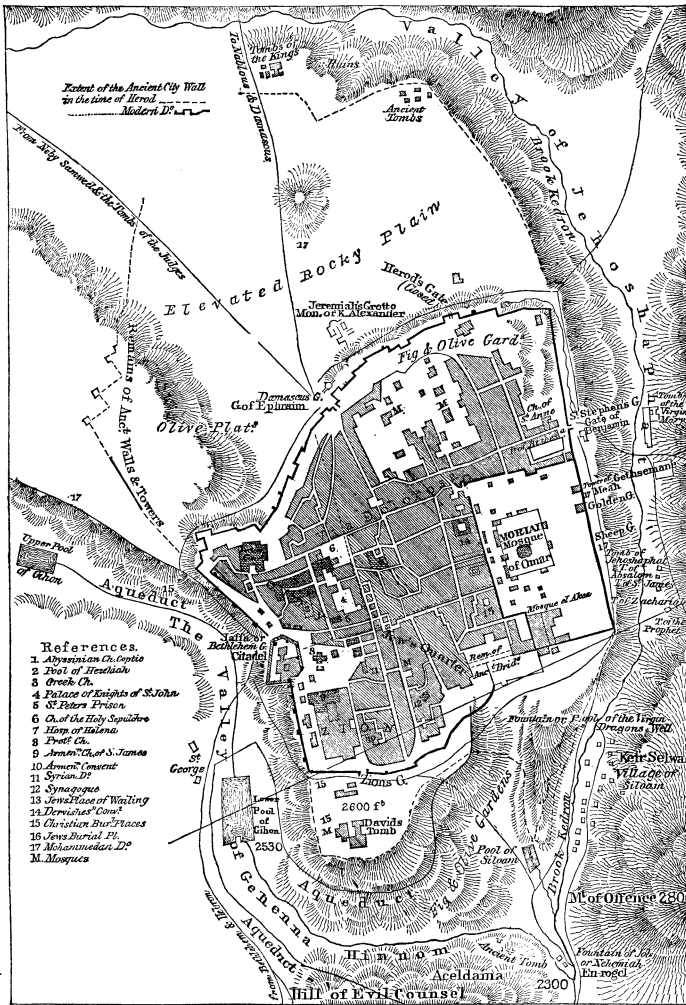

JERUSALEM (Heb. *Yerushalaim*, possession of peace; Gr. *Ἱερουσαλήμ*; Lat. *Hærosolyma*; Arab. *El-Khuds*, the holy, or *Khuds esh-Sherif*, the noble sanctuary), a city of Palestine, anciently capital of the kingdom of the Jews, afterward of that of Judah, and now the seat of a Turkish pasha. It is the holy city of the Jews and the Christians, and one of the three holy cities of the Mohammedans, ranking next in sanctity to Mecca and Medina. It is situated in lat. 31° 46' N., lon. 35° 14' E., 133 m. S. S. W. of Damascus, 33 m. E. of the Mediterranean, and 15 m. W. of the Dead sea; elevation above the Mediterranean, from about 2,000 to nearly 2,600 ft.; pop. about 20,000, of whom 5,500 are Mohammedans, 8,000 Jews, and 6,000 Christians, mostly of the Greek and Latin churches, the remainder Armenians, Protestants, Abyssinians, Copts, and Syrians. Jerusalem is built on a

high plateau about 2 m. square, connected on the north with the wide mountain range which runs N. and S. through Palestine, and which forms the watershed of the country, so that streams within a mile of the city walls flow on the one hand to the Mediterranean and on the other to the Dead sea. Between the plateau and the mountain ridge on the north is a low depression through which small streams flow during the rainy season. On the other sides the hills rise abruptly higher than the plateau on which the city stands. The limestone of this plateau is much harder than that of the surrounding hills, and is capable of receiving a high polish. The color is a pale yellow, with red or pink veins. W. of the city at Gihon, and on the N. side, about 1½ m. from each other, are two gentle depressions, one running S. E. and then E., the other E. and then S., gradually becoming deeper till they form two narrow ravines with precipitous sides. These are the valley of Hinnom and the valley of Jehoshaphat (or of the Kedron), which almost skirt the city in their course, and unite in the S. E. part, a little S. of the pool of Siloam and near the well En-rogel. A third ravine, the Tyropœon, begins in the city, and running S. joins the other two at this point. The gorge continues its course S. E. till it is lost in the basin of the Dead sea. On the east the triple-peaked mount of Olives rises abruptly from the valley of Jehoshaphat. On the south the hill of Evil Counsel overhangs the valley of Hinnom, which separates it from Zion. On the side of the hill of Evil Counsel a chain of rocks rises precipitously from the valley to a height of 30 or 40 ft., and on the ridge is the small field called Acedama (field of blood), or potter's field. Further N. W., up the valley where it blends with Gihon, is the lower pool of Gihon, formed by a strong wall built across the lower end; it is called by the Arabs *birket es-Sultan*, pool of the sultan. The wall being now broken, it is used by the Arabs as a threshing floor. The course of this valley N. and then N. W. leads up to the plateau on which the city stands. On this spot, about ½ m. from the city walls, is the upper pool of Gihon, a basin about 350 ft. long, 200 ft. broad, and 30 ft. deep. The water that accumulates in this pool, after settling, is conducted into the pool of Hezekiah, within the city, where it is used for bathing. On the sides of the pool of Gihon is the Turkish cemetery, which, as in other eastern cities, is unfenced, and presents a desolate appearance. Immediately W. of this pool is the hill Gareb; the valley (Wady Haninah) beyond declines toward the Mediterranean. E. of this place, and next to the city, is a magnificent establishment built a few years ago by the Palestine commission of St. Petersburg, under the auspices of the emperor of Russia. It consists of the fine church of the Holy Trinity, two large hospices for male and female pilgrims respectively, a house for the missionaries and travellers of the higher classes, a hospital, and

a residence for the Russian consul. Near by is another large building for the Prussian deaconesses' schools. The country around Jerusalem is rocky and not very fertile. The rocks almost everywhere crop out at the surface, which in many parts is also thickly strewn with large stones, and the whole region has a dreary and barren aspect. At almost every siege the trees were either burned or cut down, and the vege-

It began N. W. of the tower Hippicus, extended to the Xystus, and terminated on the W. side of the temple, thus separating the upper from the lower city. The other part of the wall, toward the west, commencing also from Hippicus, passed by a place called Bethso to the gate of the Essenes; thence it turned S. and E., taking in all the south of Zion till above the pool of Siloam; it

then turned N. E., by the slope Ophel, and joined the E. cloister of the temple. The second wall began at the gate of Gennath, in the first wall E. of the tower Hippicus. Advancing thence toward the N. gate of the city, it turned S. E., and terminated at the fort of Antonia, which flanked the N. W. angle of the temple. The third wall began at the tower Hippicus, extended N. W. as far as the tower Psephinus, then turning E. passed by the tomb of Helena on the north for some distance, and finally turned S., joining the old wall E. of the temple. The present walls were built by the Turkish sultan Solyman the Magnificent in 1536-'9. They are 15 ft. thick at the base, and vary in height with the inequalities of the ground from 25 to 70 ft. Their total circuit is about 2½ m.—The city is irregular in its outline, but approaches a square whose four sides, each about ½ m. long, nearly face the cardinal points. It has at present five gates that are open, two on the south, and one near the centre of each of the other sides. On the west is the Jaffa gate (or *bab el-Khalil*, Hebron

Plan of Modern Jerusalem.

tation destroyed. The soil thus exposed was gradually washed down into the valleys and thence to the plains, which to this day are remarkably fertile. Yet olives and vines thrive on the sides of these mountains, and fields of grain are seen in the valleys and level places.—The various parts of ancient Jerusalem were at different intervals surrounded by walls. The first old wall encircled Zion and a part of Moriah.

gate), the chief entrance to the city; on the north the Damascus gate (*bab el-Amud*, the gate of the columns); on the east St. Stephen's gate, called by the native Christians gate of our Lady Mary, and by the Mohammedans *bab el-Asbat*, gate of the tribes; on the south Zion gate (*bab en-nabi Daud*, gate of the prophet David), and another obscure portal, the Dung gate (*bab el-Magharibeh*, gate of the Moors),

near the centre of the Tyropœon. The Golden gate, on the E. side, is now walled up with solid masonry, and against it a tower has been erected, where a Mohammedan soldier is constantly on guard; for the Turks have a tradition that the Christians will some day enter by this gate and possess the city. Among the ancient gates mentioned in Scripture were the gates of Ephraim and Joshua, the horse, sheep, and fish gates (probably with adjoining market places for the sale of horses, &c.), and the old, fountain, and water gates. The streets are narrow, winding, dirty, and badly paved; the principal and broadest street is about 15 ft. wide, and some are only 5 or 6 ft. The houses are built of heavy masonry, with thick walls supporting arched roofs. They have neither symmetry nor elegance, but the rooms are generally lofty and well ventilated. The houses

are usually two or three stories high, with a plain front, few or no windows in the lower stories, and doors so low that a person must stoop in entering. The roofs are terraced or rise in domes, and the apartments receive light from interior courts, which in the larger houses form cool and agreeable promenades, and sometimes are turned into gardens, where the household spend their leisure time. The principal apartments are in the upper story, the lower being

occupied by lumber rooms, kitchens, stables, cisterns, and offices. Some of the houses are three or four centuries old.—The city, as seen from the mount of Olives, above the ancient Gethsemane, appears to be a regular inclined plane, sloping gently and uniformly from W. to E., or toward the observer, and indented by a slight depression or vale running N. and S., the Tyropœon, which was formerly a deep ravine, but was filled up by Simon Maccabæus when he razed Acra. The elevation W. of the Tyropœon is Zion, E. Moriah and Ophel, N. Acra, and N. E. Bezetha. The S. E. corner is occupied by the great mosque and its extensive and beautiful grounds on Mt. Moriah, comprising about one seventh of the modern city. This enclosure corresponds, in part at least, with the ancient temple area. The site was purchased by David,

having been the threshing floor of Araunah, an altar was built, and materials were collected for the temple. The building was erected by Solomon about 1012–1005 B. C., its general plan being taken from the ancient tabernacle, while the dimensions were exactly doubled. It was 120 ft. long and 60 ft. wide, and consisted of three parts, the porch, the holy place, and the holy of holies, surrounded on all sides but the front by small chambers arranged in three stories, for the priests. The porch probably rose in a lofty second story, and its ceiling was supported by two highly ornamented pillars of brass. The temple stood within courts and cloisters of great beauty, and was connected by stone bridges spanning the Tyropœon valley with the royal palace and the city on Mt. Zion. It was destroyed by Nebuchadnezzar in 586 B. C., and was rebuilt by Zerub-

The Great Mosque (Kubbet es-Sakhra).

babel about 520, but of its restored character we have little information. The temple of Zerubbabel was standing however in the time of Herod, and the restoration by that king was in two parts: the temple proper, which the priests rebuilt in 18 months, not trusting the work to profane hands, and perhaps only repairing the ancient building; and the courts and porches or cloisters, which Herod greatly enlarged, spending eight years in fitting them for use, while the work of completion continued nearly 50 years. The façade of the temple consisted of a lofty arch spanning the entrance. The temple was surrounded by a court about 360 ft. long and 270 ft. wide, adorned by porticoes and ten magnificent gates, one of them probably the "gate called Beautiful;" while beyond this was an enclosure about 600 ft. square, bounded by por-

tioces surpassing in size those of any other ancient temple. The whole structure was of white marble, the roofs lavishly adorned with gold, and the high and massive walls of the enclosure made it the stronghold of the Jews during the siege by Titus. The hill is now covered with greensward, and planted sparingly with olives, cypresses, and other trees, and is the most beautiful feature in the city. About the middle of this enclosure is a large and nearly rectangular platform, about 10 ft. high, 500 ft. long, and from 460 to 500 ft. in width. On this platform stands the grand mosque, *Kubbet es-Sakhra*, "Dome of the Rock." The building is an octagon, each side of which measures 67 ft. It is surmounted by a light and graceful dome, terminated by a tall crescent. Its exterior walls are covered with tiles of white, blue, and yellow glazed porcelain, with intricate arabesque patterns and inscriptions. The lower parts of the walls are further decorated with slabs of marble, few corresponding to each other; they are said to have been taken from the ruins. Four doors, facing the cardinal points, lead to the interior, which is about 150 ft. in diameter. A corridor 13 ft. wide runs round, having on its inner side 8 piers and 16 marble and granite Corinthian columns; the columns do not appear to occupy their proper places, and the Arabs say that they were lying about among the ruins when the mosque was built. Within these is another corridor 30 ft. wide, with 12 larger columns and 4 great piers, which together support the dome. Under this dome is the rock, which varies in height from one foot to five feet from the surface. Under the rock is a cave, partly excavated, which is entered on the southeast by a flight of stairs. Here are pointed out the altars of Solomon, David, Abraham, and St. George. In the centre of this chamber is a circular slab of marble, which on being stamped upon gives a hollow sound; the Mohammedans call this the "well of souls," and believe that the souls of believers descend there after death. The legend is that Mohammed, in his midnight visit to heaven, first alighted on this rock, from which he continued his journey, whereupon the rock raised itself to follow, but was prevented by the angel Gabriel; it therefore remained suspended in the air. About 450 ft. S. from the Sakhra, in the S. W. part of the enclosure, is the mosque Akxa (end or extremity, used figuratively, as *akasi el-ard*, "the ends of the earth"). Its form is that of a basilica of seven aisles; it is 272 ft. long by 184 ft. wide; in front there is a porch 20 ft. wide. The piers and columns in the interior are inferior to those in the Sakhra. At the S. end is a Saracenic dome similar to the Kubbet es-Sakhra, but much smaller. To the left, on the east, a door leads into a smaller mosque, said to have been the only one built by Omar. In front of the Akxa is a large basin with a fountain in the middle. The water that issued here was conducted from the

pools of Solomon, 6 m. S. of the city; but the aqueduct has lately been broken by the Arabs, who supply the city with water from the well En-rogel, near the junction of the valleys of Jehoshaphat and Hinnom. The building of the two mosques, the Sakhra and Akxa, is ascribed to Abdelmalek in 686; but some writers say that the emperor Justinian built the Akxa, then the church of St. Mary. Between this place and the E. wall are extensive subterranean cellars, called the stables of Solomon, nearly 200 ft. long and 100 ft. wide, supported by columns about 25 ft. high. In the centre of the E. wall is the Porta Aurea, a double gateway (*bab ed-Dahariyeh*, the Eternal gate), a magnificent portal with finely sculptured arches, which have been sadly defaced by travellers since the mosque was opened to Christians. When the crusaders held the city, a procession of Christians bearing palms entered by this gate on every Palm Sunday. The whole enclosure, including the mosques, is called Haram esh-Sherif. In this enclosure are immense tanks, calculated to hold nearly 8,000,000 gallons of water, which, together with the supply from the Virgin's fountain and the cisterns in the houses, would last during a protracted siege. The actual spot where the temple stood has not yet been ascertained. The Porte, although it has granted the English engineers permission to excavate around the city and in parts of it where no injury will be done to the dwellings, has not been able to overcome the superstition and fanaticism of the natives so far as to allow them to dig within the precincts of the Haram. On the S. W. side of the Haram a portion of the temple wall is still standing, known as the Jewish wailing place; in this wall are five courses of large bevelled stones in a very good state of preservation. Here the Jews assemble every Friday to lament the woes of their country. The pool of Bethesda (now *Birket Israil*), N. of the Haram, near St. Stephen's gate, is a reservoir about 360 ft. long, 130 ft. broad, and 75 ft. deep.—The church of the Holy Sepulchre is situated almost in the heart of the N. part of the city, where the empress Helena is said to have discovered the true cross. (See Cross, vol. v., p. 513.) Concerning the authenticity of the sacred places a great deal of controversy has existed and is still kept up. Dr. Robinson, in his "Biblical Researches," arrives at the conclusion "that the genuineness of the present site of the holy sepulchre is supported neither by well authenticated historical facts, nor by prior tradition, nor by archæological features." His main argument to this effect attempts to show by the topography of Jerusalem that the present locality of the sepulchre was within the walls of the city at the time of the crucifixion, and consequently could not be near the place where Christ was crucified, which is stated in the Gospel to have been without the gates. Most Protestant and a few Catholic investigators agree substantially with Dr. Robinson; while

on the other hand the great majority of Catholics and some Protestant travellers believe in the genuineness of these remains. Among others, Mr. William C. Prime maintains the authenticity of the sepulchre on the following grounds: "It is not credible that this locality was forgotten by Christians within 300 years after the great events of the crucifixion, burial, and resurrection. Critical scholars and learned men, employed in investigating the topography of the Holy Land, had no doubt of its authenticity in the beginning of the 4th century; no one, so far as we know, thought in that age of disputing the fact, but all men acknowledged its truth; it is not doubted by any one that this is the locality in which those learned men placed their confidence, it having been well preserved from that time to this." The main entrance to the church is on the south. After descending a broad flight of rude steps, a large open paved court is reached, along

near the entrance, is called the stone of unction, and is said to cover that upon which Joseph laid the body of Christ to be anointed for burial. On the east of the stone is a chamber, the roof of which forms the floor of the chapel of Golgotha; this chamber has on the right and left the tombs of Godfrey and Baldwin, between which the visitor passes to the chapel of Adam, ending against the native rock, in which a huge fissure is visible, said to have been made by the earthquake at the time of the crucifixion. This rock, ascending through the roof, is pointed out as Calvary, where Jesus was crucified. Ascending a flight of stairs outside of the chapel of Adam and the chamber of Godfrey and Baldwin, the low vaulted chapel of Golgotha is entered. At the E. end is a platform about 10 ft. long by 7 ft. broad, and 20 in. high. In the centre is an altar, under which is a hole in the marble slab on the floor, said to be the place where the Saviour's cross

was fixed, and on the right and left are shown the holes where the crosses of the thieves were placed. In the platform is another opening in the marble pavement, through which is seen a rent in the rock continuous with the one below in the chapel of Adam. On the right hand, S. of the platform, is another division called the chapel of the crucifixion, said to have been the place where Christ was nailed to the cross. This part does not stand on the rock, but forms a kind of upper story, which is accounted for by saying that Helena removed

Church of the Holy Sepulchre.

whose sides are the bases of a row of columns, which probably once supported cloisters. Recent excavations have shown that under this court is a crypt with arches of high antiquity. On the left is the convent and chapel of St. James; and on the opposite side is the convent of Abraham or Isaac, in the place, the Greeks say, where Abraham was going to sacrifice his son. The façade of the church occupies nearly the whole of the N. side of the court. The lower story has a wide double gateway, with marble and granite columns supporting richly sculptured architraves, on which is represented Christ's triumphant entry into Jerusalem; over these are finely carved arches. The eastern section has been closed for several centuries; it is said to have been walled up by the Moslems to limit the Christians to one entrance, where the fees could be collected by one person. A large polished slab of stone on the floor of the church,

the ground beneath it and took it to Rome, so that the chapel is still on the real site. Through a barred window in this division another chapel is seen, the entrance to which is by a flight of steps outside of the church. Here the Virgin Mary and the other women stood watching the crucifixion. Returning down stairs from the chapel of Golgotha, and passing by the stone of unction, we enter the rotunda, about 70 ft. in diameter, surrounded by 18 massive piers which support the Armenian church on one hand and the Latin galleries on the other; the whole surmounted by a large dome with an opening at the top. This dome was a few years ago in a ruinous condition, but in 1869-'70 it was repaired at the joint expense of the French, Russian, and Turkish governments. This combined action was a compromise reached after long negotiations, in which the two Christian powers strenuously contended for the privilege of doing the work, as protectors re-

spectively of the Latin and Greek churches in Palestine, in order to establish a claim to exclusive possession. Claims thus originating in the large churches of Jerusalem, partitioned among different sects, have sometimes resulted in fierce quarrels, lawsuits, and even fights, requiring the interference of the Turkish soldiery. The space behind the piers was formerly open; now it is partitioned off and divided among the various sects. In the centre of the rotunda is the holy sepulchre. Above it is a chapel 26 ft. long and 18 ft. broad, built of polished native limestone, and surmounted with a small dome. The façade is ornamented with several twisted marble and limestone columns, and numerous silver and brass lamps, pictures, &c. On each side of this chapel is a small circular aperture, through which the holy fire is dealt out to the pilgrims by the Greek patriarch within. The chapel is divided into two compartments. The front chamber is the "chapel of the angel," where the angel is supposed to have sat on the stone which he rolled away from the door of the sepulchre; in the centre of the apartment, on a pedestal, is a fragment of the stone; the other part is said to have been placed by the Armenians in the convent of Caiaphas, just outside of the Zion gate. In the second chamber, which is entered by a low narrow doorway, is the tomb of Christ, occupying the whole length and nearly half the width of the apartment. It is raised about two feet from the floor, and covered with a single slab of marble, whose edges have been worn off by the kisses and embraces of the pilgrims who for centuries have gathered here from all parts of the world. Facing the chapel over the sepulchre is the Greek section of the church. It is the nave of the edifice, but is now divided from the aisles by high walls, said to have been built by the Greeks after the crusaders were expelled by Saladin. This church is quadrangular, about 70 ft. by 40. At the E. end is the high altar, reached by four steps, and divided by a richly gilt screen. On the right hand is the Greek patriarch's throne. In the centre a small column indicates the middle of the earth, and Adam's skull is said to be buried beneath. There are two other side doors, N. and S., opening into the aisles. Returning by the main entrance on the west, facing the sepulchre, the visitor turns to the right, passing between the piers of the rotunda, and arrives at a circular marble pavement, where Mary, according to the tradition, stood when she first saw Christ after his resurrection. On the north, ascending a few steps, is the Catholic section of the church. In this place is pointed out the pillar to which Christ was bound when scourged; the pillar itself is hidden from view by the building, but a stick with a silver head is thrust through an iron grating in the wall; the silver head, having touched the pillar, is drawn out and kissed. In the vestry of this chapel the sword of Godfrey is exhibited. Returning and following

the course of the aisles behind the Greek section, the visitor, after passing one or two stations connected with different events in the passion of Christ, arrives at a long flight of stairs leading to Helena's church, a massive and rudely constructed edifice, crowned by a dome with windows to admit the light. Here Helena sat while search was made for the cross. At the further end another flight of stairs leads down to the cave where the cross, the crown of thorns, and the nails were discovered. It is an irregular excavation in the rock; at one end an altar marks the spot where the true cross lay. Ascending again, and continuing his course, the pilgrim arrives at last at the principal gate to the church, near the stairs leading to Golgotha, from which he first started. About 35 yards beyond the E. door of the church of the Sepulchre are the ruins of the hospital of the knights of St. John; the entrance is by a picturesque Gothic gateway, the façade of which was richly carved with historical and symbolical sculptures, now nearly defaced by curious tourists. Beyond the gateway is an open court, part of which was once the church; at the E. end is the altar. A stairway on the south leads to a corridor surrounding a quadrangular court. The building itself is very spacious, but the chambers and halls have for ages been filled with rubbish, and several are in ruins. In 1869, on the occasion of the visit of the crown prince of Prussia, the Turkish sultan presented him with these ruins; and the Prussians are now clearing them out, and intend to restore the church and other parts of the building.—On the west of Jerusalem, at the Jaffa gate, is the citadel, consisting of three high square towers, separated from the city by a low wall and from the suburbs by a deep and wide moat. The largest and highest is called the tower of David. The lower part, rising in a solid mass, is undoubtedly ancient, and is probably the remnant of the tower Hippicus, built by Herod, and named from his friend who had fallen in the Parthian wars. The upper part, like the other towers, is of more modern construction. The battlements afford a view of the whole city, the mount of Olives, the Dead sea, and the mountains of Moab beyond. To the northeast lies the pool of Hezekiah; to the south lie the gardens of the Armenian convent, in which are the ruins of the pool of Bathsheba; and to the west the Jewish almshouses, built by Sir Moses Montefiore as executor of his American coreligionist Judah Touro, who bequeathed a large sum of money for that purpose. The tomb of David, now outside of the walls, S. of the Zion gate, was formerly within the city; the place is kept by the Mohammedans, who have a mosque over the spot. In the large hall, the *caenaculum*, is a stairway leading to the cave which is said to contain the tombs of David and his successors; but no one is allowed to enter. Over the cave is a small room with a raised structure about 3 ft. high, representing a Moslem

tomb, covered with green cloth; this is pointed out as the spot under which the body of David lies. At the foot of the mount of Olives, a short distance N. of the garden of Gethsemane, is the traditional tomb of the Virgin Mary, first mentioned in the 8th century. It fronts upon a sunken court reached by a short flight of steps. Within the door 60 steps descend into the chapel, which seems excavated in the rock, and contains the tombs of Joseph and the parents of the Virgin, as well as the empty tomb of the Virgin herself. About 100 paces from it is the traditional place of the assumption. In the city walls, a few yards E. of the Damascus gate, is an opening to an extensive cavern extending to a considerable distance under the city, and known as the royal quarries. Descending S., by a sloping hill formed of accumulated débris, the traveller arrives at the edge of a large pit, into which there is a passage in another part of the cave. To the left, through some windings, is an immense hall excavated out of the rock. Several blocks, nearly detached from the rock, may be seen,

Tomb of the Virgin Mary.

and the marks of the tools in the stone are plainly distinguishable.—Modern exploration of Jerusalem begins with the visit of Dr. Edward Robinson in 1838, which was followed by his second journey in 1852. Dean Stanley, in his "Sinai and Palestine" (London, 1855), suggested the necessity of excavations in and about the city for the acquirement of certain knowledge of sacred localities; but little was done till 1864, when Miss Burdett-Coutts, for the purpose of securing a better water supply for the inhabitants, gave £500 to pay the expenses of a topographical survey of the city, and Capt. Wilson of the British army was detailed to conduct it. This led to the formation of the English society entitled "The Palestine Exploration Fund," which sent out in 1867 a party under the command of Capt. Warren, R. E., who remained in Palestine three years, chiefly occupied in and around Jerusalem, where several important discoveries have been

made. On the S. E. side of the city, where the wall rises to a height of about 55 ft. from the surface, a shaft was sunk and the foundation discovered at a depth of 73 ft., making a total height of nearly 130 ft. The masonry of the lower part must have belonged to the original wall, the bevelled stones giving indications of Phœnician workmanship. On the immense blocks that form the base of the wall several marks in red paint were discovered, resembling Phœnician characters, though no one could explain their meaning; it is supposed that they were made by Solomon's workmen. The wall extended further S. than the present one; it ran S. by Ophel, and encompassed Zion. At the foot of Mt. Moriah, in the valley of Jehoshaphat, is the Virgin's fountain, an intermittent spring; the water flows out at the rear of the cave through an aqueduct excavated in the mountain into the pool of Siloam. Above this place, on Ophel, the engineers sunk another shaft, and discovered a Roman archway leading to a small cave, at one end of which was a pit subsequently found to be connected with the subterranean aqueduct between the Virgin's fountain and the pool of Siloam. This important discovery goes far to explain how the city endured such protracted sieges. A little S. of the Jewish wailing place three large stones, forming a segment of an arch, are seen projecting out of the wall. Dr. Robinson was the first to identify it as part of the bridge that was built across the Tyropeon. Capt. Warren discovered the remains of the pier that supported the other end of the arch, about 40 ft. beneath the surface, 50 ft. from the wall. The distance from the wall to the steep sides of Zion is 350 ft., and it is calculated that five such arches formed the bridge. Further N. he found the ruins of another similar bridge. About half a mile S. of the well of Rogel is a place called by the Arabs the Almond spring, where in winter the water flowed out; it was supposed to be an outlet to the well of Rogel, through which the superfluous water escaped. The engineers dug here, and discovered a passage hewn in the rock, but choked with earth and stones, which they cleared out; it first led N. for several hundred feet, then took a N. W. direction, leaving Rogel on the right, and at last terminated in a small rock-hewn chamber, further than which no passage could be discovered. The party also excavated another remarkable rock-hewn passage, leading S. toward the temple from the convent of the sisters of Zion. Mr. Schick, who discovered the well of Gihon, traced the aqueduct from the convent to the N. part of the city, where it is partially destroyed by the formation of the ditch and the royal quarries.—The chief executive and judicial officers of Jerusalem are Mohammedans. Christians hold subordinate offices, and since the massacre of the Christians in the Lebanon, Damascus, Sidon, &c., in 1860, they have gradually been appointed to places of trust. The United States, Rus-

sia, England, France, Germany, Austria, Spain, and Greece have each a consular resident here. The jurisdiction of the pasha of Jerusalem extends northward to within 15 m. of Nablus, southward to Gaza and the confines of Egypt, and eastward to the Jordan. He is appointed by the Porte, but receives his instructions through the governor general of Syria, except in cases where despatch is necessary. His principal officers and the vice governors of the towns under his jurisdiction are appointed by the governor general, but are subject to his orders, and decisions of the courts in criminal cases are sent to the courts at Damascus for confirmation. Most of the Jews now there are of German or Polish origin, and speak a corrupt German dialect. They are called Ashkenazim, to distinguish them from the Sephardim, consisting of Jews of Spanish and Portuguese origin, whose ancestors were expelled from Spain and Portugal toward the close of the 15th century, and who speak a corrupt Spanish dialect, and of Persian and other oriental Jews. Between these two bodies little intercourse exists; they seldom intermarry, and they pray in different synagogues. The Jewish community inhabit a particular portion of the city; but of late years, in consequence of increasing numbers, they have extended their quarter far into the Mohammedan part, and many live in the suburbs. The Jews' quarter proper is badly built and filthy, and the people suffer much from crowded dwellings, scarcity of water, and extreme poverty. Their chief rabbi is elected for life, and is recognized by the Sublime Porte in this capacity. He is entitled to send a delegate to act as a member of each local court in suits to which Jews who are Turkish subjects are parties. The Spanish-Portuguese Jews being subjects of the Porte, the right of election was vested in them, and the chief rabbi always was one of the Sephardim. To this the Ashkenazim objected; but being unable to carry their point, they elected one of their own number as their chief rabbi. Though not recognized by the Porte, he has great influence over the foreign Jews. The Jews, in differences among themselves, are governed by their rabbinical laws, preferring to abide by the decisions of their rabbis rather than carry their cases before gentile courts. The Greek Christians are Arabs, Greeks, and Syrians, and speak only the Arabic language, except the superior clergy, who are natives of Greece and the archipelago. They have eight convents in the city. The Greek patriarch has more power and influence than any of the other spiritual chiefs in the city, and his church is the wealthiest. He is officially recognized by the Turkish government as the chief of the Greek church in Syria, and is entitled to send representatives to act as members in the local courts. Under him are two classes of priests besides the ordinary monks. They are the married clergy, who do not aspire to the higher grades in the church, and the unmarried. The

latter live together in the grand convent, or are appointed abbots and assistants to the other monasteries under the surveillance of the patriarch. The Latin Christians, or Roman Catholics, who are principally seceders from the Greek church, also speak Arabic. They have a patriarch, who exercises spiritual oversight over all the Catholic churches in Syria, but is recognized by the Turkish government only as a distinguished personage, and does not enjoy equal privileges with the Greek, Jewish, and Armenian spiritual heads, partly in consequence of his being a foreign subject. The right of sending representatives of the Roman Catholic community is vested in the abbot of all the Catholic convents in the country, who is always an Italian, his vicar a Frenchman, and the treasurer a Spaniard. He is appointed by the pope every three years. The Catholics at Jerusalem have one large convent, that of the Holy Saviour, and two nunneries, that of the order of St. Joseph or sisters of charity, and that of the daughters of Zion. No males are admitted into the latter, except monks and priests. There are 14 other convents in Syria, subject to the abbot of this principal one. The Armenians number about 200; they have one large convent, that of St. James, in the most elevated part of the city, and a patriarch, who is recognized in that capacity by the Turkish government, and who enjoys equal privileges with the Greek patriarch and Jewish chief rabbi. The Protestant population numbers about 200. An Anglican bishop resides here, with a diocese including Palestine, Syria, Mesopotamia, Egypt, and Abyssinia. This bishopric was established in 1841 by the joint action of the Prussian and British governments, and its incumbent is chosen alternately by the sovereigns of England and Prussia. Besides exercising supervision over a few schools, and occasionally officiating in the Protestant church, the duties of the bishop are almost nominal, as the work of preaching and conducting the Protestant institutions is managed by the missionaries. The Copts, Abyssinians, and Syrians have convents in the city, and altogether amount to about 100 persons. The non-Protestant Christians at Jerusalem are in a measure dependent on their convents, which allow them house rent and other gratuities. As nearly every community carries on a work of proselyting, it frequently happens that these Christians embrace each denomination in turn, as the chances favor. In 1867 the pasha commenced building a carriage road between Jerusalem and Jaffa, the money for the purpose being raised by taxation. For want of proper engineers and energy in the commissioners, it was imperfectly completed in about 18 months, and stage coaches carried passengers between Jerusalem and Jaffa. The work was about to be extended when a new governor was appointed, and it was discontinued. The inhabitants of Jerusalem get their support mainly from the pil-

grims and travellers who visit the city. Beads, crosses, and ornaments are largely manufactured and sold to strangers. Quantities of olive and sesame oil and soap are also produced here, and much is exported to Egypt and to ports on the Mediterranean; grain and other articles are also exported. Almost all manufactured articles, as cloths, sugars, candles, &c., are imported from France, England, and Germany. Petroleum has for several years been in great demand in the markets of Palestine, and has now almost superseded olive and sesame oil for lighting, these being used only for food and manufacturing soap.—The primitive name of Jerusalem appears to have been Jebus, or poetically Salem, and its king in the time of Abraham was Melchizedek. When Abraham returned from the slaughter of the kings who had made his nephew Lot prisoner, the king of Sodom met him in the valley of Shaveh, or the king's dale, now probably the valley of Jehoshaphat; and there Melchizedek brought bread and wine. At the conquest of Canaan by the Hebrews, the tribe of Judah took the city and set it on fire; but the fortress probably still remained in the hands of the Jebusites for 400 years longer. Its situation among the mountains almost in the heart of his kingdom naturally excited in David a desire to possess it. In the ninth year of his reign (about 1046 B. C.) he stormed the fortress of the Jebusites, Zion, called it the city of David, and made the place the capital of his kingdom. From that time it has been called Jerusalem. Under Solomon the temple was built on Mt. Moriah, and several palaces were erected. David's many conquests, his vast accumulation of treasures for the temple, the magnificent structure itself, and afterward Solomon's reputed wisdom and immense wealth, all tended to spread the fame of the city, and during his reign it attained its highest degree of power. At the accession of his son Rehoboam ten of the tribes seceded under Jeroboam and made Shechem, and subsequently Samaria, the capital of their kingdom of Israel. Jerusalem then lost much of its importance, remaining only the capital of the smaller, though more powerful, kingdom of Judah. About 971 B. C. Shishak, king of Egypt, took the city and plundered the temple and palace of their treasures. It was again conquered and sacked by Joash, king of Israel, and was afterward beautified by Uzziah, Jotham, Hezekiah, and Manasseh. In the time of Ahaz the king of Syria attacked Jerusalem, and carried many of the Jews captive to Damascus, though he could not take the city. Under Hezekiah it was besieged by Rabshakch, the general of Sennacherib, king of Assyria, but it was saved by the sudden destruction which overtook the Assyrian army. Manasseh's being carried captive to Babylon seems to intimate that the city was taken by the Chaldeans about 650, although the fact is not expressly stated in the Bible. After the death of Josiah at the battle of Megiddo, Jerusalem was tributary to

Pharaoh Necho, king of Egypt, for two or three years, when it passed into the hands of the Babylonians, who, after repeated revolts and sieges, finally reduced it in 586. (See HEBREWS.) On this occasion Nebuchadnezzar demolished the walls and all the principal houses in the city, plundered and destroyed the temple, and carried away to Babylon all except the poorest citizens. For the next 50 years Jerusalem remained in ruins, till the return of the Jews during the reign of Cyrus, the conqueror of Babylon (538). This monarch issued a proclamation allowing the return of the Jewish captives to Jerusalem and authorizing them to rebuild the temple, and enjoined every one to contribute to and assist in this work. A part of the captives returned under Zerubbabel, and rebuilt the altar and laid the foundation of the second temple. But they were interrupted by the intrigues of their enemies, who unceasingly wrote insinuating letters to the capital of the empire, and at last succeeded in stopping them. The work was renewed under Ezra, who obtained a commission from Artaxerxes (Longimanus). In the 20th year of his reign (458), the king commissioned Nehemiah to rebuild the city itself. This he effectually carried out in spite of the opposition of his enemies, being himself appointed civil governor of Judea, and having the direct patronage of the king, whose cup-bearer he was. Nehemiah rebuilt the walls on the ruins of the old city. From this period till the Macedonian invasion in 332 Jerusalem enjoyed comparative peace. Yielding to Alexander without resistance, it escaped the fate of Tyre and Gaza. After the death of that conqueror and the division of his empire among his generals, Judea and its capital, lying between the rival kingdoms of Egypt and Syria, were alternately seized by the sovereigns of these two countries. Under the Ptolemies Jerusalem flourished both as a commercial city and a shrine. It was well adapted for trade, and abounded in artificers of various crafts. Its markets were well supplied by the Arabs with spices, gold, and precious stones. Goods were also imported across the sea, for there were good harbors at Gaza, Joppa, and Ptolemais (Acre). It passed into the power of Syria, with the rest of Judea, in 198, and was mildly ruled by Antiochus the Great; but the tyranny of his son, Antiochus Epiphanes, inflicted on it repeated massacres, and finally brought about the victorious revolt under the Asmoneans. Judas Maccabæus wrested Jerusalem from his enemies, and repaired the temple (165), though he was unable to expel the garrison that had been left in the fortress of Acra W. of Moriah, which commanded the temple, and from which the Syrians made annoying sallies. Against it he fortified Mt. Zion. This, however, shortly after surrendered to Antiochus V., who, breaking the capitulation, demolished the fort. Jonathan, the brother and successor of Judas, rebuilt it, but equally failed in an attack on Acra. His brother Simon reduced Acra, de-

molished the citadel, and levelled the hill. In 63 Jerusalem was captured by Pompey, who intervened between the brothers Aristobulus and Hyrcanus, the walls were demolished, and thousands of the inhabitants were slain. He also entered the temple, but did not touch any of the treasures. It was plundered by Crassus, on his way to Parthia, in 54. The walls were rebuilt by Antipater, who was appointed procurator of Judea by the Romans. In 40 the Parthians, allies of Antigonus, son of Aristobulus, sacked the city. Herod, having been appointed king by the Roman senate, besieged Jerusalem, and took it in 37, and the massacre on this occasion was as bloody as that by Pompey. Herod erected or enlarged and beautified the fortress of Antonia; he also improved and enlarged the city, and restored the temple on a more magnificent scale than Solomon's. Jerusalem appears now to have reached the zenith of its greatness, though not of its power, which it never recovered after the death of Solomon. It is conjectured that the city at this time contained at least 200,000 inhabitants in its lofty and closely compacted dwellings. This period is marked by the most memorable events in its history, the ministry and crucifixion of Christ. About A. D. 66 the Jews, goaded to despair by the tyranny of the Romans, revolted, took possession of Jerusalem, and defeated a Roman army commanded by Cestius Gallus, governor of Syria. This was the beginning of the disastrous war which ended in the complete destruction of Jerusalem. In 70 Titus, after a long and vigorous siege, took the city, and his soldiery, maddened by the obstinate resistance of the defenders and their own repeated fruitless attempts and great losses, spared neither age nor sex. Thousands of Jews, seeing all hope lost, threw themselves headlong from the towers, turned their swords against their own breasts, rushed into the flames, or fell fighting the enemy. Titus himself was unable to control the rage of his troops, and with regret saw the temple destroyed by the flames and the principal towers demolished, which he had intended to preserve as memorials of his own victories. According to Josephus, 1,100,000 Jews perished in this siege, and 97,000 were carried into captivity; and Tacitus says that the number besieged in the city, including both sexes and every age, amounted to 600,000; but a critical examination easily proves both statements to be greatly exaggerated. The walls were levelled, the dwellings demolished, the temple was burned, and Mt. Moriah literally ploughed over. Sixty years afterward Hadrian resolved to rebuild the city and colonize it with Romans. But a revolt, headed by Bar-Cokheba, for a long time delayed the realization of his plans. For two or three years the insurgents held out in Jerusalem, but at last they were vanquished, and such edifices as remained or had been rebuilt were again demolished by the emperor's general, Severus. On the ruins Hadrian built

another city with luxurious palaces, a theatre, temples, and other public buildings. He called it *Ælia*, after his family name *Ælius*. On the site of the Jewish temple he raised another to Jupiter Capitolinus, from which the city took its surname of *Capitolina*. It is said that he erected a fane of Venus over the sepulchre of Christ, and Jews were forbidden to enter or come within a certain distance of the city on pain of death. Under the Christian emperors they were permitted to enter once a year, on payment of a large sum of money, to lament over their misfortunes. Under Constantine the city had already become the place of pilgrimage of the Christian world. It regained its ancient name, and the emperor furnished new attractions by the erection of a church over the place that had been pointed out as the sepulchre of Christ. The emperor Julian not only allowed the Jews to return to their city, but also made a futile attempt to rebuild the temple. About 530 Justinian followed the example of Constantine by building churches and hospitals in the city. In 614 Chosroes II. of Persia invaded the Roman empire. A division of his army marched into Palestine, and 26,000 Jews mustered under his banner, hoping to find in him a second Cyrus. After conquering the northern parts of Palestine, the united army of Persians and Jews laid siege to and captured Jerusalem. The Jews wreaked their vengeance on the Christians for all the persecutions they had suffered at their hands; 20,000 of them are said to have fallen, the church of the Holy Sepulchre was burned, and the part of the reputed cross of Christ which was deposited there was carried to Persia. It was recovered by the emperor Heraclius, and replaced in the church of the Holy Sepulchre with great pomp, and the law of Hadrian forbidding the Jews to enter the city was renewed. In 636 Jerusalem was besieged by Khaled and Abu Obeidah, the generals of the caliph Omar. The siege lasted four months, and scarcely a day passed without a sortie or an attack. The besiegers, notwithstanding the inclemency of the winter and the hardships against which they had to combat, displayed great courage and persistence. The patriarch Sophronius at length resolved to capitulate, but insisted upon treating with the caliph in person, hoping to gain from him better terms than he could from his generals. Omar came up to Jerusalem, and on taking possession of the city treated the inhabitants with great kindness and generosity. In the latter part of the 11th century Syria was invaded by the Seljuk Turks and converted into a province of their empire. The cruelties which the Christian pilgrims suffered at the hands of these people roused the indignation of all western Europe, and great numbers of the chivalry of France and England were led by Godfrey de Bouillon to recover the sepulchre from the infidels. Jerusalem was stormed and taken, July 15, 1099, and the crusaders, in their zeal to avenge the wrongs of the Christians, slew 70,-

000 Moslems. Godfrey was elected ruler of Jerusalem, and his brother and successor assumed the title of king. In 1187 Saladin, sultan of Egypt, marched against the city, summoned it to surrender, and promised the inhabitants rich lands in Syria; but his proposals were rejected with scorn. Upon this he swore to avenge the Moslem blood shed by the soldiers of Godfrey, and to demolish the towers. The Christians resisted bravely for 12 days, but at last were conquered. Saladin, however, did not carry out his threat of massacre, but contented himself with expelling the Christians from the city, granting them 40 days to remove their effects, and assisting many of the poor and helpless on their departure. Jerusalem again passed into the hands of the Franks by treaty in 1229, was retaken by the Moslems in 1239, once more restored in 1243, and finally conquered in 1244 by a horde of Kharesmian Turks, who had overrun Asia Minor. In 1517 Palestine was conquered by Sultan Selim I, and since then Jerusalem has been under the rule of the Ottoman empire. From 1832 to 1840 Palestine was in the hands of Mehemet Ali, pasha of Egypt, and Jerusalem was governed by his son Ibrahim Pasha. Previous to the Egyptian invasion Palestine was distracted with anarchy, and but nominally ruled by the Turks. When Ibrahim Pasha took possession of Jerusalem his first acts were to restore order in the city and country. He did his utmost to protect the Christians and Jews against the oppressions of the Moslems, and granted them many privileges. Safety was restored, the roads were cleared of robbers, and commerce revived. G. Bonney (London, 1864); De Vogüé, *Le temple de Jérusalem* (fol., Paris, 1864-'5); De Saulcy, *Voyage en Terre-Sainte* (2 vols. 8vo, Paris, 1865); Wilson, "Ordnance Survey of Jerusalem" (3 vols. fol., London, 1865-'7); Wilson and Warren, "The Recovery of Jerusalem" (8vo, London, 1871; popular edition, "Our Work in Palestine," 1873); and Wolff, *Jerusalem, nach eigener Anschauung und den neuesten Forschungen geschildert* (3d ed., including his latest investigations,

Leipsic, 1872). See also the works referred to under PALESTINE.

JERUSALEM, *Johann Friedrich Wilhelm*, a German theologian, born in Osnabrück, Nov. 22, 1709, died Sept. 2, 1789. He was appointed in 1740 preacher to Duke Charles of Brunswick, and in 1742 became tutor of the hereditary prince. In 1752 he was placed in charge of a theological seminary established by the Protestants in the former convent of Ridagshausen. He declined the appointment of chancellor of the university of Göttingen. He was one of the best preachers of Germany. The suicide of his son Karl Wilhelm suggested to Goethe the catastrophe of the "Sorrows of Werther."

JERUSALEM CHERRY, a name given to two species of *solanum* which are cultivated for the ornamental character of their fruit. The oldest and best known of these is *S. pseudo-capsicum*, which was introduced into England from Madeira in 1596; it is a half shrubby house plant, and when properly treated has a hand-

Jerusalem Cherry.

some rounded head upon a stalk 1 or 2 ft. high; it has lance-oblong leaves and white flowers; the small and inconspicuous flowers are succeeded by bright red berries about the size of cherries, which are borne in great profusion and render the plant very ornamental. It is usually raised from seeds, but may be grown from cuttings; if the seeds are sown in early spring and the plants kept growing rapidly, they will produce fruit the following winter. It is supposed that the name Jerusalem was applied to this, as it formerly was to other plants, more to indicate its foreign origin than with reference to the country from which it came. The dwarf Jerusalem cherry is *S. capsicastrum*, which is only about half as tall as the other, and its berries are more orange than scarlet; there is a form of this with variegated leaves. In England these plants are raised in large quantities for Christmas and table dec-

orations. An improved sort called *S. hybridum-compactum*, very popular for table decoration, is depicted above.

JERVAS, Charles, a British painter, born in Ireland about 1676, died in London in 1739. He studied for a short time under Sir Godfrey Kneller, and in France and Italy, although deficient in the most essential principles of art, he acquired a fictitious reputation; and having given drawing lessons to Pope, the poet dedicated to him an epistle full of extravagant praise. Horace Walpole denounced his inferiority, but Jervas was so conceited that on comparing his copy of a Titian to the original he exclaimed, "Poor little Tit! how he would stare." Lord Orford says that "the badness of the age's taste and the dearth of good masters placed Jervas at the head of his profession."

JERVIS, Sir John, earl of St. Vincent, a British admiral, born at Meaford, Staffordshire, Jan. 9, 1734, died March 15, 1823. He entered the navy at the age of 10 years, and became post captain in 1760. He distinguished himself in several naval engagements, was made C. B. in 1782, and during the same year sailed with Lord Howe to the relief of Gibraltar. He was promoted to the rank of rear admiral in 1787, and was in parliament from 1782 until the beginning of the French revolution, after which he sailed to the West Indies and captured Martinique and Guadeloupe. He was appointed admiral of the blue, June 1, 1795, and on Feb. 14, 1797, off Cape St. Vincent, defeated a Spanish fleet which was nearly twice as strong as his own. For this he was raised to the peerage by the title of earl of St. Vincent and Baron Jervis of Meaford, receiving a pension of £3,000. He was first lord of the admiralty from 1801 to 1804.

JESI, or *Iesi* (anc. *Æsis* or *Æsium*), a town of Italy, in the province and 15 m. S. W. of the city of Ancona, on the N. bank of the river Esino (anc. *Æsis*); pop. about 20,000. It is an episcopal see, and one of the most important towns of the province, with manufactures of woollen and silk goods, and with increasing activity owing to the railway connection with Ancona. Under the Romans it was a *municipium*, and from ancient inscriptions appears to have been a colony. The emperor Frederick II. was born here.

JESI, Samuele, an Italian engraver, born in Milan about 1789, died in Florence, Jan. 17, 1853. He was a pupil of Longhi, and first brought himself into notice by his engraving of the Madonna with St. John and St. Stephen, from Fra Bartolommeo's picture in the cathedral at Lucca. Subsequently he devoted himself to the works of Raphael. His portraits of Leo X. and Cardinals Rossi and Giulio de' Medici, from the original in the Pitti palace, are much admired. The latter is said to have occupied him five years.

JESSAMINE. See JASMINE.

JESSAMINE, a central county of Kentucky, bounded S. by Kentucky river; area, 160 sq.

m.; pop. in 1870, 8,638, of whom 3,439 were colored. It has a somewhat diversified surface, with a soil of more than ordinary richness. The Kentucky Central railroad terminates at the county seat. The chief productions in 1870 were 79,562 bushels of wheat, 30,176 of rye, 409,505 of Indian corn, 58,740 of oats, 13,644 of potatoes, 14,175 lbs. of wool, and 78,915 of butter. There were 2,594 horses, 1,016 mules and asses, 1,543 milch cows, 3,889 other cattle, 3,483 sheep, and 10,150 swine; 3 manufactories of carriages, 1 of bagging, and 1 distillery. Capital, Nicholasville.

JESSE, John Heneage, an English author, born about 1815, died in July, 1874. In 1839-'40 he published "Memoirs of the Court of England during the Reign of the Stuarts" (4 vols. 8vo), which he continued in his "Memoirs of the Court of London from the Revolution in 1688 to the Death of George III." (3 vols., 1843). He also published "George Selwyn and his Contemporaries" (4 vols., 1843); "Memoirs of the Pretenders and their Adherents" (2 vols., 1845); "Literary and Historical Memoirs of London" (1847), and a second series under the title "London and its Celebrities" (1850); "Richard III. and his Contemporaries" (1861), criticising the view commonly taken of the character of Richard; "Memoirs of the Life and Reign of George III., with Original Letters of the King and other Unpublished MSS." (1867); "London, its Celebrated Characters and Places" (3 vols., 1870); and several volumes of poems.

JESSO. See YEZO.

JESSULMEER, a town of British India, capital of a native state of the same name, the westernmost of Rajpootana, situated in a rocky district, 190 m. N. E. of Hydrabad on the Indus; pop. estimated at from 30,000 to 40,000, nearly all Hindoos, the ruling class being the Bhatti tribe of Rajpoots. It is one of the finest towns in that part of India, about 2 m. in circuit, with gates, ramparts, and bastions, and a lofty citadel enclosing six temples and other remarkable buildings, and the palace of the maha Rawul, the sovereign, which is surmounted by a huge metal umbrella. The dwellings are remarkably well built. The most conspicuous building has five stories of cut stone, and a sixth of timber, surmounted by five cupolas. Opium is used to excess. There is little trade, and the fortifications are decaying.

JESUITS, or *Society of Jesus* (Span. *Compañía de Jesus*), a religious order of the Roman Catholic church. St. Ignatius Loyola, its founder, does not appear to have known that the title of "Society of Jesus" had been bestowed in the 15th century on an order of chivalry established by Pope Pius II., the members of which bound themselves by special vow to fight unceasingly against the Turks. This fact is attested in a letter of that pope dated Mantua, Oct. 13, 1459, and addressed to Charles VII. of France, begging him to permit one of his nobles "to enter into the society bearing the

name of Jesus, and which has been lately founded to fight for the glory of God against the infidels." The efforts of Pius to organize a crusade for the rescue of Constantinople having failed, this new order expired almost at its birth. The appellation *Societas Jesu* was inserted in the Latin forms approved in 1540 by Paul III. The word "Jesuit," it is said, was first used by Calvin in his "Institutes;" it is found in the register of the parliament of Paris in 1552; but at that time it was never used by the companions themselves. The actual title received much opposition from the Sorbonne in France, and even in Italy, where Sixtus V. ordered Claudio de Acquaviva, then general, to discontinue it. But Sixtus died before the order could be executed; and the title was expressly approved by Gregory XIV., June 28, 1594. Ignatius Loyola, very soon after his conversion, conceived the idea of a body of apostolic men specially devoted to the propagation of Christianity among the heathen. In his conception their organization and spirit were to partake somewhat of a military character; hence he always used the Spanish word *compañía* in designating his order, both before it had been canonically established, and in the constitutions which he afterward drew up for it. His original purpose, which he never abandoned, was to have the headquarters of this religious militia in Jerusalem. To effect this he visited that city as a pilgrim in 1523; but the resident Franciscan monks forbade his remaining there. Returning to Spain and becoming conscious that he lacked the literary culture necessary for the accomplishment of his design, he set about preparing himself by study in the universities, and while there collected a small band of young men whom he formed by ascetic exercises to a life of self-renouncement and devotion to the spiritual welfare of others. But the peculiarities of their dress and manner of living, and the discourses which they addressed to the people, excited the suspicions of the inquisitors. Ignatius was repeatedly imprisoned by the holy office, and forbidden to discourse in public or private on religious subjects. He thereupon separated himself from his companions, who never afterward joined him, and went to study in the university of Paris in January, 1528. There he soon gained as followers Pierre Lefèvre, a Savoyard, Francisco Xavier, Diego Laynez, Alfonso Salmeron, Nicolas Alfonso de Bobadilla, Spaniards, and Simon Rodriguez de Azevedo, a Portuguese. When each of these had been separately prepared by Ignatius for adopting a resolution conformable to his purpose, he assembled them in July, 1534, and disclosed to them his project of going to Palestine in order to labor there for the conversion of the Asiatic populations. He added that he would "bind himself to the death" to any among them who would follow him thither, and that he intended to confirm his purpose by taking before them all the vows of chastity and poverty. This

proposal was unanimously adopted; and on the morning of Aug. 15 following Ignatius and his six companions met in a crypt of the church of Notre Dame des Martyrs at Montmartre. Lefèvre, the only priest among them, celebrated mass, and all, before partaking of the communion, read a written engagement by which they renounced all worldly dignities and possessions, bound themselves to the journey to Palestine, to perpetual chastity and poverty, and to receive no stipend for their clerical functions. These vows were renewed annually in the same place while they remained in France to complete their theological studies and receive their degrees. Three more were added to the little band before Ignatius left Paris for Spain in March, 1535; and when on Jan. 6, 1537, they met in Venice, their number was increased to 13. Ignatius having incurred the resentment of Cardinal Caraffa, afterward Pope Paul IV., and not daring to visit Rome himself to solicit the pope's consent to their going to Palestine and his approval of their labors in that country, Lefèvre and the others undertook the journey to Rome amid great hardships. They were well received by Paul III., who, hearing that they were graduates of the university of Paris, made them discuss theological questions in his presence with the most learned Italians in Rome. After learning their manner of life, he approved of their project, gave them money for their expenses, and permission to receive holy orders forthwith. But, as the war between Venice and Turkey rendered the voyage to Palestine impossible, they spread themselves throughout the peninsula after their ordination, Ignatius, Lefèvre, and Laynez going to Rome in November, 1537. He now bade them say, when asked who they were, that they belonged to the *compagnia di Gesù*. The pope appointed Lefèvre and Laynez to chairs of theology in the university of Sapienza at Rome, and Ignatius occupied himself in directing persons who wished to perform his "Spiritual Exercises." All of them embraced every opportunity of assembling and catechizing the Roman children. In March, 1538, all the companions were summoned to Rome for the purpose of deliberating on the erection of the company into a religious order. But a formidable obstacle was raised by the renewal, before the inquisitors of Venice and Rome, of the charge of heresy formerly made against Ignatius in Spain and in Paris. He boldly went himself to the pope, and related to him the whole story of these inquisitorial persecutions, and demanded that an ordinary judge should be instantly appointed to inquire into the matter and decide without delay. To this the pope assented, and a solemn sentence acquitting Ignatius and his followers was issued Nov. 18, 1538. The pope, who recognized the importance of the service which the association could render in counteracting the spirit of Protestantism, immediately commanded schools to be opened throughout the city in which Ig-

natus and his associates might teach the elements of Christian doctrine. At the same time a fearful famine in Rome afforded them the opportunity of displaying their charity. The pope would not have hesitated to recognize them at once as a religious order, had it not been that a commission appointed that very year to inquire into clerical abuses and scandals had presented to him a report discountenancing the establishment of new religious orders. Nevertheless, Ignatius and his companions began their deliberations in the first days of April, 1539, and a sketch of the proposed constitutions in five chapters was subscribed by all on May 4, and presented to the pope. The master of the sacred palace having reported favorably on this sketch, it was approved orally Sept. 3. Meanwhile these outlines were committed for thorough examination to three cardinals, among whom Cardinal Guidiccioni was so opposed to the introduction of new orders that he would not at first even read the sketch. At length having done so, he changed his mind, won over his colleagues to his opinion, and the bull of confirmation, *Regimini militantis ecclesie*, was signed Sept. 27, 1540, and promulgated in the spring of 1541. It restricted the number of "professed" members to 60; but this restriction was removed, March 14, 1543. A written promise of entering the company after its confirmation by the pope had been signed by 11 of the members, including Ignatius, on April 15, 1539. After their deliberations closed on May 4, most of them were sent by the pope on various missions. Codure, Le-Jay, Ignatius, and Francis Xavier remained in Rome, Xavier being secretary and keeping up the correspondence with the absent members. On March 15, 1540, Ignatius informed Xavier that he was to leave Rome the next day for Lisbon and the East Indies. At the same time the pope destined others for Ireland in order to counteract there the measures of Henry VIII. At the Easter of 1541 Ignatius was unanimously chosen general, those absent from Rome sending their votes in writing, and he entered on the office April 13. In conformity with the will of the pope and the wish of his companions, he now began to draw up constitutions for the new order. He had read previously the lives of the founders of religious orders, as well as the rules which they had framed for their followers; but while engaged in framing the constitutions of the society, he shut himself up, with no books near him save the Bible and the "Imitation of Christ," preparing himself before he wrote by prayer and meditation, then placing what he had written upon the altar during mass, and only consulting with the other fathers when he had well considered each matter himself and come to some decision. These constitutions, drawn up in Spanish, and translated into Latin under the eyes of Ignatius, received high praise from Cardinal Richelieu. They are now accessible to all (*Institutum Societatis Jesu*, 2 vols., Avignon, 1827-38, a reprint from the

official edition of Prague, 2 vols., 1757). It was only in 1550 that they were so far complete that Ignatius could communicate them to an assembly of the professed who had been summoned to Rome, including Laynez and Francis Borgia. He wished his work to be suitable for all without distinction, so that the difference of countries and nations, of manners and dispositions, should require neither exceptions nor dispensations. He also submitted the constitutions to the judgment of the absent. They were examined with the most minute attention, and were only published when every correction or addition suggested and deemed necessary had been made. In 1553 they were sent upon trial to Spain, Portugal, and other countries, in order that they should be approved by the whole body only when found everywhere to be in perfect accordance with the design of the society. This sanction of the whole body was not given to them till 1558, after the death of Ignatius, and in the congregation assembled to choose his successor. They were revised with the utmost care, and confirmed with unanimity. They were then presented to Pope Paul IV., who appointed a commission of four cardinals to examine them. These approved the constitutions unanimously, and the pope confirmed them without changing a single word. Laynez added nothing to them, nor is it on record that he had any more to do with the framing of them than any other of the members consulted by Ignatius.—The kernel or indestructible portion of these constitutions is found in the draft presented to Paul III. and first approved by him. In this it is said that "whoever wishes to enter the society of Jesus, to fight under the standard of the cross and of God and our Lord Jesus Christ, and to serve the church his spouse under his vicar the Roman pontiff, must keep in mind that this society has been established for the defence and propagation of the faith, for promoting the salvation of souls, by teaching Christian doctrine and Christian life, by explaining the word of God, by giving the 'Spiritual Exercises,' by teaching catechism to the young and ignorant, by the administration of the sacraments, and especially the sacrament of penance. He must keep also in mind that its object is to perform works of mercy, more particularly for the sick and the imprisoned; and all this is to be done gratuitously and without any earthly compensation." The constitutions are divided into 10 parts. The 1st describes the qualities which allow or forbid the admission to noviceship; the 2d, the causes and manner of rejection; the 3d and 4th relate to health, devotion, and study; the 5th explains the profession of the four vows and the inferior degrees; the 6th and 7th instruct the professed and spiritual coadjutors in their various offices; the 8th and 9th concern the general, his election, authority, and duties; the 10th gives general directions for the conservation and increase of the society. The greatest discrimination is used in the choice

of candidates for membership. Some circumstances or qualities form absolute impediments to admission, such as illegitimate birth or infamous descent, public heresy or apostasy, such crimes as murder or enormous secret sins, the brand of a degrading judicial sentence, matrimonial ties, membership even for one day in another religious order, and insanity or notable weakness of intellect. Less serious impediments, such as ill temper, obstinacy, injudicious enthusiasm or visionary devotion, the being involved in debt, &c., may be compensated by other redeeming qualities and circumstances. The first probation consists of a period of some weeks spent by the candidate in a house of the society, during which he is given to read the *Examen Generale*, taken from the first part of the constitutions, containing a series of questions, which he is required to answer truthfully. His examiner is bound to the strictest secrecy as to the answers. These questions involve every possible impediment to his admission. He is required also to declare if he is perfectly free in his determination to enter, or if he is led to do so by friendship for any member of the society. He is finally asked if he is willing that all letters written by him or addressed to him shall be opened by the superior; if he consents that the superior shall admonish him of all imperfections and faults which he may remark in him, and that his companions shall report the same to the superior; and, finally, if he will be content to accept any grade, occupation, or office in the society which may be assigned to him. The candidate, having waived his natural rights on these points, is admitted to his second probation or noviceship, which lasts two years and one day from the date of his first entrance. During the first year the novices devote a full month to the performance of the "Spiritual Exercises," which they are required to master as an indispensable instrument of future utility to others. The whole two years are given up to spiritual things. They teach the elements of Christian doctrine to children and the poor, serve the sick for a month in some hospital, and travel during another month from place to place without money, and subsisting on the charity received by the way. They have also daily conferences or lessons on the constitutions and rules of the society. The severest scrutiny is exercised with regard to the capacity and dispositions of each novice, and every means is employed to encourage him to correct what is faulty and to perfect what is praiseworthy in his conduct. Such as are destined for the priesthood are called "scholastic novices;" the others, who are to be lay brothers, are not allowed to rise any further in secular knowledge. They must be content with what they already possess, and apply themselves to the acquisition of humility and solid piety. At the end of these two years, the novices pronounce the simple vows of poverty, chastity, and obedience, with a formal promise to enter the society at a future

day, implying an engagement to accept readily any degree which may be given them therein. Such as are destined to study now assume the name of formed scholastics (*scholastici formati*). If they are young enough, a space of two years, called juniorship or juvenate, is spent by them in cultivating Latin and Greek letters and rhetoric; then three years are given in a scholasticate to mental and moral philosophy and the sciences. The professors in these special seminaries are all men who have themselves passed through the entire curriculum of sacred and profane science, and have either made the profession of the four vows, or are destined to do so in due time. Every six months the scholastics undergo a most searching examination before four sworn examiners, who send separately their sealed suffrages to the general and the local provincial. At the end of the philosophical course the scholastic is sent to teach in a college, both for the purpose of enabling him to apply his acquired knowledge and of training him to the science of governing men. Should his age permit, he begins with the lowest grammar and leads his scholars up to humanities and rhetoric. This is called by the French *cours de régence*, and is followed by the study of theology, Scripture, canon law, and church history, which lasts four years. The half-yearly examination here becomes still more rigorous, and at the end of the third year it is increased in length and severity. Should the candidate break down in this, he is not allowed to proceed in his fourth year of study. At the end of the third year the scholastics are raised to the priesthood. The fourth year closes with the *examen ad gradum*, or the examination which qualifies the successful candidate for the profession of the four vows, the highest rank in the society. Three months in advance of the day appointed for this, the candidate is given a series of theses embracing the substance of dogmatical theology, intellectual philosophy, and the natural sciences. He is freed from every other occupation in order thoroughly to prepare himself for the ordeal. The examination takes place before a commission of four examiners presided over by the rector, and lasts two hours, each examiner being bound by his oath to propound the most searching questions and formidable objections during half an hour. The suffrage, delivered sealed to the general and the provincial, attests that the "candidate is (or is not) able to teach the whole of theology, philosophy, and the sciences in any university." This intellectual ordeal is one regular condition for obtaining the degree of professed; the other and a more indispensable condition is proficiency in solid virtue as well as in learning. Sometimes young men of extraordinary eloquence are allowed, after passing this last examination, to spend two years more in Biblical and patristic studies. Generally, however, they pass from the theologate to what is known as the third "probation," which is an

entire year spent in a special establishment and under a master thoroughly versed in asceticism and a knowledge of the constitutions of the society. Their exercises are substantially those of noviceship or second probation, a full month being devoted to the "Spiritual Exercises," another to pilgrimage, and a third to giving retreats or missions. This year St. Ignatius called the "school of the heart." When the special informations sent to the general concerning the probationists assure him that they possess that superiority in virtue and science required by the constitutions, he awards them their degree of professed of the four vows. Throughout this protracted course of studies and probation, every precaution is taken that the mind shall not be diverted from the object of study, that the bodily health shall not be injured by intense mental application, and that the springs of piety in the soul shall not be dried up by the exclusive culture of the intellect. The establishments in which the young Jesuits are trained are allowed by Ignatius to receive endowments, or they are supported by taxes levied on all the houses of the province, or, in some instances, wealthy novices are allowed to retain the possession of their property, but not the disposal of their revenues, until their studies and probation are ended, and thus to pay their own expenses. But in no case are they allowed to seek outside of the house for alms, or to be turned away in any manner from their studies. The members of the society who have taken their final vows, *socii formati*, are distinguished into three classes, the professed, the spiritual coadjutors, and lay brothers, or temporal coadjutors. The degree of professed of three vows is an honorary distinction bestowed for some signal service or great quality on priests who do not possess the regular theological or scientific attainments required for the profession of the four vows; this distinction enables its subject to rank with the latter, but not to hold the offices reserved to them, such as those of general, provincial, and elector in a general congregation. The "professed society" (*societas professa*) constitutes the core of the whole body; the coadjutors, both spiritual and temporal, are only auxiliaries or helpers. To the professed society belong the colleges, seminaries, houses, and residences of the order, together with all other property whatsoever, movable and immovable; and it is in its name that this property is held and administered by the coadjutors. In ordinary life the professed are not distinguished from the spiritual coadjutors. The latter are appointed in preference to the government of lay colleges and seminaries, to superiorships in residences, &c.; while the professed are left free to preach, or to teach the higher branches of sacred and profane science, and it is only by certain reserved occupations and functions that their rank is known to the majority of their brethren.—The whole order is divided into assistancies, of which there are

at present five, distributed according to the foremost European races or languages, namely, those of Italy, Spain, France, Germany, and England. The original assistancy of Portugal has been abolished since the total extinction of the society in that country, and that of England has been recently created. Each assistancy embraces several provinces and missions. A province comprises one or more colleges, a novitiate, scholasticate, and residences with a stated number of professed. It has a certain autonomy, and depends on the general only in the measure prescribed by the constitutions. At the head of the order is a general (*praepositus generalis*), who is elected for life in a general congregation composed of the provincials and two delegates from each province. They elect at the same time the five assistants who form his council, the secretary of the society, and an admonitor, whose duty it is to observe the conduct and actions of the general and to admonish him when necessary. If they see in his conduct anything censurable, they must lay their observations before him; and in a case of great urgency or visible scandal, the assistants can summon without his assent a general congregation, or even depose him themselves, after obtaining by letter the suffrages of the provinces. The power of the general, so long as he acts within the limits of the constitutions, is very great. He appoints the provincials, rectors of colleges, scholasticates, and novitiates, the superiors of professed houses and residences, together with the executive officer in each house, called minister; these are properly denominated superiors, and have a right to command. The inferior officers are nominated by the provincial with the approbation of the general. Every provincial, rector, and superior has his council of four consultors and his admonitor. The provincial is required to report every month to the general; the other superiors report every three months. The consultors, both provincial and local, are bound to report separately at stated times. Every three years deputies elected by the provincial congregations meet in Rome or wherever the general resides. They compose what is called the "congregation of procurators," and one of their chief functions is to decide on the necessity of convening a general congregation. They also bear to the general from each province a complete catalogue of its members, detailing the conduct and capacity of each. In the general congregation resides the supreme legislative power. The provincial congregation is composed of the provincial, rectors, and senior professed members. The term of office for all superiors below the general is three years. Provincials visit every house in their jurisdiction once a year, to see that the constitutions are exactly observed by all. During this visitation rigorous inquiry is made into the temporal and spiritual welfare of each house. Every member, beginning with the rector or superior, has to render to the provincial a full account of

his conscience, of his temptations and trials, and the difficulties he meets with in the performance of his special office. This "manifestation of conscience," whether made in sacramental confession or not, obliges the provincial to the most inviolable secrecy. He can only make of the knowledge thus acquired the use which the inferior permits him. At the same time the latter is informed of the defects which have been remarked in his conduct. This practice is one of the fundamental points or *substantialia* of the constitutions, and contributes above all others to give to the government of the society its extraordinary power, as well as to make obedience easy. Another chief object of this yearly visitation is to correct every abuse in the matter of poverty. Obedience and dependent poverty are the two mainsprings of the order. One of the vows made at the time of the solemn profession binds the professed to maintain the obligations of poverty inviolable, or to make them more rigorous. The rectors and local superiors yearly demand the same "account of conscience" of their subjects; and as all who have not pronounced their last solemn vows renew their simple vows twice a year, this renewal affords a fitting opportunity for repairing every violation of religious poverty. Before the time of Ignatius one year's novitiate only was required before admission to membership in a religious order, and the emission of the solemn religious vows. In his constitutions, besides a novitiate of two full years, he demanded a further probation of several years before any one was admitted to final membership. Thus there are three kinds of vows made by Jesuits to the society: the simple vows made at the end of the novitiate, and renewed every six months, but not accepted by the society; the simple but final vows made by the coadjutors, both temporal and spiritual, when they are solemnly admitted into the society, which accepts them by the hands of the local superior; and the solemn vows made by the professed. The fourth solemn vow is to the pope, and binds the Jesuit to go wherever the former may send him for the service of the church. The professed, besides these four which are made publicly in the church, pronounce in private immediately afterward a formula containing several simple vows, among them one binding them neither to seek nor to accept any dignity or office in the society or in the church, and to denounce all of their brethren whom they know to be seeking them. The society of Jesus never admitted a third order, like the Dominicans and Franciscans; and St. Ignatius inflexibly refused not only to allow nuns to have any fellowship with the society, but to permit its members to be cumbered with the direction of nuns. There never has been any body of men or women directly or indirectly affiliated to the Jesuits. The dress adopted by St. Ignatius and his companions was that of the better class of Spanish secular priests. It con-

sists in a black cassock and cloak, and has been somewhat modified in various provinces. Two popes (Paul IV. and Pius V.) and one general (Francis Borgia) wished to assimilate the Jesuits in some points more to the other religious orders, in particular by introducing the observance of the canonical hours; but this was soon given up, and the whole energy of the order was directed to laboring in behalf of the church by means of education and missions.—As the "Spiritual Exercises" of St. Ignatius moulded not only his own religious character and that of his early companions, but the spirit of the society, it is impossible to understand either its constitutions or the private and public life of its members, without having some conception of the nature and aim of that famous book. It is not a book to be merely read; for it contains only germs of thought, and rude outlines of meditations on the great Christian truths and facts of gospel history. The "exercises" consist in a graduated series of meditations on the creation and destiny of man; on the degradation and misery wrought by sin; on the restoration of the fallen children of God to their true rank in Christ, and the manifestation of true heroism in following him, in poverty, toil, humiliation, suffering, and death. The meditations are intermingled with practical rules for examining one's conscience, for the prudent use of penitential austerities, for detecting and resisting temptations, for discovering the action of the good spirit on one's soul from that of the evil one, for making a safe election in determining one's calling in life, for a right distribution of alms, for moderating one's appetite in eating and drinking, and finally for conforming one's judgment to that of the church. These exercises, when fully performed in retirement, last over a month, and are divided into four stages or "weeks." In the first, the truth of God's right over man's being, faculties, and life is made the foundation of all the subsequent exercises, and a practical "indifference" in the use of all things, states, and conditions of life is inculcated as a necessary conclusion from the fact that wealth and poverty, health and sickness, are only means to an end, and in themselves indifferent. The foundation of religious poverty and self-renunciation is thus laid at the very outset. Then come the meditations on sin and its punishments in time and eternity, terminating with the contemplation of Christ crucified, and the mingled sentiments of grief and love, shame and generosity, inspired by the consciousness of one's own guilt in presence of the divine victim of sin. Next comes the meditation of Christ our king as the model of the generosity to be thenceforth displayed in serving God. Ignatius proposes here the conception formed at Manresa, when he had renounced the secular militia for a life of spiritual chivalry. Christ presents himself as a king inviting all his subjects to aid him in subjecting the whole earth to God, asking none to follow where he

does not lead himself, and promising certain victory with a fellowship in glory after a fellowship in toil and danger. The offer to follow Christ, not as the crowd may, but in the foremost ranks of those who shall wear his livery and share his poverty and privations, lays the foundation of what Ignatius conceives to be the apostolic virtues. These dispositions are fostered and continually increased by the meditations which follow on the incarnation, the nativity, the flight into Egypt, the private life of Christ at Nazareth, and the labors of his public career. In the midst of these meditations come the exercises known as the "three degrees of humility" and the "three classes of men," the whole drift of which is to raise the spiritual enthusiasm or generosity of the soul to the point of resolving to leave all to follow Christ in shame and suffering, and be content only when it has embraced what is most repugnant to flesh and blood and the judgment of the world. This resolution is still further intensified and confirmed by the meditations on Christ crucified which occupy the third week; and the meditations on the resurrection and the life of Christ with his apostles and disciples until his ascension are destined to set forth a perfect model of the sweetness to be enjoyed in Christ's company, in such a society as Ignatius contemplated.—The society spread with unparalleled rapidity, so that it was said to have had no period of youth. At the death of Ignatius there were 1,000 members in 12 provinces; soon after the death of Acquaviva, in 1615, 13,000 members in 32 provinces; in 1749, 24 professed houses, 669 colleges, 176 seminaries, 61 novitiates, 335 residences, 273 missions in Protestant and pagan countries, and about 22,600 members. In Portugal it was introduced as early as 1540 by St. Francis Xavier and Rodriguez, who found a zealous patron in King John III. Rodriguez established a college at Coimbra, which in 1544 counted 60 members. A considerable number of young noblemen prayed for admission, and thus the order soon became influential. King John appointed at the same time two Jesuits to be judges of the inquisition, but Ignatius forbade them to accept the office. "For," said he, "the society has for its mission the assistance of our neighbor by preaching and the duties of the confessional; moreover, it were undesirable that its members had power to punish heretics with death. On the contrary, their duty is to console with priestly kindness these unfortunate men." In Spain the Jesuits had at first to overcome the opposition of several bishops, but the patronage of Francis Borgia, at that time governor of Barcelona, soon procured for them a favorable reception and a number of houses and colleges, and at the university of Salamanca they received some of the theological chairs. In France, where they likewise appeared as early as 1540, they met with a very decided resistance on the part of the parliament, the university of Paris,

and many bishops. They could not secure a legal existence until 1562, when they were recognized as "fathers of the college of Clermont." The parliament at first refused to register the royal patent, but had at length to yield to the order of the king. They were unable, however, to overcome the opposition of the parliament and the Sorbonne. When Châtel, who had studied in one of their colleges, made an attempt against the life of Henry IV., they were expelled from France by a decree of the parliament in 1594, and Père Guignard, who was accused of having approved the attempt of assassination, was put to death. Henry IV. himself recalled them in 1603, and from that year they remained in the undisturbed possession of their property. They enjoyed the confidence of Louis XIII., Cardinal Richelieu, and Louis XIV., and were the principal combatants against the doctrines of the Jansenists. Their colleges were very numerous, and among their pupils were Descartes, Bossuet, Corneille, Voltaire, and the astronomer Lalande. Two Jesuits were sent to Ireland as papal nuncios in the reign of Henry VIII. Elizabeth expelled them from her dominions, and forbade them upon penalty of death to return. We find them, nevertheless, again as missionaries in the reign of James I., and after the discovery of the gunpowder plot (1605) Father Garnet, to whom the plot had been communicated by his subordinate in an "account of conscience," was put to death. In 1678 Titus Oates charged them with having entered into a conspiracy against Charles II. and the state, in consequence of which six Jesuits were put to death. In spite of several decrees against the public exercise of the Roman Catholic religion in England in general and the residence of Jesuits in particular, the society maintained itself there, although it never became very numerous. The Jesuits first appeared in Germany about 1549, at the instance of Duke William of Bavaria and of Ferdinand I. of Austria; Salmeron and Peter Canisius being appointed professors of theology in the university of Ingolstadt, and others at Prague. The society received chairs in the colleges at Cologne (1556), Munich (1559), Treves (1561), Augsburg (1563), and several other places. In Italy they spread more rapidly and more extensively than in any other country. They were banished from Venice in 1606, and the popes did not succeed until 1657 in causing their restoration. One of the wars between France and Charles V., during which all Spaniards were ordered to leave France, brought some Jesuits to the Netherlands soon after the foundation of the society. They gained a firm footing under Philip II., although the bishops showed them less favor than in other countries. In Transylvania they were favored by Prince Christopher Báthori and his son and successor Sigismund, but the assembly of the states compelled the latter prince in 1588 to sign a decree of banishment. They became very numerous in Poland, which they divided be-

fore the end of the 16th century into two provinces, and where they had houses and colleges in 20 towns. In Sweden they made great efforts, under John III. and Sigismund, to restore the sway of the Roman Catholic church, but the dethronement of Sigismund in 1604 destroyed their hopes. In Russia favorable prospects seemed to open for them with the reign of Pseudo-Demetrius, but the fall of this prince involved that of the Jesuits.—The missionary activity of the Jesuits among the pagans commenced in 1541, the year after the foundation of the order. Francis Xavier sailed in that year to the East Indies, founded a college at Goa, preached in Travancore, Malacca, Macassar, the islands, and Japan, and baptized a vast number of pagans. Other members of the order preached in Madura, Ceylon, and many other places, and the Christian population of their missions in India rose to 100,000. Some members of the society, especially Robert de' Nobili, appeared as Brahmans, and tried to excel the Hindoo Brahmans as sages and penitents, regarding this as the most efficient means of obtaining the confidence of the Hindoo population. The mission in Japan was commenced by Francis Xavier in 1549; several princes were converted, and some natives were received into the society. In 1613 the Portuguese Jesuits had in Japan two colleges, eight residences, and three professed houses; but the persecution which soon after broke out against the Catholics put an end to their establishments. Their last member, a native of Japan, was put to death in 1636. Father Rogerius penetrated into China in 1584, disguised as a merchant. Ricci established a reputation as one of the best Chinese scholars. Others became the teachers and ministers of several emperors. In 1692 they obtained a decree by which Christianity was declared to be a sacred law and the missionaries virtuous men. The number of converts was very large, and amounted in the province of Kiangsu alone to 100,000. But a controversy with several other orders on the conformity of the Jesuits to the pagan customs in China and India was decided by the pope against the Jesuits, and proved a fatal blow to the prosperity of their missions in these countries. Cochin China (1614) and Tonquin (1627) became likewise missionary fields for Jesuits; the congregations in Tonquin in 1640 numbered 100,000 members, but they were cruelly persecuted. The most celebrated of the Jesuit missions was that established in Paraguay, where they Christianized and civilized an Indian population of from 100,000 to 200,000 souls. With the consent of the Spanish authorities they retained the civil dominion over the Indians, and their principles of government have been commended by many who in other respects were their opponents, as Montesquieu, Muratori, and Southey; while many of their admirers have represented Paraguay under the sway of the Jesuits as more free from vice and corruption than any oth-

er state of modern times. The prosperity of these missions was interrupted in 1750, when Spain ceded seven parishes to Portugal, and the Indians, with an army of 14,000 men, resisted the execution of this project. After some time, however, the former state of things and the dominion of the Jesuits were restored, both of which continued until the suppression of the order in Spain. In 1566 they were sent to Florida, which in the following year was formed into a vice province of the order, and a school for the children of the Florida Indians was commenced in Havana (1568). On the invitation of a Virginian chief, called by the Spaniards Don Luis, Father Segura, the vice provincial, with seven members of the order and some Indian youths who had been educated at Havana, undertook to establish a new mission on the banks of the Chesapeake, or St. Mary's bay. But the Indian proved to be a traitor, and Father Segura with all his companions except one lost their lives (1570). This led the Jesuits to abandon Florida for Mexico. The first mission of the Jesuits in California was established by Father Eusebius Kühn or Kino, in 1683; gradually they founded 16 missionary stations, each of which was generally directed by one missionary. They administered these missions until the suppression of the order in Spain and the Spanish possessions. In 1611 the Jesuits established their first mission in the French possessions in America. This mission was interrupted for a time by the English, who in 1629 took Quebec and carried off the missionaries; but their work was resumed in 1633, and for nearly half a century they wrestled with paganism in the northern wilds. Quebec remained their centre, whence Jesuit missionaries were sent far and wide. The most distant effort made by the Jesuits was a mission in Arkansas. When Louisiana was settled, Jesuits were sent from France to undertake missions on the lower Mississippi, but these missions were not subject to the superior at Quebec, but to another at New Orleans. After the restoration of the order, the Jesuits recommenced their missions among the Indians on the Missouri in 1824, which gradually extended over a number of tribes. In 1840 the mission in Oregon was commenced by Father de Smet, one of the most celebrated missionaries of the order in the present century. Other missions were established among the tribes near the Amazon river in Brazil (1549), Peru (1567), Mexico (1572), the Antilles (1700), Congo and Angola, on the W. coast of Africa (1560), and Turkey (1627), where they effected in particular the submission of many members of the eastern churches to the authority of the pope.—Toward the middle of the 18th century the prime ministers of Portugal (Pombal), Spain (Aranda), and France (Choiseul) resolved nearly at the same time upon the expulsion of the Jesuits from their countries. Pombal was incensed against them, ostensibly because he

suspected them of having instigated the Indians in Paraguay to resist the execution of the treaty of cession above mentioned. Soon after an attempt was made to assassinate Joseph Emanuel, king of Portugal, and several Jesuits, particularly Father Malagrida, were accused of having been privy to the plot. Pombal requested the pope to take measures against the Jesuits; but as Clement XIII. took their defence, a royal edict of Sept. 3, 1759, declared the Jesuits to be traitors, suppressed the order in Portugal, Brazil, and the other Portuguese colonies, and confiscated its property. All the Jesuits living in Portugal were transported to the Papal States. In France they fell into disfavor at court when the two fathers who were the confessors of Louis XV. and Mme. de Pompadour refused to admit them to the sacraments, unless the latter was dismissed from court. Mme. de Pompadour and Choiseul united their influence with that of the parliament to suppress the order. At the same time its reputation among the people, which had long before been injured by the lax contents of some Jesuit books of casuistry, suffered greatly in consequence of the unfortunate commercial operations of Lavalette, superior of an establishment of the order in Martinique. Lavalette speculated largely in colonial produce, and, when two of his ships were taken by the English, became a bankrupt. A firm in Marseilles brought a suit for indemnification against the whole society, and the inferior courts as well as the parliament of Paris, to which the Jesuits appealed, gave sentence against them, and made them pay 2,000,000 livres to the plaintiff and the costs. Louis XV., who wished to save the society, at first yielded to the urgent calls for its suppression only so far as to demand in Rome that the society be reformed, and that the French Jesuits be placed under a vicar of their own. To this demand the general, Ricci, is reported to have given the famous response: *Sint ut sunt, aut non sint*; whereupon the king expelled them from France in 1764. Their expulsion from Spain was effected in 1767 by Aranda, on the charge, according to some historians, that treasonable writings had been discovered in one of the colleges, which declared the king a bastard and not entitled to the throne. But the true reason is not known, as the king declared that he kept the secret "locked up in his royal heart." On April 2 all the Jesuits of Spain and the Spanish colonies were arrested at the same hour, and shipped to the territory of the pope, who, at the request of the general of the order, refused to receive them. At the same time, and in a similar way, the order was suppressed in Naples, Parma, and Malta. On Dec. 10, 1768, all the Bourbon courts (France, Spain, Naples, and Parma) demanded from the pope its entire suppression for the whole church. Shortly afterward the pope died (1769), and the Bourbon courts succeeded in procuring the election of Clement XIV. (Gan-

ganelli), who had given to the minister of Spain a written declaration that a pope, without acting against the canonical laws, was at liberty to suppress the order. For four years Clement XIV. endeavored to put off an event from which he feared the worst consequences; but at length, when also the court of Vienna consented to the suppression of the Jesuits, he issued, July 21, 1773, the famous brief, *Dominus ac Redemptor noster*, by which the suppression of the society of Jesus in all the states of Christendom was declared. The brief, though not signed or published with the usual canonical formalities, was quickly complied with; yet the archives and treasures found in searching their houses did not equal in importance and amount the public anticipation. The ex-Jesuits had the choice either to enter other religious orders or to place themselves under the jurisdiction of the bishops. Everywhere, except in Portugal, they received an annuity from the proceeds of their confiscated property. In Rome and the Papal States the colleges and houses of the suppressed society were intrusted to secular priests, who employed many of the former professors, and kept up the method and discipline of their schools. A general resistance to the brief of suppression had been expected from the Jesuits and their many powerful friends; and in anticipation of this, as well as to secure possession of the large funds supposed to be hoarded up in their houses at Rome, the general, Lorenzo Ricci, was imprisoned in the castle of Sant' Angelo. The members of the order, however, submitted everywhere without hesitation to the pontifical will, Ricci did nothing to incite resistance, and the minutest search discovered no treasures. Ricci on his deathbed, in November, 1775, as he was about to receive the sacrament, read a solemn protest on the part of the extinct society, affirming that the conduct of its members afforded no grounds for the suppression, and that he had himself given no reason for his imprisonment. In Prussia, although they had to abandon the constitution of the order (1776), the favor of Frederick II., who esteemed them as teachers, permitted them to continue as an organized society, under the name of priests of the royal school institute; but this institute also was abolished by Frederick William II. In Russia, which with the eastern part of Poland had received in 1772 several houses of Jesuits, they enjoyed the patronage of the empress Catharine II., who appointed an ex-Jesuit coadjutor of the archbishop of Mohilev, and sent him in 1783 as her minister to Rome. He urged Pius VI. to recognize the society as validly existing in Russia, and Pius, moved by the memoir presented to him by Cardinal Albani, as well as by the opinion prevalent in the college of cardinals, that the brief of Clement XIV. was uncanonical, granted to the Russian Jesuits permission to elect a vicar general. The number of Jesuits in Russia amounted at that time to 178, and the total number of ex-Jesuits

was estimated at about 9,000. Attempts to restore the order under other names were made in 1794, when the ex-Jesuits De Broglie and De Tournely founded the "Society of the Sacred Heart," and in 1798, when Paccanari founded the "Society of the Faith of Jesus," known as *pères de la foi*. This latter organization, in spite of the defection of its founder, maintained its existence, and its members formed the nucleus of the restored society in France. The prospects of restoration dawned with the pontificate of Pius VII. (1800). Solicited by Ferdinand IV., he authorized in 1804 the introduction of the order into the kingdom of the Two Sicilies; and on Aug. 7, 1814, he issued the bull of restoration. The vicar general of Russia, Brzozowski, was recognized in Rome as general. At his death an attempt was made to have the constitutions changed in such a way as to suit the altered circumstances of society. At the head of the influential persons who originated and actively favored this scheme was Cardinal della Genga, soon to be Pope Leo XII. The vicar general appointed to govern the order during the interim was drawn into the scheme, and despatched couriers with sealed orders to the electors already on their way to Rome, commanding them to proceed no further on their journey. The assistant of France, De Rozaven, in the name of his colleagues, issued a counter order, enjoining on the deputies to hasten to Rome. Not one failed to be there on the appointed day, and the first act of the congregation was to decree the expulsion of the vicar general and his associates in the order, among whom was the celebrated Padre Ventura, afterward the uncompromising opponent of the Jesuits. Aloisio Fortis was elected general, Oct. 18, 1822, and took up his residence at the Gesù in Rome. Cardinal della Genga succeeded Pius VII. Sept. 28, 1823, and his election filled the Jesuits with alarm; but the new pope on his way to St. John Lateran descended from his chair of state in front of the Gesù, to bless the general and his household. In 1824 the Jesuits received the direction of the Roman college, and in 1836, under Gregory XVI., of the college of the propaganda. As no Jesuits were allowed to occupy chairs in the latter, and the teaching was principally intrusted to their theological opponents, their connection with it became a source of such serious annoyance, that Pius IX. in 1850, at the petition of Father Roothaan, relieved them from this charge. In Modena, Sardinia, and Naples they were restored in 1815, and reinstated in the possession of a part or the whole of the former property of the order, and several new houses were established. They returned to Lombardy in 1837, to Parma and Venice in 1844, and to Tuscany (for a short time) in 1846. The revolution of 1848 endangered their existence in all Italy; mobs attacked their houses in Genoa and Naples, and they were expelled from nearly every state, even from the dominions of the pope. The general

found for some time a refuge in England. They returned after the success of the counter revolution in 1849 to most states, except Sardinia and Tuscany, but were again expelled by the movements of 1859 from Lombardy, Parma, Modena, and the legations. In Naples the principal organ of the Jesuits, the *Civiltà Cattolica* of Rome, was prohibited in 1855 for having censured the government; but in 1858 they received from the latter new marks of confidence. In 1860 the progress of Garibaldi in Sicily and the Neapolitan provinces was attended by the expulsion of the Jesuits and the sequestration of their property. The establishment of the kingdom of Italy was the signal for the final suppression of the order in the peninsula. Pius IX., who was thought not to favor them in the beginning of his pontificate, gave them many proofs of special affection after his return from Gaëta. As province after province was taken from him, the Jesuits were driven from their houses. When Rome became the capital of Italy in 1870, the Italian parliament decreed the suppression of all religious orders and corporations. The houses destined as residences for the heads of these orders and their officers were at first reserved from the general decree; but in October, 1873, despite the efforts of the Italian ministry, these central residences were suppressed by the legislature, and no Jesuit at present legally exists in Rome or elsewhere in Italy. In Portugal, John VI. protested against their restoration; Dom Miguel admitted them by a decree of 1829, but Dom Pedro exiled them in 1834, since which time there have been no recognized communities of Jesuits in that country. In Spain, Ferdinand VII., after his restoration in 1814, put them in possession of all their former rights and property. They were banished again during the revolution of 1820, but restored with Ferdinand in 1823. In 1834 the ravages of the cholera were attributed to the poisoning of the wells by the Jesuits. The populace in consequence broke into the professed house and massacred the inmates. In 1835 Queen Christina was compelled to suppress the order, and in 1840 its last house, at Loyola in Guipúzcoa, was dissolved by order of the provincial regency; but in 1844 they succeeded in establishing themselves again in the Spanish dominions. They were once more banished by Espartero in 1854, but were recalled by O'Donnell in 1858, at the instance of the emperor and empress of the French. They were intrusted with several colleges and seminaries, among others the university of Salamanca, and with important missions at Fernando Po and the Philippine islands; and a wider scope was allowed to their labors in Cuba and Porto Rico. Their numbers increased with astonishing rapidity, many novices from Portugal hastening to join them. But after the revolution of 1868 they were once more banished from Spain, and allowed only a precarious existence in her colonies. In France,

during the reigns of Louis XVIII. and Charles X., they obtained only toleration, and eight of their colleges, with about 3,500 pupils, were closed in 1828 by order of the government. The revolution of July, 1830, banished them again "for ever" from France, notwithstanding which they were able to maintain themselves. In 1845 the chamber of deputies, with only a few dissenting votes, requested the government to have their houses closed; but no decree was issued against them, and after a brief interval they resumed their labors everywhere. In 1859 they there possessed 61 establishments in 38 dioceses. In 1866 they numbered in all 2,464, and in 1873 2,482, exclusive of the members belonging to the mission of New York and Canada. During the second empire the educational establishments of the French Jesuits entered into a successful competition with the university schools. Their special scientific school in Paris attained such eminence that the emperor was induced to give them the old collège St. Clément in Metz, where a second special school was established scarcely inferior to that of Paris. At the same time they accepted from the government the chaplaincy of the penal settlement of Cayenne, where the dreadful climate soon destroyed upward of 30 priests, and they multiplied their missionary colonies in Africa, Syria, Madagascar, India, and China. In the Netherlands King William I. permitted them to form establishments, and after the separation of Belgium from Holland they increased largely in the former. The Belgian province reckoned 643 members in 1873, and the province of Holland 313. The government of Austria admitted them into Galicia, which in 1820 was made a separate province of the order. The revolution of 1848 endangered their existence in Austria for a short time, but after 1849 their establishments increased rapidly. The government transferred to them seven of the state colleges, and intrusted to them one chair in the theological faculty of Vienna, and the entire theological faculty of the university of Innspruck. The Austrian Jesuits at the present time (July, 1874) are threatened with suppression. The conversion of the duke of Anhalt-Köthen to the Roman Catholic church in 1825 was followed by the establishment of a mission of the Jesuits at Köthen, which existed till 1848. In the kingdom of Saxony they were expressly excluded from the country by a provision in the constitution of 1831. The events of 1848, which expelled them from so many countries, opened to them a wide field of action in many of the German states, where they were permitted, for the first time since their restoration, to hold missions for eight or more days. Many of the larger Protestant cities, as Berlin, heard on this occasion the preaching of the Jesuits for the first time. They were allowed to settle in Prussia, and in Westphalia and the province of the Rhine they founded within a short time a considerable number of establishments. During

the Franco-Prussian war of 1870-'71 the Jesuits distinguished themselves in the service of the sick and wounded, and several of them were decorated by the emperor William. But the active part taken by the theologians of the order in advocating and promoting the dogma of pontifical infallibility, and the coalition of the ultramontane deputies with the separatists in the Reichstag, aroused the suspicions of the German imperial government, and led finally to their suppression and their expulsion from the German empire in 1873. Of the two provinces of Germany and Galicia, the former numbered in that year 764, the latter 230 members. They were recalled to Switzerland as early as 1814 by the government of Valais, which also put them in possession of the former property of the order. In 1818 they founded a college at Fribourg, which soon became one of the most famous institutions of the order, and had numerous pupils (676 in 1845) from nearly every country of Europe. The decision of the grand council of Lucerne, in 1844, to call Jesuits to the chairs of the theological school and to one of the parish churches of the capital, greatly increased the excitement already existing against them in most of the Protestant cantons. Several incursions were made from other cantons to overthrow the local government in order to expel the Jesuits. They were however unsuccessful, and strengthened the separate alliance (*Sonderbund*) which the government of Lucerne had formed with six other cantons for the protection of what they considered their sovereign cantonal rights. In 1847 the federal diet demanded the dissolution of the *Sonderbund* and the removal of the Jesuits; the seven cantons refusing submission to this decree, war ensued, and ended in breaking up the alliance and the expulsion of the Jesuits, who have ever since been forbidden by the federal constitution to return. The Swiss constitution, as revised in 1874, rigorously excludes all religious corporations from the territory of the republic. In England, a rich Catholic, Thomas Weld of Lulworth castle, in 1799 gave to ex-members of the order Stonyhurst, which is still their largest establishment in that country. They conduct at present the colleges of Stonyhurst, near Whalley, Lancashire, Mount St. Mary's, near Chesterfield, and Beaumont Lodge, near Windsor, besides the scholasticate of St. Beuno's at St. Asaph. They possess several other flourishing establishments in England and Scotland, and maintain missions in Guiana and Jamaica. In Ireland they have, besides the well known college of Clongowes, others at Tullabeg, Dublin, Limerick, and Galway, and a novitiate at Miltown Park, Donnybrook. The Irish province has also missionary establishments in Melbourne, Australia. In Russia, where their college of Polotzk received in 1812 the rank of a university, they lost the favor of the emperor when several young noblemen, who had been their pupils, were received by them into the

Roman Catholic church. An imperial ukase of Jan. 1, 1816, closed their establishments at St. Petersburg and Moscow; and another of March 25, 1820, suppressed the order entirely in all Russia and Poland.—The Jesuits had accompanied Lord Baltimore when he sailed for the Chesapeake, and were the first religious instructors of the early Catholic settlers of Maryland, as well as of the neighboring Indian tribes. John Carroll, first archbishop of Baltimore, and some of his American fellow countrymen, were completing their "third probation" in Austria when the brief of suppression was issued. They hastened to America at the beginning of the revolutionary war, and continued to live in community until the restoration of the order. Since then their progress has been rapid. They are divided into two provinces and several important missions. The parent province of Maryland has establishments in the states of Massachusetts, Pennsylvania, Maryland, and Virginia, and the District of Columbia; the province of Missouri, founded by that of Maryland with the help of numerous recruits from Belgium and Holland, has establishments in the dioceses of St. Louis, Cincinnati, Chicago, and Milwaukee. The mission of New York, originally founded by the province of France, but now independent, embraces the whole state of New York and the Dominion of Canada, and has three colleges with a novitiate, several residences, and missionary establishments among the Indian tribes of Lake Superior. The mission of the province of Germany, recently organized for the benefit of the German population, possesses several houses in western New York and Ohio. The New Orleans mission, dependent on the province of Lyons, conducts three colleges and several flourishing houses in the dioceses of New Orleans and Mobile. The province of Naples has about 25 missionaries in New Mexico and Colorado, and the province of Turin 120 in California and among the Indians of the Rocky mountains. Their colleges in the United States are as follows: Boston college, South Boston, and college of the Holy Cross, Worcester, Mass.; of St. Francis Xavier, New York; St. John's, New York (Fordham); St. Joseph's, Philadelphia; St. John's, Frederick, Md.; Loyola, Baltimore; Gonzaga, Washington, D. C.; Georgetown, D. C.; Spring Hill, near Mobile, Ala.; St. Louis university, St. Louis, Mo.; college of the Immaculate Conception, New Orleans; St. Charles's, Grand Coteau, La.; St. Joseph's, Bardstown, Ky.; St. Xavier's, Cincinnati; St. Ignatius' college, San Francisco; and Santa Clara, Cal. In Canada, the Jesuits conduct St. Mary's college, Montreal, founded in 1848; and they have recently petitioned the Dominion parliament for a restoration to them of the estates owned by the order before its suppression in France and her colonies. The number of Jesuits in the United States and Canada at the present time (1874) is 1,062. In Mexico and the states of Central and South

America they have sometimes been admitted, sometimes again expelled, their fate being dependent on the success or defeat of the several political parties. They are now entirely expelled from the Mexican and Colombian republics. The prosperous seminaries which they directed in Guatemala were suppressed in 1873, and the Jesuits themselves compelled to leave the country. Missionary establishments had been also opened a few years ago in Ecuador, Peru, and the province of Maranhão, Brazil; but they were suppressed in 1874. In Chili and Paraguay several establishments have been recently founded, all of which are subject to the same insecurity. Jesuits also now labor as missionaries among nearly all the non-Christian nations of the world, especially among the Indians of North America, in Turkey, in India, and China.—The number of Jesuits distributed through the five assistancies in 1873 was as follows: in the five dispersed provinces of the Italian assistancy—Rome 459, Naples 308, Sicily 206, Turin 301, and Venice 246; in the German assistancy—Austria 462, Belgium 642, Galicia 230, Germany 764, and Holland 313; in the French assistancy—Champagne 430, missions of New York and Canada 251, France 735, Lyons 722, Toulouse 595; in the dispersed Spanish assistancy—Aragon 560, Castile 784, Mexico 31; in the English assistancy—England 383, Ireland 183, Maryland 265, and Missouri 255. Total number of members, 9,266. Attached to the assistancy of Italy are the following missions: province of Rome, 80 members in Etruria, Æmilia, and Brazil; province of Naples, 25 in New Mexico and Colorado; Turin, 120 in California and the Rocky mountains; Venice, 40 in Illyria, Dalmatia, and Venetia. German assistancy: Austria, 23 in South Australia; Belgium, 44 in Bengal; Germany, 52 in western New York, &c., 70 in Bombay, 31 in Brazil, and 15 in Java. French assistancy: Champagne, 21 in northern China; New York and Canada, 19 in Indian missions of Lake Superior; France, 16 in Cayenne and 86 in Nanking; Lyons, 72 in Algeria, 94 in New Orleans and gulf states, and 70 in Syria; Toulouse, 77 in the isle of Réunion and Madagascar, and 78 in Madura (India). English assistancy: England, 14 in Scotland, 13 in Guiana, and 17 in Jamaica; Ireland, 12 in Melbourne, Australia; Missouri, 13 among the Osages, and 22 among the Pottawattamies. In all, 1,734 missionaries.—The order has had since the foundation the following 22 generals, many of whom belong also to its most celebrated names: 1, Loyola, a Spaniard, 1541-'56; 2, Laynez, a Spaniard, 1558-'65; 3, Borgia, a Spaniard, 1565-'72; 4, Mercurian, a Belgian, 1573-'80; 5, Acquaviva, a Neapolitan, 1581-1615; 6, Vitelleschi, a Roman, 1615-'45; 7, Caraffa, a Neapolitan, 1646-'9; 8, Piccolomini, a Florentine, 1649-'51; 9, Gottofredi, a Roman, Jan. 21 to March 12, 1652; 10, Nickel, a German, 1652-'64; 11, Oliva, a Genoese; 1664-'81; 12, De Noyelle, a Belgian, 1682-'6; 13, Gonzalez, a

Spaniard, 1687-1705; 14, Tamburini, a Modenese, 1706-'30; 15, Retz, a Bohemian, 1730-'50; 16, Visconti, a Milanese, 1751-'75; 17, Centurioni, a Genoese, 1755-'7; 18, Ricci, a Florentine, 1758-'73, died in 1775; 19, Brzozowski, a Pole, 1814-'20; 20, Fortis, a Veronese, 1820-'29; 21, Roothaan, a Hollander, 1829-'53; 22, Beckx, a Belgian. Among the Jesuits who have been canonized or beatified, the most celebrated are Ignatius Loyola, Francis Xavier, Francis Borgia, Francis Regis, Aloysius Gonzaga, and Stanislas Kostka.—Before the suppression of the order, the Jesuits counted among their members some of the greatest scholars of Europe. The works of Petavius, Sirmond, Tursellinus, and Viger in classical literature, and of Tiraboschi in literary history, are still valued and used. Among the theologians and pulpit orators, Bellarmin, Pallavicini, Paolo Segneri, and Bourdaloue are especially distinguished. Since the restoration, Passaglia (who, however, left the order in 1858) and Perrone have gained the reputation of being among the principal theological writers of the Roman Catholic church, and Ravignan and Félix in France and Roh in Germany have been counted among the greatest Catholic pulpit orators. The most extensive literary work of the order is the *Acta Sanctorum* (Bollandist), commenced in the 17th century and still continued. Among its periodicals are the *Civiltà Cattolica*, semi-monthly, at Rome (which has the largest circulation of any theological publication of Italy); the *Précis historiques et littéraires*, semi-monthly, at Brussels; the *Études théologiques*, fortnightly, at Paris; "The Month," at London; and two published at Freiburg in Germany.—Several charges of complicity in the murder of princes have been brought against the Jesuits, some of which have been abandoned by all impartial historians, while all are contested. These charges are closely connected with the doctrine of the rightfulness of tyrannicide, which has been defended by several writers of the order. It is generally admitted that 14 Jesuits, viz., Sa, Tolet, Valentia, Delrio, Salas, Mariana, Heissius, Suarez, Lessius, Becan, Gretser, Tanner, Castro-Paolo, and Escobar, have maintained it. But on the other hand, it is alleged that this doctrine was one very common among the Roman Catholic theologians, and that even Thomas Aquinas taught it; that more than 60 Jesuits have written against it; and that those Jesuits who admit it, confine it to a few exceptional cases, and allow it to be committed only by a nation. Acquaviva, by a decree issued after the assassination of Henry IV., and dated July 6, 1610, forbade any member publicly or privately to uphold the doctrine that it is lawful for any one under any pretext of tyranny to attempt the life of any ruler. On other points of ethics members of the order have been accused of unsound principles even by certain Catholic writers, and some of the writings of Jesuits have been on this account censured by Rome. Concerning

this point the defence presents the same arguments as on the preceding, viz., that none of the censured doctrines were peculiar to the order or shared by all its members. The following passage in the constitution of the order has often been and is still construed by some writers as if it gave to the superiors of the order the right of obliging their inferiors to commit a sin: *Visum est nobis in Domino, excepto expresso voto quo societas summo pontifici pro tempore existenti tenetur, ac tribus aliis essentialibus paupertatis, castitatis, et obedientiæ, nullas constitutiones, declarationes, vel ordinem ullum vivendi posse obligationem ad peccatum mortale vel veniale inducere, nisi superior ea in nomine Domini nostri Jesu Christi, vel in virtute obedientiæ juberet.* But the Jesuits have proved this to be a mistranslation of the Latin and in conflict with others of their rules; the true sense of the passage being, that none of the rules of the order so bind the members that the non-observance by itself involves a sin, but that a sin is committed only when a member violates a special order of the superior. Several Protestant historians of note, as Ranke ("History of the Popes") and Reuchlin ("History of Port Royal"), who in the first editions of their works had followed the former interpretation, have changed their view in subsequent editions, and pronounced the interpretation which the order itself gives of it the true one.—Among the most important works on the history of the Jesuits are: *Historia Societatis Jesu*, from 1540 to 1625, by Orlandini, Sacchini, Passinus, and other members of the society; Wolf (adverse to the Jesuits), *Allgemeine Geschichte der Jesuiten* (4 vols., Leipzig, 1803), valuable for its complete bibliography; Crétineau-Joli, *Histoire religieuse, politique et littéraire de la compagnie de Jésus* (6 vols., Paris, 1844-'6); Gioberti (adverse to the Jesuits), *Il Gesuita moderno* (5 vols., Lausanne, 1847); A. Steinmetz, "History of the Jesuits" (3 vols., London, 1848); Abbé Guettée (Gallican), *Histoire des Jésuites* (2 vols., Paris, 1858-'9); Huber (Old Catholic), *Der Jesuiten-Orden* (Berlin, 1873). See also the "Institute of the Society of Jesus, approved by the Holy See," "Decrees of the General Congregations," and "Ordinances of the Superiors General," all which have been published; "Life and Institute of St. Ignatius Loyola," by Bartoli; *Documents authentiques, &c.*, by Carié de la Charie (Paris, 1827); and Ravignan's *L'Existence et l'institut des Jésuites* (Paris, 1844), and *Clément XIII. et Clément XIV.* (2 vols. 8vo, 1854).

JESUITS' BARK. See CINCHONA.

JESUS CHRIST (Ἰησοῦς, the Greek form of the Hebrew Jeshua or Joshua, help of Jehovah, saviour; Χριστός, the Greek translation of the Hebrew Messiah, the anointed), the founder of the Christian religion, born in Bethlehem, a city of Judea, during the reign of the emperor Augustus, probably in the fourth year (or perhaps the sixth) before the Christian era, crucified in a locality of or near Jerusalem

called Golgotha, in the 34th or 35th year of his age. The 25th of December has been received and commemorated by the church in the festival of Christmas from the 4th century as the day of his birth, though this date was previously unsettled, and the opinions of the learned have always varied concerning it. His genealogy is traced from Abraham by St. Matthew, and from Adam by St. Luke, through the royal line of David; the two pedigrees, after David, are very different, and the discrepancies have been variously explained by Biblical critics. Nor are these the only debatable points in the Biblical narrative, the main parts of which are condensed in the following. His mother was Mary, who was betrothed to a carpenter named Joseph, when an angel announced to her: "The Holy Ghost shall come upon thee, and the power of the Highest shall overshadow thee;" accordingly "she was found with child of the Holy Ghost," and, as St. Matthew states, her husband "knew her not till she had brought forth her first-born son," who was named Jesus. Joseph and Mary resided in Nazareth, an obscure town in Lower Galilee, whence they went up to Bethlehem to be taxed, in compliance with a decree of Augustus, and because Joseph was of the house and lineage of David. It was there that the days were accomplished that she should be delivered, and the child was born, wrapped in swaddling clothes, and laid in a manger, the inn being full. His birth and Messianic dignity were revealed by angels to shepherds tending their flocks by night in the field, and they went in haste to Bethlehem to greet the babe. After 8 days he was circumcised; after 33 days he was presented in the temple at Jerusalem, when the aged Simeon took him in his arms, and blessed God that he had lived to see the Saviour; and soon after his birth, most probably while his parents remained in Bethlehem, three wise men (magi; according to ecclesiastical tradition, three kings) came from the East, guided by a star, and fell down before the young child, worshipped him, and presented to him gifts, gold, and frankincense, and myrrh. Their inquiries in Jerusalem had excited the suspicion of King Herod, who commanded them to bring him word when they had found the child. But the parents of Jesus, warned in a dream, fled with him to Egypt. Herod, to whom the wise men, by divine direction, had not returned, and who feared the loss of his throne if the Messiah were acknowledged, was greatly enraged, and, in order to secure the destruction of Jesus, gave orders that all the male children in and near Bethlehem, from two years old and under, should be put to death. After the death of Herod, a few months later, Jesus was brought by his parents to Nazareth. Of his early youth nothing more is known, except the summary statement of Luke that he waxed strong in spirit, was filled with wisdom, and the grace of God was upon him. When he was 12 years old

his parents took him with them to Jerusalem, to the feast of the passover. As they returned, he tarried behind without their knowledge; they retraced their steps in search of him, and after three days found him in the temple at Jerusalem, sitting in the midst of the doctors, hearing them and asking them questions, and astonishing them by his understanding and his answers. He returned to Nazareth with his parents, and was subject to them. Of the following 18 years, till the commencement of his public ministry, the canonical Gospels give no account. Various suppositions have been made to fill this gap in the narrative, as that he associated with learned Jews and studied the Greek authors; that in his 14th year he went with John the Baptist to Egypt, and was instructed for 16 years by Egyptian philosophers; that he was educated in the school of the Essenes (which is the oldest opinion); that he was a Nazarite; and that he belonged to the sect of the Sadducees. None of these hypotheses, however, rests upon any historical basis. It is more probable, as the gospel narrative intimates, that he followed the occupation of a carpenter, and, as the eldest son of the family, provided for its maintenance after Joseph's death. The apocryphal gospels give full but fanciful and often absurd narratives of this period, concerning which the four evangelists are silent. His appearance as a public teacher was heralded by John the Baptist, who admonished and warned the people, exhorting them to repentance, baptizing them in the Jordan, and announcing the approach of one mightier than himself, who should baptize with the Holy Ghost and with fire. It was probably in his 31st year that Jesus came to the Jordan at Bethabara to John, was recognized by him as the Messiah, and was baptized by him at his own command; and as he went up from the water a voice from heaven said: "This is my beloved Son, in whom I am well pleased." The events of his ministry, which is usually believed to have occupied about three years, are related by the evangelists, and have been arranged in chronological order (not in all cases with certainty) in harmonies of the Gospels. The public administration of baptism was followed immediately by the fast for 40 days in the wilderness, and the temptation by the devil. Directly after this he selected the first five or six of his twelve disciples, subsequently called apostles, and began to promulgate his doctrines, and to perform miracles. At a marriage in Cana of Galilee he changed water into wine to supply the guests. He attended a feast of the passover at Jerusalem, drove the traders out of the temple, and by his mighty works made many believe in his name. Passing from Judea to Galilee by way of Samaria, he announced himself as the Messiah to a Samaritan woman by Jacob's well at Sychar. Again in Cana he cured by a word a nobleman's son lying ill at Capernaum; in Nazareth he preached in the

synagogue, was scornfully rejected on account of his humble parentage and family connections, and took up his abode in Capernaum, where he healed a demoniac and other sick persons; on the sea of Galilee he lulled a tempest, and on the shores of the sea he performed many wonderful cures; and, as the number of those seeking help from him increased, he chose and ordained twelve disciples who should be with him continually. It was probably on another journey through Galilee that he delivered before a numerous concourse the sermon on the mount, in which he set forth the spirit of his doctrine, the conditions of participation in the kingdom of God, and gave in the Lord's prayer an example opposed to the long prayers of the Pharisees. He afterward healed the palsied servant of a centurion of Capernaum, and restored a widow's son at Nain to life. While performing such deeds as exemplifications and in attestation of his doctrines, the second feast of the passover came. He attended it, and gave occasion for the hostility of the Pharisees by healing on the sabbath day, at the pool of Bethesda, a man who had suffered from an infirmity for 38 years. Leaving Jerusalem for a third circuit in Galilee, he instructed and sent forth the twelve apostles, and miraculously fed 5,000 persons with five loaves and two small fishes. His numerous miraculous cures, and the increasing number of believers in him as the Messiah, deepened the enmity of the Pharisees, who sought to do violence to him. At this period the third passover in his ministry occurred. He, however, left Judea, and passed along the coasts of Tyre and Sidon, repeating his miracles. The transfiguration, the foreshadowing of his own sufferings, and the choice of 70 disciples, whom he sent two by two into all the places which he intended to visit, preceded his journey to Jerusalem to the feast of tabernacles. After his public teaching there, he went to Peræa; at Bethany he raised from the dead Lazarus, the brother of Martha and Mary, and on his way toward the capital he cured at Jericho blind Bartimæus. He made his entry into Jerusalem, riding on an ass, and was received in triumph by the people. Returning after a night spent in Bethany, he blighted with a word the barren fig tree, foiled the insidious attempt to ensnare him on the subject of tribute, and denounced their hypocrisy and the guilt and doom of the city. At the fourth and last feast of the passover with his disciples, he washed their feet as a lesson of love and humility; announced that on that night one of them would betray him, and designated Judas Iscariot as the traitor; and instituted the Lord's supper. Afterward with great agony of spirit he prayed in the garden of Gethsemane. Thither Judas came with an armed band, and betrayed to them the object of their search by saying, "Hail, master!" and kissing him. Refusing the offers of assistance, Jesus freely surrendered himself, when his disciples fled. He

was brought before the court of the sanhedrim; and as he did not deny that he was the Christ, the Son of God, he was adjudged guilty of blasphemy, and condemned to death. He was brought thence, on the charge of sedition, before the tribunal of Pontius Pilate, the Roman procurator of the province, who was induced by the clamor of the people and by threats to condemn him, although he declared him to be innocent. He was scourged, a scarlet robe and a crown of thorns were put on him in mockery, and he was led away to be crucified. At Golgotha (Calvary) vinegar mingled with gall was offered him to drink. He was crucified between two thieves, one of whom became penitent and was forgiven by the suffering Saviour. The cross on which he hung bore the inscription, in Hebrew, Greek, and Latin, "Jesus of Nazareth, the King of the Jews." He committed his mother to the care of his beloved disciple John, according to which evangelist his last words were, "It is finished." At his death the sun was darkened, the earth quaked, and the veil of the temple was rent in twain from the top to the bottom. In the evening came Joseph of Arimathæa, a disciple of Christ, and begged the body and buried it. This was on the afternoon of Friday. On the third day, *i. e.*, early on the morning of the day thence called the Lord's day, he rose from the dead; he appeared to his 11 remaining disciples, and to many others; remained with them 40 days, instructing them in the things pertaining to the kingdom of God, and blessing them; and then visibly ascended to heaven. His last charge to his disciples was to go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.—The person and work of Jesus Christ have been the subject of extended discussion from many points of view. The *Lebensgeschichte Jesu* of J. J. Hess (Zürich, 1781) is one of the earlier general works on this subject. The "Life of Christ and the Lives of the Apostles, John the Baptist, and the Virgin Mary," by John Fleetwood (Glasgow, 1813; many times reprinted), attempts from the four gospel narratives to give the connected history. Mention may be made also of the "Life of the Saviour," by H. Ware, jr. (Boston, 1832; new ed., New York, 1868). The results of German rationalistic criticism appear in the works called *Das Leben Jesu*, by H. H. E. G. Paulus (Heidelberg, 1828), D. F. Strauss (Tübingen, 1835; revised and abridged in 1864; English translation, London, 1846), and C. F. von Ammon (Leipsic, 1842-'7). The work of Strauss, the most destructively critical of the three, made a great impression, and called out many replies. That of Karl Hase (Leipsic, 1829; English translation, Boston, 1860) was prior to it in date, and the ablest answer to Strauss was the work of J. A. W. Neander (Hamburg, 1837; English translation, New York, 1848), which was followed by those of J. P. Lange (Heidelberg, 1844-'5; English translation, Edinburgh, 1864), J. A. Dorner

(Berlin, 1845-'53), Schenckel (1864), and Keim (1867-'71). A humanitarian view is presented by W. H. Furness in "Jesus and his Biographers" (Philadelphia, 1838), and "Jesus" (1870). The *Vie de notre seigneur Jésus-Christ*, by the abbé Brispot (Paris, 1850-'53), presents the Roman Catholic view. A volume of "Historical Lectures on the Life of Christ," by C. J. Ellicott (London, 1859), is a popular work, while the notes appended consider most of the points under critical discussion. The "Life of our Lord upon Earth," by Samuel J. Andrews (New York, 1863), considers only the outward events of the life of Jesus, but is a thorough discussion of these. A new impulse was given to this department of study by the *Vie de Jésus* of Ernest Renan (Paris, 1863), which considered the gospel story as a legendary romance. A reply by E. de Pressensé, entitled *L'École critique de Jésus-Christ*, appeared the same year, followed by *Jésus-Christ, son temps, sa vie, son œuvre* (Paris, 1866), by the same author; while a multitude of volumes and essays on the subject appeared in Europe and America. Among the works of more recent importance or popular interest are those of G. Uhlhorn, *Die modernen Darstellungen des Lebens Jesu* (Hanover, 1866; English translation, Boston, 1868); J. R. Seeley, "Ecce Homo" (London, 1866); Z. Eddy, "Immanuel" (Springfield, 1868); William Hanna, "Life of Christ" (Edinburgh, 1869); Lyman Abbott, "Jesus of Nazareth: His Life and Teachings" (New York, 1869); Howard Crosby, "Jesus, his Life and Works" (New York, 1871); Lewis Mercier, "Outlines of the Life of the Lord Jesus Christ" (London, 1871); Sir George Stephen, "Life of Christ" (London, 1871); Henry Ward Beecher, "Life of Jesus the Christ" (New York, 1871 *et seq.*); Charles F. Deems, D. D., "Jesus" (New York, 1872); and F. W. Farrar, "Life of Christ" (London, 1874). The principal works on the harmony and chronology of the Gospels are those of Lightfoot (1655), Macknight (1756), Bengel (1736), Newcome (1778), Greswell (1830), Wieseler (1843), Robinson (1845; revised ed., 1851), Jarvis (1845), Tischendorf (1851), Strong (1852), Stroud (1853), and G. W. Clark (1868). Other works deserving of mention are those of Stier, *Die Reden des Herrn Jesu* (1843-'8; English translation, Edinburgh, 1859); Ullmann, *Die Sündlosigkeit Jesu* (1841; English translation, Edinburgh, 1841); Schaff, "The Person of Christ" (Boston, 1865); Liddon, "Bampton Lectures of the Divinity of Christ" (London, 1867); and Plumtre, "Christ and Christendom" (London, 1867). A life of Christ according to the apocryphal gospels has been published by R. Hofmann (*Das Leben Jesu nach den Apokryphen*, Leipsic, 1851).

JET, a variety of lignite, resembling cannel coal, but harder, of deeper black, and of more brilliant lustre. It is found in detached pieces in tertiary clays along the coast of Yorkshire, England, and in various places on the continent

of Europe. From its susceptibility of taking a fine polish and its intense blackness, it has been largely used for mourning articles of ornament, as buttons, crosses, and ear rings.

JETER, Jeremiah B., an American clergyman, born in Bedford co., Va., July 18, 1802. He entered the Baptist ministry in his native county in 1822, and removed in 1827 to the "Northern Neck" of Virginia, where he was pastor of the Maratico church in Lancaster co., and of the Nicomico church in Northumberland co. In 1836 he became pastor of the first Baptist church in Richmond, and in 1849 accepted an invitation from the second church in St. Louis. In 1852 he returned to Richmond to fill the pulpit of the Grace street Baptist church. He is the author of a "Memoir of the Rev. Abner W. Clopton," the "Life of Mrs. Henrietta Shuck," a "Memoir of the Rev. Andrew Broaddus," the "Christian Mirror," "Campbellism Examined" (1845), and "The Seal of Heaven" (1871). He also, in conjunction with the Rev. Richard Fuller, compiled "The Psalmist," a hymn book in general use among the Baptists.

JETSAM. See FLOTSAM.

JEVONS, William Stanley, an English author, born in Liverpool in 1835. He was educated at University college, London, and in 1854 received an appointment in the mint at Sydney, Australia, where he remained five years. He then visited the United States, returned to England, and took the master's degree at the university of London in 1862. In 1866 he became professor of logic and mental and moral philosophy, and lecturer on political economy, in Owens college, Manchester. In 1872 he was elected a member of the royal society of London. He has published a pamphlet demonstrating the depreciation of the precious metals in consequence of the discoveries in California and Australia (1863); "The Coal Question" (1865), pointing out the probable exhaustion of the British coal mines, and the necessity of reducing the national debt; "Elementary Lessons in Logic" (1870); "Theory of Political Economy" (1871), containing an attempt to reduce the science to a mathematical form, and to explain the laws of supply and demand by the aid of the differential calculus; "The Principles of Science" (1874), in which some new views of the value of the reasoning processes are put forth, and syllogistic operations are shown to be practicable by mechanism.

JEW, The Wandering. See WANDERING JEW.

JEWEL, or **Jewell, John**, an English bishop, born at Buden, Devonshire, May 24, 1522, died at Monkton Farleigh, Wiltshire, Sept. 22, 1571. He finished his education at Oxford, became tutor there, and labored assiduously to disseminate the principles of the reformation among his pupils, but did not make a public profession of Protestantism till after the accession of Edward VI. He was expelled from Oxford in the reign of Mary, fled to the continent to escape imprisonment, and at the invitation of

Peter Martyr went to Strasburg, where he for some time assisted in conducting a collegiate institution. On the death of Mary, Jewel returned to England, and was one of the eight divines appointed by Elizabeth to hold a controversy at Westminster with a similar number of Catholics. In 1559 he was placed on the commission to extinguish Catholicism in the western dioceses of England, and on Jan. 21, 1560, was consecrated bishop of Salisbury. The most famous of his works is his *Apologia Ecclesie Anglicanae* (1562), of which Elizabeth ordered a copy to be chained in every parish church.

JEWELL, a N. county of Kansas, bordering on Nebraska; area, 900 sq. m.; pop. in 1870, 207. It is drained by affluents of the Republican and Solomon rivers. Capital, Jewell City.

JEWS. See HEBREWS.

JEWSEBURY. I. **Maria Jane**, an English writer, born in Warwickshire about 1800, died in Bombay, India, in 1833. She was a writer for literary periodicals. In 1833 she married the Rev. William Fletcher, and went with him as a missionary to India, but died soon after her arrival in that country. She published "Phantasmagoria," a series of sketches of life and literature, "Letters to the Young," "Lays of Leisure Hours," and "Three Histories." II. **Geraldine Endors**, sister of the preceding, born in Warwickshire in 1821. She is the author of "Zoe, a History of Two Lives" (1845); "The Half Sisters" (1848); "Marian Withers" (1851); "Constance Herbert" (1855); "The History of an Adopted Child" and "The Sorrows of Gentility" (1856); and "Right or Wrong" (1857). She has also written a story for children entitled "Angelo, or the Pine Forest in the Alps" (1855).

JEYPOOR. I. A Rajpoot native state of India, between lat. 25° 40' and 27° 37' N., and lon. 75° 8' and 77° 20' E.; area, 15,000 sq. m.; pop. about 1,500,000. The surface is level excepting N. and N. W., and imperfectly watered. The principal products are cattle and salt, and to some extent wheat, cotton, and tobacco. The state abounds in small forts, and possesses some of the strongest fortresses in India. The Minas are regarded as the aborigines, and the Jats are the most extensive and skilful agriculturists. The government is invested in a hereditary rajah, who pays an annual tribute of £40,000 to Great Britain. The army consists of about 30,000 men. II. A city, capital of the state, 140 m. S. W. of Delhi; pop. about 60,000. It is the most attractive city of upper Hindostan. The main thoroughfares intersect each other at right angles, each intersection forming a market square or *chank*, and they are crossed by smaller streets, the whole forming rectangular blocks. The centre is occupied by the royal residence, seven and eight stories high, with towers and domes, including a dozen palaces communicating either by galleries or gardens. In the palace proper is an audience hall of white marble. Many of the private

houses, three and four stories high, are embellished with frescoes, marble porticoes, statuary, and projecting stone balconies. Among the mosques and temples are exquisite specimens of the purest Hindoo architecture. Other notable public buildings are the extensive observatory and the arsenal. Jey Singh founded this city early in the 18th century as a substitute for his old and decayed capital Amber. —There are three other towns of the same name in various parts of India.

JHANSI, a town of India, in the Northwest Provinces, capital of a small state of the same name, annexed to the British possessions in 1854, 120 S. S. E. of Agra. It is a walled town, having a circuit of 4 m., with strong fortifications, and surrounded by fine groves. The streets are remarkably clean and orderly. A considerable trade is carried on with the cities of the Deccan and the Doab, and there are manufactories of native weapons. On June 4, 1857, a mutiny of native troops took place here, and 67 Europeans, about half of whom were women and children, were massacred at the instigation of the ranee or chieftainess of Jhansi. The ranee put herself at the head of the rebels, clad in mail, and during the rest of her career led her forces with masculine valor and ferocity. In 1858 a body of mutineers under her command shut themselves up in Jhansi, where they were besieged by Sir Hugh Rose, March 25. After a relieving force under Tantia Topee had been defeated, the city was stormed on April 2, 5,000 rebels being killed. The ranee escaped to Gwalior, in the storming of which place, in June, she was killed.

JHYLUM, Jailum, or Jelum (anc. *Hydaspes*; Sanskrit *Vitastá*; modern Hindoo, *Behut*), the most western of the five great rivers of the Punjab, British India. It rises in the N. W. Himalaya, in the southern part of Cashmere, flows N. W. along the centre of the valley of Cashmere in a winding course for about 120 m., more than half being navigable, and after various deviations finds an outlet through the pass of Baramula, and thence proceeds in a western direction toward the vicinity of Mazufarabad. Thence, enlarged by the almost equally considerable Kishen Gunga river, it pursues a S. direction until it falls into the Chenaub, after an entire course of about 450 m. It abounds in fish, and is said to contain alligators. Horace called the river *fabulosus Hydaspes*, on account of the wonderful stories associated with it. Virgil refers to it as *Medus Hydaspes*, and Ptolemy calls it *Bidaspes*. Alexander is reported to have seen crocodiles on the banks of this river, on which he built his fleet for the war with Porus from the timber of the Himalaya forests.

JIDDAH, Jeddah, or Djeddah, a town of Hedjaz in Arabia, on the Red sea, 65 m. W. of Mecca; lat. 21° 28' N., lon. 39° 13' E.; pop. about 18,000. It is built on the edge of the sea, in a sterile desert, about 10 m. back of which is a range of low hills, devoid of trees or vegeta-

tion. It is surrounded by walls, with fortified towers at intervals, and a ditch, and has nine gates, six facing the sea. The sea is gradually receding from the town, owing to the constant growth of the coral reefs. The harbor, which is the best on the Red sea, has a depth of from 3 to 17 fathoms; it is difficult of entrance, being shut in by ranges of reefs. The streets are straight and regular, and cleaner than those of most eastern towns, and the houses of the better class are built of stone or madrepora; but the suburbs are extremely filthy, and the dwellings little more than hovels. The principal buildings are the governor's residence, the custom house, several mosques of little architectural pretension, some large and handsome khans, and the British and French consulates. A rude stone structure outside the walls is venerated as the tomb of Eve. The climate is very trying to Europeans, the thermometer ranging from 76° to 107° F., and sometimes rising to

balm, incense, essences, senna, cassia, ivory, mother-of-pearl, pearls, tortoise shell, ostrich feathers, coral, dates, cutlery, hardware, and leather. The imports are provisions, including grain, from Egypt; metals, glass, bottles for essences, cutlery, soaps, cloths, silks, and cottons, from Europe; rice, sugar, timber, nankeens, muslin for turbans, and girdles, from India; elephants' teeth, ostrich feathers, musk, mules, and slaves, from Africa. A brisk trade is still carried on in slaves, the most of whom are Abyssinians; they are landed at night along the shore, and carried into the city in the morning with the connivance of the Turkish authorities, with whom the firman of the sultan for the suppression of the traffic is a dead letter. Jiddah was bombarded in 1858 by the British in retaliation for the massacre of the British consul and a number of Christians.

JHOOON. See OXUS.

JOAB, a Hebrew warrior, "captain of the host" (generalissimo of the army) during the greater part of David's reign, died about 1015 B. C. In the reign of Saul he accompanied David on his wanderings in the southern part of Palestine and its vicinity, and after Saul's death he defeated the troops of Abner, who supported Ishbo-sheth, the son of that king, as successor, and whom he assassinated after he became reconciled to David. His valor in the assault on the fortress of Zion, held by the Jebusites, gained him the chief command of the army of all Israel, and he had

Jiddah.

132° during the simoom. Intermittent fevers are prevalent, and they generally attack Europeans on arrival. During the months of pilgrimage the population is increased to 40,000, and sometimes to 60,000, about 120,000 pilgrims for Mecca and Medina passing through it annually. Of the ordinary population, about 1,000 are British-Indian subjects, a number of whom are wealthy merchants. There are also many Egyptians and a few Greeks, and several English and French merchants. The industry of the natives consists of fishing, diving for black coral, which is found for only a short distance along the coast, the manufacturing it into beads and mouth-pieces for pipes and cigars, and the dyeing of English cotton cloths. The trade of Jiddah, which is very large, is carried on chiefly by square-rigged British vessels, the vessels of the Mejidî steam company, and native coasting vessels averaging about 80 tons burden. The exports are coffee, gum, spices,

the principal merit in the conquests of his master. He adhered faithfully to the king during the revolt of Absalom. When, in order to conciliate the powerful rebellious party, the command of the host was given to Amasa, who had been Absalom's general, Joab soon rid himself of this rival by murdering him. David was obliged to overlook the murders of Abner and Amasa, but before dying gave strict directions to his son Solomon to put Joab to death. Shortly before the death of David he participated in the unsuccessful demonstration in favor of the natural heir Adonijah, and afterward fled for refuge to the altar, where he was put to death by command of the new king. His brothers Abishai and Asahel were also conspicuous as military leaders in the earlier part of the history of David.

JOACHIM, king of Naples. See MURAT.

JOACHIM, Joseph, a German violinist, born of Jewish parents at Kittsee, near Presburg,

Hungary, July 15, 1831. He received his first instruction on the violin from Helmesberger and Böhm at the Vienna conservatory. So rapid was his progress that he was permitted to play when only 11 years of age at a Gewandhaus concert in Leipsic. He performed at Leipsic during many succeeding seasons, and always with indications of progress and increasing talent. In 1850 he accepted, at the solicitation of Liszt, the post of concert master at Weimar. Three years later he exchanged this situation for a similar one at Hanover, where he still resides. He makes frequent visits to England, Holland, and Belgium, and occupies perhaps the foremost rank among living violinists. His chief points of excellence as a performer are purity and fulness of tone, perfect intonation, absolute mastery of all the technical difficulties of the instrument, and the closest sympathy with the classical composers whose works he interprets. His reluctance to appear in public has led to his declining all offers for a concert tour in the United States. He has composed both for violin and orchestra, but his fame rests on his qualities as a player rather than on the merits of his compositions.

JOACHIMSTHAL, a town of Bohemia, in the circle of Eger, near the frontier of Saxony, and 10 m. N. of Carlsbad; pop. in 1870, 6,566. It is situated in a beautiful valley of the Erzgebirge, more than 2,000 ft. above the sea. The educational institutions include schools for straw plaiting and lace making. White lead, red lead, smalt, and paper are also manufactured. But the celebrity of the town is mainly due to its lead, tin, iron, and silver mines. The last employed 12,000 men in the 16th century, but the production has since much declined. The term *Thaler* derives its origin from this place, where the counts Schlick, who were the local rulers early in the 16th century, had *Guldengroschen* coined, which became known as Joachimsthaler, and afterward as thaler. In the neighborhood are the ruins of the castle of Freudenstein. The town was almost completely destroyed by a conflagration March 31, 1873. The fine church of St. Joachim was burned, with celebrated pictures by Dürer and Cranach; nearly 450 of the 586 houses were burned, and 5,000 persons were rendered houseless. The rebuilding of the town was at once commenced.

JOAN, Pope, a fictitious female personage who was long supposed to have succeeded Leo IV. in the papal chair in 855, and to have occupied it over two years. The first who mentions her is Marianus Scotus, a monk of the abbey of Fulda in the 11th century. According to Martinus Polonus, a chronicler of the 13th century, Joan was a native of Mentz, who went with an English lover to Rome in the disguise of a man, and, having become proficient in sacred and profane learning, was chosen to the papacy under the name of John VIII., no suspicion being had of her sex. She was seized with the pains of labor one day while passing in procession to the Lateran ba-

silica, and died in the street. This story was interpolated into the work of Anastasius, who lived at the time of her supposed reign, and some critics contend that it is even wanting in the earlier copies of Martinus Polonus. It was completely disproved by David Blondel, a Protestant writer, in his *Familier éclaircissement de la question si une femme a été assise au siège papal entre Léon IV. et Benoît III.* (Amsterdam, 1649); and it is now generally admitted that no such person as Pope Joan ever existed.

JOAN OF ARC (JEANNE D'ARC), known as La Pucelle and "the Maid of Orleans," a French heroine, born at Domremy (now called from her Domremy-la-Pucelle), in Lorraine, about 1411, burned at the stake in Rouen, May 31, 1431. She was the fifth child of poor parents, whose family name was probably Darc. She received no instruction, but was accustomed to out-of-door duties, such as the tending of sheep and the riding of horses to and from the watering place. The neighborhood of Domremy abounded in superstitions, and at the same time sympathized with the Orleans party in the divisions which rent the kingdom of France. Jeanne shared both in the political excitement and the religious enthusiasm; imaginative and devout, she loved to meditate on the legends of the Virgin, and especially, it seems, dwelt upon a current prophecy that a virgin should relieve France of her enemies. At the age of 13 she began to believe herself the subject of supernatural visitations, spoke of voices that she heard and visions that she saw, and a few years later was possessed by the idea that she was called to deliver her country and crown her king. An outrage upon her native village by some roving Burgundians raised this belief to a purpose; her "voices" importuned her to enter upon her mission by applying to Baudricourt, governor of Vaucouleurs; and this, by the aid of an uncle, she did in May, 1428. The governor, after some delay, granted her an audience, but treated her pretensions with such scorn that she returned to her uncle. The fortunes of the dauphin, however, were desperate, and Baudricourt, pressed by her entreaties, sent her to Chinon, where Charles held his court. Introduced into a crowd of courtiers from whom the king was undistinguished, she is said to have singled him out at once. Her claims were submitted to a severe scrutiny. No evidence indicating that she was a dealer in the black art, and the fact of her virginity removing all suspicions of her being under satanic influence, her wish to lead the army of her king was granted. A suit of armor was made for her, and a consecrated sword which she described as buried in the church of St. Catharine at Fierbois was brought and placed in her hands. Thus equipped, she put herself at the head of 10,000 troops commanded by royal officers, threw herself upon the English who were besieging Orleans, routed them, and in a week forced them to raise the siege (May, 1429). Other exploits followed.

The presence of the virgin with her consecrated banner struck a panic into the souls of her enemies. In less than three months Charles was crowned king at Rheims, the maid of Orleans standing in full armor at his side. Her promised work was done. Dunois, however, unwilling to lose her influence, urged her to remain with the army, and she did so; but her victories were over. In an attack on Paris in the early winter she was repulsed and wounded. In the spring of the next year (1430) she threw herself into Compiègne, then beleaguered by the English; made a sortie in which she was taken prisoner (May 24), and was at once carried to Jean de Luxembourg's fortress at Beurevoir. An attempt to escape by leaping from a dungeon wall was unsuccessful, and she was taken to Rouen. The university of Paris demanded that she should be tried on a charge of sorcery, and solicited letters patent from the king of England, which were reluctantly granted. The chapter at Rouen were rather favorably disposed toward her; many of the English in authority were unwilling to proceed to extremities; but the university of Paris prevailed. The examination lasted several months, and resulted in a conviction of sorcery. The papers were sent from Rouen to Paris, and the verdict of the university was unanimous that such acts and sentiments as hers were diabolical, and merited the punishment of fire. Sentence of condemnation was read to her publicly by the bishop of Beauvais, and the alternative offered of the stake or submission to the church. The terrified girl made a recantation, and was taken back to prison. Here her visions returned. A man's apparel being left in her cell to tempt her, she put it on; the bishop seized upon the act as a virtual relapse into her old unbelief, and hastened the execution of the first sentence. A huge pile of wood was erected in the market place of Rouen, and, surrounded by a vast assembly of soldiers and ecclesiastics, Joan of Arc was burned, and her ashes were thrown into the Seine. The infamy of this transaction lies heavily upon all concerned in it. The French king did nothing to avenge her, and waited ten years before he reversed the process by which she was condemned, and pronounced her "a martyr to her religion, her country, and her king." The character of the "Maid of Orleans" was spotless. She was distinguished for her purity, innocence, and modesty. Her hand never shed blood. The gentle dignity of her bearing impressed all who knew her, and restrained the brutality of her soldiers. The cottage in which she was born still stands between two buildings, founded as a monument to her by the department of the Vosges; it contains a copy of the beautiful statue by Marie d'Orléans, daughter of Louis Philippe. The place where she was captured was indicated by a ruined tower which fell down in 1868; and the spot of her execution in the place de la Pucelle, Rouen, is marked by a mean statue. A

fine statue of her was unveiled in Paris, in the place des Pyramides, Feb. 25, 1873.—Among the French authors who have written the life of Joan of Arc are Lenglet du Fresnoy (2 vols., Paris, 1753-4), Lebrun de Charmettes (3 vols., 1817), Barthélemy de Beauregard (2 vols., 1847), Michelet (1853), Lafontaine (Orleans, 1854), Villauré (Paris, 1863), and Barante (1865). The best German life is by Eysell (Ratisbon, 1864). The best English works are by Lord Mahon (now Earl Stanhope), "Life of Joan of Arc" (London, 1853), and Mrs. Bray, "Joan of Arc and the Times of Charles VII., King of France" (1874). See also Quicherat, *Procès de condamnation et de réhabilitation de Jeanne d'Arc* (published by the French historical society, 5 vols., Paris, 1841-'50), and his *Aperçus nouvelles sur l'histoire de Jeanne d'Arc* (1850). Among the poems and dramas founded on the history of Joan of Arc, the most noteworthy are Voltaire's travesty *La Pucelle*, Southey's "Joan of Arc," Schiller's *Jungfrau von Orleans*, and Calvert's "Maid of Orleans" (1874).

JOANES, Vicente. See **JUANES.**

JOANNA. I. Queen of Naples, daughter of Charles, duke of Calabria, and granddaughter of Robert of Anjou, born about 1327, put to death at the fortress of Muro, in the province of Basilicata, May 22, 1382. An attempt was made by her father to secure harmony between the two branches of the Anjou family which had claims to the Neapolitan throne, by marrying Joanna when about seven years old to her second cousin Andrew of Hungary; but the plan proved an entire failure. As the young couple grew up the most bitter enmity arose between them, and was constantly encouraged by the opposing parties among their relatives. Duke Charles died before his father Robert, and Joanna therefore directly succeeded the latter on his death in 1343. Her court speedily divided into two factions, taking sides respectively with the queen and her husband; and two years of intense hostility terminated, in September, 1345, in the assassination of the king by a party of conspirators who enticed him from his room and strangled him in a corridor of the palace. Joanna seems to have deserved the accusation universally brought against her, of having inspired and directed this plot down to its smallest details; though the story of the old chroniclers that she wove the rope of gold thread with which Andrew was strangled is probably exaggerated. Shortly after the death of her husband she married her relative and supposed paramour, Louis of Taranto, without obtaining a papal dispensation. Louis the Great of Hungary, anxious for an opportunity to avenge his brother's death, made this his pretext, and in 1347 invaded the Neapolitan territory. Joanna, unprepared for defence, fled to Avignon, then the residence of the popes; but here she was summoned before a consistory and charged with the murder of her husband. She escaped the prosecution of

this charge by consenting to cede Avignon to the holy see for a permanent possession, on payment of 80,000 gold florins, and on condition that the pope should formally proclaim her innocence and the validity of her new marriage. In the mean time the king of Hungary retired from Naples, leaving a strong garrison behind him; and this was soon after removed, through the mediation of the pope. Louis of Taranto died in 1362, and Joanna married in 1363 James of Aragon, king of Majorca, who left her soon after and returned to his home in Spain, where he died in 1376. Joanna now married a fourth husband, Otho of Brunswick, and by this gave offence to Duke Charles of Durazzo, whose wife was heir presumptive to the throne. In 1378, when the rival popes Clement VII. and Urban VI. contested the papal see, Joanna declared for Clement. Urban in revenge immediately summoned the duke of Durazzo and proclaimed his right to the throne of Naples. Acting under the advice of Clement, Joanna made a special will, making the second son of the king of France her heir, and entirely disinheriting the duke and his wife. These events gave Charles of Durazzo the pretext for which he had long wished. He invaded Joanna's territory, met with little opposition from the people, advanced to Naples, captured the queen in the castle, and sent her a prisoner to Muro. Here she was placed at the disposition of the king of Hungary, who ordered her immediate execution. She was smothered with pillows, in revenge for the method of Andrew's assassination. **II.** Queen of Naples, grandniece of the preceding, and daughter of Duke Charles of Durazzo, born about 1370, died in 1435. Married when young to William of Austria, and several years after left a widow, she succeeded her brother Ladislas in 1414. Since her husband's death she had maintained a secret connection with Count Pandolfello Alopo, and this she now continued without attempt at concealment, appointing her favorite to the highest offices and giving him virtual control of the affairs of the kingdom. She was finally persuaded by her councillors, however, to marry again, and chose as her husband Jacques de Bourbon, count of La Marche. Joanna's marriage did not put an end to her dissolute manner of life; and her husband, detecting her infidelity, rid the court of her favorites, had Pandolfello publicly beheaded, and sent the queen into retirement. An apparent reconciliation soon followed, but Joanna was no sooner allowed to resume her place at court than she succeeded by a stratagem in imprisoning her husband in one of the Neapolitan forts, from which he escaped with difficulty only to retire from the country, and to enter a monastery in Burgundy. The rule of favorites now began again, and the history of her reign for some years is little more than a record of intrigues, which, with the hatred of the people throughout the kingdom, gave rise

to constant feuds at court and insurrections in the country. The strife of parties was augmented by the conflicts between Louis III. of Anjou and Alfonso of Aragon, who claimed the succession to the throne. Joanna decided first for Alfonso, and then reversed her decision, and on Louis III.'s death changed her choice to another member of the Anjou house. Alfonso, however, was able to seize the throne, to which he succeeded in spite of his testamentary exclusion.

JOANNES, Island of. See MARAJÓ.

JOANNY, a French actor, whose real name was JEAN BAPTISTE BERNARD BRISSEBANE, born in Dijon, July 2, 1775, died in Paris, Jan. 5, 1849. He was a royal page, a student of art, a soldier, and a clerk in the civil service, before he appeared on the stage in 1797, where he acquired a reputation next to that of Talma, whom he succeeded at the Comédie Française in 1826. He excelled in personating Corneille's old Romans, and in Othello and kindred parts; and Victor Hugo ascribed the success of his play *Le roi s'amuse* to his acting. He retired in 1841, and published poetry and prose writings.

JOB, Book of, one of the canonical books of the Old Testament, so called from the name of the patriarch whose history it contains. According to the narrative contained in the introductory chapter, Job dwelt in the land of Uz (probably in the northern part of Arabia Deserta), was a man of eminent probity and piety, blessed with great riches in camels, sheep, and cattle, and highly reputed among the surrounding people. But God permitted Satan to put his virtue to the test. His oxen were stolen by the Sabæans, his sheep were consumed by fire from heaven, his camels were carried away by the Chaldeans, and his sons and daughters perished amid the ruins of a house overthrown by a whirlwind. He bore these calamities without repining, saying: "The Lord gave, and the Lord hath taken away; blessed be the name of the Lord." Then Satan was permitted to afflict his person. He was smitten with a terrible disease, and his wife counselled him to "curse God, and die" (properly rendered, according to Gesenius and others, "bless God"). Three friends, Eliphaz, Bildad, and Zophar, informed of his misfortunes, came to console him. The book consists chiefly of discussions between Job and his consolers on the question: Why do the righteous suffer? The burden of their argument, which is afterward taken up with some variation by another friend, Elihu, is that calamities are in proportion to sins, and that Job must have been guilty of great transgressions, or he would not be made to suffer so severely. They therefore admonish him to confess and repent of the guilt of which by his misfortunes he stands convicted. Job maintains, in opposition, that his afflictions are greater than his faults, that upright men are sometimes greatly afflicted, that God's justice does not always appear in the government of the world, and that he some-

times seems to act arbitrarily, as absolute Lord. At the conclusion the Lord himself addresses Job out of a whirlwind, condemning both his presumption in daring to criticise the Omnipotent, of whose ways he knows so little, and the false reasoning of his friends, who endeavored to vindicate Providence by accusing an innocent sufferer. Job acknowledges his nothingness, and is amply rewarded for his constancy. Of the author of this book nothing is known, and its age is variously estimated. Formerly it was generally believed, from the archaic character of its diction and descriptions, to be one of the most ancient books of the canon, and to have been originally written in old Hebrew or perhaps in Arabic. More recent expositors, as Gesenius, Umbreit, and De Wette, place it in the time of the Chaldean exile. Schlottmann, Delitzsch, and others refer it to the age of Solomon, or a still later one. In poetic sublimity the book is surpassed by no other in the Hebrew Scriptures, and in vigor of expression hardly equalled by any. Many of its passages, however, are exceedingly obscure.—The book of Job has been treated by many authors, among whom are De Pineda, (*Commentarii*, Madrid, 1597–1601, and later editions in Cologne, Antwerp, Venice, Paris, and Lyons), Schultens (1737), Umbreit (1824; English translation, Edinburgh, 1836–'7), Rosenmüller (1824), Ewald (1836), Lee (1837), Hirzel (1839; new ed., 1864), Heiligstedt (1847), Hahn (1849), Noyes (1850; new ed., 1867), Schlottmann (1851), Hengstenberg (1856; new ed., 1870), Conant (1856), Ebrard (1858), Renan (1859–'60), Delitzsch (1864; English translation, Edinburgh, 1866), Davidson (1862), Merx (1870), Hitzig (1874), and Green (New York, 1874).

JOBÉ-DUVAL, Armand Marie Félix, a French painter, born at Carhaix, Finistère, in 1825. He studied under Delaroche, and became known as a genre, portrait, and religious painter of the so-called Neo-Greek school, excelling by his delicate treatment of his subjects. He was adjunct mayor of Paris in 1870–'71, but resigned shortly after the installation of the commune, and subsequently became one of the municipal councillors. Among the best known of his numerous works are "The Painting of the Virgin" (1849), "The Toilet of a Bride" (1857), "The Jews expelled from Spain" (1857), and paintings of the life of St. Francis for the Paris church of Saint Louis en l'Île (1864).

JOBERT, Antoine Joseph, a French physician, known as Jobert de Lamballe, born in Brittany in 1799 or 1802, died in Paris, April 22, 1867. He took his degree of M. D. in 1828, and became one of the most distinguished surgeons of Paris, his new operations in diseases of the womb and his process of intussusception being generally adopted. In the latter part of his life he became insane. The French institute, of which he was a member, awarded a purse of 2,000 francs to his *Traité théorique et pratique des maladies chirurgicales du canal*

intestinal (2 vols., Paris, 1829). His other works relate to his specialty of uterine diseases and his process of intestinal intussusception (*invagination intestinale*), including *Traité de chirurgie plastique* (2 vols., 1849), with a sequel, *Traité des fistules vésico-vaginales* (1 vol., 1852); *Des appareils électriques et des poissons électriques* (1858); and *De la réunion en chirurgie* (1864).

JOB'S TEARS, the fruit of a grass which has long been in use in Catholic countries for the

Job's Tears.

beads of rosaries. This grass, *coix lachryma*, is a native of the East Indies, and was formerly treated as a greenhouse plant; it will flourish in the open air in the climate of New York; and as its seeds retain their vitality during the winter, numerous self-sown plants spring up where the plant stood the year before. It grows 2 or 3 ft. high, and before flowering has much the appearance of Indian corn; each root produces numerous stems and forms a large clump. The flowers are borne at the summit of the stems in a simple spike or branching panicle, and are monocious; their structure is quite unlike that of most grasses; the pistillate flower is enclosed by an egg-shaped involucre, from an orifice in the apex of which appears a slender stem which bears several staminate flowers; the stigmas of the flowers are protruded beyond the opening in the involucre to be fertilized; when this has taken place the staminate flowers fall away, and the formerly herbaceous involucre

Flower Spike.

becomes of a very hard and bony texture. When ripe the involucre is of the size of a large pea, somewhat pear-shaped, pearly white or of some shade of gray, with a hard enamelled surface. These involucre, or seeds as they are popularly regarded, were formerly, on account of their stony appearance, supposed to be useful as remedies for gravel and stone in the bladder, and are found in the works of the old herbalists as *lachryma Jobi*; the Chinese still regard them as medicinal, but they are not recognized by modern pharmacopœias. Their principal use, as beads, has been already mentioned; in some countries they are made up into necklaces, chaplets, and other personal ornaments. The plant is of the easiest culture. The seeds may be sown in place after the soil is warmed, or they may be sown under glass and be transplanted afterward. When loaded with its ripened tears, the plant is an interesting if not highly ornamental occupant of the border.

JO DAVIESS, the N. W. county of Illinois, bordering on Wisconsin, and separated from Iowa by the Mississippi river; area, 650 sq. m.; pop. in 1870, 27,820. The surface is moderately uneven, and the soil is fertile and watered by numerous small streams. The county abounds in lead ore, and also contains copper. The Mineral Point and Illinois Central railroads pass through it. The chief productions in 1870 were 283,613 bushels of wheat, 1,286,326 of Indian corn, 874,016 of oats, 201,015 of potatoes, 66,650 lbs. of wool, 32,476 of flax, 655,681 of butter, and 34,372 tons of hay. There were 8,528 horses, 10,309 milch cows, 18,329 other cattle, 17,517 sheep, and 34,591 swine; 4 manufactories of agricultural implements, 17 of carriages, 3 of pig lead, 3 of machinery, 2 of marble and stone work, 10 of saddlery and harness, 9 of tin, copper, and sheet-iron ware, 3 of woollen goods, 2 flour mills, and 7 breweries. Capital, Galena.

JODE, Pieter de, the elder, a Flemish engraver, born in Antwerp in 1570, died in 1634. He engraved at Venice Titian's "Virgin and Child," and other works, and executed in Paris one of the largest prints known, after Jean Cousin's "Last Judgment," which is in the Louvre. After his return to Antwerp he produced many other fine works, his "Christ giving the Keys to St. Peter," after Rubens, being his masterpiece.—His son **PETER** the younger also engraved many works after Vandyke, Rubens, and others.

JODELLE, Étienne, sieur de Lymodin, a French dramatic poet, born in Paris in 1532, died there in July, 1573. He published sonnets and odes at the age of 17, and endeavored to replace the mysteries and moralities by imitations of the Greek drama with choruses. His tragedy *Cléopâtre captive* (1552) achieved a brilliant success, despite its tediousness, he himself personating Cleopatra; and his tragedy *Didon* and comedy *Eugène, ou la rencontre*, were very popular. He was also known as an orator, architect, painter, and sculptor. His collected

works appeared in 1574; the best edition is that of Lyons, 1597.

JOEL, the second of the twelve Hebrew minor prophets, son of Pethuel. By some critics he is supposed to have prophesied in the reign of Uzziah, between about 800 and 780 B. C.; while according to Credner, Movers, Hitzig, and Meier, he lived in the early time of King Joash, and according to Hilgenfeld at the time of the Persian supremacy, shortly before the arrival of Ezra. The historical background seems, however, to determine the date of the prophecy. There is no mention of a king, and all is controlled by the ministers of religion, pointing to the minority of Joash under the guardianship of the high priest Jehoiada, about 870; and the absence of Assyrians in the enumeration of foreign enemies favors this early date. The book of Joel begins with announcing an extraordinary plague of locusts accompanied by drought. This is followed by promises of the divine forgiveness, of the restoration of the land to its former fertility, of spiritual blessings, and of the divine vengeance on the enemies of the chosen people. His descriptions rank, in sublimity, vividness, and purity of style, among the finest passages of Hebrew poetry. Among the more important commentators are Pocock (Oxford, 1691, and in Latin, Leipsic, 1695), Van Toll (Utrecht, 1700), Rosenmüller (Leipsic, 1836), Credner (Halle, 1831), Meier (Tübingen, 1841), and Umbreit (Hamburg, 1844); besides the works on the minor prophets by Henderson (London, 1845), Hitzig (1852), and Pusey (Oxford, 1861), and Ewald on the Old Testament prophets (2d ed., Göttingen, 1867).

JOGUES, Isaac, a French Jesuit missionary, born in Orleans, Jan. 10, 1607, killed by the Mohawks at Caughnawaga, N. Y., Oct. 18, 1646. He entered the Jesuit novitiate at Rouen in 1624, spent some years in teaching, studied theology in Paris, and was ordained in 1636. He had earnestly sought a foreign mission, and was sent to Canada, reaching Quebec July 2. He proceeded at once to the Huron country by the way of the St. Lawrence and Ottawa, and labored among the Hurons and Dinondadies under great danger and privations for several years. In 1642, with Father Raymbault, he penetrated westward to Sault Ste. Marie, where a number of Algonquin tribes were convened. He then accompanied a party of Hurons to Quebec to obtain supplies for the mission. On the way back they fell, Aug. 3, into an Iroquois ambuscade, and were nearly all killed or taken. The missionary was hurried away to the Mohawk by way of Lake Champlain, subjected to mutilation of the hands, and to the running of the gauntlet at the lake and in the village. Here he saw his associate, Goupil, tomahawked at his side; and although the Dutch endeavored to release him, he was reduced to the most cruel slavery. While he was with a fishing party on the Hudson, below Albany, his death was resolved

upon by the tribe, as the defeat of a war party was ascribed to a letter sent by him to his countrymen. At Albany the Dutch commander, aware of this, urged Jogues to escape. He succeeded with great difficulty, and reached a vessel in the river in August, 1643; but the tribe made such furious demands for their captive that Jogues was taken ashore again till the Mohawks were appeased. He then came to New Amsterdam (now New York), where Gov. Kieft received him kindly, and sent him to Europe in the first vessel. This ship had to put into Falmouth, England, whence he proceeded to France. He returned to Canada in time to witness the negotiations with the Iroquois at Three Rivers, July 12, 1644. In May, 1646, he set out with M. Bourdon to confirm the peace in the Mohawk castles, and on his way visited Lake George, to which he gave the name Lac St. Sacrement. Peace being to all appearance firmly established, he returned to prepare for the founding of a Mohawk mission. He set out Sept. 27, 1646, but was received as an enemy, diseases in the tribe being ascribed to a box left by him. He and his companion, Lalande, were almost immediately put to death. He wrote at Albany a long Latin letter describing his captivity, a description of New Netherland as he saw it, and an account of René Goupil. These with his letters have been published by the New York historical society (New York, 1847-'8); also his *Novum Belgium*, with translation and notes (4to, New York, 1862). A life of Jogues, by the Rev. Félix Martin, S. J., appeared at Paris in 1873.

JOHANNA ISLAND, called also ANZOOAN, or HINZUAN, the most frequented of the Comoro islands, in Mozambique channel, E. coast of Africa; area, about 400 sq. m.; pop. said to be about 20,000. It is extremely fertile and picturesque. Its centre rises into a single peak, 5,900 ft. above the sea.

JOHANNES SECUNDUS, a Dutch poet, whose true name was JAN EVERARD, born at the Hague, Nov. 14, 1511, died in Utrecht, Sept. 24, 1536. He gained while young the degree of LL. D., and had also some celebrity as a sculptor and painter. After travelling in Spain and Italy, he accompanied Charles V. on his expedition to Tunis. His poems are written in purely classical Latin, and the *Basia* ("Kisses," Utrecht, 1539) have been ranked by his admirers with the lyrics of Catullus. They have been repeatedly translated into the principal European languages; and an edition, with translations by different English scholars, and with notes, was published by Bohn (London, 1858). His *Opera Poetica*, consisting of elegies, odes, epigrams, and other poems, were published by his brothers, the poets N. G. and A. M. Everard (Paris, 1541; Göttingen, 1748; Leyden, 1821).

JOHANNISBERG. See GERMANY, WINES OF.

JOHANNOT. I. Charles Henri Alfred, a French artist, born in Offenbach, Hesse-Darmstadt, March 21, 1800, died in Paris, Dec. 7, 1837.

Having shown considerable talent as an engraver in Paris, in 1831 he attempted painting. His "Shipwreck of Don Juan" and "Cinq Mars" attracted the notice of Louis Philippe, who gave him several commissions, and at his death he was rising into eminence. II. Tony, brother of the preceding, born in Offenbach, Nov. 9, 1803, died in Paris, Aug. 4, 1852. In making designs for vignettes he displayed much talent. His illustrations for "Werther," Molière's works, "Gil Blas," the "Vicar of Wakefield," and Sterne's "Sentimental Journey" are well known.

JOHN, the name of 23 popes, of whom the following are the most important. I. John I, SAINT, born in Siena about 470, died in Rome, May 27, 526. He was a cardinal priest when he succeeded Hormisdas, Aug. 13, 523. Shortly after his election he was sent to Constantinople by the Arian king Theodoric, to obtain from the emperor Justin milder measures toward the eastern Arians. He was received with much honor by the emperor, whom he solemnly crowned in March, 525. Justin revoked all rigorous laws against the Arians, but refused to restore the churches taken from them. John, having returned to Italy, was imprisoned by Theodoric, treated with great rigor, and died in captivity. He is honored as a martyr in the western church, and his feast is celebrated on May 27. II. John VIII., born in Rome about 820, died there, Dec. 15, 882. He was cardinal-archdeacon when he succeeded Adrian II., Dec. 14, 872. From the beginning of his pontificate his partiality for the French made him odious to the Italians. He crowned Charles the Bald of France as emperor in 875, and in 876 deposed Formosus, bishop of Porto, reduced him to lay communion, and banished him to France, whence he bound him by oath never to return. The innocence of Formosus, who was afterward pope (891), is now generally admitted. John, having solicited in vain the help of Charles against the Saracens who occupied southern Italy and were threatening Rome, purchased peace by promising to pay them an annual tribute. After the death of Charles the Bald he supported the claims of Charles the Fat against his Italian rivals, crowned him at Ravenna in 877, and was compelled to fly to France in 878, where he presided over the council of Troyes and crowned Louis III. He returned to Rome in 879, and at the prayer of the Greek emperor Basil I. approved of the restoration of Photius to the see of Constantinople. Soon afterward he retracted this approbation, and pronounced against Photius a sentence of deposition. This vacillating conduct caused Baronius to say that in the pontificate of John VIII. the church was governed by a woman. John gave to the duke of Gaëta the district of Traetto and the town of Fondi, in order to induce him to take up arms against the Saracens. In 879 he summoned to Rome St. Methodius, apostle of the Slavs, and confirmed him as independent me-

tropolitan of the churches which he had founded. (See CYRIL AND METHODIUS.) He made many enemies by his arbitrary conduct and numerous excommunications, and died by violence. There are 326 letters by him extant.

III. John X. (GIOVANNI CENCI), born in Ravenna about 884, died in Rome, June 2, 928. According to Luitprand, bishop of Cremona, whose relation is discredited by Milman, Giovanni was successively appointed bishop of Bologna, Ravenna, and Rome, by the influence of the powerful and profligate Theodora. He was elected pope in 914, and displayed great energy against the Saracens. He crowned Berenger as king of Italy and emperor, March 24, 916. Uniting with the imperial army the forces of the dukes of Benevento and Naples, he led them against the Saracens intrenched in the territory of Garigliano, and utterly routed them. He confirmed the appointment to the see of Rheims of Hugo, five years old, son of Héribert, count of that city. Having resisted Marozia, the daughter of Theodora, who, with her husband Guido, duke of Tuscany, could brook no rival influence in Rome, he was cast by them into prison and suffocated there.

IV. John XI. (GIOVANNI CONTI), regarded by many as the son of Marozia, born in Rome between 905 and 910, died there in January, 936. He was raised to the papacy in 931, and was the mere tool of Marozia and the evil men who surrounded her. Her son Alberico, having excited the Romans to throw off her yoke, expelled her husband, King Hugo, made himself master of Rome with the title of consul, imprisoned his mother and the pope, and held them in captivity from 933 till the death of the latter.

V. John XII. (OTTAVIANO CONTI), son of Alberico and grandson of Marozia, born in Rome about 937, died there in 964. He was intruded into the papal office in 956, and assumed the name of John, being the first pope who thus changed his name. In 957 he took into his pay the troops of the duke of Spoleto, and marched at their head against Pandolfo, prince of Capua, who defeated him and compelled him to sue for peace. He invoked the aid of Otho the Great against Berenger II. Otho, having driven Berenger from Italy, entered Rome at the head of an army, and was crowned emperor of the West in February, 962. He secured to the pope his title to the States of the Church, and exacted from him the promise that he would hold no relation with Berenger. John violated this promise; and the emperor, incensed at his faithlessness, as well as at the loud complaints about his licentious life, returned to Rome in 963, and caused the pope to be degraded in an assembly of bishops held in St. Peter's in November, and the antipope Leo VIII. to be chosen in his stead. In 964, the Romans having revolted, John reentered Rome at the head of a large force, expelled Leo, and committed many atrocities. Otho was preparing to march once more toward Rome when the pope fell suddenly sick and died. **VI. John XXII.**

(JACQUES D'EUSE), born in Cahors, France, about 1244, died in Avignon in 1334. He was an Augustinian monk, and was transferred from the see of Fréjus to that of Avignon by Clement V., who also appointed him cardinal-bishop of Porto. He was elected pope at Lyons in August, 1316, and crowned there in September. His first act was to create one Italian and seven French cardinals, a step indicating a resolve to make the papacy a permanent French institution. French historians accordingly bestow great praise on this pope, while the Italians are unsparing in their censure. After the death of Henry VII. in 1313, the imperial crown was claimed by Louis of Bavaria and Frederick of Austria. John cited the contestants before him, and Louis refusing to appear, the pope excommunicated him. Louis appealed to a general council. The diet of Frankfort sustained him, declaring that the imperial authority depended upon God alone. The strife which existed in Italy between the Guelphs and Ghibellines made the latter espouse the cause of Louis, while the former sided with the pope. Robert, king of Naples, who aspired to be sole ruler in the peninsula, became the leader of the Guelphs, while Frederick, king of Sicily, with the Visconti, the Scalas, and the Estes, supported Louis. They were excommunicated as heretics, a crusade was preached against them, and pope and emperor sent armies to the assistance of their respective partisans. Louis entered Italy in 1327, was crowned at Milan with the iron crown, and at Rome with the imperial crown. In an assembly held in the square of St. Peter's he cited the pope to appear and answer to the charges of heresy and high treason, deposed him, sentenced him to be burned alive, appointed in his stead Pietro da Corvara, who assumed the name of Nicholas V., and made it a law that any pope residing out of Rome for more than three months should be considered as deposed. Louis returned to Germany, the leaders of the Ghibellines died soon afterward, and the Guelphs gradually gained the ascendancy. John was indefatigable in his exertions to save Christendom from Saracenic aggression, and succeeded in the last year of his life in forming against the Turks a league composed of the kings of France, Sicily, Cyprus, and Armenia, and of the Greek emperor Andronicus. He sanctioned the custom introduced by St. Bonaventura of ringing the church bells at sunset, and saluting the Virgin with three *Ave Marias* in honor of the incarnation. He confirmed the military order of Christ (March, 1319), founded by King Denis of Portugal, restrained the power of the Teutonic knights, who oppressed the new Christians of Lithuania, and canonized St. Thomas Aquinas. He deprived by statute the people of towns of the right of electing their bishops, established the custom of collecting "annates" or first fruits, and left at his death a well filled treasury. **VII. John XXIII.** (BALTISSARE COSSA), born in Naples about 1360, died in Florence, Nov.

22, 1419. St. Antoninus, archbishop of Florence, describes him as a man of great administrative ability, a clever politician, and a bold soldier, who had been in his youth a corsair; but as a priest he was ill calculated to advance spiritual interests. He was created cardinal in 1402, and was degraded from that dignity by Gregory XII. in punishment of his tyrannical conduct toward the Bolognese, but was restored to it by Alexander V., who reappointed him governor of Bologna. He was elected pope in May, 1410, after the death of Alexander. Benedict XIII. and Gregory XII. now divided with John the allegiance of Christendom. John wrote letters to the imperial electors to induce them to choose Sigismund of Luxemburg, king of Hungary, and he espoused the claims of Louis of Anjou to the kingdom of Naples, in opposition to the reigning king, Ladislas. He entered Rome in triumph with Louis in 1411, and, gathering all the troops he could muster, attacked and defeated Ladislas at Roccasecca in May. He published a crusade against him in the following December, and compelled him to forsake the party of Gregory XII. and submit to himself. He then broke off his relations with Louis of Anjou, and restored Ladislas to his kingdom, appointing him at the same time general of the Roman church, and furnishing him with money. But Ladislas soon afterward took possession of Rome and forced John to fly. The latter now had recourse to Sigismund, who urged him to assemble a council at Constance for the purpose of terminating the great western schism and reforming ecclesiastical abuses, with the assurance that John should be free to come and go during the council. After much hesitation he consented to the emperor's scheme, and opened the council in person, Nov. 5, 1414. Meanwhile the death of Ladislas had left Rome open to John, who repented of having yielded to the emperor's solicitations, and only watched for an opportunity of returning to Italy. On March 2, 1415, he bound himself by oath to renounce the pontifical dignity as soon as his rivals had abdicated; but he afterward refused to sign the act of renunciation, and fled from Constance disguised as a merchant under the protection of the duke of Austria, and took refuge at Freiburg. In May a sentence of deposition was pronounced against him by the council; and the duke of Austria gave him over to the emperor, who sent him a prisoner first to Heidelberg, and then to Munich, where he was detained for four years. John escaped in 1419, and making his way to Florence was kindly received by Martin V., who appointed him bishop of Frascati and dean of the college of cardinals.

JOHN, king of England, third sovereign of the house of Plantagenet, and fourth son of Henry II. and Eleanor of Aquitaine, born in Oxford, Dec. 24, 1166, died Oct. 19, 1216. The surname of Lackland (*Sansterre*), by which

he is often mentioned, was popularly given him because of the small possessions that devolved upon him, while the elder sons were all liberally provided for; and it was "the usual appellation of younger sons, whose fathers died during their minority, and who could not possess estates until they were of age to do the feudal services required for them." When he was seven years old his father bestowed property upon him in England and Normandy. A marriage between him and Alice, eldest daughter of the count of Savoy, was negotiated, but her early death prevented its completion. Henry II. made John lord of Ireland, and he went with a large army to that country in March, 1185, accompanied by his lord deputy, De Lacy, and Gerald Barry (*Giraldus Cambrensis*), the historian. His behavior was so imprudent that he became the object of almost universal abhorrence, and his father was compelled to recall him to England at the close of the year. John was Henry's favorite son, but he joined in the repeated rebellions of his brothers; and Henry's death was occasioned by his becoming informed that John's name stood at the head of the list of those barons who had joined Philip Augustus of France against him, though at that very time he was exerting himself to benefit the fortunes of the rebellious prince. Richard I., successor of Henry, bestowed large possessions upon John, then known as earl of Mortaigne, but that did not prevent him from behaving as unfraternally as he had behaved unfilially. Richard departed on his famous crusade, intending that, in case he should die childless, his successor should be Arthur, duke of Brittany, son of his brother Geoffrey, John's senior. When Richard on his return became a prisoner in Germany, John sought to render his imprisonment perpetual, and to seize the crown, raising forces, and doing homage to Philip Augustus for such portions of Normandy as he had not surrendered to him. He besieged places in England that were held by Richard's friends, asserted that his brother was dead, and demanded his own recognition as king. He did not succeed, and Richard returned to England in 1194, seized John's castle of Nottingham, and summoned him to take his trial for treason, he being then in France, whither Richard led an army. At the intercession of their mother, the king pardoned his brother, who remained faithful during the rest of Richard's life. Richard bequeathed to John all his dominions, and most of his treasure, and required that homage should be done him. John experienced little difficulty in obtaining possession of England and Normandy, and was crowned at Rouen, April 25, 1199, and at Westminster, May 27. His accession dates from April 6, but he was not regarded as king of England until he had been crowned. According to the rule of descent, the crown belonged to Arthur, duke of Brittany, and the mother of that prince, Constance, persuaded Philip Augustus to espouse his quarrel. Philip

seized Anjou, Touraine, and Maine for Arthur, and he was advancing into Normandy when John arrived there. After some negotiation, war was renewed; but the general of Arthur's forces, finding that the French king was acting for himself alone, effected a reconciliation between John and Arthur, which was of brief duration. The uncle sought to make away with his nephew, who fled back to Philip, accompanied by his mother. In 1200 a peace was made between John and Philip, the latter acknowledging John as Richard's heir, and forcing Arthur to do him homage for Brittany. John paid a large sum of money to Philip, the collection of which caused much trouble in England. The first demand for the privileges of Magna Charta was made by the barons in May, 1201, and refused, whereupon they declined accompanying him to Paris, which he visited in order to be present at the marriage of his niece with the dauphin, and the king seized their castles. John, who had put away his first wife, Avisa, because they were related within the forbidden degrees, married Isabella, daughter of the count of Angoulême, Aug. 24, 1200. This lady had been betrothed to Hugh de Lusignan, son of the count of La Marche, who challenged John to combat. John offered to fight by his champion, an offer which Lusignan treated with contempt, declaring that the king's champions were bravos. Arthur's claims having been renewed, and insurrections in his favor occurring in Anjou and Maine, Lusignan espoused his cause, and civil war broke out in Poitou and Normandy. Arthur and Lusignan besieged Eleanor of Aquitaine in the castle of Mirebeau, in Poitou, and John hastened to his mother's assistance. On Aug. 1, 1202, he defeated the besiegers in a pitched battle, killing or capturing them all. Arthur, then in his 16th year, was among the captives. He was imprisoned, and is supposed to have been put to death by his uncle, a belief quite in keeping with John's actions. John was accused by Philip Augustus of the murder, and was summoned to defend himself before the peers of France. He refused to attend, and the court pronounced judgment, that "whereas John, duke of Normandy, in violation of his oath to Philip his lord, had murdered the son of his elder brother, a homager of the crown of France, and had perpetrated the crime within the seignory of France, he was found guilty of felony and treason, and was therefore adjudged to forfeit all the lands which he held by homage." This decree of forfeiture was vigorously put in force by Philip, whose proceedings were aided by the discontent that prevailed in John's French possessions. In 1203 nearly all those possessions except Guienne were taken by Philip, and John fled to England. He had said, on hearing of Philip's captures of towns: "Let him take them, I will one day recover them; the English sterlings will restore all things." This would have been no idle boast had he been a popular monarch in England; but there he

was even more detested than he was in France. The name of Lackland was now revived for him. He landed with an army at La Rochelle in 1206, and took Angers, but then retired. He had received no aid from the English barons, whom he proceeded to fine frequently and heavily; and the archbishop of York cursed the collectors of the fines and left England. Those quarrels now began which ended in the granting of the great charter. John became involved in a contest with the church concerning the election of Cardinal Langton to the see of Canterbury, and Pope Innocent III. laid England under an interdict. The king seized the possessions of the church, and banished those who had occupied them. A bull of excommunication was issued in 1209, and John sought to prevent its promulgation in England, without which it could have no force. His fear was that Philip Augustus would attempt the conquest of England, under papal authority, and he maintained relations with some of that prince's neighbors. In the mean time he compelled William, king of Scotland, to acknowledge his supremacy, and effected conquests in Wales, dictating terms of peace to Prince Llewellyn. He also led a great army to Ireland, where he curbed the Norman colonists, divided the English possessions into counties, and established there the laws of England. He was guilty of acts of cruelty that shocked the sentiment of even that ferocious age. Of the captives whom he took in 1202, most of the principal men were starved to death in prison. On an insurrection occurring in Wales, he caused 28 hostages, all young nobles, to be executed. In 1213 the pope solemnly deposed John, and absolved his vassals from their allegiance. The French king prepared to enforce the sentence, and John assembled a numerous army to defend his kingdom; but as he could not rely upon its fidelity, he listened to the arguments of the nuncio, Pandulph, and resigned his kingdom to the pope, whose vassal he became. This act, so degrading to modern ideas, was not viewed so harshly then, and had many precedents; and the barons themselves acknowledged its validity. Pandulph proceeded to France, where he commanded Philip to put an end to his project of invasion, as England had become the patrimony of St. Peter. That monarch endeavored to turn his preparations to account by planning the conquest of Flanders, but he had ultimately to fight for his own dominions at Bovines. John invaded France, but accomplished nothing, though his fleet had previously defeated that of Philip. As he continued his course of misgovernment, a confederacy was formed against him by the nobility, at the head of which stood Archbishop Langton and the earl of Pembroke, and Robert Fitz-Walter commanded its forces. The king was compelled to submit to the barons, who forced him to make the grant known as Magna Charta, June 15, 1215. (See MAGNA CHARTA.) His submission was but momentary;

as soon as he could raise a foreign force, aided by the pope, who regarded the barons as rebels against himself, he resumed the war with success. The barons applied to France for aid, offering to make the dauphin Louis king of England. Louis entered England at the head of an army. John was about to fight a battle for his crown, when he lost his baggage, treasure, &c., in "the Wash." This affected his mind, and as he was ill at the time of the loss, his sickness so increased that he soon after died. His death was attributed to poison, and also to dysentery brought on by partaking freely of peaches and new cider. Modern England dates from the reign of John, whose cowardice and imbecility led to the loss of the greater part of the French possessions of his family, and so caused the Norman portion of the inhabitants of the island to regard the English as their countrymen. He was succeeded by his son Henry III.

JOHN II., surnamed **LE BON** (the Good, or rather the Gallant), king of France, the second of the Valois family, born about 1319, died in London in 1364. Succeeding his father Philip VI. in 1350, he indulged in such extravagant expenditures to celebrate his accession to the throne that he soon found the royal treasury exhausted, and had to summon the states general for a grant of money. His first measures were marked by despotism and cruelty. By his orders the great constable Raoul, count of Eu and Guines, whom he suspected of treacherous dealings with the English, was arrested and beheaded without any form of trial, while his office and property were given to Charles of Lacerda, a Spanish prince. The latter having been murdered at Laigle, Normandy, by Charles the Bad, king of Navarre, a friend of Raoul, King John came unexpectedly to Rouen, where Charles was entertained by the dauphin, made him a prisoner with his own hand, and caused four of his followers to be decapitated on the spot. Philip, brother of Charles of Navarre, and the count of Harcourt, uncle of one of the victims, appealed to Edward III. of England for vengeance. The English invaded France at once. King John met one of their armies, under the Black Prince, at Maupertuis, near Poitiers, and, elated by his superiority in numbers, attacked him imprudently, was defeated, Sept. 19, 1356, and carried prisoner first to Bordeaux, and then to London, his conquerors treating him with courtesy and distinction. During his captivity violent dissensions broke out in France, and the dauphin (afterward Charles V.), who had assumed the regency, was for a while unable to contend against the rising power of the third estate. At the end of three years John tried to regain his freedom by a humiliating treaty with Edward III., which was rejected by the states general of France. The disastrous peace of Bretigny (1360), however, provided for the liberation of the French king by the sacrifice to the English of some of the best French provinces and the payment of

a ransom of 3,000,000 crowns. On his return home, John, coming by inheritance into possession of the duchy of Burgundy, bestowed it on his fourth son, Philip the Bold, as a reward for his gallantry at the battle of Poitiers. Another son, the duke of Anjou, whom he had given as a hostage for the fulfilment of the treaty of Bretigny, having forfeited his word by running away from England, John thought himself in honor bound to return to captivity, saying, "If good faith were banished from earth, it ought to be still found in the hearts of kings." He consequently returned to London, and there died.

JOHN II. CASIMIR, king of Poland, born March 21, 1609, died in Nevers, France, Dec. 16, 1672. He was a younger son of Sigismund III., of the house of Vasa, by an Austrian princess, who was baffled in her schemes to procure him the throne by his loyal adherence to his elder half brother Ladislas, who after the death of Sigismund was elected king (1632). In 1638 he embarked at Genoa for Spain to negotiate a league with Philip III. against France; but suffering shipwreck on the coast of Provence, he was seized and by order of Richelieu imprisoned at Vincennes, where he remained two years, and was only released on promise of his brother the king of Poland never to wage war against France. He then travelled through various countries of western Europe, entered the order of Jesuits in Rome, was made cardinal by Innocent X., but after his return to Poland again became a layman, and, having succeeded his brother in 1648, married his widow Maria Luisa Gonzaga. His reign commenced amid the confusion and disasters caused by the great revolt of the Cossacks under Chmielnicki, who had advanced into the very heart of Poland. The power of the king had been stripped of almost all its prerogatives by the growing influence of the nobles. Russia and Sweden, which had long been active enemies of Poland, availed themselves of its distracted condition, and renewed their attacks. George Rákóczy of Transylvania, too, invaded the Polish territory, while diet after diet was dissolved by abuses of the *liberum veto*. Charles Gustavus of Sweden triumphantly marched through the country, and occupied Cracow (1655), John Casimir having fled to Silesia. Before Czentochowa, however, the Swedes met with an unexpected check, and a confederation of the nobles against all enemies of the country having been formed, Czar-niecki won a series of victories over the Swedes, Transylvanians, Cossacks, and Russians. The wars with the Swedes and Russians were terminated by treaties involving considerable cessions of provinces on the Baltic and the Dnieper on the part of Poland, which also lost its sway over the Cossacks, who put themselves under the protection of the czar. During these long disturbances John Casimir, though feeble and of a peaceful disposition, frequently proved his patriotism and

bravery. The intrigues of his wife in favor of the duke of Enghien, son of the prince of Condé, as successor to the throne, having brought about a rebellion under George Lubomirski, and a bloody though short civil war, the king finally resolved upon abdication, and resigned his crown at the diet of Warsaw, Sept. 16, 1668. In the following year he retired to France, where he was hospitably treated by Louis XIV. His wife had died without issue before his abdication. His body was removed to the cathedral of Cracow in 1676, his heart only being interred in St. Germain des Prés, of which Louis XIV. had made him abbot. John Casimir's reign was one of the most disastrous in the history of Poland, whose dismemberment by the houses of Moscow, Brandenburg, and Hapsburg, as it took place 100 years after his death, he predicted in a memorable speech to the diet of 1661.

JOHN III. SOBIESKI, king of Poland, born in the circle of Zloczów, then belonging to the palatinate of Belz, in 1629, or according to some in 1624, died June 17, 1696. His father, Jacob Sobieski, castellan of Cracow, carefully attended to the education of his two sons, of whom Marcus was the elder, and to complete it sent them to Paris. Here John entered the ranks of the musketeers of the young Louis XIV. under Condé; but on receiving the news of the death of King Ladislas IV. and the disasters caused by the bloody rising of the Cossacks (1648), both brothers hastened to their country and offered their services to the brother and successor of Ladislas, John Casimir. Both fought bravely, John especially distinguishing himself in the battle of Beresteczko (1651), but Marcus fell soon after. The invasion of Charles Gustavus of Sweden, and the simultaneous dangers which threatened Poland from every quarter, gave Sobieski ample opportunity to display his valor, and next to Czarniecki he was foremost in saving the country from ruin. His services were well rewarded, and shortly before the abdication of John Casimir he received the chief command of the army. In 1672 Poland was invaded by the Turks and Tartars, both of whose armies he successively surprised and defeated. The new king, Michael Korybut, being besieged by the Turks in the fortress of Kamenetz, concluded an ignominious treaty with the sultan; but Sobieski caused its rejection by the senate, hastened to Podolia, and routed the Turks at Khotin (1673). The news of the king's death arrived a few days later, and the commander and his followers hastened to Warsaw to attend to the election of a successor. This resulted, after stormy debates, in the choice of Sobieski, who immediately resumed the war, and rescued the fortress of Trembowla, which had been saved by the heroism of the wife of the commander. Another campaign was terminated less successfully by a treaty with the Turks at Zurawno, where Sobieski was nearly compelled to surrender with his comparatively small army.

The rising of the Hungarians under Tököli, and the invasion of the Mussulmans under the grand vizier Kara Mustapha, having brought Austria to the brink of ruin, Sobieski was persuaded by his wife and the ambassadors of the emperor and pope to hasten to the rescue of Vienna, which was besieged by an army of 300,000 men (1683). The Poles, numbering about one tenth as many, were joined by a somewhat larger body of German troops. Scarcely had they arrived before Vienna when Sobieski gave the signal for attack. The Turks were driven within their intrenchments, and attacked there on the next day (Sept. 12). The charge was terrible, and after a short struggle the Turks were completely routed. Sobieski made a triumphal entry into Vienna, and was hailed by all Europe as the saviour of Christendom. The emperor Leopold alone, who had fled from his capital, was too proud to receive cordially the hero who was "only an elected monarch." Sobieski pursued his success, following the enemy into Hungary, which was soon restored to the emperor. Returning to Poland, where the intrigues of his wife had created for him a large number of enemies, he made a disadvantageous peace with the czar, in order to be able to turn all his forces against the Turks. The conquest of Wallachia was the aim of this undertaking, in which he failed after various attempts. The last years of his life were embittered by civil as well as domestic troubles. Admired as a warrior, he was little esteemed by the Polish nation as a monarch, and after his death his three sons, Jacob, Constantine, and Alexander, were passed over at the election, which gave the crown of Poland to Augustus of Saxony.—The *Lettres du roi de Pologne, Jean Sobieski, à la reine Marie Casimire, pendant la campagne de Vienne*, were published in Paris in 1826.

JOHN (JOHANN NEPOMUK MARIA JOSEPH), king of Saxony, born in Dresden, Dec. 12, 1801, died there, Oct. 29, 1873. He was the youngest son of Duke Maximilian of Saxony and the princess Carolina of Parma. At the age of 20 he entered the ministry of finance, of which he was president until he retired in 1831. As a member of the upper house he took an active part in the discussion of the constitution of that year. He was commander of the national guard from 1831 to 1846. His brother, Frederick Augustus II., dying without issue, Aug. 9, 1854, he became king. He adopted a policy on eastern affairs hostile to the western powers, and in the war of 1866 took the side of Austria. The Prussians entered Saxony June 18, and the Saxon army, having withdrawn without a blow to Bohemia, fought against them in the battle of Königgrätz, July 3. Peace was concluded between Prussia and Saxony, Oct. 21, and the king returned to Dresden Nov. 3, having agreed to pay a large sum, and to cede the fortress of Königstein. Subsequently Saxony entered the North German confederation, and her troops, under command of the crown prince Albert,

took a conspicuous part in the Franco-Prussian war of 1870-71. King John early showed a taste for archæological study and Italian literature. He made a journey to Italy in 1838, and as the fruit of his studies published, under the pseudonyme Philalethes, a German translation of the *Divina Commedia* of Dante, with critical and historical notes of great value (Leipsic, 1839-'49; 2d ed., 1865). In 1824 he became president of the society of antiquaries of Saxony, and in 1852 and 1853 was president of the German society of history and antiquities. He left manuscript translations from the English of 70 poems, including several by Bryant.

JOHN (JOHANN BAPTIST JOSEPH), archduke of Austria, ninth son of the emperor Leopold II. and Maria Louisa of Spain, born in Florence, Jan. 20, 1782, died in Gratz, May 10, 1859. He was carefully educated, and in 1800, when but 18 years of age, was made commander-in-chief of the Austrian army. He pressed forward into Bavaria, encountered the French under Moreau at Hohenlinden, and suffered a grave defeat there (Dec. 3), which was quickly followed by a second at Salzburg (Dec. 14). After the conclusion of peace in February, 1801, he became director-in-chief of the departments of fortification and engineering throughout the empire. He especially interested himself in the welfare of Tyrol, and after serving as minister of war from 1803 to 1805, he was appointed in the latter year to command the army stationed in that province. After the separation of Tyrol from Austria, he planned through Hormayr the rising of the Tyrolese in 1809 against their new masters, and commanded with success the army operating there and in Italy, defeating the viceroy Eugene (April 16) in an important engagement near Sacile, but retreating when he heard of the critical situation of Vienna. On his retreat he suffered two defeats (on the Piave and at Raab), nor was an attempt to join his forces with those of his brother at Wagram attended with better fortune. He resigned his command soon after the peace of October, 1809, and was afterward but little concerned in military affairs. He lived in retirement in Gratz, a city on which he conferred many public benefits, till 1848, when he was elected vicar of the empire (*Reichsverweser*) by the Frankfort parliament. In this capacity he chiefly devoted himself to protecting the interests of the house of Austria against the growing preponderance of Prussia; and this course he continued after the nomination of the Prussian king as emperor. On the expiration of his term of office (Dec. 20, 1849), which in the mean while had become merely nominal, he again retired to Gratz. He contracted a morganatic marriage in 1827 with Anna Plochel, the daughter of a Styrian postmaster; and by her he left one son, the count of Meran.

JOHN, Eugenie, a German novelist, popularly known under the *nom de plume* of E. Marlitt, born at Arnstadt, Thuringia, Dec. 5, 1825.

She is the daughter of a painter, and on account of her fine voice was adopted in 1841 by the princess Matilda of Schwarzburg-Sondershausen, who had her educated, and enabled her to study music in Vienna during three years. She then appeared on the stage, but a sudden deafness made her return to Sondershausen as a companion of the princess. Her correspondents, struck with her attractive style, encouraged her to write novels, for which purpose she returned to Arnstadt in 1863. Her first work, *Die Zwölf Apostel*, appeared in the Leipzig *Gartenlaube* in 1865. She acquired celebrity in 1866 by her graphic and poetic delineations of German life in *Goldelse*; and in the same year she published *Blaubart*. Her subsequent works are *Das Geheimniss der alten Mamsell* (1867), *Reichsgräfin Gisela* (1869), *Das Haideprinzesschen* (1871), and *Die zweite Frau* (1874). Many of them have been translated into English by Mrs. Wister of Philadelphia.

JOHN, Knights of Saint. See SAINT JOHN, KNIGHTS OF.

JOHN OF AUSTRIA, Don, a Spanish general, natural son of the emperor Charles V., born in Ratisbon, probably in 1547, died near Namur, Oct. 1, 1578. His mother was Barbara Blomberg, said to have been originally a washerwoman; she at one time declared in a fit of passion that Don John was not the emperor's son, so that there still remains some doubt as to his origin, though Charles himself never entertained any. The child, at first called Geronimo, was carried to Spain and brought up with great care by the emperor's majordomo, Don Luis Quixada; but his parentage was concealed till after Charles's death in 1558, when a private letter to his son and successor Philip II. was found acknowledging him. Philip changed his name, gave him a splendid establishment at Madrid, and sent him to Alcalá to be educated. He was distinguished for beauty and for martial tastes and accomplishments. In 1565 he departed secretly for Barcelona to take part in the defence of Malta, but was compelled to return by command of the king. Philip manifested for him the tenderest affection, and his countrymen came in time to regard him with feelings little short of idolatry. In June, 1568, Don John sailed in command of an expedition against the Barbary corsairs, with Requesens as lieutenant, and returned triumphant at the end of eight months. In the same year the great insurrection of the Moriscos of Granada had broken out, and Don John was sent thither as nominal commander-in-chief, but hampered by a council to whose will he was obliged to defer. His first independent exploit was the capture of Galera, which fell Feb. 6, 1570, after immense losses on both sides, and all the inhabitants except a few women and children were by his order put to the sword, and the place was razed to the ground and sown with salt. Other successes followed rapidly until the final expulsion of the Moriscos from Granada, in which

Don John had but a subordinate share. In 1571 he was placed in command of the immense armament organized by the holy league against the Turks, which won the famous naval victory of Lepanto, Oct. 7. Although this success was not followed up, owing to the dissensions of the chiefs, and subsequently to the avoidance of battle by the Turks, all Europe rang with the praise of the young hero, and his ambition rose with his glory. In September, 1573, he made a descent on the Barbary coast, and captured Tunis, the fortifications of which he repaired and strengthened, although ordered by Philip to destroy them, and conceived the project of establishing a throne for himself on the ruins of Carthage. The pope favored the scheme, but the king thwarted it, and the next year Tunis was recaptured by the Turks. He then turned his attention northward, and, promised all the aid in the power of the pope, dreamed of liberating and marrying the captive Mary, queen of Scots, and reigning with her over all Britain, Elizabeth being dethroned. Opportunely, as it seemed, for this wild plan, he was appointed governor general of the Netherlands, and, disguised as a Moorish slave to one of his attendants, travelled secretly through France, and entered Luxemburg Nov. 4, 1576, the very day of the terrible massacre and pillage by the Spanish soldiery known as the "fury of Antwerp." Don John came with the contradictory instructions to conciliate the provinces, but concede nothing; but before he could procure his recognition as governor, he found himself obliged to sign the treaty called, after its ratification by Philip, the perpetual edict, and to send away the hated Spanish soldiers, on whom he had relied for carrying out his personal designs upon England. The edict ostensibly confirmed the "pacification of Ghent," concluded between the provinces just before his arrival, for the purpose of securing religious toleration; but William of Nassau, and the provinces of Holland and Zealand under his guidance, perceiving the duplicity of its stipulations, and the governor's insincerity, refused to accept it. Don John, for his own purposes, was sincerely desirous of establishing peace, but at the same time determined to maintain the royal supremacy and suppress heresy; and the long and harassing negotiations carried on with these irreconcilable aims, during which he made to no purpose unbounded offers of wealth and power to the prince of Orange, chafed his fiery spirit and embittered his hatred of the Netherlanders. At length he seized the castle of Namur, held for the states by a feeble garrison, but of which he had the right as governor to take peaceable possession, and recalled in small bodies and at intervals the troops he had sent to Lombardy, while in spite of the treaty he had all the time retained a numerous German force. Meantime the archduke Matthias of Austria, called in by a faction of nobles, had been nominally accepted by the states general as governor of the Neth-

erlands, while the real power was placed in the hands of William of Nassau; and on Dec. 7, 1577, Don John was formally deposed, and denounced as an infractor of the peace which he had sworn to maintain. The states had by great exertions raised a force equal to his own, but led by lukewarm nobles, which assembled near Namur, and then retired to seek a stronger position. The governor followed with his army, and his vanguard came up with them near Gembloux, Jan. 31, 1578. There, while they were struggling irregularly through a marsh, Alexander Farnese with a small body of cavalry attacked them by surprise, and almost annihilated them, many thousands being slain, all their equipments captured, and many prisoners carried off and put to death; while on the Spanish side scarcely a man was lost or a wound received. This stunning blow, however, Don John could not effectively follow up from want of resources, though he possessed himself of many towns. All through his administration he had received abundant promises, but very little substantial aid, from Philip II., who, by the intrigues of his minister Perez, had been led to suspect him of designs upon the throne; and he was forced to remain idly in his intrenched camp a league from Namur, while the provinces, more united than ever, were again gathering head under the exertions of William, and the duke of Alençon was threatening him with a French force from another quarter. Moreover, his own soldiers were dying in crowds of the plague; and he now heard of the assassination, by royal order, of his secretary and confidential friend Escovedo, whom he had sent to Madrid in the previous year to represent his grievances. (See PEREZ, ANTONIO.) At length he was carried off by a fever which had long been consuming him, dying in a wretched hovel hastily prepared for his reception. His body after death presented strong appearances of having been poisoned, but no other evidence of the fact has ever transpired. His funeral was celebrated with great pomp at Namur, and then his embalmed remains were by order of Philip, in order to save the expense of a public progress, divided into three parts and secretly transported through France in bags slung at the pomels of troopers. On their arrival in Spain they were reunited by wires, magnificently robed for presentation to Philip with a mockery of life, and then interred in the Escorial, in accordance with his wish, by the side of Charles V. He was succeeded in the government of the Netherlands by his nephew Alexander Farnese.

JOHN THE BAPTIST, the forerunner and relative of Christ, son of the priest Zacharias and Elizabeth, and cousin of the Virgin Mary, born at Juttah or at Hebron about 5 B. C., beheaded about the end of A. D. 28. The main particulars of his life are contained in the Gospel of Luke. His birth and office were foretold by the angel Gabriel to his father

as he was burning incense in the temple of Jerusalem. When Zacharias asked for some sign of the truth of the prophecy, his tongue was sealed, and he did not recover his speech till after the birth of the child. Six months after Elizabeth had conceived, she was visited by Mary, and at her salutation she felt the babe leap in her womb. John abode in the desert until, a short time before the ministry of Jesus, he appeared clothed with camel's hair and with a leathern girdle about his loins as a prophet in the country about the Dead sea, exhorting the people to repentance, and proclaiming the approach of the Messiah. Those who believed he baptized in the Jordan, announcing at the same time the coming of a mightier one, who should baptize them with the Holy Ghost and with fire. He recognized the Messiah in Jesus, who presented himself for baptism, and publicly declared him "the Lamb of God, that taketh away the sins of the world." It is not certain what were the relations between John and Jesus; but the disciples of the former were a separate sect after his death, and still exist in the East under the name of Sabians or Christians of St. John. On account of his censure of the marriage of Herod Antipas with his sister-in-law Herodias, John was imprisoned in the castle of Machærus, and probably it was there that he was beheaded at the instance of Herodias. His birth and death are commemorated by the Roman Catholic church respectively on June 24 and Aug. 29. In England he was formerly esteemed the patron of architects, and was held in special honor by the freemasons.—See, besides the different lives of Jesus, especially those by Hase and Neander, Witsius, *De Joanne Baptista* (in his *Miscellanea Sacra*, vol. ii.); Leopold, *Johannes der Täufer* (Hanover, 1825); and Von Rohden, *Johannes der Täufer* (Lübeck, 1838). The ecclesiastical traditions concerning John the Baptist are collected in the *Acta Sanctorum*, vol. iv., and in a compendious form in Tillemont's *Mémoires*, vol. i.

JOHN THE EVANGELIST, one of the apostles, son of the fisherman Zebedee and Salome, born in Bethsaida, on the lake of Galilee, died about A. D. 100. He followed the occupation of his parents, was probably a disciple of John the Baptist, and became when about 25 years old, with his brother James, a disciple of Jesus, whom he was one of the first constantly to accompany. It is believed that he was the youngest of the apostles, and the special attachment of the Saviour to him is expressed in his description of himself as "that disciple whom Jesus loved." He was present at the transfiguration, assisted in preparing the last supper, at which he reclined on the bosom of his master, and was the only disciple who accompanied Jesus to the cross. While hanging on the cross the Saviour confided his mother to the care of St. John. After the ascension John remained for a while at Jerusalem, but from this time Scriptural history is silent con-

cerning him. The traditions, however, agree that he afterward abode in Ephesus and Asia Minor. According to Jerome, he was arrested by command of the proconsul, and taken to Rome, where he was plunged into a vessel of boiling oil, but, as this did not harm him, he was banished in the year 95 to the island of Patmos. He was released after the death of Domitian, and died in the reign of Trajan, at a very advanced age. According to the same authority, he became toward the last so weak that he was obliged to be carried to the Christian assemblies, and when there could only say, "Love one another, my children." His festival is celebrated by the Roman Catholic church on Dec. 27. He is usually painted with a cup from which a serpent is issuing, in allusion to poison which was believed to have been offered him in a glass, from which he expelled the venom in the form of a serpent by making the sign of the cross.—The New Testament contains a Gospel, three epistles, and the Apocalypse, or book of Revelation, bearing his name. His Gospel gives the speeches of Christ more fully than the synoptic Gospels, but historical facts appear less prominently in it than the doctrines which are implied and established by the facts. According to the fathers, it was written at Ephesus or at Patmos in the latter part of the 1st century. The work of Bretschneider, *Probabilia de Evangelii et Epistolarum Johannis Apostoli Indole et Origine* (Leipsic, 1820), is the earliest attempt of importance to raise doubts of the genuineness of the Gospel. The subject is discussed by Strauss (in his *Leben Jesu*), Baur, Schwegler, and others, from a rationalistic standpoint; while it has been defended by Tholuck (*Glaubwürdigkeit der evangelischen Geschichte*) and others of note. See, besides the authors just mentioned, Ebrard, *Kritik der evangelischen Geschichte* (Zürich, 1850); Meier, *Commentar* (Göttingen, 1856; new ed., 1865-'6); Ewald, *Die Johanneischen Schriften* (2 vols., Göttingen, 1861-'2); Bleek, *Einleitung in das Neue Testament* (Berlin, 1862); Davidson, "Introduction to the New Testament" (London, 1868); and Roffhack, *Auslegung, &c.* (Leipsic, 1871).—The first epistle was probably addressed to Christian congregations in Asia Minor, which had been under the charge of the apostle, and urges love, devotion, and moral strictness. It consists of separate thoughts and precepts, with little logical connection. The most important works on this epistle are the commentaries of Sebastian Schmid (Leipsic, 1687, and many later editions) and Neander (Berlin, 1851; English translation by Mrs. Conant, New York, 1852). The second epistle is addressed to a lady of rank, called "the elect lady," supposed by some to refer to a Christian church. The third epistle is addressed to Gaius, who is commended for his hospitality to the faithful, and contains, like the first, allusions to Gnostic errors. (For the book of Revelation, see APOCALYPSE.)

JOHN THE FEARLESS, duke of Burgundy, born about 1370, assassinated Sept. 10, 1419. He was the son of Philip the Bold, whom he succeeded in 1404, and took immediate measures to secure for himself the influence which his father had possessed in the government of France. He was opposed by the queen and the duke of Orleans, brother of the king. The duke of Orleans was murdered in Paris by assassins hired by John in 1407. A civil war ensued, in which John was supported by Henry IV. of England (1411); it was suspended by the treaty of Arras in 1414. In 1416 John entered into a secret alliance with Henry V. of England, and soon overran a great part of France, and in 1418 obtained possession of the king's person. A plot was formed to assassinate him, in pursuance of which he was invited to meet the dauphin on the bridge of Montereau. He went there with an escort slightly armed, and perished with many of his companions, the rest escaping by flight. He was succeeded by his son Philip the Good.

JOHN OF GAUNT (or **GHEENT**), duke of Lancaster, fourth son of Edward III., born in Ghent in 1340, died Feb. 3, 1399. He distinguished himself for valor in the wars of his brother the Black Prince in France, and succeeded to his government in that country. In 1359 he married the lady Blanche, daughter and heiress of Henry Plantagenet; she bore him a son who in 1399 became the first English king of the house of Lancaster, as Henry IV. After her death he married in 1370 Constance, daughter of Pedro the Cruel of Castile, and assumed the arms and title of king of Castile, but returned to England within less than a year after his brother. There he defended Wycliffe, and was often suspected of aiming at the crown. He resigned his pretensions to the throne of Castile when his daughter Catharine married the heir apparent of that kingdom. John of Gaunt's third wife was Catharine Swynford, governess of his children, by whom he had three sons and one daughter before their marriage. These were legitimated, and one of them, John de Beaufort, earl of Somerset, was an ancestor of the Tudors.

JOHN OF LEYDEN, a Dutch fanatic, born about 1510, put to death in Münster, Westphalia, in January, 1536. His true name was John Boccold or Bockelson, and he was the son of a magistrate of the Hague, and worked in that city at the trade of a tailor. In 1533 he joined the Anabaptists in Münster, where he assisted Matthias of Haarlem in the rebellion of that year, and after his death assumed power as a prophet. On June 24, 1534, he was crowned with the title king of Zion. He appointed 12 judges to administer his government, assumed princely state and luxury, introduced polygamy, marrying 15 wives, and the city was given up to excesses of fanaticism and lust. He issued proclamations against neighboring rulers, and sent out more than 20 apostles, who preached

his doctrine, though they rejected many of his excesses. He coined money, specimens of which, silver pieces with his stamp, are in the museum of Hanover. Being besieged by the bishop of Münster, discontent and rebellion broke out among his followers, which he repressed with much cruelty and bloodshed, executing one of his wives with his own hand. The city was taken by treachery in the night of June 24, 1535, and he was made prisoner. He was sent through the country in an iron cage, and at length, together with two of his companions, was tortured to death with hot pincers. Their caged bodies were hung upon the tower of St. Lambert's church, where the cages are still to be seen. His house in Münster is yet standing. (See ANABAPTISTS.)

JOHN OF SALISBURY, called also **JOHANNES PARVUS** (John the Little), an English scholastic philosopher, born in the old town of Salisbury (Old Sarum) about 1120, died in Chartres, France, Oct. 25, 1180. He studied at Oxford, and in 1136 passed over to France, where he attended the lectures of Abélard and others. He opened a school in Paris about 1140, but with little success, and on account of his poverty retired to the abbey of Montier-la-Celle. About 1151 he returned to England, and was appointed secretary to Theobald, archbishop of Canterbury, who introduced him to his future successor Thomas à Becket. He was sent on important diplomatic missions to Popes Eugenius III., Anastasius IV., and Adrian IV., with the last of whom he was an especial favorite. He was the secretary of Becket when he became archbishop of Canterbury, was called his eye and his arm, supported him in his contest with Henry II., shared his exile and disgrace, and returned with him to England. In 1176 he was elected bishop of Chartres, and passed the rest of his life in his diocese. He was highly reputed not only as a scholar, but as a poet and orator. His most important works are *Polycraticus, sive de Curialium Nugis et Vestigiis Philosophorum*, an erudite and caustic satire on the follies of courtiers and philosophers, and *Metalogicus*, in which he vindicates the studies of the schools against the sneers and outcries of the ignorant. His complete works were first collected by J. A. Giles (5 vols., Oxford, 1848).

JOHN SCOTUS. See ERIGENA.

JOHN OF SWABIA, or **John the Parricide**, a German prince, born in 1289, died in 1313 or 1368. He was a son of Duke Rudolph of Swabia and nephew of the emperor Albert I., the son and successor of Rudolph of Hapsburg. On attaining his majority he claimed the possessions to which he was entitled in Austria and Bohemia, but the emperor would not even surrender the county of Kyburg, which had been bequeathed to John by his mother Agnes of Bohemia. The prince thereupon entered into a conspiracy with a number of discontented noblemen, with the assistance of three of whom he murdered his uncle the emperor,

May 1, 1308, near Windisch, in Switzerland, assailing him as he was crossing the river Reuss on his way to Brugg. The murderers, who had been disguised as monks, escaped separately, and John fled to Italy, where according to some accounts he ended his life in Pisa, April 13, 1313, after having received absolution from Pope Clement V. at Avignon. But this story is doubtful, as well as that of his having spent the rest of his life as a hermit on his estate of Eigen without being recognized, and that he only made himself known at the time of his death in 1368. The emperor's daughter Agnes, the widow of Andrew III. of Hungary, and her mother, the dowager empress Elizabeth, being unable to lay hands on the conspirators, doomed to death thousands of their innocent relatives, friends, and vassals, destroying their abodes and confiscating their property. One of the conspirators, Rudolph von Palm, was beheaded in the presence of Agnes and Elizabeth, with 63 other knights and their armbearers, while Agnes held a wreath of roses in her hand and exclaimed exultingly that "she was bathing in the dew of May," referring to the shedding of her father's blood on the first of May. Rudolph von der Wart, another conspirator, having been surrendered by the Burgundian count Blamont, to whom he had fled, was broken on the wheel after having been submitted in his wife's presence to fearful tortures. Part of the proceeds of her victims' estates was appropriated by Agnes toward the establishment of the nunnery of Königsfelden, on the site where her father had been slain, and where she died, May 13, 1364, but without having been able to satiate her revenge on John himself. He was however outlawed by her father's successor, Henry VII. of Luxemburg. Schiller introduces John in his *Wilhelm Tell*.

JOHNSON, the name of eleven counties in the United States. **I.** An E. central county of Georgia, bounded W. by the Oconee river, and drained by the Great Ohoopsee; area, about 250 sq. m.; pop. in 1870, 2,964, of whom 915 were colored. The surface is undulating. The chief productions in 1870 were 47,229 bushels of Indian corn, 7,168 of sweet potatoes, and 1,558 bales of cotton. There were 374 horses, 680 milch cows, 755 other cattle, 1,306 sheep, and 4,571 swine. Capital, Wrightsville. **II.** A N. E. county of Texas, bounded S. W. by Brazos river; area, 594 sq. m.; pop. in 1870, 4,923, of whom 279 were colored. The surface is undulating; the soil is well adapted to wheat, and is generally fertile. Prairie and timber lands are distributed in nearly equal quantities. The chief productions in 1870 were 5,694 bushels of wheat, 155,435 of Indian corn, 6,718 of oats, 7,297 of sweet potatoes, and 1,212 bales of cotton. There were 6,343 horses, 2,549 milch cows, 16,396 other cattle, 1,212 sheep, and 8,758 swine. Capital, Cleburn. **III.** A N. W. county of Arkansas, bounded S. by Arkansas river, which is here navigable by steamboats; area,

576 sq. m.; pop. in 1870, 9,152, of whom 613 were colored. The surface is moderately uneven, and the soil is fertile, but not uniformly so. The Little Rock and Fort Smith railroad passes through it. The chief productions in 1870 were 13,864 bushels of wheat, 275,185 of Indian corn, 21,159 of oats, 7,048 of Irish and 16,890 of sweet potatoes, 11,915 lbs. of tobacco, 70,493 of butter, and 4,489 bales of cotton. There were 3,341 horses, 2,958 milch cows, 4,708 other cattle, 3,135 sheep, and 18,906 swine. Capital, Clarksville. **IV.** The N. E. county of Tennessee, bordering on Virginia and North Carolina, and having the Alleghany mountains on its S. E. boundary; area, 300 sq. m.; pop. in 1870, 5,852, of whom 418 were colored. It is watered by Watauga river and its branches. The surface is mountainous and thickly wooded, and the county is rich in iron. The chief productions in 1870 were 16,484 bushels of wheat, 13,397 of rye, 85,782 of Indian corn, 34,682 of oats, 10,671 of potatoes, 11,333 lbs. of wool, 72,041 of butter, and 1,513 tons of hay. There were 951 horses, 1,601 milch cows, 2,579 other cattle, 6,004 sheep, 5,271 swine, and 7 iron forges and rolling mills. Capital, Taylorsville. **V.** An E. county of Kentucky, traversed by the W. fork of Big Sandy river; area, 140 sq. m.; pop. in 1870, 7,494, of whom 37 were colored. It abounds in sandstone and coal, and has a hilly surface with a sandy but fertile soil. The chief productions in 1870 were 9,482 bushels of wheat, 256,256 of Indian corn, 30,310 of oats, 13,341 of potatoes, 14,481 lbs. of tobacco, 13,798 of wool, and 81,082 of butter. There were 1,129 horses, 1,537 milch cows, 1,088 working oxen, 2,352 other cattle, 8,105 sheep, and 9,277 swine. Capital, Paintville. **VI.** A central county of Indiana, watered by the W. fork of White river and several smaller streams; area, 320 sq. m.; pop. in 1870, 18,366. The surface is moderately uneven, and the soil is chiefly a rich loam. The Jeffersonville, Madison, and Indianapolis and the Cincinnati and Martinsville railroads traverse it. The chief productions in 1870 were 544,917 bushels of wheat, 1,240,221 of Indian corn, 50,392 of potatoes, 45,363 lbs. of wool, 300,915 of butter, and 6,376 tons of hay. There were 6,319 horses, 4,279 milch cows, 8,233 other cattle, 13,775 sheep, and 30,006 swine; 2 manufactories of agricultural implements, 11 of brick, 13 of carriages, 3 of clothing, 7 of cooperage, 5 of brick and stone masonry, 8 of saddlery and harness, 1 of starch, 2 of woollen goods, 2 leather-carrying establishments, 11 flour mills, 2 planing mills, and 14 saw mills. Capital, Franklin. **VII.** A S. county of Illinois, drained by Cache river; area, 486 sq. m.; pop. in 1870, 11,248. It has a level surface and a good soil. The chief productions in 1870 were 92,191 bushels of wheat, 343,298 of Indian corn, 74,525 of oats, 19,764 of Irish and 7,076 of sweet potatoes, 307,013 lbs. of tobacco, 21,663 of wool, 99,725 of butter, 2,327 tons of hay, and 33 bales of cotton. There

were 2,247 horses, 926 mules and asses, 1,846 milch cows, 2,202 other cattle, 9,563 sheep, and 13,988 swine. Capital, Vienna. **VIII.** A S. E. county of Iowa, drained by Iowa river, which is navigable by small steamboats in the S. part; area, 324 sq. m.; pop. in 1870, 24,898. The surface is moderately uneven and the soil remarkably fertile. The Chicago, Rock Island, and Pacific railroad passes through it. The chief productions in 1870 were 503,141 bushels of wheat, 2,147,570 of Indian corn, 491,137 of oats, 104,889 of potatoes, 674,500 lbs. of flax, 69,796 of wool, 594,573 of butter, 32,962 of cheese, and 40,659 tons of hay. There were 9,989 horses, 9,628 milch cows, 15,902 other cattle, 16,975 sheep, and 40,456 swine; 7 manufacturing of carriages, 1 of linseed oil, 1 of wrapping paper, 5 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 2 of woollen goods, 3 breweries, 6 flour mills, 1 planing mill, and 4 saw mills. Capital, Iowa City. **IX.** A W. county of Missouri, drained by branches of Black river; area, 785 sq. m.; pop. in 1870, 24,648, of whom 1,458 were colored. The surface is mostly prairie, diversified with large tracts of timber. The soil is generally good and suitable for pasturage, and there are rich beds of coal. The Pacific railroad of Missouri passes through it. The chief productions in 1870 were 462,990 bushels of wheat, 1,946,741 of Indian corn, 356,351 of oats, 106,731 of potatoes, 18,700 lbs. of tobacco, 43,256 of wool, 367,464 of butter, and 12,049 tons of hay. There were 9,732 horses, 2,137 mules and asses, 7,161 milch cows, 14,516 other cattle, 16,865 sheep, and 36,152 swine; 2 manufacturing of agricultural implements, 5 of carriages, 1 of iron castings, 6 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 5 flour mills, and 3 saw mills. Capital, Warrensburg. **X.** An E. county of Kansas, bordering on Missouri, and bounded N. W. by Kansas river; area, 472 sq. m.; pop. in 1870, 13,684. It is watered by several streams, and has a fertile soil. The Kansas City and Santa Fé division of the Leavenworth, Lawrence, and Galveston railroad, and the Missouri River, Fort Scott, and Gulf line pass through the county. The chief productions in 1870 were 71,835 bushels of wheat, 1,074,186 of Indian corn, 335,056 of oats, 112,046 of potatoes, 219,358 lbs. of butter, 24,850 of cheese, and 16,399 tons of hay. There were 4,798 horses, 4,518 milch cows, 6,701 other cattle, 3,691 sheep, and 10,342 swine. Capital, Olathe. **XI.** A S. E. county of Nebraska, intersected by the Big Nemaha river, and drained by the S. fork of the Little Nemaha; area, about 375 sq. m.; pop. in 1870, 3,429. It contains extensive fertile prairies, with good timber along the streams. Coal and limestone are abundant. The chief productions in 1870 were 81,454 bushels of wheat, 113,495 of Indian corn, 32,914 of oats, 21,341 of potatoes, 58,107 lbs. of butter, and 4,545 tons of hay. There were 671 horses, 533 milch cows, 999 other cattle, and 1,442 swine. Capital, Tecumseh.

JOHNSON, Alexander Bryan, an American author, born at Gosport, England, May 29, 1786, died in Utica, N. Y., Sept. 9, 1867. He came to the United States in 1801, and settled at Utica, where he was a banker for many years. He was admitted to the bar, but never practised. From his youth he had given all his leisure to the study of problems in intellectual philosophy, and especially of the relations between knowledge and language. He attempted to show the ultimate meaning of words, apart from their meaning as related to each other in ordinary definition, and thus to ascertain the nature of human knowledge as it exists independent of the words in which it is expressed. His publications include "Philosophy of Human Knowledge, or a Treatise on Language" (New York, 1828); "Treatise on Language, or the Relation which Words bear to Things" (1836); "Religion in its Relation to the Present Life" (1840), in which he aims to establish the congruity of Christian precepts with man's physical, intellectual, and emotional nature; "The Meaning of Words Analyzed into Words and Unverbal Things, and Unverbal Things Classified into Intellections, Sensations, and Emotions" (1854), in which he confesses that he had been 50 years in arriving at a clear comprehension of the object of his search; "Physiology of the Senses, or How and What we See, Hear, Taste, Feel, and Smell" (1856); "Encyclopædia of Instruction, or Apologues and Breviates on Men and Manners" (1857); and several works on financial and political topics.

JOHNSON, Andrew, seventeenth president of the United States, born in Raleigh, N. C., Dec. 29, 1808. His father, Jacob Johnson, who died in 1812, was city constable, sexton, and porter of the state bank. Extreme poverty prevented Andrew from receiving any schooling, and at the age of 10 he was apprenticed to Mr. Selby, a tailor. A gentleman was in the habit of visiting the shop and reading to the workmen, generally from "The American Speaker;" and Andrew became intensely interested, especially in the extracts from the speeches of Pitt and Fox. He determined to learn to read, and having done this, he devoted all his leisure hours to the perusal of such books as he could obtain. In the summer of 1824, a few months before his apprenticeship expired, he got into trouble by throwing stones at an old woman's house, and ran away to avoid the consequences. He went to Laurens Court House, S. C., and obtained work as a journeyman tailor. In May, 1826, he returned to Raleigh. Mr. Selby had moved into the country, and Johnson walked 20 miles to see him, apologized for his misdemeanor, and promised to pay him for the unfulfilled portion of his apprenticeship. Selby required security, which Johnson could not furnish; and in September he went to Tennessee, taking with him his mother, who was dependent upon him for support. He worked for

a year at Greenville, during which time he married, and, after a vain search for a more desirable home further west, finally settled there. Thus far his education had been limited to reading; but now, under his wife's instruction, he learned to write and cipher. Taking an interest in local politics, he organized in 1828 a working men's party, to oppose the so-called aristocratic element which had always ruled the town. Considerable excitement ensued, and Johnson was elected alderman by a large majority. He was reelected in each of the two following years, and in 1830 was chosen mayor, which office he held three years. During a portion of this time he was prominent in a debating society formed by some young men of the neighborhood and students of Greenville college. One of the students says: "On approaching the village, there stood on the hill by the highway a solitary little house, perhaps ten feet square. We invariably entered when passing. It contained a bed, two or three stools, and a tailor's platform. Here we delighted to stop, because one lived here whom we knew outside of school, and made us welcome; one who would amuse us by his social good nature, taking more than ordinary interest in catering to our pleasure." In 1834 the county court elected Johnson a trustee of Rhea academy; and in that year he was also active in securing the adoption of the new constitution of the state. In the summer of 1835 he offered himself as candidate for a seat in the lower house of the legislature, and announced that he was a democrat. Meeting with a cool reception from the leaders of that party, he entered the canvass personally, and in his first speech made such a vigorous and well sustained attack on the political career of his whig opponent that their opposition soon ceased, and he was elected. The most important measure brought before that legislature was a bill which involved the state in a debt of \$4,000,000, for a vast scheme of internal improvements, consisting chiefly of macadamized and turnpike roads. Johnson strenuously opposed it, on the ground that no such debt should be incurred until the question had been submitted to the people, and predicted that the scheme would only result in a squandering of the money, without securing the benefits it promised. The bill became a law, and was so popular that in the election of 1837 Johnson failed to be returned to his seat. But before the expiration of the next two years the evils he predicted had developed themselves; many of the works were abandoned, and some of the companies had defrauded the state. In 1839 he was again elected. In the presidential contest of 1840 he canvassed eastern Tennessee in favor of Mr. Van Buren, and was a candidate on the democratic ticket for elector at large. In 1841 he was elected to the state senate, into which he introduced a judicious measure for internal improvements in the eastern part of the state. He was elected

to congress from the first district of Tennessee in 1843, took his seat in December of that year, and held it by successive reëlections for ten years. During this time he advocated the bill refunding the tax imposed on Gen. Jackson at New Orleans, the annexation of Texas, the war with Mexico, the tariff of 1846, and general retrenchment in the expenses of the government. He sustained President Polk in his acceptance of the parallel of 49° as a settlement of the Oregon boundary question, and was conspicuous in urging the passage of a homestead law. On Aug. 2, 1848, he delivered an elaborate speech in favor of the veto power. In 1853 he was elected governor of Tennessee, over Gustavus A. Henry, the whig candidate; and in 1855 he was reelected, over Meredith P. Gentry, candidate of the whigs and the "know-nothings." The contest was exciting, and violence and threats of murder were frequent. At one meeting Johnson appeared with a pistol in his hand, laid it on the desk, and said: "Fellow citizens, I have been informed that part of the business to be transacted on the present occasion is the assassination of the individual who now has the honor of addressing you. I beg respectfully to propose that this be the first business in order. Therefore if any man has come here to-night for the purpose indicated, I do not say to him, let him speak, but let him shoot." After pausing for a moment, with his hand on his pistol, he said: "Gentlemen, it appears that I have been misinformed. I will now proceed to address you on the subject that has called us together."—On Dec. 7, 1857, Mr. Johnson took his seat in the United States senate, to which he had been elected for a full term by the legislature of Tennessee. Here, as in the lower house, he persistently urged the passage of a bill giving 160 acres of the public land to any citizen who would settle upon it and cultivate it a certain number of years; and he was soon recognized as the leading advocate of that measure. The bill was finally passed by more than a two-thirds vote in each house; but President Buchanan vetoed it, and the veto was sustained. In 1858 Johnson was one of the foremost opponents of the bill introduced by Jefferson Davis to increase the standing army because of the troubles in Utah, and offered a substitute which authorized the raising of 4,000 volunteers, to be dismissed when the trouble was over; which was modified so as to authorize two regiments of 18-months' men, and passed. In 1859 he was conspicuous in his efforts to secure the passage of a bill to retrench the government expenses, and in his opposition to the Pacific railroad. On the question of slavery, Johnson as a southern man and a democrat generally went with his party. He accepted slavery as an existing institution, protected by the constitution, but believed it would some day come to an end, and held that it must be kept subordinate to the Union at every hazard. He opposed the compromise measures of 1850, but finally voted for

them. In the Charleston-Baltimore democratic convention of 1860 he was the presidential candidate of the Tennessee delegation. In the canvass which followed he supported Breckenridge and Lane, the candidates of the ultra southern wing of his party. But when the purposes of the leaders of that wing became apparent, and secession was actually introduced, he took ground against them, and in a speech delivered in the senate, Dec. 18 and 19, set forth the injustice and folly of the movement, and placed himself unreservedly on the side of the government. The legislature of Tennessee having voted the state out of the Union, in spite of the fact that the people had voted down a proposition for a convention on the subject, a reign of terror began there, and Johnson, returning home in May, 1861, was in peril of his life. On one occasion a mob entered a railroad car with the intention of lynching him; but he met them boldly, pistol in hand, and they retired. In nearly every city of the state he was burned in effigy. He took a prominent part in the East Tennessee Union convention of May 30, and on his arrival at Cincinnati (June 19) he received an ovation from the loyal citizens. On Jan. 31, 1862, he spoke in favor of the expulsion from the senate of Jesse D. Bright of Indiana. In the winter of 1861-'2 large numbers of Unionists were driven from their homes in East Tennessee, and sought refuge in Kentucky. Mr. Johnson met them there, relieved the immediate wants of many from his own purse, and used his influence with the government for the establishment of Camp Dick Robinson, where these refugees found shelter, food, and clothing, and were to a large extent organized into companies and mustered into the national service. His own wife and child had been turned out of their home, and his nine slaves confiscated.—On March 4, 1862, President Lincoln nominated Andrew Johnson to be military governor of Tennessee; the senate confirmed the nomination; and on the 12th of that month he reached Nashville and assumed the duties of the office. The insurgent state government had been moved to Memphis when the capital was occupied by national troops. On March 18 Governor Johnson issued a proclamation which recited briefly the history of the state, the means by which it had been placed in hostility to the federal government, the reestablishment of the national authority, and the abdication of the governor and dissolution of the legislature; announced his own appointment as military governor, and his purpose to fill the state and county offices by appointment until order could be restored; and declared that, "while it may become necessary, in vindicating the violated majesty of the law and reasserting its imperial sway, to punish intelligent and conscious treason in high places, no merely retaliatory or vindictive policy will be adopted." This proclamation attracted wide attention, because it was looked

upon as indicating the policy of the federal administration; but it produced little effect on the secession element in Tennessee. He next addressed a letter to the mayor and council of Nashville, requiring them to take the oath of allegiance. They refused, and he immediately declared their offices vacant, and appointed other citizens to fill them temporarily. Two months later, to protect Unionists from outrage at the hands of roving bands of secessionists, he issued a proclamation of which the following is the essential portion: "In every instance in which a Union man is arrested and maltreated by the marauding bands aforesaid, five or more rebels, from the most prominent in the immediate neighborhood, shall be arrested, imprisoned, and otherwise dealt with as the nature of the case may require; and further, in all cases where the property of citizens loyal to the government of the United States is taken or destroyed, full and ample remuneration shall be made to them out of the property of such rebels in the vicinity as have sympathized with, and given aid, comfort, information, or encouragement to the parties committing such depredations." Three days after issuing this proclamation, he addressed a Union meeting at Nashville in a three-hour speech, which was most enthusiastically received. Here the tide of affairs seemed to turn, and similar meetings in various parts of the state greatly strengthened the Union cause. But Tennessee was still overrun by guerillas, and Johnson pursued his task amid continual personal peril. He showed courage and ability in maintaining order in Nashville while it was threatened by Gen. Bragg, and preventing the evacuation or surrender of the place, in providing for Union refugees, and in raising troops for the government. On Dec. 8, 1862, he issued a proclamation ordering elections to fill vacancies in the 37th congress; and on the 15th an order levying five monthly assessments on certain citizens of Nashville, "in behalf of the many helpless widows, wives, and children in the city of Nashville who have been reduced to poverty and wretchedness in consequence of their husbands, sons, and fathers having been forced into the armies of this unholy and nefarious rebellion." On Feb. 20, 1863, he issued a proclamation warning all persons who occupied property belonging to "traitors" not to pay the rents until a person should be appointed to receive them in the name of the United States. In a speech at Columbus, Ohio, March 3, he expressed his belief that slavery would be extinguished by the war, but declared that the emancipation proclamation would not at all affect the question. On the first Saturday in March, 1864, by his order, elections were held for state and county officers, and the usual machinery of civil government was once more set in motion.—On June 7, 1864, the republican convention at Baltimore, having renominated Mr. Lincoln for the presidency, nominated Andrew Johnson for the vice presidency.

He accepted the nomination in a long letter, in which he set forth fully his views on the questions at issue. On Sept. 30 he issued a proclamation ordering an election in Tennessee for presidential electors, and prescribing a rigid test oath as the condition of suffrage. On his inauguration as vice president (March 4, 1865) Johnson delivered an incoherent address, which was severely censured. President Lincoln was assassinated on the evening of April 14, and died the next morning. The members of the cabinet, excepting Mr. Seward, at once addressed a note to Mr. Johnson announcing the fact, and urging his immediate qualification as president. Accordingly, at 10 o'clock he took the oath of office, in the presence of the chief justice, a portion of the cabinet, and several congressmen, at his room in a hotel. On April 17 he made a speech in which he said: "The American people must be taught, if they do not already feel, that treason is a crime and must be punished; that the government will not always bear with its enemies; that it is strong not only to protect, but to punish. In our peaceful history, treason has been almost unknown. The people must understand that it is the blackest of crimes and will be surely punished." Though in the same speech he said, "In regard to my future course I will now make no professions, no pledges," yet the whole country looked upon these expressions as foreshadowing a severe policy in dealing with the secessionists. But it soon became evident that this expectation was to be disappointed, and the result was the alienation from President Johnson of almost the entire body of the party that had elected him. On May 1 he appointed a military commission for the trial of those immediately concerned in the assassination conspiracy, and offered \$100,000 for the arrest of Jefferson Davis, and smaller amounts for several others, on the ground that they had aided and incited that conspiracy. On May 9 a new set of rules regulating trade with the southern states was promulgated, and on June 24 all restrictions were removed. An order for the restoration of Virginia to her relations with the federal government was issued May 9; and on May 29 two proclamations were promulgated, one establishing a provisional government in South Carolina, the other granting a general amnesty, on condition of their taking an oath of allegiance, to all persons engaged in the rebellion, with the exception of 14 specified classes, persons included in any of which might obtain pardon by a special application to the president. The appointment of provisional governments for the other insurgent states followed at brief intervals. On the assembling of congress in December, a determined opposition on the part of the majority to the reconstruction policy of the president was at once developed. The point at issue was, whether the seceding states should be at once admitted to representation in congress, and resume all the rights

they enjoyed before the civil war, without further guarantees of good faith than the surrender of their armies, and with no provision for protecting the emancipated blacks in the enjoyment of their freedom and securing them the full rights of citizenship. A joint committee of 15 was appointed, to which were referred all questions concerning the recognition of these states, and the credentials of all persons sent from them as senators or representatives were laid on the table, to await the action of that committee. Congress passed an act known as the "civil rights bill," and another for the extension of the freedmen's bureau, both of which the president vetoed, and the bills were then reconsidered and passed over the veto. In a speech delivered before the White House, Feb. 22, 1866, the president characterized the position assumed by congress as a new rebellion; and thereafter, in messages and speeches, he maintained an open hostility to the majority of that body. In June, 1866, a call was issued for a convention to be held at Philadelphia on Aug. 14, of delegates from every state and territory. Its specific object was not defined; but it was understood to be the foundation of a new party, on the basis of President Johnson's reconstruction policy. It failed of any practical effect, though some leading members of the dominant party attended or approved it. The members of President Lincoln's cabinet had remained in office; but in July the postmaster general, Mr. Denison, the attorney general, Mr. Speed, and the secretary of the interior, Mr. Harlan, resigned their offices, because of disagreement with the president; and their places were filled by A. W. Randall, Henry Stanbery, and O. H. Browning, respectively. On Aug. 28 President Johnson, accompanied by Secretaries Seward, Welles, and Randall, Gen. Grant, Admiral Farragut, and others, left Washington for Chicago, to be present at the laying of the corner stone of a monument to Stephen A. Douglas. They went by way of Philadelphia, New York, and Albany; and at every important place the president addressed the assembled crowd, entering very fully into a discussion of his policy, and often denouncing the action of congress. An expression which he frequently repeated in these speeches gave rise to the popular quotation, "swinging round the circle." The effect of this conduct upon himself was disastrous, and the autumn elections indicated a decided popular approval of the position maintained by congress. In June that body had resolved that no state should be readmitted until it had ratified the proposed 14th amendment to the constitution, which made all persons born or naturalized in the United States citizens thereof, and of the state wherein they resided; and in the session of 1866-'7 it passed acts requiring the elective franchise to be granted without distinction of color in the territories before they should be admitted as states, and similarly extending the franchise in

the District of Columbia. All these measures met the determined opposition of President Johnson; but his vetoes were regularly overridden by the constitutional majority in congress. His argument against such measures was, that they "initiated an untried experiment for a people who have said, with one voice, that it is not for their good," and that they were unconstitutional. On March 2, 1867, congress passed over the president's veto an act dividing ten of the seceding states into five military districts, and making the civil governments therein subject to the authority of the United States, exercised through the military commanders. After appointing the commanders, President Johnson requested the opinion of Mr. Stanbery, the attorney general, as to the legal questions arising from the reconstruction acts; and this opinion, after being considered in the cabinet, where Mr. Stanton alone objected to those portions calculated to nullify the law, was issued to the district commanders as an order. Gen. Sheridan, commanding the fifth district, soon after reported to Gen. Grant, commander-in-chief, that "the result of Mr. Stanbery's opinion is beginning to show itself by a defiant opposition to all acts of the military commander, by impeding and rendering helpless the civil officers acting under his appointment." In July congress passed an act declaring the meaning of the previous act, and making the conduct of the military commanders subject only to the approval of the general of the army. This was vetoed, and passed over the veto. The only resource left to the president was to change the military commanders, which he did before the end of the year. On Aug. 12, 1867, the president notified to Mr. Stanton his suspension from office as secretary of war, and the appointment of Gen. Grant as secretary *ad interim*. Mr. Stanton turned over the office to the latter, submitting, "under protest, to superior force," but denying the right of the president to remove him. This denial was based on the tenure-of-office act (passed March 2, 1867), which provided that no such removal should be made without the consent of the senate, and that appointments to vacancies occurring during the recess of congress should be subject to the approval of the senate at its next session. On Aug. 20 the president issued a proclamation declaring that peace, order, and civil authority existed once more throughout the United States; and on Sept. 7 he proclaimed an amnesty which relieved nearly all the white inhabitants of the southern states from any liability to confiscation of property, and restored to them the right of suffrage. When congress assembled in December the president sent to the senate a statement of his reasons for the removal of Mr. Stanton; but that body refused to sanction the removal, and Gen. Grant immediately resigned the office into Mr. Stanton's hands. On Feb. 21, 1868, Mr. Stanton was again in-

formed of his removal, and of the appointment of Gen. Lorenzo Thomas as secretary of war *ad interim*. When the senate was officially informed of this action, it passed a resolution declaring that "the president has no power to remove the secretary of war and designate any other person to perform the duties of that office." Mr. Stanton consequently refused to vacate the secretaryship. On Feb. 24 the house of representatives passed a resolution that the president be impeached for high crimes and misdemeanors (yeas, 126; nays, 47; not voting, 17). The articles of impeachment were agreed to by the house on March 3, and presented to the senate on the 5th. The specifications were based on the president's removal of Mr. Stanton, his expressions in public speeches of contempt for congress, declaring the 39th not a constitutional congress, and his hindrance of the execution of some of its acts. The trial began on March 23, the president appearing by counsel. In his defence he asserted that his reconstruction policy was in pursuance of a course which had been marked out and determined upon by President Lincoln and his cabinet; and that Mr. Stanton himself had expressed his emphatic opinion of the unconstitutionality of the tenure-of-office act, when its veto was under consideration. On May 16 the senate voted upon the article in reference to contempt of congress and hindrance of execution of its acts, and on the 26th upon that in reference to the removal of Mr. Stanton. In each case the vote stood: guilty, 35; not guilty, 19. So the president was formally acquitted, as a two-thirds vote is required to convict. Mr. Stanton thereupon resigned his office, and was succeeded by Gen. Schofield. At the democratic national convention held in New York, July 4, 1868, Mr. Johnson's name was presented as a candidate for the presidency, and on the first ballot he received 65 votes, leading all other candidates except George H. Pendleton, who received 105. On the successive ballots he lost rapidly, until on the 19th he received no votes. On July 4 President Johnson issued a proclamation of pardon to all persons except those under presentment or indictment before a United States court; and on Dec. 25 a full pardon to everybody who had participated in the rebellion. On March 4, 1869, he was succeeded in the presidential office by U. S. Grant, and retired to his home in Greenville, Tenn. In 1870 he was a candidate before the legislature of Tennessee for a seat in the United States senate, but was defeated by two votes. In 1872 he was an independent candidate for congressman at large, and divided the democratic vote with the confederate Gen. B. F. Cheatam, which resulted in the election of Horace Maynard, the republican candidate.—See "Life and Public Services of Andrew Johnson," by John Savage (New York, 1865); "Life, Speeches, and Services of Andrew Johnson" (Philadelphia, 1865); "Speeches of Andrew

Johnson," with a biographical introduction by Frank Moore (Boston, 1865); "Life and Speeches of Andrew Johnson, President of the United States," by Lillian Foster (Philadelphia, 1866); "Life and Times of Andrew Johnson" (New York, 1866); "Impeachment and Trial of Andrew Johnson" (Philadelphia, 1868); and "Proceedings in the Trial of Andrew Johnson" (Washington, 1868).

JOHNSON, Eastman, an American painter, born at Lovell, near Freyburg, Me., July 29, 1824. He first became known for his drawings in crayon, and in 1849 went to Düsseldorf, where he studied for two years. He afterward resided at the Hague for four years, and executed there the "Savoyard" and "Card Players," his earliest elaborate paintings in oil, besides a number of portraits and genre paintings. He also visited the principal galleries and studios in Holland, Italy, and France. In 1856 he removed to Paris, but returned the same year to America, and has since resided for the most part in New York. He gives his attention mainly to genre painting, finding his favorite subjects in the American rustic and negro, and in glimpses of household and childish life. His paintings are characterized by clearness, vigor, and faithfulness to nature. Among the best known are "The Old Kentucky Home" (1859), first exhibited in New York, and sent with "Mating" (1860) and "The Farmer's Sunday Morning" (1866) to the Paris universal exposition in 1867; "The Barefoot Boy" (1860), illustrating Whittier's poem; "The Village Blacksmith" (1864); "Fiddling his Way" (1865); "The Boyhood of Abraham Lincoln" and "The Field Hospital" (1867); "The Pension Claim Agent" (1868); "Our Father who art in Heaven" (1869); "The Old Stage Coach" and "Bo-peep" (1871); "The Wounded Drummer Boy" (1872); "Dropping off" and "The Peddler" (1873). He has also, during a visit to the upper Mississippi, sketched some excellent portraits of American Indians. His "Old Kentucky Home," "Boyhood of Abraham Lincoln," and some other works, have been copied in chromolithography, and photographs have been published of the "Wounded Drummer Boy" and "Our Father who art in Heaven."

JOHNSON, Edward, a historian of New England, born in Kent, England, about 1600, died at Woburn, Mass., April 23, 1672. He emigrated to America probably with Gov. Winthrop in 1630. In 1632 he was engaged in trade at Merrimack, but appears to have resided usually at Charlestown. He was on the committee appointed to superintend the foundation of a new town and church at the place now called Woburn. In 1643 he went to Providence with Capt. Cook's party to seize Gorton, and in the same year was elected a member of the legislature of Massachusetts, in which he continued to sit till 1671, with the exception of the year 1648. In 1655 he was chosen speaker of the house. He was recorder of Woburn from the time of its incorporation till

his death. In 1665 he was one of the members deputed to hold conference with the commissioners sent from England by Charles II. He wrote a "History of New England from the English Planting in 1628 till 1652, or Wonder-Working Providence of Zion's Saviour" (London, 1654), which, notwithstanding its defective and desultory style, is interesting and valuable. It has been reprinted in the second series of the Massachusetts historical collections, scattered through vols. ii., iii., iv., vii., viii.

JOHNSON, Isaac, one of the original colonizers of Massachusetts, born in Clipsham, Rutlandshire, England, died in Boston, Sept. 30, 1630. He arrived at Salem with his wife, June 12, 1630, and was one of the four persons who founded the first church at Charlestown in the following month. The water there, however, being bad, Mr. Johnson and some others removed to Shawmut, now Boston, where was "an excellent spring." He superintended the first settlement of Boston, and bequeathed at his death considerable property to the colony. —His wife, **ARBELLA** or **ARABELLA**, daughter of Thomas, 14th earl of Lincoln, accompanied him to New England, and died in Salem in the August subsequent to her arrival. She was usually styled the "Lady Arbella," and was highly esteemed by Winthrop, who changed the name of his ship, and called it after her.

JOHNSON, Reverdy, an American statesman, born in Annapolis, Md., May 21, 1796. He was educated at St. John's college in that city, and at the age of 17 began to study law in Prince George's co. in the office of his father, who was chief justice of the judicial district of which that county was a part. In 1815 he was admitted to the bar, and in 1817 removed to Baltimore. He has devoted much of his time to the arguing of cases before the United States supreme court. In conjunction with Mr. Thomas Harris he reported the decisions of the Maryland court of appeals, known as "Harris's and Johnson's Reports" (7 vols., 1820-'27). In 1821 he was elected a state senator for four years, and in 1825 reelected. In 1845 he was chosen a United States senator, which office he resigned in 1849 on being appointed by President Taylor attorney general of the United States. On the succession of Mr. Fillmore after the death of President Taylor, Mr. Johnson resigned that office, and resumed in Baltimore the practice of the law. In 1861 he was a member of the convention in Washington which tried to prevent the outbreak of the civil war. In 1862 he was again elected to the United States senate, and was a member from 1863 to 1868. In June of the latter year he was appointed minister to England, where he negotiated a treaty for the settlement of the Alabama claims, which was rejected by the senate. He was recalled in 1869.

JOHNSON, Richard Mentor, an American statesman, born near Louisville, Ky., Oct. 17, 1780, died in Frankfort, Nov. 19, 1850. He was educated at Transylvania university, and sub-

sequently studied law and practised with success. He commenced his public career as a member of the Kentucky legislature, to which he was elected at the age of 23, and in 1807 was returned to congress, and remained a member of the house till 1819. He was a firm supporter of the administration of President Madison, and upon the commencement of the war of 1812 raised a body of Kentucky mounted riflemen, whom he commanded with the rank of colonel on the Canadian frontier. He resumed his legislative duties in the autumn of that year, but upon the adjournment of congress in the spring of 1813 he immediately raised another mounted regiment, with which he was employed for several months on the Indian frontier. In September he joined Gen. Harrison, then in pursuit of Proctor, and by the decisive charge of his mounted volunteers mainly contributed to the brilliant victory gained over the British and Indians at the battle of the Thames, Oct. 5. Col. Johnson fought with distinguished valor in this engagement, and it was by his hand that the Indian leader Tecumseh is commonly supposed to have fallen. He was carried from the field desperately wounded, his person, clothing, and horse having been pierced by more than 25 bullets; but in the following February he resumed his seat in congress. In 1819 he was elected to fill a vacancy in the United States senate, of which he continued a member till 1829, when he was again returned to the house of representatives, and held his seat there till March, 1837. Having been a candidate for vice president on the Van Buren ticket in 1836, and received a large plurality of votes, though not a majority as required by the constitution, he was elected to the office by the senate, and discharged the duties of presiding officer of that body for four years. In the presidential election of 1840 he was again candidate of the democratic party for vice president, and was defeated. He returned to his farm in Scott co., Ky., after upward of 34 years' continuous public service, and thenceforth lived chiefly in retirement. He was, however, serving a term in the state legislature at the time of his death. In congress his chief efforts were against the discontinuance of the Sunday mails, and in behalf of soldiers of the revolution or of the war of 1812 who applied for pensions. He was the author of the law abolishing imprisonment for debt in Kentucky.

JOHNSON, Samuel, an American clergyman, first president of King's (now Columbia) college, New York, born in Guilford, Conn., Oct. 14, 1696, died in Stratford, Conn., June 6, 1772. He graduated at Yale college in 1714, and two years later was appointed tutor there. In 1720 he was ordained as a Congregational minister, and settled at West Haven. He relinquished his pastoral charge in 1722, and soon after, in company with Mr. Cutler, rector of the college, and another gentleman, sailed for England, where they received

episcopal ordination in 1723, and in May he received the degree of A. M. from the university of Oxford. He soon returned to America, bearing a commission as missionary of the society for the propagation of the gospel in foreign parts, and settled in Stratford, Conn., as rector of an Episcopal church there. In 1743 he received the degree of D. D. from the university of Oxford. In 1746 he published "A System of Morality," and about the same time composed a compend of logic and metaphysics, and another of ethics, originally prepared for the use of his sons. The two latter were printed by Franklin (Philadelphia, 1752), as text books for the university of Pennsylvania. In 1753 he was invited to become president of the newly founded college in New York; and having declined the presidency of the university of Pennsylvania, he entered upon his duties in New York in 1754. In addition to teaching the classes he assisted in planning the college edifices, and made earnest appeals to his friends in England for assistance in its endowment. During the nine years of his presidency he lost his wife, younger son, and stepson, and became so much depressed as to be unwilling to remain longer in charge of the college. He accordingly wrote to England for a successor, and in 1763 resigned and returned to Stratford. During his presidency he published one or two small works, and after his return to Stratford, where he resumed his parochial duties, revised his previous works, and published an English and a Hebrew grammar.—See "Life of Dr. Samuel Johnson," by E. E. Beardsley (New York, 1874).

JOHNSON, Samuel, an English author, born in Lichfield, Sept. 18, 1709, died in London, Dec. 13, 1784. His father, Michael Johnson, was a bookseller and stationer, and for some time a magistrate of Lichfield; but dying in middle age, he left his family in poverty. From his birth the younger Johnson was afflicted with a malignant scrofula which permanently disfigured his face, and injured both his sight and hearing. At 10 years of age he commenced the study of Latin at the Lichfield free school, and remained there five years, and another year at a private academy in Stourbridge. On account of poverty his entrance at Oxford was delayed for two years, during which time he amused himself chiefly in reading the books in his father's shop. At length he went to Oxford with a schoolmate, the son of a neighboring gentleman, as assistant and fellow student, and was admitted to Pembroke college in 1728. His college life was disorderly, but not vicious. He especially distinguished himself in a Latin translation of Pope's "Messiah," for which he received the applause of his college, while Pope himself declared that it would be a question for posterity which was the original and which the translation. While at Oxford he showed signs of the morbid state of his brain and nervous system which affected him in all his after life; but by skilful treat-

ment, and the strong will of the patient, the disease was held in check, and the threatened wreck of intellect averted. He remained at the university about three years, left it on account of poverty without a degree, and procured employment as an usher in a school at Market Bosworth, Leicestershire. He next spent some time at Birmingham with a bookseller, who also published a small newspaper, to which Johnson contributed. Here he became acquainted with the family of Mr. Porter, a linen draper, whose widow he afterward married. About this time he executed his first literary work, a translation of Father Lobo's "Voyage to Abyssinia." He soon after issued proposals to publish by subscription the Latin poems of Politian, with a history of Latin poetry from the age of Petrarck to the time of Politian; but the work was never completed. He spent his time alternately at Birmingham and Lichfield, till after two years he was married to Mrs. Porter, who was nearly twice his age, and then he opened a private academy at Edial Hall, near Lichfield. But he obtained only three pupils, two of whom were David Garrick and his younger brother; and after trial of a year and a half the enterprise was abandoned.—In the spring of 1737 he set out for London accompanied by Garrick. He sought employment among the booksellers, and lived at the most economical rates, bearing all his privations and discouragement with a sullen fortitude. He contributed to the "Gentleman's Magazine," and at length became assistant editor of that publication. He first became known in 1738 by the publication of "London," a poem in imitation of the third satire of Juvenal, which was received with decided favor. He was recommended to the mastership of a school at Appleby, but his want of a degree disqualified him by the statutes of the corporation. A like difficulty prevented his entering the legal profession. He now contributed to the "Gentleman's Magazine" a class of papers in biography and general literature which gave a new and higher character to that work. He also wrote two or three political pamphlets against Walpole and the whig administration. At the beginning of the session of parliament in November, 1740, Johnson undertook to write imaginary reports of the debates, following the order in which the members spoke, and imitating their respective styles. The eloquence of the speeches thus produced excited universal admiration, and the sale of the magazine was greatly increased; but after a little more than two years Johnson relinquished the position, because he doubted the morality of the deception he was practising upon the world, though he still retained his connection with the magazine. Early in 1744 was published the "Life of Richard Savage," which Johnson had promised to the public immediately upon the death of its subject, a few months before. The book contributed very considerably to fix the repu-

tation of its author. The next year, among other labors, he wrote the preface and index to the Harleian miscellany, a collection of pamphlets from the library of the earl of Oxford, which had been purchased by the bookseller Osborne. In that painful drudgery Johnson toiled as a day laborer, and was treated by Osborne with an insolence that once provoked Johnson to knock him down. The same year he issued a pamphlet entitled "Miscellaneous Observations on the Tragedy of Macbeth," to which he affixed proposals for a new edition of Shakespeare. This pamphlet attracted the attention of Warburton, who was then engaged in a similar work, and was commended by him as evidently the work of "a man of parts." In 1747 Garrick became joint manager of Drury Lane theatre, and Johnson wrote a prologue to be spoken at its opening, which added greatly to his reputation. In this year he issued proposals for his "Dictionary of the English Language." The plan of the work, which indicates a thorough acquaintance with the subject, and a comprehensive knowledge of the method to be pursued in its prosecution, was addressed to the earl of Chesterfield, then one of the secretaries of state, who was ambitious of the reputation of a patron of learning, and expressed a warm interest in the enterprise. Five publishing houses were concerned in the contract. Johnson was to receive £1,575, which amount however was to cover all the incidental expenses of preparing the work for the press. To facilitate his work he removed to Gough square in Fleet street, where he had rooms properly arranged for its prosecution, being assisted by six copyists. He availed himself of whatever helps were offered in the extant works on English philology and lexicography, but relied chiefly on his own original labors. This great work occupied its author, though not exclusively, during the next seven years. A trip to Tunbridge Wells, in the summer of 1748, brought him into contact with some of the celebrities of the metropolis, among them William Pitt, Lord Lyttelton, and Speaker Onslow, who paid him marked attention. To facilitate his intercourse with his literary associates, he also this year originated a club, called from its place of meeting the "Ivy Lane Club." At its organization it consisted of ten members, of whom Johnson, Hawkins, and Dyer afterward belonged to the celebrated "Literary Club." In 1748 Dodsley brought out his "Preceptor," a compilation of choice pieces for young persons, in which first appeared Johnson's "Vision of Theodore, the Hermit of Teneriffe." To this year also belongs his second poetical production, "The Vanity of Human Wishes," an imitation of the 10th satire of Juvenal; it was printed by Dodsley, and brought its author 15 guineas. While yet residing at Lichfield Johnson had commenced a tragedy, in five acts, called "Irene," which he finished during his first two or three years in London; and Garrick,

soon after his accession to the management of Drury Lane theatre, undertook to bring it out. It was acted for nine successive nights, before tolerably large and highly respectable audiences, and was received with a good share of favor. The author's profits amounted to £200, and the copyright brought him another £100, making together a larger amount than he had hitherto received on any one occasion.—On March 20, 1750, Johnson issued the first number of the "Rambler." Its authorship was not publicly confessed, but it was readily identified by all who knew anything of Johnson's style, nor did he affect any great secrecy in the matter. Its merits were generally confessed, and for two years the semi-weekly issues were continued without omission. Johnson was the sole author of all but eight of the 208 numbers. At the same time he was chiefly occupied with his dictionary, then rapidly approaching its completion. During this portion of his life his mind was remarkably vigorous and fruitful, and its vast accumulations were thrown off in profusion and with great facility. The "Rambler," though coldly received as a periodical, immediately became popular when collected into volumes. About this period Johnson was concerned in an attempt to prove Milton guilty of a wholesale plagiarism in his "Paradise Lost." One Lauder, a Scotch schoolmaster, pretended to have found a large share of the best portions of Milton's great poem among the works of the modern Latin poets; his proofs of this grave charge were embodied in a pamphlet, to which Johnson was induced to write a preface and postscript, thus by implication approving the whole production. But Lauder's pretended quotations from the modern Latin poets were found to be either taken from Hogg's Latin version of "Paradise Lost," or pure forgeries. Johnson was deeply chagrined, and at once acknowledged his own error, and compelled Lauder to publicly confess his falsehood. That Johnson highly appreciated Milton's genius, he about this time gave a practical demonstration. "Comus" was to be produced at Drury Lane theatre for the benefit of Milton's granddaughter, then living in London in poverty. Johnson entered into the arrangement with zeal, and wrote the prologue for the occasion, which was spoken by Garrick. Early in 1752 Johnson's wife died. Notwithstanding the disparity of their ages, his early affection had only changed into a settled esteem. At her bedside he was convulsed with grief, and yet while she lay a corpse awaiting burial he composed a funeral sermon to be spoken over her remains. His published "Prayers and Meditations" indicate his feeling. He prayed that, if agreeable to the will of God, he might be favored with her guardianship, and with intimations of her presence, "by appearances, impulses, dreams, or in any other manner agreeable to the divine government." In 1752 Johnson engaged with Dr. Hawkesworth in

the publication of the "Adventurer," a series of periodical essays on the plan of the "Rambler." Of these 140 numbers appeared, 29 of which were written by Dr. Johnson. The dictionary was completed in 1755. Lord Chesterfield, who had received the "Plan" with great coolness, now wrote two laudatory letters in "The World," shortly before the work was printed. But Johnson rejected these tardy advances, and the dictionary was issued without a dedication. The original preface was at once a characteristic and a highly valuable essay. The merits of Johnson's dictionary are too well known to require any statement in this place. It first brought order out of the chaos of the language; and though it has been generally superseded by later compilations, yet the fundamental excellences of all modern dictionaries of the English language have their elements in that work. It greatly enhanced its author's reputation, but he was still compelled to labor unremittingly for the means of daily subsistence. He published at this time a large number of reviews in Newbery's "Literary Magazine." The proposal for an edition of Shakespeare made some years before, but not prosecuted, was renewed and a subscription opened, but the work still lingered on his hands through nine years. He next engaged with the publishers of the "Universal Chronicle," a weekly newspaper, to furnish a series of miscellaneous essays, and the "Idler" appeared in regular order for two successive years, beginning in April, 1758. Of its 103 numbers Johnson wrote all but 12. In the spring of 1759 appeared his most celebrated work, "Rasselas, Prince of Abyssinia," which he wrote in the evenings of one week, and sent to the printer as first written, receiving for it £100, out of which he paid the expenses of his mother's funeral. But if Johnson's literary labors had failed to provide him a competence, they had procured for him a greatly advanced social position, and secured him a large circle of admirers. His constitutional indolence had however become positively morbid, and he indulged in idleness just as far as his immediate necessities would allow. He seldom went abroad, lay in bed till past noon, and spent the rest of the day in promiscuous conversations with whosoever called upon him; or moped in morbid melancholy if left to himself, which, however, was not often the case. To his guests he devoted a large share of each afternoon, meanwhile regaling himself with his favorite tea, with which he solaced both his earlier and his later hours. Among his personal associates at this period were Richardson, Garrick, Reynolds, Warton, Baret, Arthur Murphy, Dr. Charles Burney, Dr. (afterward Bishop) Percy, Bennet Langton, and Topham Beauclerk. He was all this time domiciled at Gough square, where he had passed the greater portion of the years of his residence in London. Here, before the decease of his wife, he had begun to gather about

him a family group, which was afterward much enlarged, made up of a strangely assorted set of dependants and pensioners. Anna Williams, the blind daughter of a Welsh physician; Robert Levett, who practised medicine among the very poor, and often received his fees in liquor; Mrs. Desmoulins and her daughter, who had no other claim upon his benevolence than the service which the father of the former, Dr. Swinfen, had rendered to Johnson in a professional capacity in his youth; and Francis Barber, his negro servant, were among the inmates of his house.—Johnson had an implicit belief in the supernatural and invisible world. He practically adopted the maxim that it is safer to believe too much than too little. He believed in the existence and appearance of disembodied spirits, and that they might be manifested to our cognizance. A case of this kind occurred in 1763, which exposed Johnson to the ridicule of his enemies. Certain strange phenomena in the form of “rappings” about the bed of a young girl, in a house in Cock lane, caused a considerable excitement, and a number of gentlemen, of whom Johnson was one, attempted to solve the mystery. Their examinations satisfied them that the whole was a cheat and imposture, and Johnson afterward wrote out a statement of it for the “Gentleman’s Magazine.” But the affair was seized upon by Johnson’s enemies, as exposing a vulnerable point for their attacks. Churchill, in his poem “The Ghost,” depicted Johnson in such broad caricature that it was at once recognized; and Foote the comedian proposed to present him on the stage for the amusement of the town, but abandoned his purpose upon being assured that Johnson was preparing to chastise him if he undertook it.—In 1762 Johnson received from the king a pension of £300. He had often stigmatized the whole business of giving and receiving pensions as the basest kind of bribery; but it being urged by his friends that the whole nation was his debtor for what he had written, and especially for the dictionary, and the premier assuring him that no service to the ministry would ever be expected from his pen in return for the favor, he allowed his scruples to be overcome. Early in 1765 the long promised and long delayed edition of Shakespeare made its appearance, with an elaborate preface discussing the genius and writings of the dramatist, and with a concise account of each play, and notes and commentaries, both original and selected, on various passages. But the work was not such as the reputation of the editor had promised. He no doubt possessed many valuable qualifications for such a work, yet he was better adapted for original compositions, and in this case his powers were but moderately called into requisition. His own estimate of the work did not differ greatly from that of others. He had now fully attained the height of his ambition as a scholar and man of letters. His claim to the first place among his peers

was cheerfully conceded to him with almost absolute unanimity. The university of Oxford, from which he sought in vain for the degree of M. A. when it would have been valuable to him, now accorded a tardy recognition of his greatness by granting to him by diploma the honor of LL. D. He had received the same degree ten years earlier from Dublin university; but after returning thanks for the honor, he declined to wear it, and would not consent to be called doctor till Oxford had given him the title.—About this time Johnson was introduced by Arthur Murphy to Mr. Thrale, a wealthy brewer of Southwark. Thrale was a man of a well cultivated mind, of sound judgment, and great force of character; and his wife, whose name has become intimately connected with Johnson’s history, was also a person of some learning and of almost unbounded vivacity, flippant, versatile, and addicted to hero worship. The acquaintance thus begun soon grew into friendship. Johnson dined with his new friends weekly during several succeeding months, when, having suffered by an attack of sickness, he was removed in 1766 to their residence, and had apartments assigned him in their house at Southwark, and also in their villa at Streatham. Thrale was a member of parliament for Southwark, and as his political creed was nearly allied to that of his guest, Johnson became interested in the politics of the times, and there was at one time a purpose to bring him into parliament; but the government, fearing that he would not prove sufficiently facile, did not encourage it, and so the design was abandoned. He accompanied his friends on their annual excursions, visiting various parts of the kingdom with them, and also making a visit of several weeks at Paris. His connection with this family not only brought him innumerable comforts and pleasures, but it also afforded him a retreat from his own strangely assorted household, where strifes and complaints were loud and frequent. It continued till the death of Thrale, and the subsequent marriage of his widow to Signor Piozzi, greatly to the chagrin of her friends.—A few years previous to his connection with the Thrales, Johnson had formed another association, by which his future renown was to be very largely affected. In 1763 James Boswell, a young man, the son of a Scotch judge, visited London and obtained an introduction to Johnson. Boswell was loose in life and conversation, conceited, meddling, and inquisitive, yet endowed with an insight into character, and an appreciation of qualities the furthest possible removed from his own. Johnson fancied this young Scot on first acquaintance, and Boswell at once fastened himself upon him. They were together almost daily, rambling in the parks, supping together at the Mitre tavern, or wandering the streets till after midnight. Boswell lived in Johnson’s shadow, noting his words, describing his manners, and detailing the most trivial occurrences; all of

which were afterward embodied in his "Life of Johnson," by which, much more than by the dictionary, or the "Rambler," or even by "Rasselas" and the "Vanity of Human Wishes," Johnson is known.—The founding of the "Literary Club" belonged to this period. Reynolds and Johnson led in the movement, and among the original nine members were Hawkins, Langton, Beauclerk, Goldsmith, and Burke. Goldsmith had a few years before become somewhat intimate with Johnson, by whom he was greatly esteemed as a writer and cherished as an associate. During its earlier years the club held weekly meetings for conversation, which contributed not a little to maintain the balance of Johnson's strangely affected mind. New members were admitted with great caution, and for several years the whole number did not exceed 12. In 1778 it had grown to 26, and two years later to 35, when 40 was fixed as its complement. The club is still in existence, but it has become rather a learned than a convivial society.—Johnson's indolent and purposeless mode of life proved highly unfavorable to his spirits. His "Prayers and Meditations," published after his death, indicate the unhappy state of his mind. He was accustomed to write bitter things against himself in his penitential moments, and especially during Lent. Sometimes his melancholy verged almost on insanity; and again he would pass suddenly to the most extravagant hilarity. His ordinary manners, especially in his later years, were strangely eccentric. He talked much to himself, muttering in a vocal but generally inaudible undertone. He was never still, but sat with head inclined over the right shoulder, his vast trunk swaying backward and forward, and his hand keeping up a corresponding motion upon his knee. At times he would make a kind of clucking sound, and again a suppressed whistle, and still more frequently a humming noise, accompanied with a vacant smile. His conversation was often violent and discourteous, and he delighted in contradictions. During the years from 1770 to 1775 he produced several political pamphlets, all in the interest of the government, and designed to meet some immediate necessity. The last of these, "Taxation no Tyranny" (1775), was written to controvert the remonstrance of the American congress against taxation without representation. In this Johnson sustained the British government in its measures against the colonies, and predicted the speedy subjugation of America. In 1773 he made a tour to the highlands of Scotland and the Hebrides, through the persuasion of Boswell, who became his fellow traveller, and afterward the chronicler of the journey, of which an account was also written by Johnson. While in Scotland Johnson made inquiries respecting the original manuscripts from which Macpherson pretended to have translated the poems of Ossian, and came away with the conviction that a large share of that work was a forgery, and the rest

of comparatively modern origin. His avowal of this conviction after his return led to a violent controversy between himself and the professed translator. In 1774 he made a tour in Wales with Mr. and Mrs. Thrale. His last considerable literary work, the "Lives of the English Poets," in four volumes, appeared from 1779 to 1781, when their author was over 70 years old; they were undertaken at the request of the booksellers, and performed by irregular impulses. In some respects this was one of the best written of all his works, simple in its style, genial and appreciative in its spirit, and full of interesting statements and valuable criticisms.—About the date of the close of that work the hand of death began to be busy with those about him. Mr. Thrale died in 1781, and a few months later he removed to his own house. In 1782 Levett died, and the next year Mrs. Williams followed him. Some time before the last event he had suffered temporarily from a partial paralysis of the vocal organs. In the latter part of the same summer he once more visited his native town; but as winter drew on he was again brought down, and his whole system became swollen with dropsy. By the assiduity of his friends, and skilful medical treatment, he so far recovered that during the next summer he visited Derbyshire and was again at Lichfield. Late in the following autumn he grew worse. To physical suffering he was comparatively indifferent, and when near his end he earnestly entreated his attendants to spare no efforts, however painful, to prolong his life. He anticipated death with horror; but as his last hour approached his forebodings at length gave place to humble confidence in the divine clemency.—Few names are more conspicuous in the annals of English literature than that of Dr. Johnson. Though scarcely reckoned among English poets, his productions in that department sufficiently vindicate his claim to a recognition, and not a few judicious critics have believed that with equal devotion to that kind of writing he would have rivalled Pope or Dryden. As an essayist he is ranked with Addison and Steele, whom he imitated only as to the form of his pieces, impressing whatever he thus wrote with his own individuality. He lacked their vivacity and variety, and especially their genial good humor, but surpassed them in depth of reflection and nervous energy of style. He especially excelled in biographical writing, and among his numerous sketches of personal history and mental portraits are some that may be studied as models of their kind. As a critic, his judgment was clear and discriminating, and such was his independence that he often condemned the popular favorites of the day, and in most cases posterity has confirmed his decisions. His fictions are chiefly moral allegories; for so fully was he intent on inculcating the practical lesson of life, that it was constantly before him, and gave form and coloring to his purely imaginative productions.—The only complete

edition of Johnson's works is that of Oxford (11 vols. 8vo, 1825). That by Hawkins (15 vols. 8vo, London, 1787-'9) contains several pieces not written by Johnson. That by Murphy not containing the parliamentary debates (12 vols. 8vo, London, 1792), has been frequently reprinted, and in a compact form by Bohn (2 vols. 8vo, London, 1850). Lives of Johnson are numerous. Boswell's (2 vols. 4to, London, 1791) has been many times edited. Croker's edition (5 vols. 8vo, London, 1831) is one of the best; and an exact reprint of the first edition, with notes by Percy Fitzgerald, appeared in 1874 (3 vols., London).

JOHNSON, Walter Rogers, an American physician, born in Leominster, Mass., June 21, 1794, died in Washington, April 26, 1852. He graduated at Harvard college in 1819, and in 1821 became principal of the academy at Germantown, Pa. In 1826 the Franklin institute established a high school in Philadelphia, to give the industrial classes cheap instruction in sciences and arts, according to a plan of Mr. Johnson, and gave him the chair of mechanics and natural philosophy. He added to his instructions a public course of lectures on mechanics and philosophy, under the direction of the institute, which were largely attended by both sexes. In 1836 he commenced a series of geological investigations, with special reference to the coal formations and iron ores of Pennsylvania. In 1837 he was appointed to take charge of the department of magnetism, electricity, and astronomy in the United States exploring expedition, but he resigned owing to changes of the original plan. In 1839 he was appointed to the chair of chemistry and physics in the medical department of the university of Pennsylvania. In 1843 he entered upon a course of investigations, under the authority of congress, into the character of the different varieties of coal, and their absolute and relative values for generating steam and heat and producing illuminating gas, of which a report was published in 1844. He subsequently made scientific researches on other subjects connected with the navy department; and in 1845, under appointment of the city authorities of Boston, he examined the sources from which a supply of pure water might be brought to that city. He participated in the organization of the American association of geologists, and, at its subsequent reorganization as the American association for the advancement of science, was its first secretary.

JOHNSON. I. Sir William, baronet, a British general and colonial officer, born at Warrentown, county Down, Ireland, in 1715, died near Johnstown, N. Y., July 11, 1774. He was a younger son of Christopher Johnson, an Irish gentleman of good family. Educated to a mercantile life, his career was entirely changed by the refusal of his parents to permit him to marry a lady with whom he had fallen in love. His uncle, Admiral Sir Peter Warren, had married a daughter of Stephen De Lancey

of New York, and received with her a large landed estate in that colony, which he increased by purchase, chiefly in the valley of the Mohawk, then a wilderness. Sir Peter offered his nephew the management of his entire property in New York, if he would undertake its improvement and settlement. Johnson accepted the offer, and in 1738 established himself upon a tract of land on the Mohawk, about 24 miles from Schenectady, which Sir Peter had called Warrensburgh. In addition to the settling and improving of the country, he embarked in trade with the Indians, whom he always treated with perfect honesty and justice. He would never deal with them when they were under the influence of liquor, nor yield to them anything when he had once refused. This course, added to his easy but dignified and affable manner, and the intimacy which he cultivated with them, by accommodating himself to their manners, and sometimes even to their dress, soon won for him their entire confidence, so that he acquired an influence over them greater than was ever possessed by any other white man. He became a master of their language, speaking many of their dialects perfectly, and was thoroughly acquainted with their peculiar habits, beliefs, and customs. He was adopted by the Mohawks as one of their own tribe, chosen sachem, and named Wariaghejaghe, or Warraghiaghy, "he who has charge of affairs." Complaints against the Indian commissioners and local quarrels led to their resignation, upon which Gov. Clinton appointed Johnson, already justice of the peace, colonel of the Six Nations. In 1746 he became commissary of New York for Indian affairs, and as such was very active in sending out war parties against the French. In February, 1748, he was placed in command of all the New York colonial troops for the defence of the frontier, and showed ability in organizing and preparing for a campaign. No important operations took place, as peace was soon after made at Aix-la-Chapelle. In April, 1750, he was appointed a member of the provincial council. The revival of the Albany board of commissioners in 1753 led to a quarrel between the colonists and the Indians, and the council and assembly urged Col. Johnson to effect a reconciliation. The governor having granted him a new commission, July 5, 1753, he proceeded to Onondaga, held a council, and succeeded in settling the difficulty, but declined having anything further to do with Indian affairs. He lived at Fort Johnson, a large stone dwelling which he had erected upon the N. side of the Mohawk, directly opposite Warrensburgh, and which he had fortified in 1743 shortly before the commencement of the war with the French. It is now (1874) standing in good preservation, about three miles west of the present village of Amsterdam. In 1754 he attended as one of the delegates from New York the celebrated congress of Albany, and also the great council held with the In-

dians on that occasion, at which they strongly urged his reappointment as their superintendent. At the council of Alexandria, April 14, 1755, he was sent for by Braddock and commissioned by him "sole superintendent of the affairs of the Six United Nations, their allies and dependants." He was also, pursuant to the determination of that council, created a major general, and commander-in-chief of the provincial forces destined for the expedition against Crown Point. At the head of these forces, in September, Johnson utterly defeated Baron Dieskau at Lake George. He was wounded in the hip early in the action, but remained on the field of battle. This victory saved the colony from the ravages of the French, prevented any attack on Oswego, and went far to counteract Braddock's disastrous defeat on the Monongahela. Gen. Johnson received the thanks of parliament for his victory, was voted £5,000, and on Nov. 27, 1755, was created a baronet of Great Britain. It was on his arrival at Lake St. Sacrement a few days before this battle that he gave to it the name of Lake George, "not only in honor of his majesty, but to assert his undoubted dominion here." In March, 1756, he received from George II. a commission as "colonel, agent, and sole superintendent of the affairs of the Six Nations, and other northern Indians," with a salary of £600, paid by the mother country. He held this office for the rest of his life. In 1756 and 1757 he was engaged with his Indians in the abortive attempts of the British commanders to relieve Oswego and Fort William Henry; and in 1758 he was present with Abercrombie at the repulse of Ticonderoga. In Gen. Prideaux's expedition against Fort Niagara in 1759, Sir William Johnson was second in command, and upon the death of Prideaux before that fort succeeded to the command in chief. He continued the siege with great vigor, routed the French' army under Aubry sent to its relief, and then summoned the garrison, which surrendered at discretion. He led the Indian allies the following year in the Canadian expedition of Amherst, and was present at the capitulation of Montreal and the surrender of Canada to the British arms in 1760. The war was now at an end, and the king granted to Sir William for his services a tract of 100,000 acres of land, north of the Mohawk, long known as "Kingsland" or the "Royal Grant." His influence alone prevented the whole Six Nations from joining Pontiac in 1763, though he could not prevent some acts of hostility by the Senecas. In 1764 Sir William erected Johnson hall, a large wooden edifice still standing near the village of Johnstown, a few miles north of Fort Johnson. The village of Johnstown had already been laid out, and the building of stores, an inn, a court house, and an Episcopal church soon followed. Numerous settlers were brought in, the surrounding country was improved, and in three years Johnstown be-

came a thriving village, and in 1772 the shire town of Tryon co. Sir William gave great attention to agriculture, and was the first who introduced sheep and blood horses into the valley of the Mohawk. He lived in the style of an old English baron, and exercised the most unbounded hospitality. He continued active in his duties as head of the Indian department, made the treaty of Fort Stanwix in 1768, and his death resulted from over-exertion at an Indian council. About 1740 he married Catharine Wisenburgh, a German girl, who died young, leaving him a widower with three children, a son, John, knighted in 1765, and two daughters, who married respectively Col. Claus and Col. Guy Johnson. Sir William never married again. He had for some years many mistresses, both Indian and white, by whom it is said that he had 100 children; and one of his earlier ones, also a German, has been the probable cause, from having been confounded with his wife, of the erroneous statement that none of his children were legitimate. Mary, or as she is generally called "Molly" Brant, the sister of Thayendanege or Joseph Brant, the great Mohawk sachem, whom he took to his house, and with whom he lived happily till his death, is by some termed his wife, but they were never legally married. He had eight children by her, whom he provided for by his will, in which he calls them his natural children. The church in a vault of which he was buried was burned down in 1837; but in 1862 the vault was discovered, and his remains were removed and reinterred. His life has been written by W. L. Stone (2 vols., 1865). **II.** Sir John, son of the preceding, born in 1742, died in Montreal, Canada, Jan. 4, 1830. He succeeded to his father's title in 1774, and was at the same time appointed a major general in the British service. In the revolutionary war he remained loyal to the crown, and used his influence with the Indians to inflict frequent injuries upon the frontier settlements of New York, in retaliation for the sequestration of his large estates in the Mohawk valley. He was governor of Upper Canada for several years subsequent to 1796.

JOHNSTON, a central county of North Carolina, drained by Neuse and Little rivers; area, 660 sq. m.; pop. in 1870, 16,897, of whom 5,194 were colored. It has a diversified surface, and contains iron ore and granite. The North Carolina railroad traverses it. The chief productions in 1870 were 246,338 bushels of Indian corn, 132,277 of sweet potatoes, and 4,108 bales of cotton. There were 1,366 horses, 788 mules and asses, 3,253 milch cows, 1,639 working oxen, 4,239 other cattle, 5,653 sheep, and 20,530 swine; 4 flour mills, 5 saw mills, 1 manufactory of sash, doors, and blinds, and 6 of tar and turpentine. Capital, Smithfield.

JOHNSTON, Albert Sidney, an American soldier, born in Mason co., Ky., in 1803, killed at the battle of Shiloh, April 6, 1862. He graduated at West Point in 1826, and served on fron-

tier duty and in the Black Hawk war till 1834, when he resigned, went to Texas, enlisted as a private soldier, in 1836 became adjutant general, and soon after succeeded Gen. Felix Houston in the chief command of the army of Texas. This led to a duel, in which Johnston was wounded. He was the Texan secretary of war from 1838 to 1840. On the outbreak of the Mexican war he was made colonel of a volunteer regiment of Texan rifles; his regiment having been discharged, he became inspector general on the staff of Gen. W. O. Butler, and was present at the battle of Monterey. From 1846 to 1849 he was engaged as a farmer on the Brazos river. In October, 1849, he reentered the United States army with the rank of major, and served as paymaster till 1855. He was then made colonel of cavalry and placed in command of the department of Texas, which he held till August, 1857, when he took command of the expedition to Utah. In November, 1857, he was made brevet brigadier general for meritorious conduct while in command of the army in that territory. In January, 1861, he was placed in command of the department of the Pacific, but was superseded in April by Gen. Sumner. He resigned his commission May 3, entered the confederate service, and was placed in command of the division of the West. On the first day of the battle of Shiloh he received a ball in the leg which severed an artery, and he soon died from loss of blood, Gen. Beauregard succeeding to the command.

JOHNSTON, Alexander, a Scottish painter, born in Edinburgh in 1816. He early became known chiefly in Scotch genre painting and smaller pictures. His more elaborate work, "Lord and Lady Russell receiving the Sacrament in Prison" (1846), is in the Vernon gallery, and his subsequent productions include "Melancthon surprised by a French Traveller while rocking the Cradle of his Child" (1854) and "Tyndal translating the Bible" (1855). His "Introduction of Flora Macdonald to Prince Charlie" was exhibited at Paris in 1855. Many of his pictures have been engraved.

JOHNSTON, Alexander Keith, a Scottish geographer, born in Kirkhill, Mid-Lothian, Dec. 28, 1804, died at Ben Rhydding, July 9, 1871. He was educated in Edinburgh, and then apprenticed to an engraver, but soon manifested a decided taste for the study of geography. That he might be able to consult the highest geographical authorities in the original, he made himself master of a number of modern languages. He also travelled extensively for scientific purposes. His first important work was the "National Atlas" (1843), which secured his election to the royal geographical society, and his appointment to the office of geographer to the queen for Scotland. In 1848 his "Physical Atlas" was published, and immediately after its appearance he was chosen member of the *Gesellschaft für Erdkunde* of Berlin, of the geographical society of Paris, and of the geological society of London. His

other principal works are: a "Dictionary of Geography" (1850-'52; last ed., 1867); a "Geological Map of Europe," in the preparation of which he was aided by Sir R. I. Murchison and Prof. Nichol; "Atlas of North America" (1858); "Military Atlas to Alison's Europe;" "Royal Atlas of Modern Geography," with a special index to each map (1860-'62, and later editions), the only atlas for which a prize medal was awarded at the London exhibition of 1862; and a series of six library maps of the great divisions of the globe (1863-'5).

JOHNSTON, Arthur, a Scottish physician, born at Caskieben, near Aberdeen, in 1587, died in Oxford in 1641. After studying at the university of Aberdeen, he went to Padua, where he completed his education in 1610. He then travelled for some time in southern and central Europe, and resided for 20 years in France. About 1632 he returned to Scotland, and was appointed physician to Charles I. In 1637 he became principal of the university of Aberdeen, but his duties as royal physician requiring his residence at court, the greater part of his subsequent life was passed in England. He was highly esteemed as a Latin poet, his principal works being *Parerga et Epigrammata* (Aberdeen, 1632); *Cantici Salomonis Paraphrasis Poetica* (London, 1633); and *Paraphrasis Poetica Psalmorum Davidis* (Aberdeen, 1637), by many considered equal to Buchanan's version.

JOHNSTON, or Johnstone, Charles, a British satirist, born in Ireland early in the 18th century, died in British India about 1800. He studied law, but on account of deafness practised only as a chamber counsel in London; and during his last 18 years he was a journalist in Bengal. He published many satirical works, and acquired most notoriety by his "Chrysal, or the Adventures of a Guinea" (London, 1760; 3d and enlarged ed., 4 vols., 1761; French translation by Frenais, Paris, 1768), with contemporary sketches painting "the baser sides of literature and life."

JOHNSTON, George, a Scottish naturalist, born in 1798, died in Berwick-on-Tweed, July 3, 1855. After serving a medical apprenticeship with Dr. Abercrombie of Edinburgh, he entered the university of that city, where he graduated in 1819. Subsequently he settled as a medical practitioner at Berwick-on-Tweed. Amid many arduous professional duties he cultivated natural history with an enthusiasm and a success which rendered the place of his residence "one of the most classic localities in Great Britain." Apart from numerous papers contributed to the "Edinburgh Philosophical Journal" and other scientific periodicals, he published two works of first-rate importance: "History of British Zoöphytes" (2d ed., 2 vols. 8vo, London, 1847), and "History of British Sponges and Lithophytes" (8vo, 1842). In 1850 appeared his "Introduction to Conchology," with an abundance of illustrations. His latest work was "The Natural History of the East-

ern Borders" (vol. i., "Botany," 8vo, 1854), and he was engaged at the time of his death upon a complete work on British annelids. He is considered one of the most accomplished contributors to the literature of natural history, and was one of the founders of the Ray society.

JOHNSTON, James F. W., a Scottish chemist and agricultural writer, born in Paisley about 1796, died in Durham, England, Sept. 18, 1855. When a young man he supported himself by preparing students for the Glasgow university, and in 1825 he established a school at Durham. In 1830 he married, gave up his seminary, went to Sweden, and became a pupil of Berzelius. On his return he settled in Edinburgh, and was appointed chemist to the agricultural society of Scotland, filling at the same time the office of lecturer on chemistry and mineralogy in the university of Durham. After the dissolution of the society he removed to Durham, and devoted himself chiefly to the composition of works on agricultural chemistry. He subsequently visited the United States and France. His works are: "Elements of Agricultural Chemistry and Geology" (8vo, Edinburgh, 1842); "Suggestions for Experiments in Agriculture" (8vo, 1843); "Catechism of Agricultural Chemistry and Geology" (16mo, 1844), translated and used as a school text book in most countries of Europe and America; "Lectures on Agricultural Chemistry and Geology" (8vo, 1844); "Contributions to Scientific Agriculture" (1849); "Treatise on Experimental Agriculture" (1849); "Use of Lime in Agriculture" (1849); "Notes on North America, Agricultural, Economical, and Social" (2 vols. 8vo, 1851); "Instructions for Analysis of Soils, Limestone, &c." (3d ed., 1855); and "Chemistry of Common Life" (2 vols., 1854-5).

JOHNSTON, Joseph Eccleston, an American soldier, born in Prince Edward co., Va., in February, 1807. He graduated at West Point in 1829, and served mainly in garrison duty till 1834, and afterward in the Seminole war, in which he was aide to Gen. Scott. He resigned in May, 1837, and became a civil engineer, but in July, 1838, reëntered the army, with the rank of first lieutenant of topographical engineers, and was brevetted as captain for gallantry during the war with the Florida Indians. He served in the topographical bureau, and in 1843 on the survey of the boundaries between the United States and the British provinces. From 1844 to 1846 he was engaged on the coast survey. During the Mexican war he served as captain of topographical engineers under Gen. Scott in all the important actions, was twice wounded, and successively brevetted as major, lieutenant colonel, and colonel. The regiment of voltigeurs, of which he had been made lieutenant colonel, was disbanded in 1848, but he was replaced in his former rank as captain in the army. From 1853 to 1855 he was in charge of western river improvements. He was subsequently employed in various duties in Kansas and elsewhere, and in 1858 was act-

ing inspector general in the Utah expedition. In June, 1860, he became quartermaster general, with the rank of brigadier general of staff. He resigned his commission April 22, 1861, entered the confederate service, and commanded at the battle of Bull Run, and subsequently at Yorktown and Richmond. During the battle of Fair Oaks (May 31, 1862) he was severely wounded, and was for some months disabled for service. In November he reported for duty, and was assigned to the command of the departments of Tennessee and Mississippi. During Grant's Vicksburg campaign he made an attempt with a feeble force to extricate Pemberton, but was repulsed, May 14, 1863, at Jackson, and retreated to Canton. After Bragg's defeat at Chattanooga in November, he took command of his army, occupying a position at Dalton, Ga., which was turned by Sherman early in May, 1864; whereupon Johnston fell back successively to Resaca, Allatoona pass, Kenesaw mountain, and Atlanta, in turns fighting and flanked. Failing to satisfy the expectations of the authorities at Richmond, he was on July 17 ordered to turn over the command to Gen. Hood. Near the close of February, 1865, Sherman having marched from Atlanta to Savannah, and thence into South Carolina, Johnston was directed to assume the command of the army of Tennessee and all troops in the department of South Carolina, Georgia, and Florida, and to "concentrate all available forces and drive back Sherman." The force which he could concentrate was wholly inadequate, and he was unable to check the march of the victorious army, though he fought a part of it at Bentonville, N. C. (March 19). Having learned that Lee had surrendered the army of Virginia to Grant, Johnston surrendered the forces under his command to Sherman, April 26, at Durham's Station, near Greensboro, N. C. In his farewell order to his troops he said: "I earnestly exhort you to observe faithfully the terms of pacification agreed upon, and to discharge the obligations of good and peaceful citizens as well as you have performed the duties of thorough soldiers in the field." Since the close of the war he has been actively engaged in the industrial reconstruction of the South, especially in connection with its agricultural, commercial, and railroad enterprises, residing at Savannah, Ga. He has published a "Narrative of Military Operations" directed by him during the war between the states (New York, 1874).

JOHNSTONE, a town of Renfrewshire, Scotland, on the Black Cart Water, 10 m. W. of Glasgow; pop. in 1871, 6,882. It has grown rapidly in population and importance within the last 50 years, in consequence of the establishment of cotton mills and iron and brass founderies. It is well built, and contains five churches and several schools and libraries.

JOHNSTOWN. I. A village in the town of the same name, seat of justice of Fulton co., New York, on Cayadutta creek, a branch of

the Mohawk river, 40 m. N. W. of Albany; pop. in 1870, 3,282; of the town, 12,273. It is connected with Fonda on the New York Central railroad, 6 m. distant, by the Fonda, Johnstown, and Gloversville line, and contains large skin and leather dressing establishments, a large number of glove and mitten factories, three hotels, a gas-light company, three weekly newspapers, and ten churches. The town also contains the village of Gloversville. (See GLOVERSVILLE.) **II.** A borough of Cambria co., Pennsylvania, at the junction of Stony creek and Conemaugh river, on the Pennsylvania canal and railroad, 78 m. E. of Pittsburgh; pop. in 1850, 1,269; in 1860, 4,185; in 1870, 6,028. It has an active trade, and contains extensive iron works, a national and a savings bank, two state banks, a daily and four weekly newspapers, and a monthly periodical.

JOIGNY (anc. *Jovinacum*), a town of Champagne, France, in the department and on the river Yonne, 15 m. N. W. of Auxerre; pop. in 1872, 6,400. It is surrounded by an old wall with six gates, and has two suburbs, exceedingly steep streets, a fine quay, several Gothic churches besides the fine cathedral, and good cavalry barracks. Coarse cloth and other articles are manufactured, and the trade in wine is brisk.—The territory of Joigny was a county in the middle ages, and about 1600 belonged to the cardinal de Gondy, a brother of Marshal de Retz, who built a handsome castle here.

JOINT-STOCK COMPANY. This name usually designates a partnership in which the capital is distributed by shares among a large number of partners. They assume in certain respects a corporate form, but possess legally none of the peculiar attributes or powers of corporations, except as conferred by statute. Like these, however, they adopt a corporate name; divide a fixed capital into shares, which they make transferable by assignment and delivery; and commit the conduct of their business to a board of directors. It is also sometimes stipulated in the fundamental articles of the association, that no member shall be liable for the company's debts beyond the amount of his shares. So far as the partners alone are concerned, they may adopt what rules they will for the internal administration of the partnership; but their imitation or assumption of corporate powers or responsibilities cannot avail them in law, except so far as recent legislation favors them, or prejudices the rights of third parties. They remain partnerships, and are generally subject to the rules of law which govern partnerships. Thus, such a company cannot sue its shareholders at law for breach of their engagements to it; for as copartners of the plaintiffs, they cannot be made liable, according to the rules of pleading, in such a suit; they must therefore resort to the intervention of trustees in order to avail themselves of contracts made or to be made with their members, or they must sue in equity. And they are bound by that familiar rule of

partnership law, which no mere mutual agreement can evade, that each member of the association is liable as a partner *in solido*, or to answer with his whole private property for all the debts of the partnership. It is doubtful whether this rule would be changed even though the creditor dealing with the company have notice of a stipulation in the articles of association limiting the responsibility of the members to the mere joint funds, or to a qualified extent. In recognition of the advantages secured to the community by the combination of capital in the prosecution of important enterprises, and in view of the embarrassments to which they are subjected by the operation of the rules of law, joint-stock companies have received both in England and in the United States some assistance from legislation, which gives them a qualified corporate character, and a separate legal existence apart from that of their individual members. There is no such uniformity in these statutes as will admit of a comprehensive statement of their purport. In general it may be said that the statutory joint-stock companies occupy an intermediate position between corporations and partnerships, and partake of the nature of both.

JOINT TENANTS, persons to whom a single estate is granted jointly by the same deed or will, and without any exclusive restrictions or explanatory words. The grant can take effect in such a case only by considering that all the grantees have equal interests, and that each has the entire possession of the whole estate. For between the grantees there is a unity: 1, of title, the estate being derived from one and the same conveyance; 2, of time, for it was created and vested in them at the same period; 3, in respect to interest, for it is a single estate which was conveyed; 4, in respect to possession, for the estate is to be enjoyed in common during the same time. It was the distinguishing incident of joint tenancies that, upon the death of his co-grantees, the estate passed undiminished to the last survivor. This is the so-called *jus accrescendi*, or right of survivorship. It originated in the feudal law, the policy of which was averse to the division of tenures, and to the distribution of the feudal services among tenants who might be strangers to the lord. The rules of law in relation to joint tenancies were strictly upheld for a long time by the courts of common law, but were regarded with less favor in proportion as the law of tenancies was modified. Joint tenancies, with all their incidents, have been but little recognized in the United States; and the incident of survivorship is very generally abolished, except in the case of conveyances to husband and wife, or to trustees as such, or by way of mortgage.

JOINVILLE, François Ferdinand Philippe Louis Marie d'Orléans, prince de, the third son of Louis Philippe, king of the French, born at the palace of Neuilly, near Paris, Oct. 14, 1818. Like his elder brothers, he completed his classical studies in the college of Henry IV., and then

entered the naval school at Brest. His birth secured him rapid promotion. In 1838, when Admiral Baudin was sent against Mexico, he had reached the rank of post captain, and distinguished himself during the bombardment of the castle of San Juan de Ulua. A few days later, at the head of a detachment of sailors, he landed near Vera Cruz, broke in the gate of the city, passed through the streets amid brisk discharges of musketry, and with his own hand took Gen. Arista prisoner. He was rewarded by the cross of the legion of honor, and promotion to the rank of full captain. In 1840 he was sent to St. Helena, with two frigates, the *Belle Poule* and *Favorite*, to receive the remains of Napoleon I., which were transported to France. After a visit to the United States and a cruise along the coast of Africa, he repaired to Rio de Janeiro, which he had already visited, and there, May 1, 1843, married the princess Francesca of Bragança, the sister of Dom Pedro II. In the same year he was appointed rear admiral, and became a member of the admiralty board; he participated in the deliberations of the committee for the organization of a steam navy, insisting upon the necessity of taking active measures toward this end. In 1844 he was placed in command of the French fleet cruising along the coast of Morocco, and while Marshal Bugeaud was invading that empire by land, he bombarded Tangier, Aug. 6, and Mogadore, Aug. 15, taking possession of the island and harbor, and obliged the Moors to come to terms. The prince, who entertained liberal opinions, had more than once warned his father of the dangers attending his retrograde policy; but his voice had been powerless. On the breaking out of the revolution of 1848 he was in Algeria; he resigned his command to republican officers, sailed for England, and joined his exiled family at Claremont. When the constituent assembly discussed the decree of banishment against the Orleans family, he sent in a protest couched in most dignified terms. He lived for some years in retirement, keeping aloof from all political intrigues, and devoting his leisure hours to the education of his children and the colonization of his vast possessions in Brazil. The domain in France which he inherited from his aunt Adelaide was confiscated by Louis Napoleon in 1852. Shortly after the breaking out of the civil war in America he, with his nephews, the count de Paris and the duke de Chartres, joined the staff of Gen. McClellan, and took an active part in the Chickahominy campaign, returning to England in 1862. At the news of the first defeats of the French in the war of 1870 he offered his services to Napoleon, who declined to accept them. Considering the decree of his exile made void by the downfall of the empire, he went with his brother the duke d'Aumale and the duke de Chartres to Paris. The government of national defence ordered their immediate departure, but the prince succeeded in participating in the campaign of the army of

the Loire under cover of his American pseudonym of "Colonel Lutherod." Gambetta, who was then minister of war, ordered his arrest, and he was escorted by the police on board of a vessel to take him back to England, Jan. 18, 1871. Two departments, La Manche and Haute-Marne, elected him in the following month to a seat in the national assembly. He decided to represent the latter, but the assembly reserved its decision on the validity of his election. After the repeal of the laws of expatriation against the former sovereign families of France, and the declaration of the validity of the election of the princes, Joinville resigned his seat at the instance of Thiers. But, contrary to their promise, he and the duke d'Aumale appeared in the national assembly, Dec. 19. In letters addressed to the electors they explained their reasons for this step, and by an almost unanimous vote the assembly declared that the promises given were an entirely private affair in which it was not concerned. He has contributed anonymously to the *Revue des Deux Mondes* many articles, several of which have been reprinted in pamphlet form. Among these are: *Note sur l'état des forces navales de la France* (1844); *Étude sur l'escadre de la Méditerranée* (1852); *La guerre de Chine* (1857); *La guerre d'Amérique, campagne du Potomac* (1863); and a comparative view of the fleets of the United States and of France (1865). To him also has been attributed an article on the battle of Sadowa (1868).

JOINVILLE, Jean, sire de, a French chronicler, born in the château of Joinville, Champagne, about 1224, died about 1319. He was of an illustrious family, and early became seneschal to Thibaut IV., king of Navarre. In 1248 he joined the crusade of Louis IX. with 700 men-at-arms, and a strong friendship sprang up between them. He fought bravely, was taken prisoner and liberated with the king, spent four years with him in Palestine, returning to France in 1254, and afterward remained his intimate friend and counsellor. But when, in 1270, Louis summoned his barons to another crusade, Joinville declined to go, in consequence of an ominous dream, though he excused himself on the ground of duty to his people. He bore witness to the king's virtues during the inquest preparatory to canonization, and he gladly assented when Queen Jeanne of Navarre requested him to write the deeds and good sayings of her husband's grandfather. To this request we owe his *Mémoires*, which are invaluable as a chronicle, and unrivalled in point of simplicity and grace. They were completed about 1309, and first printed by Marnef brothers (4to, Poitiers, 1547). The best editions are those of Du Cange (1668), Capperonnier (1761), and F. Michel (Didot, Paris, 1858). Capperonnier's was reprinted in 1840, with annotations, in the *Recueil des historiens de France*, vol. xx. An edition from a newly discovered manuscript, rendered into modern French by Natalie de

Wailly, was published at Paris in 1873, under the title of *Histoire de St. Louis*.

JÓKAI, Mór, a Hungarian author, born at Comorn in 1825. He became known in 1842 by a drama, and in 1846 by a novel. He has since published more than 150 volumes. During the movements of 1848 he made himself conspicuous by his revolutionary ardor, but in 1849 belonged to the moderate party. He was at the time editor of the weekly literary journal *Életképek*, and from 1858 to 1863 of the humorous *Üstökös* ("The Comet"). Since 1863 he has been editor of the *Hon* ("Fatherland"), a daily political journal. He has been several times elected to the diet from Pesth. His more recent works include *Politikai divatok* ("Political Fashions," 4 vols., Pesth, 1863); *Mire megvénülünk* ("Till One grows Old," 4 vols., 1865); *Szerelem bolondjai* ("Love's Fools," 4 vols., 1867); *A kőszívű ember fia* ("The Sons of the Man with the Stony Heart," 4 vols., 1869); and *Fekete gyémántok* ("Black Diamonds," 5 vols., 1870). In 1848 he married Rosa Laborfalvi, a distinguished actress.

JOKJOKERTA, Jokyokarta, or Yugyakarta. I. A maritime province or residency in the S. part of Java, formerly one of the most important native states on the island, but now subject to the Dutch; pop. about 500,000. It contains the volcano of Nerapi, 3,000 ft. high, abounds in teak, is very fertile, and produces rice, coffee, and tobacco, but has no good harbors. **II.** The capital of the residency and seat of a native sultan and a Dutch resident, near the S. coast, about 275 m. E. S. E. of Batavia; pop. about 120,000. The most interesting features of the town are said to be the native monarch's water palace, with its walls, towers, and subterranean approaches, and the fort occupied by Europeans. The sultan is attended by a body guard of young females, armed with lance, sword, and pistol, and serving both as infantry and cavalry. From them are often chosen inmates for the royal harem. There is now a Christian church and school.

JOLIBA. See NIGER.

JOLIET, a city and the county seat of Will co., Illinois, situated on both sides of the Des Plaines river, 35 m. S. W. of Chicago; pop. in 1850, 2,659; in 1860, 7,102; in 1870, 7,263. The Illinois and Michigan canal passes through the city, and it is the point of junction of the Chicago, Rock Island, and Pacific, the Chicago and Alton, and the Michigan Central railroads. It is surrounded by a rich agricultural country, and is the principal shipping point for the produce of this region which is exported by canal. The canal and river furnish water power, and there are several flour mills, manufactories of agricultural implements, &c. There are inexhaustible quarries of fine blue and white building stone near the city. Joliet is well built and lighted with gas. The city hall is a large and imposing edifice. The state penitentiary, one of the finest buildings of the kind in the country, cost more than \$1,000,000. There

are two national banks, a semi-weekly and two weekly newspapers, and 10 public schools, including a high school.

JOLIET, Charles, a French author, born at Saint-Hippolyte, department of Doubs, Aug. 8, 1832. He was employed in the civil service till 1864, and became known as a journalist and as a miscellaneous writer. His works include *Le roman de deux jeunes mariés* (Paris, 1866), *Mademoiselle Chérubin* (1870), and patriotic novels based upon the Franco-German war of 1870-'71, which have given him a reputation almost equal to that of Ereckmann-Chatrian.

JOLIETTE. I. A W. county of Quebec, Canada, bounded S. E. by the St. Lawrence river; area, 2,669 sq. m.; pop. in 1871, 23,075, of whom 22,020 were of French descent. It is drained by the river L'Assomption and several smaller streams. **II.** A town, capital of the county, on L'Assomption river, 42 m. N. N. E. of Montreal; pop. in 1871, 3,047. It is connected by a railway 12 m. long with a harbor on the St. Lawrence. Joliette is the business centre of the surrounding country, has a weekly market, and carries on an extensive trade in agricultural produce and lumber. It contains large grist, saw, carding, and fulling mills, an extensive foundery, a tannery, quarries of limestone, a college, a French weekly newspaper, a hospital, and a convent.

JOLLIET, or Joliet, Louis, one of the early explorers of the Mississippi, born in Quebec in 1645, died in 1700. His father was the smith of the settlement, but placed his son at the Jesuit college, where he made rapid progress and evinced a decided taste for hydrography. He received the tonsure and minor orders in 1662, and graduated in 1666. He soon after abandoned his design of becoming a priest, and went west, where he spent some years in trade, acquiring a knowledge of Indian languages and of western topography. This led to his selection by Talon in 1672 to push through to the Mississippi. He and Père Marquette studied over the route, drawing up maps from their own knowledge and Indian reports, laying down rivers, tribes, and natural features. They started from Michilimackinac May 17, 1673, and proceeded to Green bay. Then they ascended the Fox river to an Indian town, where they obtained guides to the Wisconsin, and on June 17, 1673, entered the Mississippi. They found some Illinois 60 leagues lower down, near the mouth of the Des Moines, but passed the Missouri, the Piesá or Painted Rocks, and the Ohio, without encountering other Indians. They soon met a tribe not named, then the Mitchigamea, and finally the Arkansas. Here they found that the Indians had intercourse with Europeans; and having gone far enough to be certain that the river flowed into the gulf of Mexico and not into the Pacific, they turned back up the river, July 17, ascended the Illinois, and reached Lake Michigan. Jolliet at once set out to report his success, but his canoe up-

set in the Lachine rapids near Montreal, and he lost his men and his valuable maps and papers, barely escaping with his life. His report from memory was necessarily brief, and his map less accurate than that which Père Marquette had drawn and retained. Although he continued to study the topography, and by maps from time to time embodied all new data of discovery, he was not allowed to continue his researches in the west, but made an expedition in the king's service to Hudson bay. His modest merits were thrown in the shade by the pretensions of La Salle, who had won Frontenac's favor. As if to keep Jolliet as far as possible from the Mississippi, he was rewarded in 1680 by a grant of the seignury of Anticosti island. He devoted himself to the development of its fisheries and trade, and from this time signed himself Jolliet d'Anticosti. He was also appointed royal hydrographer at Quebec, and his numerous maps still extant show that his title was not a nominal one. Few men contributed more to the geography of the continent at that time. In 1697 he obtained the seignury of Joliette, which still belongs to his family. Among his descendants in 1874 are Archbishop Taschereau of Quebec and Archbishop Taché of Red River.

JOLLIVET, Pierre Jules, a French painter, born in Paris, June 27, 1803. He left the school of fine arts in 1825, lived for some time in Madrid, and returning to Paris exhibited in 1831 genre pictures relating to Spanish history and life. His works include "Louis VIII. taking the Oriflamme at Saint Denis," and other pieces, at Versailles; "Lara," after Byron's poem, at the Luxembourg; "The Massacre of the Innocents," at the museum of Rouen; and "The Installation of the Magistrates in 1849," in possession of the government. Among his recent productions are "Art in the Time of Pericles" and "The Jewels of Cornelia" (1869).

JOMARD, Edme François, a French geographer, born in Versailles, Nov. 20, 1777, died Sept. 22, 1862. He was a member of the Egyptian scientific commission in 1798, distinguishing himself by his successful researches, and was afterward appointed secretary of the commission to prepare the *Description de l'Égypte*, and in 1807 superintendent of the engraving and printing of that work, to which he devoted 18 years. He participated in 1821 in the establishment of the geographical society. In 1828, on the organization of the new department of geography and travels in the royal library, he received the appointment of *conservateur administrateur*. Being held in great esteem by Mehemet Ali, he persuaded the pasha to send a number of young Egyptians to study in Paris. These young men formed what was called the *institut des Égyptiens*, placed under the direction of Jomard. As a reward for his services, the successor of Mehemet Ali appointed him his scientific correspondent, and granted him the honorary title of bey. His numerous publications are all devoted to

geography, archæology, or public education. Besides his contributions to the great work of the Egyptian commission, which he printed separately, under the title of *Recueil d'observations et de mémoires sur l'Égypte ancienne et moderne* (4 vols. 8vo, Paris, 1830), his most important publications are: *Voyage à l'oasis de Syouah* (1819), from the notes of the travellers Caillaud and Drovetti; *Remarques sur les rapports de l'Éthiopie et de l'Égypte, &c.* (1822); *Aperçus et coups d'œil sur les nouvelles découvertes dans l'Afrique centrale* (1824-'7); *Observations sur le voyage au Darfour* (1845); *Classification méthodique des produits de l'industrie extra-européenne* (1862); and *Les monuments de la géographie* (1862), a collection of ancient charts of Europe and the Orient, reproduced in facsimile.

JOMELLI, Nicolò, an Italian composer, born in Aversa, near Naples, in 1714, died in Naples, Aug. 28, 1774. He was a pupil of Leonardo Leo. His *Errore amoroso* and *Odoardo*, produced in Naples before he was 24 years of age, established his reputation, and he was invited to Rome, where he composed two new operas. Thence he went to Bologna, where he studied under Padre Martini. After a successful career in the chief cities of Italy, he returned in 1749 to Rome, where his *Artaserse* was coldly received. In the following year he produced his *Achille in Sciro* with complete success in Vienna, where he made a congenial friend in the poet Metastasio, whose *Didone* he set to music, and on whose works he thenceforth almost exclusively employed himself. Returning to Rome in 1751, he was made chapelmaster of St. Peter's, but resigned in 1753 to accept an invitation from the duke of Würtemberg to settle as musical director in Stuttgart. He returned to Naples in 1768; but his style no longer pleased, and his *Demofoonte* and *Ifigenia in Aulide* failed. The *Miserere* was the last and greatest of his works.

JOMINI, Henri, baron, a French military historian, born at Payerne, canton of Vaud, Switzerland, March 6, 1779, died at Passy, near Paris, March 24, 1869. He joined the French army in 1804 with the rank of major, and was soon made a colonel, serving as aide-de-camp and chief of staff to Marshal Ney in Germany and Spain. In 1805 he presented to Napoleon on the field of Austerlitz the first edition of his *Traité des grandes opérations militaires, ou Histoire critique et militaire des guerres de Frédéric II. comparées à celles de la révolution* (5 vols. 8vo, with an atlas, Paris, 1804-'5). In consequence of a misunderstanding with Ney in 1808, he resigned, and offered his services to the emperor Alexander; but Napoleon compelled him to return and accept the commission of brigadier general. In 1812 he was appointed governor of Wilna and then of Smolensk, and was of great service to the French army during the latter part of the disastrous retreat from Moscow. After the victory of Bautzen Ney asked for him the rank of general of divi-

sion; but Berthier, who was unfriendly to him, put him under arrest on account of some trifling irregularities in his routine duties. This treatment he deeply resented; and after the armistice of Pläswitz he left the French army and repaired to the headquarters of Alexander, who appointed him his aide-de-camp. Sentence of death was passed against him as a deserter. The rumor that he betrayed the military plans of the French was wholly unfounded, according to Napoleon's own declaration. Jomini even declined taking an active part in the operations of the allied armies against France. In 1815 he accompanied the czar to Paris, and received the cross of the order of St. Louis from Louis XVIII. He tried, but in vain, to save the life of Ney. After sojourning in France to superintend the publication of his great work, *Histoire critique et militaire des campagnes de la révolution de 1792 à 1801*, written in conjunction with Col. Koch (15 vols. 8vo, Paris, 1819-'24), he returned to Russia in 1822, and was intrusted with the completion of the military education of the grand duke Nicholas, who on his accession to the throne retained him as his aide-de-camp. He served in 1828 during the Russian war against Turkey, and organized in 1830 the Russian military academy. He then retired to Brussels, but hastened to St. Petersburg on the breaking out of the Crimean war. He spent the last years of his life in Brussels and Passy. Besides the above mentioned works, which are the basis of his reputation as a military writer, his chief publications are: *Principes de la stratégie* (3 vols. 8vo, Paris, 1818); *Vie politique et militaire de Napoléon, racontée par lui-même au tribunal de César, d'Alexandre et de Frédéric* (4 vols., 1827); *Tableau analytique des principales combinaisons de la guerre et de leurs rapports avec la politique des états* (4th ed., St. Petersburg, 1836); *Précis de l'art de la guerre, ou nouveau Tableau analytique des principales combinaisons de la stratégie, de la grande tactique et de la politique militaire* (1830; new ed., Paris, 1855); *Précis politique et militaire de la campagne de 1815* (1839); *Appendice au Précis de l'histoire de la guerre* (1849). The following translations of his works have appeared in the United States: "Art of War," by Capt. G. H. Mendell and Lieut. W. P. Craighill (Philadelphia, 1862); "Political and Military Life of Napoleon," by Maj. Gen. H. W. Halleck (4 vols. 8vo, New York, 1864); "Political and Military History of the Campaign of Waterloo," by Capt. S. V. Benet (New York, 1864); "Treatise on Grand Military Operations, and Art of War," by Col. S. B. Holabird (2 vols. 8vo, with atlas, New York, 1865).

JONAH, the fifth of the minor Hebrew prophets, son of Amittai, born in Gath-hepher, in the tribe of Zebulun, prophesied in the kingdom of Israel under Jeroboam II. The book called after him relates that he received the divine command to go to Nineveh and denounce the

wickedness of that city. Fearing to undertake the mission, he embarked at Joppa for Tarshish, that he might flee from the presence of the Lord. Overtaken by a tempest, the mariners threw him overboard as the cause of their disaster. He was swallowed by a great fish, within which he lived three days and three nights, when the monster threw him forth upon dry land. Again sent to Nineveh, he prophesied the destruction of that city within 40 days. The Ninevites repented, and God forbore to execute the sentence which he had pronounced. Jonah complained of this result, retired from the city, and while dwelling in a booth was symbolically reproved by God. The literal interpretation of the book of Jonah was maintained by the early ecclesiastical authors. Various allegorical and mythical interpretations have been advanced by some modern critics, as Semler, Michaelis, Herder, Eichhorn, Meier, and De Wette. A modern oriental tradition places the tomb of Jonah at Nebi Yunus, opposite Mosul. (See NINEVEH.)—See Jäger, *Ueber den Zweck des Buches Jonas* (1840), and Kralmer, *Das Buch Jonas historisch-kritisch untersucht* (1846), besides the collective works on the minor prophets by Hitzig, Keil, and Lange.

JONAS, Justus, a German theologian, born in Nordhausen in 1493, died in Eisfeld in 1555. He studied law and afterward theology at Erfurt, and was appointed in 1521 professor at Wittenberg, where he embraced with zeal the doctrines of the reformation, becoming intimate with Luther and accompanying him to the diet at Worms. He was present at the conference in Marburg and at the imperial diet of Augsburg. In 1541 he was appointed preacher at Halle, from which place when banished he accompanied Luther on his last journey to Eisleben. At the time of his death he was pastor and superintendent at Eisfeld. He assisted Luther in translating the Bible. The work by which he is best known is the *Discussio pro Conjugio Sacerdotali* (1523).

JONATHAN, brother of Judas Maccabæus. See HEBREWS, vol. viii., p. 592.

JONES, the name of five counties in the United States. **I.** A S. E. county of North Carolina, drained by Trent river; area, 380 sq. m.; pop. in 1870, 5,002, of whom 2,656 were colored. It has a level and marshy surface, with pine and cypress forests, and a sandy soil. The chief productions in 1870 were 96,385 bushels of Indian corn, 14,139 of sweet potatoes, and 1,196 bales of cotton. There were 251 horses, 256 mules and asses, 683 milch cows, 1,594 other cattle, 1,610 sheep, and 4,717 swine. Capital, Trenton. **II.** A central county of Georgia, bounded W. by Ocmulgee river; area, 360 sq. m.; pop. in 1870, 9,436, of whom 6,445 were colored. The surface is hilly, and the soil generally good, though much worn. Iron, granite, and quartz are found. The central Georgia railroad passes along its southern boundary, and the Macon

and Augusta line crosses the S. E. portion. The chief productions in 1870 were 6,191 bushels of wheat, 108,945 of Indian corn, 6,815 of oats, 14,354 of sweet potatoes, and 5,188 bales of cotton. There were 479 horses, 891 mules and asses, 1,082 milch cows, 2,648 other cattle, 1,250 sheep, and 6,675 swine. Capital, Clinton. **III.** A S. E. county of Mississippi, drained by Leaf river and its tributaries; area, 672 sq. m.; pop. in 1870, 3,313, of whom 308 were colored. It has a rolling or slightly hilly surface, with a sandy soil of various qualities. The chief productions in 1870 were 43,187 bushels of Indian corn, 5,662 of oats, 20,503 of sweet potatoes, 29,070 lbs. of rice, and 315 bales of cotton. There were 608 horses, 1,804 milch cows, 2,738 other cattle, 3,773 sheep, and 7,764 swine. Capital, Ellisville. **IV.** A N. W. county of Texas, drained by the head streams of Brazos river; area, 1,004 sq. m.; returned as having no population in 1870. It is nearly all prairie; mesquite grass and the timber of the same name abound. The soil is of a reddish color and generally fertile. The county is well adapted to stock raising. **V.** An E. county of Iowa, drained by Wapsipinicon and Makoqueta rivers; area, 576 sq. m.; pop. in 1870, 19,731. It has a diversified surface, with alternations of prairie and forest, and a fertile soil resting chiefly on a bed of limestone. The Dubuque Southwestern, the Davenport and St. Paul, and the Sabula, Ackley, and Dakota railroads traverse it. The chief productions in 1870 were 476,039 bushels of wheat, 1,606,646 of Indian corn, 682,260 of oats, 111,216 of potatoes, 37,104 lbs. of wool, 733,645 of butter, 35,121 of cheese, and 37,936 tons of hay. There were 7,791 horses, 9,736 milch cows, 9,811 other cattle, 7,725 sheep, and 18,724 swine; 10 manufactories of carriages, 1 of cheese, 6 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, and 4 flour mills. Capital, Anamosa.

JONES, Anson, president of the republic of Texas, born in Great Barrington, Mass., Jan. 20, 1798, died by his own hand in Houston, Texas, Jan. 7, 1858. He commenced the study of medicine in Litchfield, Conn., in 1817, and in 1820 was licensed to practise. After a residence in South America, Philadelphia, and New Orleans, he established himself in 1833 in Brazoria, Texas. Upon the outbreak of the troubles between Texas and Mexico he served as a private soldier and as surgeon in the Texan army. In 1837-'8 he was a representative in the Texan congress. In 1838 he was sent as minister to Washington, where he remained about a year, and where he unsuccessfully endeavored to secure the annexation of Texas to the United States. On his return to Texas he took his seat in congress as senator from Brazoria, and in 1841 he was appointed by President Houston secretary of state, which office he filled three years. In September, 1844, he was elected president for three years from the

ensuing December, and held that office until the annexation of Texas to the United States. The latter years of his life were passed in agricultural pursuits. In 1859 his journal, preceded by a brief autobiography, was printed for private circulation.

JONES, Inigo, an English architect, born in London about 1572, died July 21, 1652. He was of humble origin, and in early life is said to have been apprenticed to a joiner; but manifesting a strong inclination for drawing, he attracted the notice of the earl of Pembroke, who afforded him the means of procuring an art education abroad. During several years he made careful studies of the chief architectural monuments of France, Germany, and Italy. In Venice he became acquainted with the masterpieces of Palladio, whose style he subsequently transplanted into England. At the invitation of Christian IV. of Denmark he visited Copenhagen in 1604, and furnished, it is said, the designs for the royal residences of Rosenborg and Frederiksborg. In 1605 he returned to England, where he was employed by James I. to prepare the scenery, decorations, and machinery for the masques written by Ben Jonson, which were among the chief amusements of the court. He became a person of considerable consequence at court, and by his overbearing manners incurred the enmity of his dramatic associate Jonson, who satirized him under the name of Lantern Leather-head in his "Bartholomew Fair." In 1612, upon the death of Prince Henry, to whom he had been appointed architect, he revisited Italy, and succeeded in materially improving his style. Upon his return he was appointed surveyor general of the royal buildings, and during the next 25 years was occupied with many important public works. His designs for the palace at Whitehall, of which only the banquetting house was built, are considered his masterpieces; besides which he designed the river front of Somerset house, a Corinthian portico added to old St. Paul's, the arcade and church of St. Paul, Covent Garden, York stairs, surgeons' hall, Shaftesbury house, Ashburton house, and many private residences in various parts of England. At the request of James I. he made a careful examination of the druidical remains at Stonehenge, and pronounced them part of a temple of the Roman or Tuscan order dedicated to Cœlus. The errors of his restoration, as disclosed in his "Essay on Stonehenge," published after his death by his son-in-law John Webb (fol., 1655), have since become apparent. During the civil war he adhered to the royal cause, and suffered so much from fines and other persecutions that he died broken-hearted and in poverty. He was an accomplished classical scholar and mathematician, and occasionally wrote verses. His publications consist of a masque and several miscellaneous essays, and he also left some notes on Palladio's architecture. His designs were published by

William Kent in 1727 and 1770, and by Isaac Ware in 1743. See "Life of Inigo Jones," by Peter Cunningham (London, 1848).

JONES, Jacob, an American naval officer, born near Smyrna, Kent co., Del., in 1770, died in Philadelphia in August, 1850. After studying medicine, he received in April, 1799, a midshipman's warrant, and served for some time in the frigate United States under Commodore John Barry. He was promoted to the rank of lieutenant in February, 1801, and at the opening of the war with Tripoli was attached to the frigate Philadelphia, in which he was captured off Tripoli in 1803, and remained a prisoner 20 months. He was afterward employed for some years on the S. coast of the United States, a part of the time in command of the brig Argus. In April, 1810, he was commissioned as master commandant, and in 1811 was appointed to the command of the Wasp, a sloop of war of 18 guns. He was on his passage home from France in 1812 when war was declared by the United States against England. On his arrival the Wasp was ordered to sea again immediately, and met a convoy of English merchantmen protected by a sloop of war. An engagement ensued, lasting 43 minutes, when the Wasp boarded and carried her antagonist. The captured vessel, which proved to be the British sloop Frolic, Capt. Whinyates, was a mere wreck when she surrendered. Before they were able to clear the wreck, the British ship Poictiers, of 74 guns, captured both vessels and carried them to Bermuda. The Americans were soon put on parole, and returned to the United States. Congress voted a gold medal to Jones, and silver ones to each commissioned officer of the Wasp. In March, 1813, he was promoted to the rank of post captain, and appointed to command the frigate Macedonian in the squadron of Decatur.

JONES, John, a Welsh clergyman, born in Carmarthenshire, died in London, Jan. 10, 1827. He completed his education at the Unitarian college of Hackney, and in 1792 was appointed classical and mathematical tutor in the Welsh academy at Swansea. He continued in this situation for three years, and then removed to Plymouth Dock, where he became minister of a Unitarian church. This charge he exchanged in 1797 for that of the Unitarian congregation at Halifax, in Yorkshire. About 1800 he removed to London, and resided there during the remainder of his life, chiefly as a classical teacher. He published a Greek grammar (1804), "Illustrations of the Four Gospels" (London, 1808), a "Greek and English Lexicon" (1823), and *Etymologia Græca* (1826), an enlarged edition of his grammar.

JONES, John Paul, an American naval officer, born at Arbigland, on Solway firth, Scotland, July 6, 1747, died in Paris, July 18, 1792. His name was John Paul, that of Jones having been assumed in after life. At the age of 12 he was apprenticed to a merchant of Whitehaven, who was engaged in American trade.

His first voyage was to Virginia, where his elder brother was established as a planter. He was afterward engaged for a short time in the slave trade, which he left in disgust, and made a number of voyages to the West Indies, realizing, it was said, a fortune by commercial speculations. At the commencement of the American revolutionary struggle he was in Virginia, and entered the colonial service as a lieutenant in the navy, Dec. 22, 1775. It is said that Jones hoisted on the Alfred (of which he was first lieutenant), the flag ship of a squadron of eight vessels, the first American flag ever displayed. The device it bore is believed to have been a pine tree with a rattlesnake coiled at its root. From the Alfred he was soon transferred to the command of the sloop Providence, of 12 guns and 70 men, in which vessel he made 16 prizes during a cruise of six weeks between the Bermudas and the gut of Canso. He was appointed a captain in 1776, receiving command of the Alfred, and in 1777 of the Ranger. He made many prizes on his cruises and broke up the fishery at Cape Breton. In November, 1777, he sailed to Europe, harassed the coasting trade of Scotland, and made a bold attack on Whitehaven. He also attempted to capture the earl of Selkirk, who resided upon his estate near Kirkcudbright, on the river Dee, in order to bring about a system of exchanges of prisoners, to which England had hitherto showed a reluctance. This design failed, owing to the absence of the earl from home. The crew plundered the house of the silver plate; but Jones bought it of them and restored it to Lady Selkirk. During this cruise the Ranger captured the Drake, a sloop of war superior to her in force. On May 8, 1778, the Ranger arrived at Brest, with her prize and 200 prisoners, being nearly double the number of her own crew. From this time until February, 1779, he used every effort to obtain another and better command. The Ranger was despatched by the commissioners to America, Jones being retained by them in France. After many months of disappointment, he set out for Paris, and made such strong personal appeals to the minister, M. de Sartine, that on Feb. 4 he was appointed to the command of the ship Duras, an old Indiaman converted into a ship of war, and then lying at Lorient. In compliment to Dr. Franklin, Jones changed the name of this ship to "Bon Homme Richard." After many delays she was equipped for service, though in a very inefficient manner. On her main or gun deck she mounted 28 12-pounders, and on her quarter deck and fore-castle 14 9-pounders, making an armament of 42 guns in all. But Jones, determined to make the most of her, caused 12 ports to be cut in her gun room below, where 6 old 18-pounders were mounted. This expedient did not add to the efficiency of the ship, but, on the contrary, as will be seen, produced disastrous consequences. On Aug. 14, 1779, Jones sailed from Lorient, having under

his command a squadron of five vessels. By the middle of September 26 vessels had been captured or destroyed by them, which created great alarm upon the E. coast of England. On Sept. 23 the *Bon Homme Richard* was off Flamborough Head, having in company the *Alliance*, Capt. Landais, and the *Pallas*, a ship mounting 32 light guns, commanded by Capt. Cottineau. Soon after noon the headmost ships of a fleet, known to be from the Baltic, were seen standing out from under Flamborough Head, and beating down toward the straits of Dover. This fleet was under convoy of the *Serapis*, 44, and *Countess of Scarborough*, 22. Signal for general chase was made by Jones, and the *Alliance*, being the fastest of the squadron, took the lead; but no sooner had she discovered the force of the English vessels of war than she stood off from them. About 7½ o'clock the *Richard* came up with the *Serapis*, commanded by Capt. Pearson, and closed with her, upon her weather quarter, to about half pistol shot. At the commencement of the action two of the old 18-pounders mounted in the *Richard's* gun room burst, blowing up the deck above and killing or wounding a large portion of the men stationed at them. This part of the battery was then abandoned, and the ports were closed. A close and heavy cannonade was now maintained by both ships for about an hour, when they fouled each other, and Jones with his own hands assisted in lashing the jib stay of the *Serapis* to the mizzen mast of the *Richard*. The ships being in actual contact, fore and aft, each discharged her guns into the side or through the ports of her antagonist. The effect of such a fire was terrible to both. Soon after 10 o'clock the *Serapis* struck, and Dale, the first lieutenant of the *Richard* (afterward Commodore Dale), was ordered on board to take possession of her. In the morning the spectacle presented by the *Richard* was singular and dreadful. She was on fire in two places, and had 7 ft. of water in her hold. Her counters and quarters on the lower deck were driven in, the whole of her main battery was dismounted, and she was cut to pieces in a most extraordinary manner. The after part of the ship, in line with the guns of the *Serapis*, was so completely beaten in that the upper deck was only sustained by a few frames, which had been missed by shot. It being deemed impossible to carry her into port, the wounded were removed, and she soon after sank. The *Serapis* suffered much less. She was a new ship, in excellent condition, and much superior in force to the *Richard*, mounting 50 guns, though rated at 44. Her crew numbered 320, while those engaged upon the *Richard* were only 227, Irish, Scotch, Portuguese, Norwegians, &c., with but very few Americans. During the action the *Countess of Scarborough* surrendered to the *Pallas*, the captain of which requested Capt. Landais of the *Alliance* to take charge of the prize, to enable

him to go to the assistance of the *Richard*; but Landais, instead of complying, actually opened fire upon Jones's ship. Jones carried his prize into the Texel. On his arrival in France he was received with the most distinguished honors. A sword was presented to him by Louis XVI., who also requested permission of congress to decorate him with the military order of merit. In 1781 he sailed for the United States, arriving in Philadelphia in February, where congress voted him a gold medal, and Washington addressed him a highly complimentary letter. He was afterward employed to superintend the construction of a line-of-battle ship, the *America*, at Portsmouth, N. H., which he was to have commanded; but the ship was presented by congress to France. He then went to Paris as an agent for prize money, and while there was invited into the Russian service with the rank of rear admiral, but was disappointed at not receiving command of the fleet in the Black sea. He quarrelled with the admiral, the prince of Nassau, and owing to the intrigues of enemies fell into disfavor at court, and was finally permitted by the empress Catharine to retire from the service, with a pension which was never paid. He took up his residence in Paris, where he died in poverty and neglect.

JONES, Owen, an English architect, born in Wales in 1809, died in London, April 19, 1874. He was the only son of Owen Jones, a Welsh tradesman, whose "*Myvyrian Archæology of Wales*," published under the name of Owain Myvyr (3 vols., London, 1801-'7), has been described by Matthew Arnold as a great repository of Welsh literature. The son, after studying with a London architect, spent four years on the continent and in the East. While in Granada he made with Jules Goury drawings of the Alhambra, which revealed for the first time the striking characteristics of that unique monument; and after Goury's death he carried on the publication of the work almost alone, investing in it his whole patrimony, and sparing no effort in its elaborate execution. It was published under the title of "*Plans, Elevations, Sections, and Details of the Alhambra*," with a notice of the kings of Granada and the translation of Arabic inscriptions by Gayangos (London, 1836-'42; 2d ed., 1847, with 101 plates). In 1851 he became one of the superintendents of the crystal palace in London, and next year director of its decoration in conjunction with the present Sir Matthew Digby Wyatt; and the courts of architecture and sculpture in the Sydenham crystal palace, and the decorative painting of that building, were all completed under his direction, with the assistance of Bonomi, Sharpe, and others in the Egyptian court. His polychromatic decoration of the Greek court having excited comment, he vindicated his imitation of the ancient Greek sculptors, and illustrated his views by painting a portion of the casts of the Elgin marbles at Sydenham in party-colors, the

hair being gilt. In his handbooks to the Alhambra and other courts of the crystal palace, he gives a full exposition of the principles of ornamentation. His principal architectural work is St. James's Hall in Piccadilly. He also delivered lectures, and published one of the most important of them for the promotion of his views, which he lived to see generally adopted, though the variety and novelty of his conceptions occasioned controversy. The last of the many public recognitions he received was an honorary diploma for designs at the Vienna exhibition of 1873. He also prepared with Goury "Views on the Nile" (London, 1842), and furnished many others for illustrated works. His other productions include "Designs for Mosaic and Tessellated Pavements," with an essay by F. O. Ward (1842); "The Polychromatic Ornament of Italy" (1846); an elaborate "Grammar of Ornament" (folio, 1856); "One Thousand and One Initial Letters," and "Seven Hundred and Two Monograms" (1864); "Examples of Chinese Ornament" (1867); and several volumes of Biblical illustrations. A scholarship was founded after his death in 1874, by the "Owen Memorial" committee, in commemoration of his genius, and his portrait in mosaic was presented by it to the nation.

JONES, Thomas Rymer, an English anatomist, born about 1810. He became a member of the royal college of surgeons in 1833, but on account of a defect in his hearing has never practised. Subsequently he was appointed professor of comparative anatomy in King's college, London. His first work, "A General Outline of the Animal Kingdom" (8vo, 1841), written to supply a want in English scientific literature, established his reputation as a comparative anatomist and physiologist, and is still regarded as one of the best works of its kind in any language. About this time he was appointed Fullerian professor of physiology in the royal institution, and subsequently he became examiner in comparative anatomy and physiology in the London university. In 1845 and 1852 were published the first two volumes of his Fullerian lectures, under the title of "Lectures on the Natural History of Animals," the work being still incomplete. His other works are: "General Outline of the Organization of the Animal Kingdom, and Manual of Comparative Anatomy" (1855); "The Aquarian Naturalist" (London 1858); and "The Animal Creation" (1865). He also contributed to the "Cyclopædia of Anatomy and Physiology."

JONES, William, an English divine, born at Lowick, Northamptonshire, in 1726, died at Nayland in 1800. He was educated at the Charterhouse, and at University college, Oxford, and became successively vicar of Bethersden (1764), rector of Pluckley, perpetual curate of Nayland (1776), and rector of Pasten and of Hollingbourn, the last three of which appointments he held at his death. He was eminent as a scholar and theologian, and proficient in music. His principal works are: "The Catho-

lic Doctrine of the Trinity Proved" (1756); "Lectures on the Figurative Language of the Holy Scriptures" (1786, several times reprinted); "The Scholar Armed against the Errors of the Time," a compilation (2 vols., 1792); and a "Life of Bishop Horne" (1795). He also wrote treatises on music, composed anthems, and was the originator of the "British Critic." A collected edition of his works, with a biography by William Stevens, was published in 1801 (12 vols.; new ed., 6 vols., 1810). Two posthumous volumes of his sermons, edited by Henry Walker, appeared in 1830.

JONES, Sir William, an English orientalist, born in London, Sept. 28, 1746, died in Calcutta, April 27, 1794. His father, an eminent mathematician, died when he was but three years old, and the care of his education devolved on his mother. When seven years old he was sent to the grammar school at Harrow, where he remained ten years, not only surpassing his associates in classical studies, but making some progress in Hebrew and Arabic, and applying himself to French and Italian during his vacations. In 1764 he was entered at University college, Oxford; and in 1765 he was invited to reside in the family of Earl Spencer, as tutor to Lord Althorp, then seven years of age, which office he held for five years, during which he was elected a fellow at Oxford. Meantime his fame for oriental scholarship had begun to extend, and in 1768 Christian VII. of Denmark requested him to translate into French a Persian life of Nadir Shah. This was published at London in 1770, in connection with a dissertation, also in French, on oriental poetry, containing translations of several of the odes of Hafiz. In the following year appeared his Persian grammar, which, as enlarged by subsequent editors, long remained the standard text book on the subject. In 1770 he became a student at the Temple, and began to contemplate "the stately edifice of the laws of England," but was immediately called upon to defend his university against the aspersions of the French orientalist Anquetil-Duperron. His pamphlet (1771) was anonymous, in idiomatic and effective French, and was universally admitted to surpass the attack both in wit and learning. In the following year he published a small volume of poems, chiefly translations from the Asiatic languages, which was followed by the more important *Poeseos Asiaticae Commentariorum Libri Sex* (1774; republished by Eichhorn, Leipsic, 1777), in which with equal skill and erudition he aimed to familiarize the European mind with oriental modes of thought and expression. Called to the bar in 1774, he left at Oxford all his oriental books and manuscripts, and applied himself exclusively to legal studies. He was ambitious of a seat in parliament, and in 1780 stood for the university of Oxford; but his liberal politics, and his condemnation of the American war and of the slave trade, deprived him of all chance of success, and he withdrew from the

contest. His political opinions were declared in several essays, as his "Inquiry into the Legal Mode of Suppressing Riots," "Plan of a National Defence," and "Principles of Government;" and he produced in 1781 a more elaborate work on the "Law of Bailments," which alone, according to Judge Story, would have given him "a name unrivalled in the common law for philosophical accuracy, elegant learning, and finished analysis." He resumed his oriental studies to produce a translation of the "Moallakat, or Seven Arabian Poems which were suspended in the Temple at Mecca" (1783). In 1783 he was married, knighted, and, through the influence of Lord Ashburton, appointed a judge of the supreme court of judicature at Fort William in Bengal. One of his first acts after his arrival was the founding of the Asiatic society of Bengal, or "society for inquiring into the history and antiquities, the arts, sciences, and literature of Asia." He was the first president of this body, and contributed to the first four volumes of its "Asiatic Researches" numerous treatises of great importance. He undertook to make a digest of Hindoo and Mohammedan laws, similar to the codification of Greek and Roman law effected by Justinian. This task he did not live to complete, and it was finished under the superintendence of Mr. Colebrooke. He translated and published in 1794 the ordinances of Manu, the foundation of Hindoo jurisprudence. He also translated the *Sakontala*, or "The Fatal Ring," an Indian drama by Kalidasa; the *Hitopadesa*, the original of the famous fables of Bidpay; the tales and fables of Nizami; and portions of the Ramayana and the Vedas. He had decided to return to England, when he died suddenly. He was familiar with 27 languages. No predecessor had equalled his attainments in Sanskrit, Arabic, and Persian. A collected edition of his works was published in 6 vols. in 1799; a life by Lord Teignmouth was added in 1804; and the whole was reprinted in 1807, in 13 vols.

JONESBORO, a village, capital of Clayton co., Georgia, on the Macon and Western railroad, 20 m. S. of Atlanta; pop. in 1870, 531. An important battle was fought here, Aug. 31, 1864. Sherman, then besieging Atlanta, despatched a force under Howard to seize the railroad near Jonesboro, an operation which if successful would compel the evacuation of Atlanta. Hood, the confederate commander, sent a force under Hardee to oppose this attempt. Howard occupied an intrenched position in which he was attacked by Hardee. After a severe action of two hours, the confederates withdrew. Their loss, as officially given by Hood, was 1,400 killed and wounded; the Union force, being attacked in their intrenchments, suffered much less. As the immediate consequence of this action, Atlanta was evacuated by the confederates in the night of Sept. 1.

JÖNKÖPING. I. A S. province or län of Sweden, bordering on Östergothland, Kalmar,

Kronoberg, Halland, and Elfsborg; area, 4,298 sq. m.; pop. in 1872, 181,788. It is traversed by several mountains, and is watered by the rivers Nissa and Em and by Lake Wetter. It is well cultivated and wooded, and abounds in minerals, particularly iron, which is largely exported, together with corn, cattle, butter, cheese, pitch, and tar. Hemp, flax, and potatoes are also extensively raised. II. A town, capital of the län, situated on a tongue of land at the S. end of Lake Wetter, 175 m. S. W. of Stockholm; pop. in 1872, 11,751. The low situation requires embankments against inundations. It is well built, and has a fine parish church, ruins of an old castle, a governor's residence, a superior court, and a theatre. The harbor in the adjoining Munk lake has increased in importance through the opening of the Göta canal. The trade is chiefly in corn, iron, and wood; famous lucifer matches are made here, and much used in France and England. In the vicinity are mineral springs, summer resorts, and villas. It is one of the principal stations on the southern railroad, and is connected by steamers with Stockholm.

JONSON, Benjamin, commonly called BEN, an English dramatist, born in Westminster in 1573 or 1574, died Aug. 6, 1637. He was the posthumous son of a clergyman, and during his childhood his mother was married a second time, according to tradition, to a master bricklayer named Fowler. Ben was educated at Westminster school under the tuition of Camden, and subsequently followed the calling of his stepfather, whom he assisted in building part of Lincoln's Inn. Finding this occupation not to his taste, he enlisted in the army, and served a campaign in Flanders. Returning to England, he is said to have entered himself at St. John's college, Cambridge. About the age of 20 he went upon the stage, but met with little success as an actor, and also engaged in dramatic composition. In 1596 appeared his "Comedy of Humors," which was recast and brought out at the Globe theatre in 1598 under the title of "Every Man in his Humor." Shakespeare, who is said to have aided in the composition of the play, was one of the performers. About the same time he was imprisoned for killing Gabriel Spenser, an actor, in a duel, and during his confinement was converted to the Roman Catholic faith, although he subsequently became again a Protestant. "Every Man in his Humor" was succeeded in 1599 by "Every Man out of his Humor," a less able performance, in which the "enpluism" so fashionable at that time is ridiculed; "Cynthia's Revels" (1600); the "Poetaster" (1602), which involved the author in a quarrel with Decker, who retaliated upon him in "Satyromastix;" and "Sejanus," a tragedy (1603), in which Shakespeare is said to have taken his farewell of the stage as an actor. Shortly after the accession of James I., Jonson, in conjunction with Chapman and Marston, wrote the comedy of "Eastward Hoe," containing

some reflections on the Scottish nation, in consequence of which the three dramatists were imprisoned and threatened with the loss of their ears and noses. After a short confinement they were pardoned, and Jonson made his peace with James, who employed him in writing masques and other court entertainments. Between 1605 and 1611 appeared his comedies of "Volpone," "Epicæne, or the Silent Woman," and "The Alchemist," and the tragedy of "Catiline." In 1613 he visited the continent as travelling tutor to a son of Sir Walter Raleigh. Among his favorite haunts at this time was the Mermaid club, where he was thrown into the society of Shakespeare and the great Elizabethan dramatists, and of Raleigh, Camden, Selden, Donne, and others. The Apollo club, which met at the Devil tavern in Fleet street, was founded by Ben Jonson himself at a later date. In 1619 he received the appointment of poet laureate with a pension of 100 marks, and about the same time made a pedestrian excursion to Scotland, in the course of which he visited Drummond of Hawthornden, who has preserved some curious notes of his conversation. In 1628 he was attacked by palsy, and compelled also by poverty to write for the stage. His "New Inn" was unsuccessful, but Charles I., hearing of his necessities, sent him a present of £100, and raised his salary to that sum, adding a tierce of canary annually. Notwithstanding this assistance, his improvident habits kept him always in difficulties. He wrote two or three more dramas, which Dryden calls his "dotages," and left "The Sad Shepherd," a fragment of great beauty. Jonson's pride of learning, which obtrudes itself into some of his best works, has interfered not a little with their popularity as literary performances. In the opinion of some of his critics his genius was more poetic than dramatic. His delineations of character are striking, original, and artistic, rather than natural. His comedies are esteemed his best performances. His tragedies, founded on classic history, and burdened with long extracts from Sallust, Tacitus, and other Latin authors, are correct in form, but lack vivacity. He published in 1616 a folio edition of most of his works produced previous to that date, carefully revised and corrected. Various collective editions subsequently appeared, the first good one being that of Gifford (9 vols. 8vo, 1816), accompanied with notes critical and explanatory, and a biographical memoir, written with ability, but in a partisan spirit. Moxon's reprint, the latest, prefaced by Gifford's memoir (royal 8vo, 1853), contains 17 plays, 15 of which were performed on the stage; over 30 masques and interludes; epigrams, translations from Horace, an English grammar, and a variety of miscellanies in prose and verse. He was buried in Westminster abbey, and the pithy inscription upon his tomb, "O rare Ben Jonson," was added at the expense of an eccentric Oxfordshire squire, called Jack Young, who, observing

the tomb to be destitute of an epitaph, gave a mason 18 pence to carve the words upon it. The stone has since been removed.

JONSSON, Finn, an Icelandic historian, born in Hitardal, Jan. 16, 1704, died July 23, 1789. In 1725 he entered the university of Copenhagen, and in 1728 was present at the fire which destroyed the great collection of Icelandic MSS. formed by his patron Arni Magnússon. In his endeavors to save these MSS. he neglected his own effects and library, which were burned. On returning to Iceland he obtained a benefice, and in 1754 was appointed bishop of Skalholt. He wrote many works in Latin and Icelandic, the principal of which is the *Historia Ecclesiastica Islandiæ*, published under the care of his son Hannes Finsson at Copenhagen (4 vols. 4to, 1772-'9). The latter, who succeeded his father in the bishopric, made important additions to this work, edited several sagas, and was the founder of the Iceland agricultural society.

JOODPOOR, or Marwar. I. The largest of the native Rajpoot states of India, between lat. 24° 36' and 27° 40' N., and lon. 70° 4' and 75° 23' E.; area, about 36,000 sq. m.; pop. estimated at 1,800,000, chiefly Hindoos. The Loonee river divides it into two parts; the S. E. or left bank is fertile, and the N. W. or right bank is a continuation of the desert of Sinde. It is traversed in the east by the Aravulli range of mountains, from 3,000 to 4,000 ft. high, the torrents of which irrigate the south, and favor the cultivation of grain. The chief products are wheat and cotton, but frosts often destroy the latter in a single night. Millet and a pulse called *moth* are the principal food. Camels, horses, cattle, and sheep abound, as well as many wild animals, and snakes to such an extent that thick gaiters are worn as a protection. Salt is plentiful. Iron is worked to some extent, and there are large deposits of hard red sandstone adapted for building; and fine quarries of marble at Mukrana, 120 m. N. E. of Joodpoor. Various woollen articles are manufactured, and trade is active, the natives, chiefly Jains, excelling as merchants and bankers. The revenue is about £175,000, and the maharajah or ruler of Joodpoor pays to Great Britain a considerable annual tribute. **II.** A town, capital of the state, 300 m. S. W. of Delhi; pop., including suburbs, estimated as high as 150,000, but supposed to be rather less than 80,000. It is enclosed by a rampart 5 m. in circuit, which is in a dilapidated condition. The town is well built; several streets and the tanks are bordered by trees, and some of the houses are built of red freestone. The greater part of the area of the citadel is occupied by the royal palace and premises, and there are many temples. The Mahumandir suburb outside the walls, enclosed by a fortified wall with a distinct settlement of 1,000 houses, derives its name from a great sanctuary which has a lofty spire and rich interior decorations, one of the most conspicuous of which

is a canopy of silver in the shape of an umbrella. The most important manufactures are those of ivory and hardware. It was founded in 1459 as the capital of Marwar, in place of Mandor, the ruins of which are 5 m. N.

JOONPOOR, or **Jannpoor**, a town of India, capital of a district of the Northwestern Provinces, on the Goomtee, 36 m. N. W. of Benares; pop. about 16,000. The river, which is navigable here, divides the town into two unequal parts, and its bridge is one of the finest and strongest in India. The fort on the bank of the river, with a highly ornamental gateway, is half a mile in circuit, and is used as a prison. The castle and mosques were renowned in former times for their splendor, and the town and its vicinity abound in ruins of magnificent buildings. The principal mosque, though dilapidated, is an imposing edifice with colonnades and lofty domes. The population was formerly much more considerable in the town as well as in the district, in which latter it has declined from over 1,100,000 to about 800,000. Joonpoor is renowned for its sugar.

JOPPA. See **JAFFA**.

JORDAENS, Jacob, a Flemish painter, born in Antwerp in 1594, died there in 1678. He studied in the school of Adam van Oort, whose daughter he married. Rubens, whom he imitated, intrusted him with the execution on a large scale of many of his small sketches. He excelled in the representation of bacchanalian subjects and scenes of festive riot. Of these, the pictures of the "Satyr and the Man blowing hot and cold," and "Pan and Syrinx," are well known specimens. He was an industrious painter, designing and executing with great facility, and in the course of his long life finished an immense number of works.

JORDAN (Heb. *ha-Yarden*, the descender, now called by the Arabians of Palestine *esh-Sheriah*, or *Sheriat el-Kebir*, the great watering place), the only large river in Palestine, and one of the few perennial streams in that country. Its sources are on the southern declivities of the Libanus and Anti-Libanus. The highest rises in the S. part of Mt. Hermon, near the village of Hasbeiya, 1,700 ft. above the level of the sea, formed by about 20 springs which bubble up within a small circuit and form a pool 15 ft. deep. The united waters, under the name of the Hasbany, flow W. and then S., receiving small tributaries on either side till the river enters the marshy plain of Huleh, where it is joined by the united streams of the Leddan, Dan, or Daphne, and the Baniyas, the two larger and principal sources of the Jordan. The former of these streams, one of the largest single sources in the world, originates in a large pool, 12 m. below the source of the Hasbany, at the southern prolongation of Hermon, about 650 ft. above the sea; and 4 m. E. of it rises the other, near Baniyas, about 1,150 ft. above the sea level. Struggling through the morass, which is thickly overgrown with papyrus, the Jordan

enters Lake Merom, now called Huleh, also El Mallaha and Bahr Baniyas or Bahr Khait, 150 ft. above the sea. On leaving the lake the river is sluggish and turbid, but is soon purified, and becomes a torrent rushing between small islands and rocks thickly set with oleanders.

Source of the Jordan.

About 2 m. below the lake is the so-called Jacob's bridge, where Jacob on his return from Mesopotamia is said to have crossed; it was built after the crusades, probably in connection with the caravan route from Egypt to Damascus. The breadth of the river at this place has been variously stated from 64 to 80 ft. About 13 m. below it enters the lake of Tiberias or Gennesaret, which is between 600 and 700 ft. below the Mediterranean, and about as much above the Dead sea. Issuing from the S. extremity of this lake, the river enters a broad valley, or *ghor*, by which name the natives designate a depressed tract or plain between the mountains; the Bible calls it "the plain;" its width varies from 5 to 10 m. The river at first winds very much, and flows first near the W. hills, then turns E., and continues to the district called Kurn el-Hemar, then again returning toward the W. side. Lower down it rather follows the middle of the great valley. Its course is so tortuous that within a space of only 60 m. long and 4 or 5 m. broad it traverses at least 200 m. and plunges over 27 formidable rapids. It enters the Dead sea at its N. extremity, 1,316 ft. below the Medi-

terreanean, after a total direct course of 120 m. Its mouth is 180 yards wide. Its principal affluents are the Zurka (Jabbok) and Sheriat el-Mandhur, or Yarmuk. Its breadth and depth greatly vary, which circumstance explains the great discrepancies in the reports of travellers. Its entire descent from Hasbeiya to its mouth is about 3,000 ft., from Baniyas about 2,450 ft. The Jordan flows through a deep chasm or fissure in the earth's crust, caused by the rending and falling in of the aqueous strata, upheaved by the eruption of the basalt which forms its bed, and belonging to the prehistoric age of the present configuration of the earth's surface. At the surface of the sea of Galilee it is 653 ft. below the Mediterranean; at the surface of the Dead sea it is 1,316 ft., and at the greatest depth of that sea 2,624 ft., below the ocean level. The sources and the course of the Jordan were partially explored in 1847 by the English Lieut. Molyneaux, and very thoroughly in 1848 by an American expedition under Lieut. Lynch, and again in 1868-'9 by Mr. Macgregor (see "The Rob Roy on the Jordan," London, 1869). As Christ was baptized by John in the Jordan, Christians have often regarded it as a special privilege to receive baptism in its waters, and water is even now occasionally procured from the Jordan for the baptism of princes. (See DEAD SEA, and GENNESARET.)

JORDAN, Camille, a French statesman, born in Lyons, Jan. 11, 1771, died in Paris, May 19, 1821. He was educated by the Oratorians, opposed the revolutionary government, distinguished himself in the insurrection at Lyons, and left France on the fall of that city, Oct. 9, 1793. Returning after the 9th Thermidor, he was elected in 1797 to the council of 500, advocated the principles of religious liberty, opposed the directorial government, and was again compelled to seek refuge abroad after the 18th Fructidor. Recalled in 1800, he energetically opposed the designs of Bonaparte, and denounced the frauds in the election of 1802, in a pamphlet entitled *Vrai sens du vote national sur le consulat à vie*. From that period till the return of the Bourbons he devoted himself exclusively to literature. In 1816 he was elected to the chamber of deputies. He was one of the fathers of the *doctrinaire* school of politics. A collection of his speeches was published in 1818.—See *Camille Jordan et Madame de Staël*, by Sainte-Beuve (1868).

JORDAN, Charles Étienne, a French author, born in Berlin, Aug. 27, 1700, died there, May 14, 1745. He belonged to a French Protestant family and became a clergyman. After the death of his wife in 1732 he travelled for some years; and in 1736 he became a literary assistant of the crown prince of Prussia, who on his accession as Frederick II. (1740) made him privy councillor and curator of the national academies. He was the king's inseparable companion. Carlyle in his "History of Frederick the Great" makes many references to Jordan's intimate relations with the king, and

to his gossiping letters to him, which are included in vol. x. of his posthumous correspondence; but Carlyle ridicules Jordan's *Histoire d'un voyage littéraire en 1733 en France, Angleterre et Hollande*, because it "awakens a kind of tragic feeling, being itself dead, and treating of matters which are all gone dead."

JORDAN, Dorothy or Dora, an Irish actress, born near Waterford about 1762, supposed to have died at St. Cloud, July 3, 1816. She was the daughter of a Capt. Bland, an Irish gentleman, who, having married her mother under age, procured the invalidation of the union. At 16 she made her début in Dublin, under the name of Miss Francis, as Phebe in "As You Like It." She soon, under the name of Mrs. Jordan, by which she was afterward known, was engaged at the York theatre, where she remained for three years. She then went to London, and made her first appearance there Oct. 18, 1785, soon becoming immensely popular in comedy and musical farce. By her talents and remarkable beauty she attracted the attention of the duke of Clarence, afterward William IV. She was at that time under the protection of Mr. Richard Ford, and had several children, but yielded to the admiration of the royal duke. Her children by him were ten in number, and are known under the name of Fitz-Clarence. At the termination of this connection she went to France, and died there in obscurity and poverty. A monument by Chantrey was erected to her memory at St. Cloud by William IV. after his accession to the throne. Her professional career was brilliant. She was of an amiable character and a kind heart, and her domestic duties were performed with devotion to the interests of her family. Her "Memoirs," by J. Boaden, were published in 1831. There is some mystery as to her retirement, which is not cleared up by her biographer, and it was generally supposed that she did not actually die at the time and place stated, but that she lived in England for seven years after under a different name.

JORDAN, Rudolph, a German painter, born in Berlin in 1810. He studied in that city and in Düsseldorf, resided for a long time in Heligoland, and became known as a marine and genre painter. His "Interior of a Pilot's House" (1831) has been purchased for the royal gallery at Babelsberg, and his "Proposal of Marriage in Heligoland" (1834) has been often lithographed. His other masterpieces comprise "An Examination of Pilots," "Shipwreck on the Coast of Normandy," in the gallery of the earl of Ellesmere, and pictures of life in the Dutch islands.

JORDAN, Wilhelm, a German poet, born in Insterburg, Prussia, Feb. 8, 1819. He graduated at the university of Königsberg in 1842, and published his first volume of poetry in the same year. He was a member of the Berlin national assembly in 1848, and was subsequently employed for a short time in naval affairs. His works include *Geschichte der Insel Haïti*

(2 vols., Leipsic, 1846-'9), tragedies and comedies, and translations of Sophocles and of Shakespeare's poems and several of his plays. His most famous poetical production is *Demiurgos, ein Mysterium* (3 vols., 1852-'4), and he has written an epic, in a peculiar old German metre, entitled *Sigfridsage*, portions of which he has recited in various cities of Germany, as well as of the United States, which country he visited in 1872.

JÖRG, Joseph Edmund, a German author, born at Immenstadt, Bavaria, Dec. 23, 1819. He studied theology at Munich, and was for several years amanuensis of Döllinger. In 1847 he became connected with the bureau of archives, and in 1852 succeeded Guido Görres as editor of the *Historisch-politische Blätter*. In 1865 he became a member of the second Bavarian chamber, to which he has been repeatedly reelected, and in 1867 of the customs parliament. He is a prominent partisan of ultramontane views, and his works include *Geschichte des grossen Bauernkriegs* (Freiburg, 1850), *Geschichte des Protestantismus in seiner neuesten Entwicklung* (2 vols., 1857), and *Geschichte der social-politischen Parteien in Deutschland* (1867).

JÖRG. I. Johann Christian Gottfried, a German physician, born at Predel, near Zeitz, Dec. 24, 1779, died in Leipsic, Sept. 20, 1856. He was professor of obstetrics in the university of Leipsic from 1810 till his death. His works relate chiefly to female physiology and pathology, and include a series of manuals which passed through several editions. **II. Eduard**, son of the preceding, born in Leipsic, Jan. 19, 1808. After taking his degree of M.D. he travelled extensively, went to the United States in 1837, and spent several years in Cuba observing tropical diseases, on which he published several works. Subsequently he returned to the United States and practised in Illinois and in Pennsylvania.

JORGENSEN, Jorgen, a Danish adventurer, born in Copenhagen in 1779, died in New South Wales about 1830. He belonged to the celebrated family of watchmakers named Jürgensen, was apprenticed at 14 years of age to the master of an English collier, and subsequently, it is said, served in the British navy as a midshipman, and Anglicized his name into Jorgenson. In 1807 he sailed from Copenhagen in command of a privateer, and was captured and taken to England, where he was put upon his parole. He succeeded in inducing a London merchant named Phelps to freight a vessel for the purpose of opening a trade with Iceland. Jorgenson arrived at Reykiavik in January, 1809, but was forbidden to land his cargo. He then seized a Danish brig, which had arrived with needed provisions, and the alarmed authorities permitted him to land his goods, but forbade trade with him. Restoring the captured brig, and leaving his supercargo with his goods, he returned to England, but came back with Phelps in June. Five days

before his arrival the governor, Count Trampe, had agreed with the captain of the British sloop of war Rover to allow trade with British subjects during the war; but this agreement not being carried out, Phelps imprisoned the governor on his ship, making a prize of his brig the Orion; and the next day Jorgenson assumed the government of Iceland, declaring its independence of Denmark, and seized the public money chest, containing 2,700 rix dollars. On July 11 he proclaimed himself protector of Iceland, appointed a new flag, and repealed all restrictions upon trade. His authority was acknowledged by an ecclesiastical synod, and by the people generally. He equipped an army of eight men, confiscated all Danish property on the island, established a battery to defend Reykiavik, and seized a Danish vessel which came into the harbor. But in August the British sloop of war Talbot arrived at the island, and, upon the representations of the Danish merchants and Count Trampe, her captain sent both Jorgenson and Trampe to England. The former opened a correspondence with the admiralty, but it having transpired that he was a prisoner of war who had broken his parole, he was confined for a time in Tothill Fields prison. In 1811 he published a work entitled "State of Christianity in Otaheite, and a Defence of the Gospel against Modern Antichrists." Upon the conclusion of the Napoleonic wars he travelled on the continent, and in 1817 published "Travels in France and Germany in 1815-'17." He subsequently fell into bad habits, was convicted of theft, and sentenced to transportation for life, and in 1825 was sent to New South Wales. Previous to his departure from England he published "The Religion of Christ is the Religion of Nature; written in the condemned cells of Newgate, by Jorgen Jorgenson, late Governor of Iceland" (8vo, London, 1827).

JORNANDES, or according to the oldest MSS. **JORDANES**, a Gothic historian, who lived about the middle of the 6th century. He was at first one of the notaries or rather secretaries of the king of the Alans, who inhabited Mæsia, but became a convert to Christianity, and embraced the monastic state. It has been said, but without proof, that he was bishop of Crotona. He wrote *De Getarum sive Gothorum Origine et Rebus Gestis*, which is chiefly an extract from Cassiodorus's lost "History of the Goths." Notwithstanding its many shortcomings and incorrect style, it is an important work. He left also, under the title *De Regnorum et Temporum Successione*, a synopsis of universal history, which has been generally printed at the end of his Gothic history. The first edition of the latter is that published by Peutingger with Warnefrid's "History of the Lombards" (Augsburg, 1515). It has been frequently reprinted in various historical collections; a correct edition is to be found in Muratori's *Scriptores Rerum Italicarum*; the latest edition, with critical notes, is that of Closs (Stuttgart, 1861).

JORTIN, John, an English divine and author, born in London in 1698, died in Kensington, Sept. 5, 1770. He graduated at Cambridge in 1719, and was presented by his college with a living in Cambridgeshire; but after his marriage he removed to London, where he soon became widely known as a popular and powerful preacher. He was successively rector of Eastwell in Kent and St. Dunstan's-in-the-East, domestic chaplain to the bishop of London, prebend of St. Paul's, and in 1764 archdeacon of London. He published *Lusus Poetici* (1722), a small volume of Latin poems, which were greatly admired, and numerous critical and theological works, which display a vast amount of unusual learning. The most important are: "Remarks upon Authors, Ancient and Modern" (2 vols., 1731-'2); "Remarks on Ecclesiastical History" (5 vols., 1751-'73); and "Life of Erasmus" (2 vols., 1758-'60). He also wrote criticisms on Spenser, Milton, Tillotson, and Seneca.—See "Memoirs of John Jortin, D. D.," by John Disney, D. D. (London, 1792).

JORULLO, a volcano of Mexico, in the state of Michoacan, 160 m. W. by S. of the city of Mexico. It rises from the plain of Malpais, which forms a part of a platform having a mean elevation of 2,500 ft. above the sea, and is on a line with a chain of volcanoes including Tuxtla, Orizaba, and Popocatepetl to the east, and Colima to the west. From the discovery of America down to the middle of the 18th century no volcanic disturbance had occurred in this region; and the present site of Jorullo, about 100 m. from the nearest sea, was the centre of a series of sugar and indigo fields, drained by two small streams,

Jorullo.

the Cuitimba and the San Pedro. In June, 1759, strange hollow sounds were audible, and earthquakes succeeded each other until the end of September, when flames issued from the ground, and rocks were thrown to a prodigious height. On the line of a chasm

running from N. N. E. to S. S. W. were formed six volcanic cones composed of scoriae and fragmentary lava, the smallest of which attained 300 ft. in height, while Jorullo, the central volcano, rose to an elevation of 1,600 ft. above the level of the plain, and launched forth streams of basaltic lava which included fragments of granitic rocks, which ejection did not cease until February, 1760. The natives, on returning to the spot many years after the outburst, found the ground still uninhabitable from the excessive heat. Around the base of the newly formed cones, and radiating from them as from a centre, over an area of 4 sq. m., is a convex mass of matter some 550 ft. high at its junction with the cones, and gradually sloping thence in all directions toward the plain; and on this convex protuberance, sloping at an angle of about 6°, are thousands of low conical mounds, called *hornitos*, ranging from 6 to 9 ft. in height, from which, as well as from extensive fissures across the plain, issued clouds of sulphurous acid and aqueous vapor. In 1827 they had entirely ceased to emit steam, and the mountain has not since shown any signs of activity; vegetation had made marked progress on the flanks of the new hills; and cultivation had been resumed on the fertile plain surrounding the volcanic centre. The great distance of Jorullo from the ocean is observed by Lyell as an important circumstance, showing that proximity to the sea, though a common characteristic, is not an essential condition of the site of active volcanoes. The two streams above mentioned disappeared at the time of the eruption below the eastern extremity of the plain, and afterward reappeared as hot springs at its western limit.

JOSEPH, son of Jacob and Rachel, having a younger brother Benjamin and ten elder half brothers. He was envied by his brethren on account of his father's partiality toward him; and their aversion was increased by two dreams that he told, in which was foreshadowed his preëminence in the family. Conspiring against him, they sold him for a slave to a caravan of Arabian merchants, and he was taken to Egypt. There he rose to the highest power in the house of Potiphar, an officer of Pharaoh. The wife of Potiphar, stung by his rejection of her licentious advances, caused his imprisonment on a false charge; but his successful interpretation of the king's dreams soon raised him to supreme authority at the court. One of the dreams foretold a famine, against which he made ample provision; and such was his distinction that he married the daughter of the high priest of On or Heliopolis. While the famine prevailed, his brethren came from Canaan to Egypt to purchase corn. He at once recognized them, and after a period of delay in which he became convinced that they had lamented their former cruelty to him and repented of it, he made himself known to them, and appropriated to Jacob and his family the land of Goshen. The Egyptian people were

at length obliged to pay with their land for food from the public granaries, so that "Joseph bought all the land of Egypt for Pharaoh," and the whole territory of the country, excepting that of the priests, was let to the population as tenants. The story of Joseph is one of the most interesting portions of the Mosaic writings. He died at the age of 110 years, and left two sons, Manasseh and Ephraim, who, being adopted by Jacob, took their place among the heads of the tribes of Israel.

JOSEPH, the spouse of Mary the mother of Jesus Christ. He was of the tribe of Judah, and a descendant of David. Matthew and Luke give his genealogy, the former making him the son of Jacob and descended from David through Solomon, and the latter calling his father Eli, and tracing his lineage through Nathan. This discrepancy is explained in various ways. Julius Africanus supposes that Jacob and Eli were brothers, and that, Eli dying without children, Jacob married his widow, who bore him Joseph. The child was thus the son of Eli according to the Mosaic law, but of Jacob according to nature. Other commentators assume that the genealogy given by Luke is that of Mary. It is not known where Joseph was born. He was living at Nazareth, where, according to the received tradition, he followed the trade of a carpenter, when he was betrothed to Mary. Finding her pregnant, he was minded to put her away; but being warned by an angel in a dream that she was with child of the Holy Ghost, he took her to himself, but knew her not till she had brought forth her first-born son, who was called Jesus. Joseph is supposed to have died before the crucifixion of Christ, but there is little mention of him in the Scriptures. He is held in high honor in the Roman Catholic church, and March 19 is assigned as his festival. In painting he is represented as an aged man, with a lily or flowering branch.

JOSEPH I., emperor of Germany, of the house of Hapsburg, eldest son of Leopold I. by his third wife, born July 26, 1678, died April 17, 1711. He was crowned king of Hungary in 1687, of Rome in 1690, and after the death of his father succeeded to the imperial throne of Germany in 1705. He inherited at the same time a double war, against Louis XIV. for the succession of his brother Charles to the throne of Spain, and in Hungary against the revolted patriots under Francis Rákóczy. He was willing to make concessions to the Protestants of Hungary and other provinces, frequently attempted to negotiate with the insurgents, and readily yielded to the demands of Charles XII. of Sweden in behalf of the Protestants of Silesia, which country the young conqueror crossed on his march from Poland to Saxony without even asking the permission of the distracted emperor. The victories of Marlborough and Eugene in the war of the Spanish succession allowed Joseph, who had personally taken part in the siege of Landau, to send con-

siderable forces against the Hungarians, and dissensions which broke out in the camp of the latter slowly prepared a final triumph of the imperial arms. Shortly before the death of Joseph, Count Pálffy succeeded in concluding a treaty with the insurgents at Szatmár, in the absence of Rákóczy. Joseph was of a mild disposition, and exceedingly fond of ceremony and of the chase. He founded the academy of arts at Vienna, and a national bank. He was succeeded by Charles VI.

JOSEPH II., emperor of Germany, elder son of Francis I. and Maria Theresa, born March 13, 1741, died Feb. 20, 1790. When Joseph was born, his mother confided him and her rights under the pragmatic sanction to the protection of the Hungarian nation, which gallantly responded to her confidence, and Prince Batthyányi afterward took the principal charge of his education. Ambitious, but obstinate, Joseph gave proofs of considerable capacity. Languages, mathematics, war, and music were the studies to which he devoted most of his zeal. He participated in none of the campaigns of the seven years' war, though this was waged in the years of his advanced youth, and though he admired no less the military glory of its hero, Frederick, than he did after its close his peaceful career. He successively married and lost within seven years a princess of Parma and a princess of Bavaria. His only daughter died in 1770 in her eighth year. Made titular king of Rome in 1764, he became emperor of Germany on the death of his father in the following year; but this was then little more than an empty title, and in the hereditary possessions of his mother he received only the dignity of assistant without any real influence, though placed at the head of military affairs. He returned to the state 22,000,000 florins of bonds and all the estates which his father had purchased during his reign. He travelled extensively incognito, traversing not only the countries which were to be ruled by his sceptre, but also non-Austrian Germany, Italy, Spain, Holland, and France. He had an interview with Frederick in his camp at Neisse in Silesia (1769), a province which that king had wrested from the empire of Maria Theresa. Frederick in the following year repaid the visit at Neustadt in Moravia, where Joseph not only strove to display the perfections of his army, upon which he bestowed his principal cares, and into which he had introduced various liberal reforms, but also concerted with his guest the scheme of dismembering Poland jointly with Catharine II. of Russia. This extraordinary act was executed in 1772, and added Galicia and the Zips to the empire of Austria. A few years later Bukowina was taken from Turkey. Bavaria, the elector of which died in 1777, was also to be annexed, but Frederick suddenly marched into Bohemia; and Joseph, who eagerly grasped the opportunity of measuring his strength with that of the renowned conqueror, was compelled by the order of the

old empress peaceably to terminate the short struggle of succession. In 1780 he went to Mohilev to see Catharine, with whom schemes of Russian and Austrian aggression in Turkey and Italy respectively were agreed upon. Soon after his return his mother died, and the reign of the imperial philanthropist, so long impatiently looked for by liberal Europe, began. The long suppressed desire of totally transforming his empire and its nations, nourished by a love of the people, and a certainly not less ardent ambition, now found full satisfaction. Equality, centralization, and uniformity were the leading principles. Serfdom was abolished, German was made the official language everywhere, new codes were introduced, the press was almost entirely made free; about 700 convents, containing 36,000 of the younger monks, were dissolved, and all others placed under the bishops; the bulls of the pope were made dependent upon the *placet regium*; the bulls *Unigenitus* and *In Cœna Domini* were expunged from the Austrian rituals; and by the celebrated edict of toleration, which, however, excluded deists, the Protestants were set on a perfectly equal footing with the Catholics. All this was executed without consulting any legislative or deliberative body, and the private rights of individuals were as little considered as the privileges of classes, or the prejudices and ignorance of the masses. The people were to be enlightened and made happy by decrees, all obstacles violently removed, and the refractory punished. Pius VI. personally visited Vienna, and strove in vain to check or moderate the reformatory movement. But in the mean time the interests which had been so violently assailed by these changes, having their defenders in the most powerful and most influential classes of society, were active in preparing the overthrow of the new system. Nobles, priests, and patriots were united in secret opposition. The dissatisfaction was most intense in Hungary, Brabant, Tyrol, and Bohemia. In Transylvania a bloody rising of the Wallach peasantry against the nobles, under Hora and Kloska, was slowly suppressed and most cruelly punished. Joseph's attempt to exchange the Austrian Netherlands for Bavaria was prevented by Frederick's last great act of external policy, the formation of the *Fürstentbund* (confederation of princes) in 1785. Unflinching amid all these difficulties, Joseph proceeded in his course of reform, and, eager to add military glory to the fame of his internal achievements, visited Catharine at Kherson during her triumphal progress through the southern regions of her empire (1787), and finally concerted with her the long meditated war against Turkey. It was soon begun. Joseph opened it by a sudden attack on Belgrade, but suffered a repulse, which was followed by the defeat at Lugos (1788), and other disasters. A part of the army was lost, when Joseph returned to his capital, with a fatal malady, while victory followed the banners of the Russian

generals. Brabant, which had long been in open rebellion, declared its independence, Hungary was violently agitated, and it availed Joseph little that Laudon partially restored the fortunes of the war in 1789. The revolution in France brought new dangers. Broken in spirit, Joseph, shortly before his death, which was attributed by some to poison, abrogated all his innovations (January, 1790), except toleration and the abolition of serfdom.

JOSEPH, king of Naples and of Spain. See BONAPARTE, vol. iii., p. 29.

JOSEPH, Father, the confidential friend of Cardinal Richelieu, whose real name was FRANÇOIS LECLERC DU TREMBLAY, born in Paris, Nov. 4, 1577, died at Rueil, Dec. 18, 1638. He was the son of an eminent functionary, and his mother belonged to the Lafayette family. In his youth he saw much of society of different countries, and also something of warfare, having served in the army under an assumed name. Entering the priesthood, he attained great eminence in the order of Capuchin friars. His tact, intelligence, and activity attracted the attention of Richelieu, who employed him as his secretary and as his agent in many diplomatic negotiations. The immense work of the cardinal was performed by Father Joseph, who became indispensable to him, and was intimately associated with the most confidential and important transactions of the period. To an enthusiastic religious zeal, which caused him to send missionaries to England, Canada, and the East, and to advocate a crusade against the Turks, he added a consummate shrewdness and a wonderful capacity for incessant labor. Richelieu used to say that no statesman in Europe could grapple with the astute Capuchin friar, and deplored his death as a great calamity. The king prevailed upon the pope to make Joseph cardinal, but the latter died before the dignity was tendered to him. Owing to his immense influence over the cardinal and in public affairs, he was treated with great regard, though his cat-like and mysterious manner and his occasional outbursts of rudeness and wrath were repulsive. He is the reputed author of a Latin poem in favor of a crusade against the Turks, and of other writings, the most remarkable being manuscript memoirs in 4 vols. (in the national library in Paris), purporting to be a history of Louis XIII. in 1634-'6, but narrating events down to near the end of 1638; it gives authentic documents of several treaties, and interesting information about Wallenstein (in whose removal from command in 1629 Father Joseph was instrumental at Vienna), about the project of making a free state out of the Netherlands, and in respect to other schemes and incidents. Ranke submitted in 1860 a report on these memoirs to the French academy of moral and political sciences. Gérôme has painted a celebrated picture of Father Joseph, called *L'Éminence grise*.

JOSEPHINE, a S. W. county of Oregon, bordering on California, bounded N. by the Rogue

River mountains, and drained by Rogue and Illinois rivers; area, 1,000 sq. m.; pop. in 1870, 1,204, of whom 223 were Chinese. The surface is hilly and in some parts mountainous, with small valleys of rich alluvial soil. In the S. part are rich gold mines, and copper ore is also found. The value of farm productions in 1870 was \$24,775; of live stock, \$27,100. Capital, Kirbyville.

JOSEPHINE, empress of France. See **BONAPARTE**, vol. iii., p. 46.

JOSEPHUS, Flavius, a Jewish historian, born in Jerusalem about A. D. 37, died about 100. His father belonged to the highest sacerdotal family, and his mother was descended from the Asmonean princes. He received a superior education, and acquired an extensive acquaintance with Greek literature. He studied the doctrines of the three Jewish sects, and passed three years in the desert with the ascetic Banus, of the sect of the Essenes, after which he remained by creed as by birth a Pharisee. At the age of 26 he was sent to Rome to plead the cause of some Jewish priests arrested by the procurator Felix, and, escaping from a shipwreck on his way, was introduced to Poppæa, the wife of Nero, and not only effected the liberation of his friends, but received many presents from the empress. Returning to Jerusalem, he attempted to dissuade the Jews from the revolt on which they were bent, but failing in his efforts he joined the war party. He was appointed one of the generals and deputed to defend the province of Galilee, and he made vigorous and for a time successful preparations against the Romans, though vehemently opposed by a strong party in the council at Jerusalem led by John of Giscala. On the approach of Vespasian in 67 he threw himself into Jotapata, the strongest of the Galilean cities, where he maintained a desperate resistance for 47 days. Escaping from the massacre which succeeded its fall, he took refuge in a cave, but was betrayed to the Romans. He thereupon assumed the character of a prophet, and, professing to derive his knowledge from the sacred books of the Jews, announced to Vespasian that the Roman empire should one day be his and his son's. Confidence in him was increased by the discovery from prisoners that he had foretold the exact number of days that the siege of Jotapata should last. He was not, however, released from bonds till Vespasian became emperor, and Titus succeeded to the control of the Jewish war. He was present at the siege of Jerusalem, suspected as a traitor by both Jews and Romans, and accompanied Titus on his return to Rome, where he passed the remainder of his life in literary pursuits. He was presented with the freedom of the city, an annual pension, and a house which had formerly been an imperial residence. He was three times married, and was divorced from his first two wives. Pride in the ancient glories of his nation, awe of the greatness and power of Rome, personal vanity, and a ten-

dency to unbounded flattery of the Flavian family, appear with equal prominence in his writings. In a passage, the genuineness of which is much disputed, allusion is made to Christ as something more than man, to his miracles, Messiahship, death, and resurrection in accordance with the prophecies; but there is no evidence that he was a Christian. His principal works are a "History of the Jewish War," written in Hebrew, translated by himself into Greek, and published about 75; and a treatise on "Jewish Antiquities," written in Greek, completed about 93. The former extends from 170 B. C. to the war which terminated in the destruction of Jerusalem, of which it gives a detailed narrative; and the latter includes the period from the creation to A. D. 66, and manifests a desire to conciliate heathen readers. He also wrote his own biography, and a treatise against Apion on the antiquity of the Jewish nation. An account of the martyrdom of Eleazar, and of seven youths and their mother, entitled *Εἰς Μακκαβαίωνος*, has been ascribed to him, but is of doubtful genuineness. The best editions of his works are by Hudson (Oxford, 1720), Havercamp (Amsterdam, 1726), and Dindorf, in Didot's *Bibliotheca Græca* (Paris, 1845). The principal English translations are by Lodge (1602), L'Estrange (1702), Whiston (1737), and Dr. Robert Traill, who died, leaving finished only "The Jewish War," which was edited by Isaac Taylor (2 vols., London, 1847). An imitation of Josephus's histories, in excellent Hebrew, but containing many legendary and fabulous narratives, was composed in the middle ages, and has often been published under the title "Book of Josipon."

JOSH BELL (now called **BELL**), a S. E. county of Kentucky, bordering on Tennessee and Virginia, and drained by Cumberland river and the S. fork of the Kentucky; area, about 600 sq. m.; pop. in 1870, 3,731, of whom 111 were colored. The surface is mountainous. There are extensive deposits of coal and iron ore. The chief productions in 1870 were 3,608 bushels of wheat, 105,465 of Indian corn, 12,883 of oats, and 42,357 lbs. of butter. There were 670 horses, 2,660 cattle, 2,890 sheep, and 5,036 swine. Capital, Pineville.

JOSHUA, the successor of Moses in the command of the Israelites. He was the son of Nun, of the tribe of Ephraim. He gained the victory over the Amalekites at Rephidim, accompanied Moses to Mt. Sinai, was deputed with eleven others to explore the land of Canaan, was appointed by Moses, at the age of 85, to the command of the Israelites, led them into the promised land, and divided the country among the tribes. (See **HEBREWS**.) He governed Israel during 25 years. He was buried at Timnath-serah in the mountains of Ephraim. His reputed tomb was discovered in 1873, near Tibneh, by M. Guérin, who was employed by the French government in scientific researches in Palestine.—His history is contained in the

canonical book called after him. Formerly this book was usually regarded as a production of Joshua; but at present the common opinion among theologians of all schools is that it received its name from its subject, not from its author. While some critics believe it to have been written soon after the death of Joshua, others refer its origin to the time of David, or even of the Babylonian exile. Among the best commentaries on the book are those by Maurer (1835), Keil (1847; new ed., 1863), Knobel (1861), and Crosby (New York, 1874).—There is a Samaritan book of Joshua (published in Arabic and Latin by Juynboll, Leyden, 1848), which is a chronicle of events from the death of Moses to the time of Alexander Severus.

JOSIAH, king of Judah, son of King Amon, succeeded to the throne about 640 B. C., at the age of eight, and died about 609. Unlike his immediate predecessors, he did right in the sight of the Lord, and undertook to free the land from idolatry, though the groves and altars consecrated to idol worship were favored by men of rank and influence in the kingdom. Having accomplished this purpose in the 18th year of his reign, he proceeded to repair and adorn the neglected temple of the Lord. In the sanctuary there was found a volume containing the books of Moses, which seems to have been regarded as the original copy of the Mosaic law. Soon after this he ordered the celebration of the passover with a care and magnificence unexampled from the time of the judges. Being tributary to the Babylonian empire, he resisted the passage through his territories of the Egyptian king Necho, on an expedition against the Chaldeans, and fell in the battle of Megiddo fought between the Hebrew and Egyptian forces.

JÓSIKA, Miklós, baron, a Hungarian novelist, born in Torda, Transylvania, Sept. 28, 1796, died in Dresden, Feb. 27, 1865. He studied law, and early entered the Austrian army, which he left in 1818 with the rank of captain of cavalry. After the rennion of Transylvania with Hungary in the spring of 1848, he became a member of the upper house of the Hungarian diet, was a decided supporter of Kossuth, and on the resignation of the Batthyányi ministry was appointed member of the committee of defence. He followed the revolutionary government to Debreczin, and after its overthrow effected his escape to Brussels, where he resided till 1864, when he removed to Dresden. Condemned to death in his absence, he was hanged in effigy in Pesth in 1851. His works include *Abafi* (1836); *Az utolsó Báthori* ("The Last of the Báthoris"); *A Csehek Magyarorszában* ("The Bohemians in Hungary"); *Zrinyi a költő* ("Zrinyi the Poet"); *Jósika István* ("Stephen Jósika"); *Eszter* ("Esther"); and *Második Rákóczi Ferencz* ("Francis Rákóczy II.," 1861). All these, with others of his works, have been translated into German, partly by Klien, partly by the

author's second wife Julia Podmaniczky, whom he married in 1847.

JOSQUIN DES PRÉS, or *Deprés* (*JODOCUS PRATENSIS*), a French composer, born in Hainaut, Belgium, about 1450, died at Condé, France, Aug. 27, 1531. Though known to musicians as Josquin, this was only his Christian name, it being the contraction of the Flemish Jossekin, or little Joseph. He was rightly styled the father of modern harmony, and was esteemed in his own day as the greatest composer of his time. Preceding as he did by nearly a century Palestrina, Cipriano, and Orlando di Lasso, he nevertheless anticipated most of their methods and forms of composition. So great was his knowledge of counterpoint and fertility of invention, that every subtlety of the art seemed known to him. His first master was Jean Ockeghem, one of the chaplains of Charles VII., with whom he studied at Paris for several years. He then went to Italy, and entered the pontifical choir of Sixtus IV. at Rome. Here he studied with diligence and gave the first proofs of his great genius as a composer. Returning to France, he was made the chief singer in the chapel of Louis XII., a position corresponding to that of chapelmaster subsequently created. He added to his duties as musician those of an ecclesiastic. The king had promised Josquin a benefice, but it was long before the promise was redeemed, the composer being constantly put off with the words *Laissez moi faire*. At last Josquin composed a mass on the notes *La sol fa ré mi* (*Laissez faire moi*). This not being effectual as a reminder, he composed music to a part of the 119th psalm (*Memor esto verbi tui servo tuo*), "Remember thy word unto thy servant, upon which thou hast caused me to hope." This also failing to produce the desired effect, Josquin composed a motet on the words, "I have no inheritance in the land of the living." Upon this the benefice was granted, and the composer expressed his gratitude in a setting of the psalm, "O Lord, thou hast dealt graciously with thy servant." These compositions were all of great merit. The works of Josquin were numerous, consisting of masses, motets, and other compositions of a religious character. Many of them are preserved among the manuscripts of the British museum.

JOST, Isaak Markus, a German author, born in Bernburg, Feb. 22, 1793, died in Frankfurt, Nov. 25, 1860. He studied at Göttingen and Berlin, was appointed teacher in the latter city in 1816, and in 1835 principal teacher of the Jewish *Realschule* in Frankfurt, which post he held till his death. Of his numerous historical and other works, the best known are: *Geschichte der Israeliten* (9 vols., Berlin, 1820-'29); *Allgemeine Geschichte des jüdischen Volkes* (2 vols., 1832); *Neuere Geschichte der Israeliten* (3 vols., 1846-'47), containing the history of the Jews since 1815; and *Geschichte des Judenthums* (3 vols., Leipsic, 1857-'59). He translated the Mishnah into German (6

vols., 1832-'4), and in 1839-'41 edited the *Israelitische Annalen* (Frankfort).

JOTUNS. See MYTHOLOGY.

JOUBERT, Barthélemy Catherine, a French general, born at Pont-de-Vaux, in Bresse, April 14, 1769, fell at the battle of Novi, Aug. 15, 1799. He enlisted in the army in 1791, distinguished himself on the Rhine and in Italy, and especially in the invasion of Tyrol which preceded the peace of Campo Formio (1797). Napoleon gave him the highest praise, and sent him to Paris with the trophies of his brilliant victories, upon which the directory successively placed him at the head of the army in Holland, at Mentz, and in Italy (August, 1798), where he speedily occupied Piedmont and gained possession of vast materials of war in the arsenal of Turin and other places. He took umbrage in 1799 at the commissioners appointed by the directory for the prevention of venality among the generals, and tendered his resignation, which was accepted. He was soon reinstated in his command, but being detained in Paris by his marriage with Mlle. de Montholon, he reached his headquarters only in August to take the place of Moreau. Joubert, in order to recover the ground lost during his absence (Alessandria and Mantua having surrendered in July), at once crossed the mountains of Montferrat with 20,000 men, took Acqui, and effected a junction with the remains of the army of Naples under Championnet, when his forces mustered about 40,000, against 70,000 Russians and Austrians. Before he had time to carry out his project of retiring to the passes of the Apennines to await additional reinforcements, he was attacked at the dawn of Aug. 15 by Suvaroff, and, exposing himself to the fire of the enemy, was shot while encouraging his soldiers, and died begging one of his aides-de-camp to make the Russians believe that he was still alive. Joubert's death was mourned as a great public calamity. Fort La Malgue at Toulouse received the name of Fort Joubert, and monuments in his honor were erected at Bourg and in the senate building. It was generally believed that if he had lived, he instead of Napoleon would have been called upon by the directory to restore order in Paris.

JOUDPORE. See JOODPOOR.

JOUFFROY, Théodore Simon, a French philosopher of the eclectic school, born in the hamlet of Les Pontets, Doubs, July 6, 1796, died in Paris, Feb. 4, 1842. After attending the college of Nozeroy, he was confided in 1807 to the care of his uncle, an ecclesiastic and professor in the college of Pontarlier, with whom he remained four years, and was then transferred to the college of Dijon. Rollin was the first author in whom he took delight, and history continued through his life to be a constant and favorite study. He had already attempted a tragedy, when in 1814 he was selected as a brilliant pupil for admission into the normal school. Theological meditations had led him to the highest problems, and he

describes himself as at this time uncertain about the enigma of human destiny, yet detesting incredulity, and resolute to solve the question by the light of reason, since he had lost that of faith. He was thus in a condition to be strongly impressed by the youngest of his masters, Victor Cousin, whose eloquent lectures decisively directed his vocation to philosophy. In 1817 he became pupil-assistant in the philosophical department of the normal school, at the same time lecturing in the Bourbon college, and fulfilled both tasks till his health obliged him to resign the latter in 1820. By the suppression of the normal school in 1822, he was deprived of public employment for five years, and in the interval he delivered a private course of lectures, attended by the élite of the young men of the capital; published philosophical articles in the *Globe* and other journals and reviews, one of which, entitled *Comment les dogmes finissent*, added much to his reputation; translated the "Moral Philosophy" of Dugald Stewart (Paris, 1826), to which he furnished an elaborate preface; and began his translation of the complete works of Thomas Reid (6 vols., Paris, 1828-'35), to which he added several of the lectures of Royer-Collard, and a preface in which he undertook a complete examination of the Scottish philosophy. In 1828 he was made assistant professor of ancient philosophy in the faculty of letters of Paris, and, interested rather in philosophy than its history, treated of the faculties of the soul in a course of lectures on the first "Alcibiades" of Plato; and in 1830 became adjunct professor of the history of modern philosophy, and delivered his *Cours de droit naturel* (2 vols., 1835; vol. iii., edited by Damiron, 1842), his most eloquent work, which treats at once of ethics, psychology, and theodicy. In 1831 he was elected to the chamber of deputies, and in 1833 was appointed to the chair of Greek literature and philosophy in the collège de France, and elected to the academy of moral and political sciences. In 1835 he was obliged to seek a restoration of his health in Italy, and on his return in 1838 resigned his professorship to succeed Laromiguière as librarian of the university. His feeble voice and calm and methodical mind alike unfitted him to excel in the chamber of deputies, though from his abilities and personal character he always commanded attention. In 1840 he was called into the royal council of public instruction, and, being appointed to draw up the address of the new ministry, maintained that its administration should be distinguished by some broad difference from that which had preceded it. Finding himself in a minority, his disappointment had a fatal influence on his already broken health. His principal works not already mentioned are the *Mélanges philosophiques* (1833), containing 28 essays, most of which had before appeared in periodicals; the *Nouveaux mélanges philosophiques*, edited by Damiron (1842); and the *Cours d'esthétique*, also edited

by Damiron (1843). His *Cours de droit naturel* has been translated into English under the title of "An Introduction to Ethics," by W. H. Channing, and a selection from his essays under that of "Philosophical Miscellanies," by G. Ripley, in Ripley's "Specimens of Foreign Literature" (Boston, 1838-'40).

JOUFFROY D'ARBANS, Claude François, marquis de, a French mechanician, born about 1751, died in Paris in 1832. The idea of steamboats occurred to him first in 1775, on occasion of his examining a fire engine; but he failed in the experiment which he made with a small propeller on the river Doubs in the summer of 1776. Other experiments in 1780 and 1783 on the same river and on the Saône at Lyons were less unsatisfactory, though far from successful; and the government, after referring the matter to the academy, declined (1784) to grant him a patent, whereupon he went to England. He did not return to France until the consulate, when he became acquainted with Fulton. In 1816 he received permission to form a company, and the count of Artois allowed him to give his name of Charles Philippe to the first steamer, which was launched on the Seine Aug. 20. But the enterprise, as well as that of a rival company, ended disastrously, and the marquis retired after the July revolution to the Invalides, where he died of the cholera. He wrote *Mémoires sur les pompes à feu* for the academy, and published in 1816 *Les bateaux-à-vapeur*. His claim to the discovery of steam navigation was acknowledged by Arago, and in 1840 by the French academy; and Fulton spoke highly of his invention.—His son **ACHILLE**, marquis de, born about 1790, was an ardent legitimist politician and writer, but after the revolution of 1830 devoted himself to the perfecting of steamboats, invented an unsuccessful system of railway propulsion, and published several works on history, inventions, &c.

JOULE, James Prescott, an English natural philosopher, born at Salford, Dec. 24, 1818. At the age of 15 he became the pupil of Dr. John Dalton, the author of the atomic theory, who trained him in the art of physical experimentation and the philosophy of chemistry, and taught him mathematics. His first scientific paper was upon the construction of electro-magnetic engines; but on account of the difficulties in the way, the chief of which is the rapid decrease of attraction accompanying increase of distance between magnets, he soon relinquished the design of producing a practical motor. In 1841 he gave a lecture in the royal Victoria gallery at Manchester on the results of his experiments on a new class of magnetic forces, which embraced a statement of what had been done by Jacobi of St. Petersburg and himself in applying magnetism as a motive power. Continuing the investigation in connection with Mr. Scoresby, Joule arrived at the result that a grain of coal consumed by a steam engine will raise 143 lbs. one foot in height, while a grain

of zinc consumed in a voltaic battery can only raise, theoretically, a weight of 80 lbs. through the same distance; and that the cost of power by electro-magnetism is about 25 times greater than that of steam. His communication to the royal society "On the Change of Temperature produced by the Rarefaction and Condensation of Air" led Prof. Thomson of Glasgow to unite with him in investigating the thermal effects of fluids in motion. The first of the series of papers on this subject was read before the royal society in June, 1853, the last in June, 1862; and they were all published in the "Philosophical Transactions." He also published, in connection with Dr. Lyon Playfair, an account of investigations into the volumes occupied by bodies when in a solid state, and when dissolved in water; a subject having many important relations to molecular physics. His inventive talent was early displayed in the construction of galvanometers, the use of which was so constantly required in his electro-magnetic investigations. In 1863 he described to the Manchester society a new and sensitive thermometer, with which he was enabled to detect heat in the moon's rays. The principal subject to which he has devoted himself, however, is that of heat in its relation to mechanical power. His labors in this direction commenced about the year 1840, when he communicated to the royal society the discovery of a principle in the development of heat by voltaic action, in which he established certain relations between heat and chemical affinity. The experiments of Count Rumford in 1796-'8 had exposed the fallacy of the caloric or material theory of heat, and had very nearly established the mechanical equivalent of heat, and Prof. Mayer of Heilbronn had announced his belief that the heat evolved in compressing a gas was exactly equal to the compressing force; but these views required for their complete establishment the demonstration by experiment. Placing water in a vessel made for the purpose, Joule agitated it by paddles driven by a measured force, and determined both the amount of heat produced by stirring the liquid, and the amount of labor expended. He also measured the amount of heat produced by revolving cast-iron wheels against one another. He varied the experiments by forcing water through capillary tubes, and calculating the heat generated by the friction produced. He employed other liquids in place of water, such as oil and mercury, and although he found a different degree of sensible heat evolved with the same force expended upon different fluids, still he found that it was exactly in the inverse proportion of the fluid's specific heat, thus adding another proof of the correctness of his opinions, and of his methods of experimenting. By numerous trials he found that the quantity of heat required to raise one pound of water one degree F. in temperature is precisely competent to raise 772 pounds avoirdupois one foot in height, or in other words, is equal to

772 "foot pounds," which is the measure of the force called the mechanical equivalent of heat. (See CORRELATION OF FORCES.) In consideration of these important labors, the Rumford medal of the royal society was awarded to him in 1852, and in 1870 he received the Copley medal. His contributions to scientific periodicals and other publications have been numerous and important. He was elected a fellow of the royal society in 1850; has received the degree of D. C. L. from Oxford, and of LL. D. from Dublin and Edinburgh; is a corresponding member of the institute of France; and was president of the British association for the advancement of science in 1873.

JOUNPORE. See JOONPOOR.

JOURDAN, Antoine Jacques Louis, a French physician, born in Paris, Oct. 29, 1788, died there, Jan. 2, 1848. He was a surgeon in the army and in military hospitals till 1814, and took the degree of M. D. in Paris in 1819. He wrote *Traité complet des maladies vénériennes* (2 vols., 1826), *Pharmacopée universelle* (2 vols., 1828; 2d ed., 1840), and *Dictionnaire raisonné, étymologique, synonymique et polyglotte des termes usités dans les sciences* (2 vols., 1834). He translated many works from the German (including those of Hahnemann), English, Italian, and Latin.

JOURDAN, Jean Baptiste, count, a French general, born in Limoges, April 29, 1762, died in Paris, Nov. 23, 1833. He enlisted in the army when scarcely 16 years old, served five years in America under Count d'Estaing, and was discharged in 1784. He then became a merchant's clerk, and had married a milliner and adopted her business when the revolution broke out. He became a lieutenant of the national guards, and was in 1791 elected to command a battalion of volunteers; he joined the army of the north, distinguished himself in Belgium under Dumouriez, was appointed brigadier general in 1793, and four months later promoted to the rank of general of division. Wounded at the battle of Hondschoote, he had scarcely recovered when he was placed in command of the army of the north. He drove the imperial troops from their position at Wattignies, Oct. 16, 1793, and was called to Paris to consult with the committee of public safety; but being unexpectedly placed on the retired list, he returned to his shop at Limoges. But his services could not well be dispensed with, and on April 15, 1794, he received the command of the army of the Moselle. A few days later he was transferred to that of the Sambre and Meuse, with which he won (June 26) the victory of Fleurus, executed several other successful operations, and drove the Austrians beyond the Rhine. In 1795 he displayed uncommon talents in crossing that river. In 1796 he advanced into Germany, and defeated Clerfayt at Altenkirchen; but being subsequently worsted near Würzburg by the archduke Charles, he was obliged to fall back, and resigned his command. In 1797 he was

elected to the council of 500, where he procured the adoption of the law of military conscription. He was president of that body in October, 1798, when he resigned his legislative functions to assume the command of the army on the Danube. After a short and unsuccessful campaign, he returned to Paris, was reelected to the council of 500, refused to participate in the plans of Bonaparte for the subversion of the directorial government, and was one of the members excluded from the corps législatif formed after the 18th Brumaire. He nevertheless was sent by the first consul on a special mission to Piedmont, and reconciled that country to the French domination. He was appointed marshal of the empire and grand eagle of the legion of honor in 1804, but received no important command, and lived in comparative inactivity until he was appointed in 1806 governor of Naples, and became the principal adviser and friend of Joseph Bonaparte. He accompanied Joseph to Spain, with the title of major general of the armies of his Catholic majesty; but he had as such neither authority nor influence, and was not answerable for the reverses of the French armies in the Peninsula from 1808 to 1813. He was treated by Napoleon with a coldness amounting to disgrace. In 1814, having assented to the deposition of Napoleon, he received a peerage from Louis XVIII. He joined Napoleon during the hundred days, but on his defeat at Waterloo went back to the Bourbons, was created a count, then governor of the seventh military division, and in 1819 peer of France. On the revolution of July, 1830, he held for a few days the ministry of foreign affairs, and was appointed by Louis Philippe governor of the Invalides. He was honest, and died poor.

JOURNALISM. See NEWSPAPERS.

JOUEL, Henri, a French explorer, born in Rouen about 1651. He was the son of a gardener, served in the army from an early age, and in 1684 joined La Salle's expedition to the mouth of the Mississippi. La Salle placed Jouetel in command of his first fort in Texas, and also of the larger one, St. Louis, when he set out in November, 1685, to seek the river. On the last expedition, in January, 1687, Jouetel accompanied La Salle, and was in charge of the camp when the latter was assassinated. Leaving the murderers, he set out with La Salle's brother and nephew and three others, and reached Canada by way of the Illinois. Thence he returned to France in 1688, and retired to his native city. In 1713 appeared at Paris his *Journal historique du dernier voyage que feu M. de la Sale fit dans le golfe de Mexique*, edited by M. de Michel. Charlevoix met Jouetel at Rouen in 1723, and speaks highly of him. The only stain on him is his complicity in the fraud practised by Cavalier on Tonty in the Illinois country.

JOUVENET, Jean, a French painter, born in Rouen about 1645, died in Paris, April 5, 1717. He belonged to a family of artists, be-

came known in 1673 by his "Jesus curing the Paralytic," and was professor and president of the academy of painting. In 1675 appeared his masterpiece, "Esther before Ahasuerus," comparing favorably with the works of Poussin and Lebrun. Several of his pictures are at Notre Dame and in the Louvre. His right hand being disabled shortly before his death, he painted with his left hand the "Magnificat" in the choir of Notre Dame.

JOUY, Victor Joseph Étienne de, a French author, born at Jouy, near Versailles, probably in 1764, died in St. Germain-en-Laye, Sept. 4, 1846. Having enlisted in the army when a boy, he went to South America, and afterward to India, where he was introduced to Tippoo Sahib. He participated in the first campaigns of the French revolution, reached the rank of major, and at the age of 33 was placed on the retired list. He now produced several light comedies, and in 1807 gained considerable reputation by *La vestale*, a lyric poem, set to music by Spontini; this performance was rewarded three years later with one of the great decennial prizes. He composed the libretti for Spontini's *Fernand Cortez* (1807), Catel's *Les bayadères* (1810), Cherubini's *Les amazones* and *Les Abencerrages* (1812-'13), and Rossini's *Moïse* (1827) and *Guillaume Tell* (1829). He also attempted tragedy. His *Tippo-Saïb* was performed in 1813; *Sylla*, for which Talma's acting, and especially his wonderful resemblance to Napoleon, secured a remarkable success, in 1822; *Bélisaire* in 1825; and *Julien dans les Gaules* in 1827. A series of his sketches was collected in 1812-'14 under the title of *L'Hermite de la chaussée d'Antin*, which was compared with Addison's "Spectator." In 1815 he became a member of the French academy. Under the restoration he took an active part in politics, and his attacks brought the wrath of the government upon him and his friend Jay; both were incarcerated for a few months, which considerably added to their popularity, and was the occasion of their publishing *Les hermites en prison* (1823) and *Les hermites en liberté* (1824). After the revolution of July, 1830, he was appointed librarian at the Louvre by Louis Philippe, who granted him also in his later years an apartment in the château of St. Germain. He published his own *Œuvres complètes* (27 vols. 8vo, Paris, 1823-'7).

JOVELLANOS, Gaspar Melchior de, a Spanish poet, born in Gijon, Jan. 5, 1744, died at Vega, Nov. 27, 1811. He was originally destined to the church, and received his first tonsure at the age of 13. But after having studied philosophy at the university of Oviedo, his friends in Madrid persuaded him to change, and he was appointed a magistrate of the criminal court of Seville in October, 1767. In 1774 he became judge of the same court, and four years later alcalde of the royal household and court at Madrid. The friend and protector of Cabarrus, he shared in the persecutions visited upon the latter by Godoy. Cabarrus was cast into

prison, and Jovellanos banished from court, under the pretext of a mission to explore the province of Asturias, and report upon the state of its natural resources. On the restoration of Cabarrus to Godoy's favor Jovellanos was recalled (1797), and appointed ambassador to Russia; but before he had time to set out he was made minister of justice. But Godoy soon sent him once more to Asturias, and in 1801 had him dragged from his bed by night, hurried to Barcelona, and transported to Majorca, whence he did not return until after the downfall of Charles IV. in 1808. He rejected a portfolio tendered him by Joseph Bonaparte, but represented his native province in the first central junta, and was its leading spirit in the darkest moments of his country's struggle for existence. When the junta was dissolved, on the approach of the French troops, he succeeded in reassembling the dispersed members, and prevailed upon them to yield their power to the regency. He then returned to Gijon, whence upon the occupation of the town by the French in 1811 he escaped to Vega. Distinguished alike as a patriot and a scholar, he materially aided Llorente in his endeavors for the introduction of such reforms into the tribunal of the holy office as should insure the publicity of its proceedings, and strove sedulously for the reform of the Spanish drama. His complete works (7 and 5 vols., Madrid), with a biography prefixed, comprise lyrical and didactic poems, epistles, odes, and other minor compositions in verse, both grave and gay; a drama, *El delincuente honrado*, a discourse on the study of history; a paper on the agrarian law, &c. Jovellanos was versed in English literature, and translated the first book of "Paradise Lost."—See *Memorias para la vida de Jovellanos*, by Cean-Bermudez (12mo, Madrid, 1814).

JOVIAN (FLAVIUS CLAUDIUS JOVIANUS), Roman emperor, died in February, 364, after a reign of seven months. The son of Varronianus, one of the greatest generals of his age, he was captain of the body guards of the emperor Julian, and participated in his fatal campaign against the Persians. After the death of Julian, he was proclaimed emperor by the legions, and declared himself a Christian. His army was in the midst of a hostile country, from which his first care was to extricate it. But Sapor, the Persian monarch, so harassed his march with repeated attacks, that Jovian, to save his army from destruction, consented to an ignominious peace, which restored to the Persians several possessions formerly wrested from them, both E. and W. of the Tigris. On reaching the Roman territory, the emperor caused an edict to be issued which abrogated Julian's edicts against the Christians, and restored the supremacy of their religion; but he would not permit the pagans to be oppressed on account of their belief. On the way to Constantinople he arrived, Feb. 16, 364, at Dadastana, an obscure village of Galatia, where he was found dead in his bed the next morn-

ing; whether suffocated by the charcoal fire in the room, or overcome by intemperance, or the victim of poison, is uncertain.

JOVIUS, Paulus. See GROVIO.

JOWETT, Benjamin, an English clergyman and critic, born at Camberwell in 1817. He was educated at St. Paul's school, elected scholar of Balliol college, Oxford, in 1835, and fellow three years later. He became tutor in his college in 1842, was very successful as an educator, and was appointed regius professor of Greek in the university in 1855, and master of Balliol college in 1870. He published a "Commentary on the Epistles of St. Paul to the Thessalonians, Galatians, and Romans" (2 vols., 1855), and contributed to the "Essays and Reviews" a paper "On the Inspiration of Scripture." His principal work is "The Dialogues of Plato, translated into English, with Analyses and Introductions" (4 vols., 1871).

JOWF, or Djowf (Arab., belly), a province of the sultanate of Jebel Shomer, Arabia, between lat. 29° and 30° N., and lon. 39° and 41° E.; area, about 700 sq. m.; pop. about 40,000. It is a kind of oasis, a deep oval depression in the desert, by which it is surrounded as if by hills, about 70 m. long by 10 or 12 broad. The principal town, of the same name, is a collection of eight villages, once distinct but now united. Sekakah, another large village, lies 12 m. N. E. of Jowf. The united population of the two towns is about 34,000. The climate of the valley is temperate and dry. The gardens of the Jowf are celebrated in that part of the East. The date palm is the main object of cultivation, but the peach, apricot, fig, and grape grow luxuriantly, and surpass in flavor the fruits of Syria and Palestine. Various cereals, leguminous plants, gourds, melons, &c., are also raised. The gardens are irrigated by running streams, instead of from wells and cisterns, as in the interior. The inhabitants are fine specimens of the northern Arab type. They are tall, well proportioned, and of dignified carriage, strong, active, long-lived, brave, hospitable, and intelligent. They are said to have been Christians before their forcible conversion to Islamism.—The Jowf became subject to the Wahabee monarchy near the close of the last century, but recovered its independence at the downfall of that power. Civil contentions followed, and the surrounding Bedouins forced it into a tributary position. This continued until the rise of the new sultanate of Jebel Shomer, when it was subdued and made a province of that government. Since then it has advanced rapidly in wealth and civilization.

JOZE, Antonio, a Portuguese dramatist, born in Lisbon early in the 18th century, burnt there, Sept. 23, 1745. His comic plays were very popular, especially "Don Quixote" and "Æsop." Being of Jewish descent, he was accused of Judaism, and condemned by the inquisition to die at the stake. His works are included in the *Theatro comico portuguez* (5 vols., Lisbon, 1759-'62).

JUAB, a central county of Utah; area, 1,100 sq. m.; pop. in 1870, 2,034. It is situated in a mountainous region, and contains the sources of streams flowing N. to Utah lake and S. W. to Sevier river and lake. The loftiest peak is Mt. Nebo, 12,000 ft. high. Along the E. border is the most elevated portion of the Wasatch range. Only a small portion is suitable for agriculture. The chief productions in 1870 were 23,965 bushels of wheat, 6,141 of Indian corn, 2,069 of oats, 12,320 of potatoes, 5,947 lbs. of wool, 23,300 of butter, and 1,181 tons of hay. There were 313 horses, 460 milch cows, 607 other cattle, and 2,908 sheep; 1 flour mill, 2 saw mills, and 1 wool-carding establishment. Capital, Nephi.

JUAN, Don. See JOHN OF AUSTRIA.

JUANES, or Joanes, Vicente, a Spanish painter, born at Fuente la Higuera, Valencia, in 1523, died at Bocairent, near Alicante, Dec. 21, 1579. He studied in Italy, and devoted himself to religious subjects, his piety leading him to partake of the communion as a preparation for each new painting. His studio at Valencia became a nucleus of art, and he was one of the most renowned Spanish painters of his day. The churches and convents of Valencia and other parts of Spain abound with his works. His masterpieces are the "Baptism of Christ" in the cathedral of Valencia, and six pictures of the life of St. Stephen in the royal palace of Madrid. The finest of his works in the Louvre is the "Holy Supper."

JUAN FERNANDEZ, an island in the South Pacific ocean, in lat. 33° 38' S., lon. 78° 46' W., about 420 m. W. of Valparaiso, belonging to Chili. It is of irregular form, about 12 m. in length from E. to W., but not more than 4 m. across in the widest part. A small detached portion at the S. W. end is called Santa Clara island. About 92 m. W. lies a small island called Mas-á-Fuera (further off shore), Juan Fernandez being distinguished as Mas-á-Tierra (nearer the mainland). Mas-á-Fuera is covered with trees and well provided with fresh water; but being destitute of anchorage or landing place, it is seldom visited, and very little known. Juan Fernandez is, like most of the isolated oceanic islands, of volcanic origin, though the original shape and position of the crater are difficult to trace. The principal material in its formation is a stratified tufa, interspersed with blocks of harder volcanic rocks, such as vesicular lava and greenstone. The N. E. part is high, rising to 3,000 ft. in the mountain called El Yunque (the anvil). The headlands form abrupt cliffs toward the sea, and are separated by narrow valleys, clothed in rich vegetation, and watered by small streams of excellent water. The S. W. prolongation of the island is less elevated, forming a plateau covered with grass, destitute of trees, and bordered by cliffs. A few other parts of the S. shore present the same appearance. The island is very picturesque, particularly when approached from the north. The mountains, rising rapidly from

the sea, have when seen from that side an aspect of grandeur which they lose when seen from other directions. Notwithstanding their steepness, which renders most of the summits inaccessible, they are wooded to the top. The only anchorage in use is Cumberland bay in the N. E. part; it is well sheltered from the southerly winds, which are the prevailing ones in summer. Two valleys open into this bay, and at their confluence is situated the settlement, consisting of a few Chilian huts, surmounted by the remains of a fort.—The first settler on the island was a Spaniard, after whom it is named, who resided here with his family, but afterward went to live on the newly conquered mainland of Chili. Subsequently the island was for a long time a debatable ground between the Spaniards and the buccaneers, the latter finding it a convenient place to refit within easy distance of the Spanish settlements. To that period may be attributed the numerous small batteries of which the remains can be seen in Cumberland bay, and, according to the residents, in all the small bays in which a landing might have been attempted. At one time it was made the seat of a Chilian penal settlement. To the labor of the convicts are due the series of large caves, dug in the side of the hill above the anchorage, now being rapidly closed up by the crumbling of the hillside. A foot path over the Yunque range, through a pass 1,800 ft. high, was also constructed by them. In 1872 only a dozen Chilians resided on the island, cultivating a few vegetables, and raising poultry in limited quantities; but they were supplied with most of the necessaries of life from Valparaiso.—It is doubtful whether there were any native land mammals on the island at the time of its discovery. Anson indeed speaks of having seen the burrows of an animal called *pardela* by older writers, which he thought to be then extinct. Goats were early introduced, perhaps by Juan Fernandez himself. They multiplied enormously, and formed the chief supply of the buccaneers who used the island as a rendezvous. The viceroy of Peru caused a large number of dogs to be landed, in the hope that they would destroy the goats and thus deprive the buccaneers of this resource; but the steepness of the summits and of the cliffs preserved many of those animals. When Anson visited the island (1741) the dogs were still numerous, but subsisted chiefly on young seals. At present they have been nearly exterminated by the settlers, and the goats have increased again, though mostly confined to the southern slope of the island. Horses and asses roam over the island in a half wild condition; horned cattle and a few sheep are kept by the settlers, but apparently in numbers much below the resources of the pasture offered. The shores were formerly frequented by large numbers of seals, sea lions, and sea elephants. The last are extinct, as on the neighboring coast of South America, and the first have become

much less numerous. A thrush-like bird and one or two of smaller size are found in the woods. A fine humming bird is abundant at a considerable elevation; and a few hawks may occasionally be seen. Most of these birds are peculiar to this island. Pigeons, resembling the European rock pigeon, frequent the cliffs on Cumberland bay, and may have been introduced. Few sea birds are seen except at the breeding season on some of the islets on the S. side. No reptiles have been found here. Fish are abundant, and are dried for the Chilian market, to which are also sent the dried tails of a large crawfish.—The most striking parts of the vegetation are a myrtle-like tree, the aromatic wintersbark, tree ferns, and a large variety of other ferns. A remarkable palm, peculiar to the island, but very limited in numbers, grows only on a few inaccessible summits. Apples, plums, apricots, and peaches were planted by Anson, and have become plentiful. Fig trees grow luxuriantly near the settlement, where also turnips and radishes run wild in abundance. A species of *Gunnera*, with enormous leaves, forms a beautiful ornament, overhanging the small streams at the bottom of the valleys. Strawberries abound. The pasture lands are covered with a species of oat, besides other grasses.—A romantic interest attaches to this island through the story of Alexander Selkirk, supposed (though probably without reason) to have given to Defoe the idea of "Robinson Crusoe." (See DEFOE.) Selkirk, a Scotch sailing master on board the ship *Cinque Ports* of Dampier's squadron, was left on this island at his own request (1704), on account of differences with his captain. He remained in solitude four years and four months, and was finally taken off in February, 1709, by Capt. Woodes Rogers. After having exhausted his ammunition, he subsisted by running down and catching goats. Tradition points to a cave in the bay next west to Cumberland bay as his habitation. The summit of the pass over the Yunque range is called his lookout, and a tablet reciting the principal points of his history has lately been placed there by the officers of the British ship *Topaz*. Previously to Selkirk, a Mosquito Indian had been accidentally left behind, and taken away again, after the lapse of three years, by Dampier.

JUAN Y SANTACILIA, Jorge, known as Don JORGE JUAN, a Spanish explorer, born at Orihuela, Valencia, in 1712, died in Cadiz, June 21, 1774. He crossed the Atlantic in 1733 as commander of a frail polacca, explored a great portion of the American coast, and made astronomical observations which on his return to Madrid led to his election to the academy. Philip V. appointed him vice admiral, and adjoined him in 1755 to Ulloa's expedition to South America for the measurement of a degree of the meridian at the equator, with the assistance of La Condamine and Bouguer of the French academy. In 1753 he became commander of the marine guards and inspector of

harbors, and promoted the efficiency of the Spanish navy. He wrote the scientific part of Ulloa's *Relacion* of the expedition to South America and of the measurement at the equator (see ULLOA, ANTONIO DE), and jointly with him published a historical and geographical dissertation on the Spanish-Portuguese meridian boundary line (Madrid, 1749; French, Paris, 1776). His other works include a manual of navigation (Madrid, 1757), and a work relating to the application of technology to ship building (2 vols., Madrid, 1761-77), which has been translated into English and French.

JUAREZ, Benito Pablo, president of Mexico, born in the village of San Pablo Guetatao, near Tixtlan, in the state of Oajaca, March 21, 1806, died in Mexico, July 18, 1872. When very young he lost his parents, who were Indians in humble circumstances; and at the age of 12, when he was still unable to speak Spanish, an uncloistered friar of Oajaca took him into the service of his family, and gave him his first education, placing him afterward at the seminary of that city. Young Juarez soon abandoned theology for the law; and having graduated with honors at the new college of Oajaca, where in addition to his legal studies he held the chair of natural philosophy from 1829 to 1831, he was admitted to the bar in 1834. In 1836 he was imprisoned by the conservatives; but in 1842 he became chief judge of the republic, which post he held till 1845, when a partial triumph of his party led to his appointment as secretary of the state government of Oajaca under Gen. Leon. He was, however, soon obliged to give up this office, and he acted as chief justice of the superior court till the end of the same year. When the revolution headed by Salas triumphed in August, 1846, the state of Oajaca resumed its sovereignty, and established a junta, vesting the executive power in a triumvirate composed of Fernandez del Campo, Arteaga, and Juarez. The junta immediately after its organization restored the constitution of 1824; and Arteaga was elected governor, while Juarez was sent as deputy to the general constituent congress of 1846, where he gave a vigorous support to the policy of the acting president Farias in negotiating a loan of \$14,000,000 on church property, to defray the expenses of the war against the United States. Arteaga having resigned in 1847, Juarez was elected in his stead, and remained governor till August, 1852. During this period he introduced many useful reforms, and managed the finances so well that, after over-paying all the contributions to the national government and liquidating the state debt, he left on retiring a surplus of \$50,000 in the treasury. One of the first acts of his implacable enemy Santa Anna, on seizing the reins of government soon afterward, was the arrest and exile of Juarez, who, almost destitute of resources, sojourned two years in New Orleans. In July, 1853, he returned to Mexico by way of Panama, and landed at Aca-

pulco, where he joined Gen. Alvarez, then commanding the revolutionary troops against Santa Anna. Alvarez was proclaimed president on Oct. 4, and he at once appointed Juarez minister of justice and religion. Immediately after the inauguration of the new administration, Juarez proposed a bill for the abolition of the special clerical and military courts, under which these two classes had long enjoyed immunity from the laws of the nation. The measure received the unanimous sanction of the constituent congress. When Comonfort succeeded Alvarez in the presidency (Dec. 11, 1855), he at once appointed Juarez governor of Oajaca, in order to remove him from the cabinet. Juarez was received with joy in his native state, and his second administration was marked by still more happy results than the first. He was reelected as constitutional governor in September, 1857, at the same time that the general elections resulted in his elevation to the post of president of the supreme court of justice, which in Mexico is equivalent to the vice presidency of the nation. In October Comonfort, in obedience to the voice of the whole liberal press, created him minister of the interior. On the downfall of the Comonfort administration, Juarez repaired to Guanajuato, issued a manifesto, formed a cabinet, and, in virtue of his office of chief justice, was recognized as president by all the states in January, 1858; but, unable to oppose the reactionary forces, he was obliged to transfer his government first to Guadalajara, afterward to Colima, and ultimately by way of the isthmus of Panama and New Orleans to Vera Cruz, where he arrived on May 4. In April, 1859, he was recognized as president by the United States. On Jan. 11, 1861, after having defeated Miramon, he entered the city of Mexico; and in the following March he was confirmed in the presidential functions by a general election, in which Don Miguel Lerdo de Tejada was the opposing candidate. Three important acts of the Juarez administration deserve special mention: the suppression of religious orders, the confiscation of the church property (June, 1861), and the suspension for two years of payments on account of the foreign debt and of all national liabilities. The decree for this last measure, issued by congress, on the recommendation of Juarez, July 17, led to the formation of an alliance of intervention (London, Oct. 31) between England, France, and Spain, and the invasion of the republic by the allied forces, which reached Vera Cruz on Dec. 8. Juarez, however, promised to protect the interests of the creditors, and in consequence England and Spain declined to commence hostilities, and prepared to evacuate the country; but France insisted upon the necessity of active measures, ostensibly for the protection of the French residents, but really for the purpose of establishing an empire in Mexico, and accordingly declared war against Juarez on April 16, 1862. The president, after the capture of Puebla by

Gen. Forey, regarding the defence of the capital as hopeless, abandoned it on May 31, 1863, and established his government at San Luis Potosí (June 10), whence he was compelled to retreat to Monterey, and thence to Chihuahua, arriving at the last city on Oct. 12, 1864. Meantime the archduke Maximilian of Austria had assumed the functions of emperor at the capital. Continued reverses of Juárez's troops rendered it necessary for him to withdraw as far north as El Paso del Norte, where he fixed his government on Aug. 15, 1865. While at this place, his term of office having expired (Nov. 30), Gen. Gonzalez Ortega, in virtue of his position as president of the supreme court of justice, asserted his right to assume the executive power; but Juárez, foreseeing the disastrous effects that a change of government might produce at such a juncture, declared his term of administration extended until peace should be restored and new constitutional elections take place. To avoid the appearance of abandoning the national soil, he frequently refused invitations of the American commander of Fort Bliss to visit him. In June, 1866, his arms obtained a first decided success; and continuing victorious, he left El Paso and steadily advanced southward, tarrying for brief periods at Chihuahua, Durango, Zacatecas, and San Luis Potosí (February, 1867), while the troops under Maximilian were concentrated in the city of Querétaro, after the reembarkation for France of the forces under Bazaine. That place was soon invested by the Juárez troops, and Maximilian captured and shot (June 19). On July 16 Juárez reentered the capital of the republic, and in October he was reelected constitutional president. The five succeeding years were marked by a series of revolutions, in which the principal actors were Gen. Porfirio Diaz (the unsuccessful candidate against Juárez in 1867) and his partisans. Peace was restored in 1872; and Juárez, who had been reelected in 1871, seemed likely to enjoy a season of tranquillity; but his constitution, naturally strong, had gradually given way under the trials which beset his stormy administration, and he died of apoplexy.

JUARROS, Domingo, a Central American ecclesiastic, died about 1820. He was synodal examiner to the archbishop of Guatemala, and wrote *Compendio de la historia de la ciudad de Guatemala*, in six books (Guatemala, 1800-'18). It embraces accounts of Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica.

JUBA I., king of Numidia, son of Hiempsal (who had been restored to the throne by Pompey), died by his own hand in 46 B. C. Juba succeeded to the throne on the death of his father, and in the conflict between Cæsar and Pompey he sided with the latter, both from enmity to Cæsar, with whom he had quarrelled on an official visit to Rome during his father's lifetime, and from friendship for the man to whom his father owed his crown. The moment Curio, Cæsar's lieutenant, landed in Afri-

ca (49), Juba hastened to the succor of Atius Varus, the commander of Pompey's forces. Varus had already been defeated under the walls of Utica; but on the approach of Juba, Curio retreated and assumed a strong post near the sea. He was drawn from his position by a stratagem, and overthrown, himself being slain, and his army almost cut to pieces. Juba sullied the glory of this victory by cruelty, causing some cohorts of cavalry who had surrendered to be massacred. He enjoyed his kingdom in peace till 46 B. C., when Cæsar arrived in Africa to crush the last remnant of the Pompeian faction. Bocchus, king of Mauritania, was incited to invade Juba's dominions, and a Roman force was sent to coöperate with him. Juba heard of their inroad on the way to join Scipio, the Pompeian commander, and turned against them, but finally went to Scipio's aid. The rival hosts encountered at Thapsus, and the result proved fatal to the Numidian and his allies. Juba, fleeing from the field, wandered about for a few days as a fugitive, and then in despair killed himself. After his death his kingdom was formed into a Roman province, of which the historian Sallust was the first governor.—His infant son, **JUBA II.**, was taken to Rome and carefully educated, and became a favorite of Octavius, who in 30 B. C. restored him to his father's kingdom, which in 25 was exchanged for Mauritania and a part of Gætulia. He wrote many valuable historical and other works, all of which are lost. He is supposed to have died about A. D. 18.

JUBBULPOBE, a town of India, in the British territory of Saugor and Nerbudda, at the base of a rocky hill, near the Nerbudda river, 200 m. S. W. of Allahabad, and capital of a district of 6,237 sq. m., with about 500,000 inhabitants. The population of the town is not stated, but it has acquired importance as a station on the East Indian railway. It is a large and flourishing place, with a renowned school of industry, established in 1850 in place of the former college. In the vicinity are many remarkable geological formations, and a number of lakes and tanks, which in the rainy season are so swollen as to make the place inaccessible, and to strengthen its strategical position. A small English force defeated here, Dec. 19, 1817, 5,000 Mahratta troops of the rajah of Nagpore. The town has an English garrison and a political agent subordinate to the authorities of Saugor.

JUBILEE, a festive twelvemonth of the ancient Hebrews, celebrated every 50th year, and inaugurated by the blowing of trumpets (*yobel*.) According to the Mosaic law every 7th year as well as every 7th day was observed as a period of rest. To avoid the difficulty of supposing two successive years to be thus observed, some critics have endeavored to prove that the year of jubilee was the 49th instead of the 50th. During this year there was neither sowing nor reaping, all depending alike on the spontaneous products of the earth and

the surplus produce of the preceding years. Bondmen of Hebrew descent became free, and every one resumed possession of his inheritance, howsoever it had been alienated. Unlike the sabbatical year, however, the jubilee did not annul debts. The design of this institution was to check the rise of any great inequality of social condition, and to prevent the rich from oppressing and enslaving the poor or appropriating their lands. It also strengthened the bonds of families, and bound the people to their country, by leading them to cherish an affection for estates derived from their ancestors and to be transmitted to their posterity. The jubilee did not continue to be observed after the Babylonish captivity.—In the middle ages, the term was applied to the year in which all who visited the church of St. Peter at Rome for a certain number of days with pious offerings received plenary indulgence. A jubilee was first declared by Pope Boniface VIII. in 1300, and was to recur in every 100 years. The time was limited by Clement VI., Urban VI., and Paul II. respectively, to 50, 33, and 25 years, and the last period still remains the ordinance of the Roman Catholic church. The condition of visiting Rome is no longer in force, certain works of charity or devotion being substituted.

JUDÆA. See JUDEA.

JUDAH (Heb. *Yehudah*), the fourth of the sons of Jacob by Leah. The tribe named after him was the most numerous of the tribes of Israel. On the conquest of Palestine it received all the land bounded by Dan, Benjamin, the Dead sea, Idumæa, Simeon, and the Mediterranean. It became particularly powerful under the dynasty of David, which originated in one of its towns, Bethlehem, and, after the division of the Hebrew state into two kingdoms, the principal member and representative of the southern, named from it the kingdom of Judah. After the destruction of the northern kingdom, Israel, by the Assyrians, Judah became the common name of the Hebrew nation in general, and the name Jews (Heb. *Yehudim*, Lat. *Judæi*) is derived from it. Jerusalem, the capital of the undivided Hebrew state, and afterward of the southern division, was situated on the confines of Judah and Benjamin. The mountain of Judah was a range traversing its centre, and the desert of the same name near its southern boundary.

JUDAH, surnamed **HAKKADOSH**, "the Holy," a celebrated rabbi of the 2d century, of the house of Gamaliel, one of his successors as *nasi* (patriarch), and the principal author of the Mishnah. He was a friend of one of the Roman emperors, whom Rapoport, the most competent critic on the subject, identifies with Marcus Aurelius.

JUDAH, surnamed **HALLEVI**, "the Levite," a Spanish rabbi of the 12th century, called as an Arabic writer **ABUL HASSAN**. He distinguished himself as a physician, philosophical theologian, and poet, in the last capacity being unsurpassed, if not unequalled, by any post-

Biblical writer in Hebrew. Shortly before the middle of the 12th century he made a pilgrimage to the land of his fathers, a part of which he sings in glowing strains of pious devotion; but before he reached the holy city every trace of him is lost. According to a tradition, he was killed by a Mussulman before entering its gate. His principal work is the *Kuzari* ("The Khazar"), a vindication of the truth and exposition of the principles of Judaism, in fictitious discourses on religion between a king of the Khazars, who was converted to that faith about four centuries before the time of the author, and a rabbi. It was translated from the Arabic into Hebrew by Judah ben Tibbon, into Latin by Buxtorf, and also into Spanish and German. His songs, which among others contain the gems of Hebrew liturgical poetry, have found numerous translators and editors, among the most recent of whom are Luzzato, Sachs, Dukes, and Geiger (*Der Divan des Castiliens Abu'l-Hassan Juda ha-Levi*, Breslau, 1851). His elegy on Zion was translated into German by Mendelssohn.

JUDAS ISCARIOT, one of the twelve apostles, and the betrayer of Christ. As to his surname Iscariot (Gr. Ἰσκαριώτης), there are many theories; the most probable is, that it is merely the Greek form of writing the Hebrew *ish Kerioth*, "man of Kerioth," a town of Judah. He was the son of Simon, was appointed treasurer of the apostles, covenanted with the chief priests to deliver Jesus up to them for 30 pieces of silver (at the highest computation about \$22, but in comparative value probably equivalent to nearly \$500), accomplished this purpose, repented when he saw his Lord condemned and buffeted, offered to restore the money, confessed that he had betrayed innocent blood, and in despair committed suicide by hanging, according to Matthew, or fell and burst asunder, as related in Acts in the words of Peter. Some interpreters suppose that the motive of his betrayal was to oblige Jesus, in self-defence, to announce himself as the expected king Messiah, to surmount the emergency by his miraculous powers, and to open to himself, the apostles, and the Jewish kingdom the anticipated career of aggrandizement. "The difference," says Archbishop Whately, "between Iscariot and his fellow apostles was, that though they all had the same expectations and conjectures, he dared to act on his conjectures, departing from the plain course of his known duty to follow the calculations of his worldly wisdom and the schemes of his worldly ambition." See Whately's "Discourse on the Treason of Judas Iscariot," in his "Essays on some of the Dangers to Christian Faith" (London, 1839). That he was simply a traitor is the impression generally made by the narrative.

JUDAS MACCABÆUS. See HEBREWS, vol. viii., p. 592.

JUDAS TREE. The tradition that Judas hanged himself upon a species of *cercis* (the oriental name for the tree) has kept his name

attached to the three or four species comprised in the genus. In America the genus is represented by *C. Canadensis*, which also bears the popular name of red-bud; it is a small tree, rarely exceeding 30 ft., found from New York southward and westward, especially on the banks of rivers. When not crowded by other trees it forms a rounded head, and appears at a distance somewhat like an apple tree; the leaves are round heart-shaped, of a bluish green above, with a grayish green on the under surface; the foliage has a remarkably clean and healthy appearance, and is not liable to the attacks of insects. It belongs to the *leguminosæ*, in a suborder in which the flowers are not perfectly papilionaceous; the flowers are of a dark peach-blossom color, and are produced before the leaves appear in small umbel-like clusters, not only upon the wood of the previous year, but upon branches that are several years old, and even upon the trunk itself; though individually small, the flowers are in

Judas Tree (*Cercis Canadensis*).

such profusion as to quite cover the tree, which when planted for ornament should be set against a background of evergreens, to show to the best advantage; the fruit is a flattened pod with numerous seeds. The wood is hard and capable of receiving a fine polish. Upon the continent the flowers of the European species are used in salads, and fried in butter as fritters, and the flower buds are pickled in vinegar; it is said that the French settlers in this country make a similar use of the flowers of our species, which have a pleasantly acid taste. This is one of the native trees which have received too little attention from planters, as it is pleasing at all times, and highly ornamental in early spring.—The European Judas tree, *C. siliquastrum*, has less pointed leaves and darker flowers than ours, and is also less hardy. One of the most valuable hardy ornamental shrubs of recent introduction is called in the nurseries *C. Japonica*, but is probably a variety of *C. Chinensis*, and is known as the

Japan Judas tree. It is of slow growth, but blooms profusely when only a foot or two high, and has darker-colored flowers than the others. All the species grow from seeds.

JUDD, Sylvester, an American author, born in Westhampton, Mass., July 23, 1813, died in Augusta, Me., Jan. 20, 1853. He graduated at Yale college in 1836, subsequently embraced the Unitarian creed, studied theology at Cambridge, and was ordained pastor of the East parish in Augusta, Me., in 1840. In 1843 he began the work on which his literary reputation chiefly rests, "Margaret, a Tale of the Real and Ideal," &c. (12mo, Boston, 1845), which has been illustrated by a series of outline drawings by Darley (New York, 1856). In 1850 he published "Philo, an Evangeliad," a didactic poem in blank verse, and in the same year "Richard Edney," a romance. An old Indian tradition suggested to him a dramatic poem in five acts, "The White Hills, an American Tragedy." A volume entitled "The Church, in a Series of Discourses," was published posthumously in 1854; and his "Life," by Mrs. Arethusa Hall, appeared in the same year.

JUDE (Gr. 'Ιούδας), **Saint**, surnamed **THADDEUS**, or **LEBBEUS**, one of the apostles, a relative of Jesus, probably a son of Alpheus and a brother of James the Less. No circumstances of his life are related. According to the traditions of the West, he preached and suffered martyrdom in Persia. According to eastern traditions, he labored in Arabia, Syria, and Palestine, and died in Edessa; or, according to others, visited Assyria also, and died in Phœnicia. He is commemorated in the western church on Oct. 8. The tradition of the church regarded him as the author of the Epistle of Jude, one of the canonical books of the New Testament; but some recent critics believe the apostle Jude Thaddeus to be different from Jude the brother of the Lord and of James the Less, and the latter Jude to have been the author of the epistle. The genuineness of the epistle was disputed as early as the time of Jerome, chiefly because it cites the two apocryphal books of "Enoch" and the "Assumption of Moses." Most critics, however, have maintained it. It is written with vehemence, and fervor, seems to have been addressed to converted Jews in Asia Minor and beyond the Euphrates, and contends against Gnostic, Nicolaitan, and other dangerous doctrines. Commentaries on the epistle have been written by Scharling (1841), Rampf (1854), Gardiner (Boston, 1856), Huther (2d ed., 1859), Wiesinger (1862), and Schott (1863).

JUDEA, or **Judæa**, a name variously used in ancient geography to designate the whole of Palestine or the land of the Jews, especially during the period between the Babylonish captivity and the last wars of the Jews; the southern kingdom of the Hebrews, or that of Judah, in contradistinction to that of the ten tribes of Israel; or the southern division of Palestine W. of the Jordan in the time of the

Asmoneans and Romans, between Samaria on the north, the Jordan and the Dead sea on the east, Idumæa and the desert on the south, Egypt on the southwest, and the Mediterranean on the west. The limits of Judea in each of these acceptations were continually varying. (See PALESTINE, and HEBREWS.)

JUDGES, Book of, one of the historical books of the Old Testament, narrating the deeds of the thirteen judges of Israel from Othniel to Samson. It is a fragmentary rather than a complete and connected history, the fullest accounts being given of Deborah and Barak, Gideon, Jephthah, and Samson. It begins with showing that the calamities suffered by the Hebrews after the death of Joshua were due to their apostasy from Jehovah. It is supposed by many that the first 16 and the remaining 5 chapters are by different authors. The first portion, believed by some to have been written before the time of David, is ascribed to Samuel. Most German critics, however, believe the book to have been compiled on the basis of ancient documents at a late period. According to Bertheau (Schenkel's *Bibelleicon*, art. *Richter*, Leipsic, 1873), the compiler was Ezra. The same writer also regards it as probable that the book of Ruth originally formed a portion of the book of Judges. Among the most important commentators on the book are Le Clerc, Rosenmüller, Maurer, Studer, Bush, Bertheau, Keil (1863), and Bachmann (1868).

JUDGES OF ISRAEL. See HEBREWS.

JUDGMENT, in law, a solemn determination of a question; declared by a court of record. The language used in a judgment is, that "it is considered by the court," &c., the theory being that the function of the court is not to give its own decision, but to ascertain and pronounce the decision of the law. To give validity and full force to a judgment, the court which renders it must have competent jurisdiction over the case; that is, it must be authorized by law to entertain and determine the question which it decides, and the parties, or, in case of proceedings *in rem*, the subject matter of the suit must, by process or some substitute therefor, have been brought within the authority of the court. When these circumstances concur, merely irregular action of the court or its officers will not invalidate its judgments. A judgment may be arrested and avoided, if, within the time prescribed by the rules of the court, it can be shown that there are intrinsic defects appearing of record, which are of sufficient importance. For, the judgment being founded upon the record, it cannot stand if the party against whom it is rendered can show that the record is inconsistent with it or insufficient for it. The more common instances of this are where there is an irreconcilable contrariety between parts of the record; as, for example, where the judgment is founded upon a verdict which is essentially different from the pleadings at issue.—Judgments are of many kinds, for the reason that they must conform to the

pleadings and issue. They are usually classed as judgments upon demurrer, on a verdict, on confession, on default, or on nonsuit. (See PLEADING.) A judgment is also interlocutory or final; and the best definition of an interlocutory judgment is to say that it is any judgment which is not final, or which does not entirely dispose of the whole question. A judgment that is final and valid is the highest assurance known to the law. Such judgments were formerly extensively used in England to operate as conveyances of land; the party to whom the land was to be transferred commencing an action for it against the party who was to transfer it, and this being concluded by a judgment that the land in question belongs to the plaintiff.—From the high and solemn nature of a judgment, the doctrine of merger was applied to it. If one sues another on his promise, or indebtedness of any kind, or for wrong of any kind, and recovers judgment, it is a technical rule of law that the original cause of action merges or is lost in the judgment. So, too, it was formerly thought to be well established that if one brought an action against another for depriving him unlawfully of his property, and recovered a judgment for damages, this judgment vested in the defendant a right or title to the property, although the damages were never paid nor the judgment satisfied in any way. There are writers who hold, however, that the title does not pass until execution is taken out, and still others of high authority that satisfaction of the judgment is essential; and this, perhaps, is the better doctrine.—There is no doubt whatever that a judgment of a court of record may be made the foundation of a suit. If it be the judgment of a competent court in the same state, it proves itself; and no defence can be made which does not distinctly impeach it for fraud, or for want of jurisdiction. If it be the judgment of a court of another of the United States, it falls within that clause in the federal constitution which provides that "full faith and credit shall be given in each state to the public acts, records, and judicial proceedings in every other state," and authorizes congress to provide the manner in which they shall be proved. Congress, by an act passed May 26, 1790, made this provision. Under this it is held that a judgment has the same conclusive nature in another state that it has in the state in which it was rendered. The question how far a foreign judgment, *proprio vigore*, has force and validity, has been discussed in many cases, with some diversity in the conclusions. On one extreme stand those who would make it a mere *prima facie* evidence, open to rebuttal by any evidence tending to show that it ought not to have been rendered. Where this doctrine is held, it is plain that the whole case may be tried over again in the action on the judgment, with the burden of proof on the party who would set it aside. Against this are those who hold the opposite extreme, that a foreign judg-

ment is as conclusive as a home judgment. The law on this subject both in the United States and in England may now be considered as resting on a medium ground. First, it is certain that no sovereign state is bound to execute a judgment or decree of any foreign state. Next, a foreign judgment is valid and conclusive, provided: 1, that the court rendering the judgment had full jurisdiction of the case; 2, that the case was properly brought before that court and properly tried; 3, that there is nothing in the unquestionable law of the case which forbids or contradicts the judgment; and 4, that it was not obtained by fraud, deception, or oppression. The civilians of the continent of Europe generally maintain the absolute validity of a foreign judgment. But the courts of France have never yet recognized the validity of a foreign judgment, to the extent to which this is now admitted in England and the United States; although the recent adjudications of that country indicate a much nearer approach than formerly to what may be called the English view of "the comity of nations" in this respect.—Not only may a judgment be made the foundation of a suit, but a former judgment may be relied upon as a defence against a suit which would raise the same question anew. This ancient and important rule is never denied in its general form; and it rests upon the obvious principle that there must be, at some time and by some means, an end of litigation. Therefore, if a question be once tried by a proper tribunal, and in a proper way, and solemnly decided, it is decided for all time, and cannot again be brought up for consideration. In other words, a judgment rendered is conclusive upon the merits of a question; and this rule is now applied, with the qualifications above stated, to a foreign judgment.—For the lien on the real estate of the judgment debtor created by the judgment, see LIEN.

JUDENBACH, a village of Saxe-Meiningen, Germany, on the S. E. ridge of the Thuringian Forest, near the former boundary line of Thuringia and Franconia, and formerly celebrated as a great focus of trade between N. and S. Germany and of Nuremberg and Augsburg merchants. Luther was here in 1530, and the tavern (*Wirthshaus zur Rast*) where he resided, a decayed old building, was about to be sold and pulled down in 1873, when it was purchased by Mr. Fleischmann, a merchant of the neighboring town of Sonnenberg, who put it up in 1874 on the Schönberg, in the same condition in which it was when Luther inhabited it.

JUDITH, daughter of Merari of the tribe of Reuben, widow of Manasseh, celebrated for her deliverance of her native city Bethulia when besieged by the Assyrian general Holofernes. Mourning the death of her husband during the siege of the town, and noted for her beauty, she went forth in rich attire to the camp of the enemy, played a treacherous part,

attracted Holofernes by her charms, and on the third day, when she was alone with him in his tent, and he was intoxicated, struck off his head with a falchion, and bore it into Bethulia. In the morning the Israelites attacked and discomfited the Assyrians, who were panic-struck at the loss of their general. She lived to the age of 105 years, and the Jews are said to have instituted an annual festival in honor of the victory. The history is contained in the apocryphal book of the Old Testament which bears her name. Calmet supposed the narrative to be a parable and not a real history, an opinion which is now generally shared by critics. According to Hilgenfeld, Lipsius, and others, the events described in the book took place in the time of the Maccabees; and by Nebuchadnezzar we must understand Antiochus Epiphanes, and by Holofernes Nicanor. They suppose the book to have been written about 144 B. C. According to Volkmar, Hitzig, and others, it was not composed until about A. D. 118, and the principal persons described in it are the emperor Trajan and his general Lusius Quietus. The book appears to have been originally written in Hebrew, and the Greek translation to have been the source from which the somewhat different Latin version was derived.

JUDITH, Mlle. (JULIE BERNAT), a French actress of Jewish parentage, born in Paris, Jan. 29, 1827. She is a remote relation of Rachel Félix, and made her first appearance on the stage in 1842. From 1844 to 1846 she played at the Variétés theatre, her oriental beauty and fine voice contributing to her success, and subsequently at the Théâtre Français, of the society of which she became a member in 1852. In 1859 she married M. Bernard-Derosne, whom she assisted in translations from the English. She afterward left the Théâtre Français and performed at the Galeté and other theatres. She excels as Charlotte Corday and as Rosine in the *Barbier de Séville*, and unites tragical power with sprightliness.

JUDSON, I. Adoniram, an American missionary, born in Malden, Mass., Aug. 9, 1788, died at sea, April 12, 1850. He was the son of the Rev. Adoniram Judson, a Congregational clergyman, and descended from William Judson, who came to New England in 1634. He graduated at Brown university in 1807, opened a private school in Plymouth, Mass., and published "Elements of English Grammar" (1808) and "Young Ladies' Arithmetic" (1809). His previously skeptical views having yielded to an examination of the evidences of Christianity, he entered the second class at Andover theological seminary, not as a candidate for the ministry, but as an inquirer after truth, and completed the course in 1810. The reading in 1809 of Dr. Buchanan's celebrated sermon entitled "The Star in the East" led him to devote himself to the missionary enterprise. Several of his fellow students concurred in his views, and a formal application

for counsel and encouragement, addressed by Adoniram Judson, jr., Samuel Nott, jr., Samuel J. Mills, and Samuel Newell, to the general Congregational association of Massachusetts, became the incipient step toward the formation of the American board of commissioners for foreign missions. Impatient at the slow progress of the American movement, he embarked for England, under invitation, to consult with the directors of the London missionary society in regard to the practicability of coöperation with that society by the newly formed American board. The vessel in which he embarked was captured by a French privateer, and the young missionary soon found himself in a prison in Bayonne. Released on parole, he reëmbarked for England, where he arrived in May, 1811, and was offered for himself and his associates appointments and support from the London society, but the plan of coöperation was declined as unadvisable. He returned to New York in August, and in September was present at the meeting of the American board at Worcester. Here his eloquent importunity, united with that of one of his colleagues, triumphed over the continued tendency to delay, and Judson, Newell, and Nott, with Gordon Hall, were appointed by the board its missionaries to the Burman empire. Luther Rice was subsequently added to their number, and the five young men were ordained at Salem, Feb. 6, 1812. Mr. Judson's marriage with Miss Ann Hasseltine had occurred the day previous to his ordination, and on the 19th of the same month they, with Samuel and Harriet Newell, embarked from Salem for Calcutta. At this place, and at Madras, they were subjected for a full year to much annoyance by the East India company's regulations. Finally they found refuge in flight to Rangoon, in the Burman empire, the place of their original destination, where they arrived in July, 1813. Meanwhile Mr. and Mrs. Judson had adopted the views of the Baptist denomination, and having been baptized by Dr. Carey, English Baptist missionary at Serampore, had surrendered their connection with the American board. Mr. Rice, arriving at Calcutta by another vessel, had on his voyage pursued similar studies with similar results, and had returned to America to enlist the Baptists of the United States in the support of foreign missions. In April, 1814, the Baptist general convention, called since 1845 the American Baptist missionary union, was formed at Philadelphia, and immediately appointed Mr. and Mrs. Judson its missionaries. Established in Rangoon, the field left to them by the closing of the English Baptist mission, they applied themselves with great zeal to the acquisition of the language, without grammar or dictionary, or teachers who could speak English. Mrs. Judson first attained the power to converse; Mr. Judson's habits of thorough philological inquiry rendered his progress less rapid, but made his mastery of the language equal to

that of native scholars. In three or four years he published a "Summary of the Christian Religion," a catechism, and a translation of the Gospel of Matthew. In March, 1817, an intelligent Burman, accompanied by his servant, presented himself to Mr. Judson as an inquirer; in April, 1819, the first *zayat* (an edifice which is both a caravansary and a place for public meetings) was opened for Christian worship; and on June 27 in the same year the first native convert was baptized. At the close of the year 1820 the number of baptized converts was 10. Meanwhile the mission had been reinforced by the arrival of additional missionaries, and the impression which it was making had in 1819 excited the displeasure of the new viceroy. Mr. Judson determined to appeal to the king for toleration, and, with his colleague Mr. Colman, ascended the Irrawaddy to Ava for that purpose. He was admitted to an audience, but the plea was unavailing. Believing that they had made a mistake in appealing to the king, and fearing that this measure would bring upon the converts the vengeance of the government, they had well nigh formed the purpose of removing to a safer place in Aracan, but were deterred by the steadfast courage of the native Christians. In 1821 the continued ill health of Mrs. Judson compelled her to return for a time to the United States, where, after a short stay in England, she arrived in September, 1822. While in this country she published her "History of the Burman Mission," and by her presence and her personal appeals contributed largely to increase the missionary zeal of the American churches. In the spring of 1823, with her health but partially restored, she reëmbarked for Calcutta, accompanied by Mr. and Mrs. Wade as recruits to the mission, and rejoined her husband at Rangoon in the autumn of the same year. During her absence the number of converts had been nearly doubled, and Mr. (now Dr.) Judson had completed a translation of the New Testament, as well as an epitome of the Old. Their residence had been transferred to Ava by request of the king, who was anxious to command the medical services of Dr. Price, a missionary physician who was colleague with Dr. Judson. The sudden breaking out of war however between the East India company and the Burman government brought upon the missionaries, and other foreign residents at Ava, the severest privations, perils, and sufferings. For nearly two years no tidings came of the fate of the missionaries. Three Englishmen residing at Ava having been arrested by the native authorities and examined, it was found that the accounts of one of them showed considerable sums of money paid to Drs. Judson and Price, and, ignorant of the methods of transmitting funds by bills of exchange, the government saw in this fact proof of their complicity with the English in the war. On June 8 Dr. Judson was arrested at his dwelling by a posse of officers, thrown into the "death prison" with

all the other white foreigners, and loaded with chains. Mrs. Judson was kept a prisoner in her own house, under the guard of ten ruffianly men; but on the third day a message to the governor of the city, expressing a desire to appear before him with a present, resulted in an order for her release. Further gifts secured the promise of an amelioration of her husband's sufferings, and permission to visit him in prison; and by the same means all the prisoners were delivered from their suffocating confinement, and placed in an open shed within the prison enclosure. Hither she sent food and mats for them all, commencing those angelic ministries to the sufferers which have rendered her name immortal. Seven months thus passed away, during which she employed her time in devising and executing measures for the comfort of the prisoners, and especially for the release of her husband, scarcely a day passing in which she did not visit some member of the government, or some branch of the royal family; with no other effect, however, than that she and the objects of her solicitude were kept from despair by the encouraging promises of a capricious court. New miseries were still in store. The hot season had arrived, and the sufferings of the prisoners had become intolerable. The birth of a child suspended for a brief period these ministries of Mrs. Judson. Twenty days after this event she was again at the prison, and again in the presence of the governor pleading for ameliorations. Returning to the prison from an interview which the governor had requested, she found the white prisoners all removed. She learned from an old woman that they had gone toward Amarapura, the old capital, distant six miles. She obtained a passport, and set off for Amarapura, where she learned that the prisoners had just left for Oungponla. Here she found them, chained two and two, and almost dead from fatigue and suffering. They spent the next six months at this place, subjected to continual oppression and extortion. The king was at length forced to ask conditions of peace of the British, and in February, 1826, Mr. and Mrs. Judson were released through the demand of Gen. Sir Archibald Campbell. Descending the river to the territories ceded by the Burman government to the English, they commenced missionary operations at Amherst, a new town designed to be the British capital. Scarcely, however, were they fixed in this abode, when urgent overtures were made to Dr. Judson to accompany an embassy to Ava, to negotiate a new treaty. In the hope that an article providing for religious toleration might be incorporated, he yielded to the wishes of the commissioner, and parted with Mrs. Judson on July 5, never to see her more. Her constitution, broken by the intense sufferings and cares of the long imprisonment, yielded to an attack of fever, and she died after 18 days' illness. Returning to Amherst, Dr. Judson applied himself with diligence to missionary labors. The number

of native converts was increased, many new missionaries arrived, and new branches of the mission were established, that among the Karens starting at once into importance as among the most successful of modern times. Dr. Judson was chiefly employed in the translation and revision of the Scriptures, and in the preparation of a Burmese-English dictionary. In January, 1834, he completed the translation of the Bible. In April of the same year he married Mrs. Sarah H. Boardman, widow of a missionary, the Rev. George Dana Boardman. For eleven years he continued his missionary labors, to a large degree Biblical and philological, till 1845, when the failing health of his wife compelled a voyage to the United States. Mrs. Judson died in the harbor of St. Helena, Sept. 1, and was buried on that island. Dr. Judson arrived at Boston, Oct. 15. The emotion excited by his return spread over the whole country, and was shared by every denomination of Christians. He was received with distinguished marks of respect and veneration by public meetings in many chief cities and towns of the United States, and especially by his Baptist brethren assembled in their missionary conventions at New York and Richmond. On July 11, 1846, he reëmbarked for Burmah, having married Miss Emily Chubbuck. Arriving at Maulmain in December, he resumed his work with ardor, assuming the pastorship of the Burman church, and carrying forward the dictionary on which he had been so long engaged. In the autumn of 1849 a severe cold, followed by a fever, withdrew him from his work. His disease refused to yield to remedies, and on April 3, 1850, he left his wife in a state of health which forbade her accompanying him, and departed with a single attendant for the isle of Bourbon. He suffered much while descending the river, but rallied for a time on the open sea. On April 12 he sank quietly to rest, and was buried in the ocean. The Burmese and English dictionary, on which he was engaged at the time of his death, was compiled from his papers by E. A. Stevens and printed at Maulmain in 1852. —A memoir of his life was written by the Rev. Francis Wayland, D. D. (2 vols. 12mo, Boston, 1853). See also a memoir by J. Clement (12mo, Auburn, N. Y., 1852); "Records of his Life, Character, and Achievements," by the Rev. D. T. Middleditch (12mo, New York, 1854); and "The Earnest Man: a Sketch of the Character and Labors of the Rev. Adoniram Judson," by Mrs. H. C. Conant (8vo, Boston, 1856). **II. Ann Hasseltine**, first wife of the preceding, daughter of John and Rebecca Hasseltine, born in Bradford, Mass., Dec. 22, 1789, died at Amherst, Burmah, Oct. 24, 1826. She was educated at the academy of her native town. Her mind was well disciplined, and her acquisitions were unusually large. Mr. Judson's acquaintance with her commenced in 1810, and resulted in an invitation to share with him the responsibilities and perils of mis-

sionary life. They were married at Bradford, Feb. 5, 1812, and on Feb. 19 embarked for Calcutta. Her subsequent history will be found in connection with that of her husband. A memoir of her life was written by the Rev. James D. Knowles (2d ed., Boston, 1829; many times reprinted). **III. Sarah Hall (Boardman)**, second wife of Adoniram Judson, born in Alstead, N. H., Nov. 4, 1803, died at the island of St. Helena, Sept. 1, 1845. She was the eldest child of Ralph and Abiah Hall. While she was a child her parents removed, first to Danvers, Mass., and then to Salem. On July 4, 1825, she became the wife of the Rev. George Dana Boardman, and on July 16 they embarked for Calcutta, arriving there Dec. 15. The Burman war still raging, Mr. Boardman accepted temporarily an invitation to preach at the Circular Road Baptist church in that city. Here they remained till the spring of 1827, when they embarked for Burmah, where arrangements were made for the establishment by Mr. Boardman of the mission station at Maulmain, which subsequently became the chief seat of Baptist missions in that country. Here Mrs. Boardman made rapid progress in the acquisition of the language, and availed herself of every opportunity and method in her benevolent work. This mission being fairly established, Mr. and Mrs. Boardman were transferred to Tavoy for a similar service, where was commenced the remarkable work of the propagation of the gospel among the Karens, the inhabitants of the interior jungles. In two years Mr. Boardman died. His widow continued her missionary labors, and besides managing a school with great success, and giving religious instruction in various ways at Tavoy, she was accustomed to make long and toilsome journeys among the mountains. In these excursions, assemblies of hundreds gathered around her, and notwithstanding her reluctance to assume what seemed like the office of a public teacher, she was obliged to conduct their worship, and instruct them more perfectly in the Christian faith. In April, 1834, she became the wife of Dr. Judson. Her subsequent life was less eventful, but it was filled with steady, quiet usefulness. She was perfectly familiar with the Burmese language, and skilful in the use of it. She translated into it the first part of Bunyan's "Pilgrim's Progress," and various tracts, prepared a hymn book, several volumes of Scripture questions for Sunday schools, and, as one of the last works of her life, a series of Sunday cards. Before the Peguans had a missionary, she acquired their language, and translated or superintended the translation of the New Testament and the principal Burman tracts into the Peguan tongue. In these useful labors she continued till 1845, when her shattered health compelled her to attempt a voyage to America in the hope of its restoration, but she sank before its completion. A memoir of her life was written by Mrs. Emily C. Judson (18mo,

New York, 1850). **IV. Emily Chubbuck**, third wife of Adoniram Judson, born in Eaton, Madison co., N. Y., Aug. 22, 1817, died June 1, 1854. Though her opportunities of early culture were extremely limited, she made much progress in learning. At the age of 14 she took charge of a district school, and continued teaching, with very brief intervals, until the age of 23, contributing in the mean time a number of pieces in prose and poetry to the village newspapers. In 1840 she entered the Utica female seminary as a pupil, but was soon transferred to the office of teacher. She began her career of formal authorship by writing several Sunday school books ("Charles Linn," "Allen Lucas," &c.), which, however, yielded little pecuniary remuneration. Charged with the support of her aged parents, she turned to other sources, and in 1844 addressed a playful letter, under the assumed name of Fanny Forester, to Messrs. Morris and Willis, editors of the New York "Evening Mirror," proposing contributions to that journal. She soon after became a regular contributor to several periodicals, and a brilliant literary career was opening before her, when a new direction was given to her destiny by her marriage with the Rev. Dr. Judson, in June, 1846, and their departure for India in July following. She remained in Burmah until January, 1851, when, learning the death of her husband, she returned to America. While in Rangoon she wrote the memoir of Mrs. Sarah B. Judson, and in Maulmain composed some of her best poems connected with her personal history. She returned with a broken constitution, but devoted herself to the care of her children and of her aged parents, and to her literary labors. She prepared and arranged the papers for Dr. Wayland's life of Dr. Judson, and collected her poems, which were published under the title of "Olio of Domestic Verses." Her other works are "The Kathayan Slave," a collection of missionary writings in prose and verse, and "My Two Sisters." Her magazine tales and sketches had been collected and published before she left America, under the title of "Alderbrook." A memoir of her life was written by Dr. A. C. Kendrick (12mo, New York, 1860). The "Lives of the Three Mrs. Judson," by Mrs. A. M. Wilson, was published in New York in 1851-'5.

JUEL, Niels, a Danish admiral, born May 8, 1629, died in Copenhagen, April 8, 1697. He served under Martin van Tromp and De Ruyter, and became captain of a Dutch frigate, and subsequently commander of a Danish squadron, with which he cooperated in defending Copenhagen in 1659 against the Swedish fleet. In 1676 he captured the island of Gothland, and repulsed (June 4), with 25 ships, a Swedish force twice as large; and he soon afterward achieved another victory over the Swedes in conjunction with Cornelius van Tromp. In 1677 he was still more successful in overwhelming two separate Swedish squadrons, capturing a great number of ships, for which he subse-

quently received the rank of grand admiral lieutenant, the order of the Elephant, and the island of Taasing. He failed in an attempt to take Calmar, but took Rügen in 1678.—His brother JOHANN, Baron Julinge (died 1700), shared in many of these victories, and was one of the negotiators of the peace of Lund (1679).

JUGGERNAUT, or **Jagannath** (called by the natives Pooree), a town of Bengal, India, on the N. W. coast of the bay of Bengal, in the province of Orissa, and in the district and 45 m. S. of the city of Cuttack; pop. about 30,000. The ground on which it stands is esteemed holy, and is held free of rent on condition of performing certain services in and about the temple. The principal street is composed chiefly of religious establishments called *maths*, which consist of stone buildings with low-pillared verandas in front and shaded by trees. At the end of this street, which is very wide, rises the celebrated temple. In the vicinity of the town are luxuriant groves and gardens, and many fine tanks of great antiquity. Between the S. W. side of the town and the sea are numerous ancient edifices nearly buried in the drifting sand. Juggernaut is the most holy of the shrines of Hindostan, and is visited annually by upward of 1,000,000 pilgrims. The temple stands within a square enclosure, surrounded by a lofty stone wall, each side of which measures 650 ft., making an area of about 10 acres. On the E. side is a grand gate-

way from which a broad flight of steps leads to a terrace 20 ft. high, enclosed by a second wall, each side of which measures 445 ft. From this terrace the great pagoda rises, from a base of 30 ft. square, to the height of 200 ft. above the ground. It tapers from bottom to top, and is rounded off in the upper part. Most of the Hindoo deities have temples within the enclosure. The great temple is dedicated to Krishna, considered as an avatar or incarnation of Vishnu, and derives its name from his title Juggernaut (properly Jagannâtha, "the lord of the world"). Siva and Subhadra are the next principal objects of adoration, and these three deities are respectively represented by three frightful-looking idols made of blocks of wood about 6 ft. high, each surmounted by a grim

representation of the human countenance. The block representing Krishna is painted dark blue, while Siva's image is white, and Subhadra's yellow. Each idol is provided with a chariot, which is a lofty platform mounted on wheels. That of Juggernaut or Krishna is the largest, 43½ ft. high, 34½ ft. square, and is mounted on 16 wheels, each 6½ ft. in diameter. The *Rath Jatra*, or great festival of Juggernaut, occurs in March when the moon is of a certain age, and the idols are then taken on their chariots to visit their country house, about 1½ m. from the temple. The chariots are drawn by long ropes held by enthusiastic thousands of men, women, and children, while priests standing on the platforms sing and repeat obscene stories, accompanied by corresponding gestures, amid

The Principal Gateway of the Temple of Juggernaut.

the applauses of the multitude. In former years some of the votaries were occasionally sacrificed by falling accidentally or by design before the chariot wheels, and being crushed to death by the ponderous rolling vehicle; but latterly there have been no occurrences of this sort. The temple of Juggernaut is of considerable antiquity. The present building is supposed to have been completed in 1198, at a cost of more than \$2,000,000. The British obtained possession of the town in 1803. Its former masters, the Mahrattas, had levied a tax upon the pilgrims resorting thither, and out of the large sum thus raised granted a small allowance to defray the expenses of the temple. The British continued this tax and the provision for the maintenance of the temple till 1839, when

the tax was abolished and an annual donation from the public treasury given to the priests. In consequence of the scandal created by the spectacle of a Christian government contributing to support the most obscene rites of heathen worship, this donation was suspended about 1855, and the temple now depends on a pilgrim tax collected by the native authorities.

JUGGLER, one who practises or exhibits tricks by sleight of hand, or who makes sport by tricks of extraordinary and deceptive dexterity. The further we go back in history, the more do we find the juggler assuming the character of the thaumaturgist or worker of serious marvels; and in the 16th century men were burned alive in Spain and Italy for performances which now excite but little wonder. In the earliest times, when knowledge and science were devoted to strengthening heathen religion, juggling was a real power, and formed the most efficient means of sustaining the dignity of the priesthood. The hierarchy of India and Egypt carried thaumaturgy to an incredible extent, and it is by no means impossible that a great proportion of the marvels ascribed by legend to magicians were actually or apparently performed. The investigations of Salvete have shown in what manner most of these could have been done, and with what effect, especially in the depths of temples, before witnesses filled with awe and devoid of doubt. Thus Iamblichus (*De Mysteriis*, cap. 29) and Porphyry speak of those who showed the apparitions of gods in the air; a trick explained by Robertson ("Memoirs," vol. i., p. 354) to be of easy performance. The wonder-worker Maximus probably used a similar secret when, on burning incense before a statue of Hecate, the goddess was seen to laugh so plainly as to fill all present with horror. Ordinary jugglers at the present day show the face of another person to those looking in a mirror; a trick also used by fortune tellers to exhibit future husbands to superstitious girls. This, which is done by a very simple optical contrivance sold in many shops, perfectly explains the manner in which the Agrippas and Fausts of the middle ages, as well as the earlier magicians, showed those who were supposed to be absent, or the forms of the departed, as Cleonice appeared to Pausanias. Juggling, properly regarded, is a science, the principal of whose divisions is that of sleight of hand or substitution. The commonest tricks performed by these means have been known to all cultivated races. The tosser of knives and balls, the marvellous balancer, the producer of unexpected objects from strange receptacles, occur in Saxon manuscripts and on the walls of Egyptian and Etruscan tombs; they amazed the Norseman and the Roman; and when the troubadour degenerated to a vagabond, he became a *jongleur* (Lat. *joculator*), whence the word juggler. The tying and untying of intricate knots, which has even in these days been attributed to supernatural agency, yet which is shown by every

juggler, leads us back to the Scottish warlock whom no bonds could hold, and to the symbolic mazes of Runic and Gordian ties. Not many years ago London was amazed at a man who could tell one person in secret what card it was that another thought of. Lord Bacon (*Sylva Sylvarum*, cent. ix., 946) tells of one that "did first whisper the Man in the Eare, that such a Man shoulde think such a Card." Those who have seen glasses or chains broken, and handkerchiefs apparently torn to pieces, and then restored to the owners, may be amused to know that a learned writer of the 16th century, Fromann (*Tractatus de Fascinatione*, p. 583), really believed that this was done by magic, though he tells us in the same book that in his time many common jugglers (*conculatores aut saccularii*) were often mistaken for magicians. Modern wizards simply amuse by showing us eggs or other objects which dance and follow the motion of the hand, an invisible silk thread or hair being the medium used; but of old the king of Babylon stood at the parting of the ways and used divination with arrows which leaped up and pointed the way he was to go, as they did in after times for the Arabs (Koran, v. 99); and for the Tartar Genghis Khan the same trick was used. Reginald Scot, in his "Discoverie of Witchcraft," explains how the head of a man may come through a table, upon a plate, and being duly whitened like a corpse may astonish the world by talking; an account which throws much light on the talking heads of Arabic, Greek, Hebrew, Norse, and mediæval fable. Down to the present century ventriloquism was regarded as a physiological mystery, and of old it seemed awful when the river Nessus saluted Pythagoras, when a tree spoke before Apollonius, and when a new-born infant, or animals, or statues talked. Every modern juggler allows himself to be shot at; the first European, Laing, who went among the Sulimas, near the source of the Joliba, saw a native chief perform the same trick on a grand scale and in a curious manner, the muskets always flashing in the pan when aimed at him, but shooting well when turned, however unexpectedly, to other objects. In all ages, and especially in the East, wizards have stuck arrows and swords through their own limbs, and driven nails through their hands; but when in 1859 a so-called "India-rubber man" attempted to astonish by similar feats, his secret was quickly exposed in the newspapers. Ancient jugglers performed extraordinary feats by mechanism, which is defined by Cassiodorus (*Varia* lib. i., c. 45) as "the science of constructing machines whose effects shall seem to reverse the order of nature." In those days the floors of temples heaved like waves, doors widened of themselves to admit portly visitors, tripods advanced to salute them, statues wept, nodded, and bled; all which marvels are imitated by modern jugglers. In the 17th century, by acoustics, invisible sprites called *trarames* rapped audibly on any object indicated; in the

19th, Haller, Blitz, and others summon them again. The abbé Mical and Maelzel in modern times astonished the world with *androides*, little speaking figures; the Egyptian priests made gods and statues which prophesied and explained dreams. Stone statues of the gods which rang like a bell when struck (Pausanias, "Attica," c. 42) are still found in China as the jade-stone images of Buddha. In optics, the Chinese jugglers show a clear metallic mirror which, when it reflects sunshine on a wall, exhibits in the circle of light an inscription; the secret of which was accidentally discovered several years ago in Paris by seeing a letter stamped in the back of a daguerreotype plate reflected in like manner, though not visible on the reflecting surface. The magic lantern fully explains the images of the gods shown in the water by ancient wizards, and the devils seen by Benvenuto Cellini in the Colosseum. In hydrostatics, the bottle yielding all kinds of wine, which has often appeared in romance, as on the table of Faust, has been realized by many wizards of the present day. Many tricks performed by modern eastern jugglers have however never been fairly explained. Their placing a boy in a basket on the ground and stabbing through it, causing blood to flow and the boy to vanish and reappear, is one of these; so too is their curious trick of making trees grow visibly in a few minutes. Something like this was shown by a Neapolitan, who professed to make lettuce seed sprout by electricity, and who thereby long puzzled the scientific world. In modern Egypt (Lane, "Manners and Customs of the Modern Egyptians," vol. ii.) a naked juggler is tied up in an empty bag, and comes out bringing with him plates of food and lighted candles. The Indian and Japanese jugglers are also exceedingly skilful.—Common jugglers are said to have originated in Egypt, and thence made their appearance in Greece; in Rome they were termed *præstigiatores*, *pilarii* (ball players), *ventilatores* (tossers), and *saccularii*, "those who tricked with bags and into pockets." The real Faust of the middle ages was a common juggler, and much below the dignity of black-art scholars like Agrippa and Paracelsus. Of his class was the Bohemian Zito. Among the most remarkable jugglers of modern times have been Pinetti, Eckartshausen, Philadelphia, and the famed Katterfelto. More recently we have had Bartolommeo, Bosco of Turin, Döbler, Prof. Anderson, Heller, Houdin, and Hermann. Most eminent of these was the Frenchman Robert Houdin, who applied to his art both genius and science. His memoirs were published in Paris in 1859. For other works on the subject, see Reginald Scot, "Discoverie of Witchcraft" (1584); the works of Wiegleb, Halle, Funk, and Eckartshausen; Sir David Brewster, "Letters on Natural Magic" (London, 1831); and Eusèbe Salverte, *Des sciences occultes* (2 vols., Paris, 1829).

JUGURTHA, a Numidian king, born before the middle of the 2d century B. C., died in Rome

in 104. He was the illegitimate son of Mastanabal, youngest son of Masinissa, king of Numidia. Micipsa, his paternal uncle, on succeeding to the throne, adopted him, and had him brought up with his own sons, Hiempsal and Adherbal. Jugurtha's superior abilities and skill in all martial exercises soon excited the jealousy of Micipsa, who, to remove him out of the way, sent him in 134 with an auxiliary force to aid Scipio in the Numantine war. Jugurtha's courage and capacity won him the friendship of the Roman commander and officers. On the conclusion of the war he returned to Numidia, and was received with ceremonious respect by Micipsa, who, to purchase his forbearance, made him at his death (118) heir to the kingdom in common with his two sons. The three princes quarrelled on their first meeting after his death, and a little later Hiempsal was assassinated by Jugurtha. Adherbal and his party took up arms, but were defeated, when he fled for refuge to Rome, and submitted his case to the senate, which, despite the intrigues and bribes of Jugurtha, sent commissioners to Africa to divide Numidia between the rivals. The commissioners took gifts from Jugurtha, and gave him the larger and better half of the kingdom. But he was not satisfied, and after trying in vain to provoke Adherbal to declare war, he invaded his territory, and compelled him to take refuge in Cirta, where on his surrender in 112 he massacred him and all his followers. The conduct of Jugurtha now excited loud indignation at Rome, and an army was despatched to Africa to depose him. But the Roman commander and legate suffered Jugurtha to purchase peace on terms which involved no greater sacrifice on his part than 30 elephants and an inconsiderable sum of money. This shameful transaction so weakened the confidence of the Roman people in the patricians, that the prætor Cassius was sent to Numidia to guarantee to Jugurtha a safe-conduct if he would go to Rome and give evidence against the generals. The king consented, proceeded to Rome, and appeared in the *comitia*; but a tribune in the interest of the generals forbade him to testify, and the attempt to convict the corrupt officers proved a failure. Jugurtha remained at Rome for some time, intriguing and adding to his influence among the aristocracy. Having however procured the assassination of Massiva, a Numidian prince, who since the death of Adherbal had been a competitor for that kingdom, he was ordered to quit Italy. It was while leaving Rome on this occasion that he uttered the memorable exclamation, which indicates how the Romans had fallen from their ancient integrity: "Behold a city for sale, could she but find a purchaser." The war was now renewed, and a division of the army of Spurius Albinus, under the command of his brother Aulus, was surprised by Jugurtha in its camp, the greater part cut to pieces, and the survivors compelled to pass under the yoke. This dis-

grace stirred up the Roman spirit, a new army was raised, and Q. Cæcilius Metellus was sent to succeed Albinus. Metellus was at once an able general and an honest man. After the first campaign Jugurtha was willing to purchase peace on any conditions short of surrendering himself a prisoner of war. But Metellus was ambitious not only of terminating the war, but of adorning his triumph with the vanquished, and the contest was renewed. Jugurtha avoided a general engagement, and Metellus discontinued offensive operations on hearing that Marius was to supersede him in the command. Marius arrived in Africa in 107, speedily reduced almost all the king's strongholds, and gradually subjected his territory to the dominion of Rome. Jugurtha, seeing his kingdom slipping from his grasp, had formed an alliance with Bocchus, king of Mauritania, and the united forces attacked the army of Marius on its march, but after a desperate contest were totally defeated. The Mauritanian king now deserted his ally, and enticed him into an ambush, where he was made prisoner, and delivered in chains to Sulla, the questor of Marius. He was taken to Rome, and, after adorning the triumph of his conqueror (Jan. 1, 104), was cast into prison, where he died of starvation in six days. The details of the life of Jugurtha are chiefly known from the interesting history of the "Jugurthine War" by Sallust.

JULLERAT, Clotilde Gérard, a French painter, born in Lyons about 1810. She studied under Delaroche, and exhibited her first works in 1833. In 1840 she married the poet and dramatist Paul Juillerat (born in Paris about 1815). Her productions include many fine portraits.

JUJUBE, a name given to species of *zizyphus*, especially *Z. vulgaris*, a small tree, native of

and probably also jujube through the French. In its native country it is a tree 20 or 30 ft. high, but it will bear fruit when only a shrub; it has prickly branches, oval, thick, shining leaves, inconspicuous greenish flowers, and a fruit of the shape of an olive, but not quite so large, which in ripening turns yellow and then red; the fruit contains a single bony nut surrounded by a fleshy pulp, which is somewhat acid when fresh, but when dried is sweet and agreeable to the taste. In the East the fruit is eaten both fresh and dried; it is considered as mildly medicinal, and a sirup and a paste of jujubes are used in Europe for coughs and catarrhs; the true jujube paste is made of the pulps of jujubes, gum arabic, and sugar, but that which is sold under the name is merely gelatine and sugar, sometimes with a little tartaric acid and flavoring. The tree has fruited in Georgia, and would probably be hardy further north; aside from its fruit, it is worth cultivating, where the climate will allow, on account of its graceful habit and fine foliage. The Chinese cultivate several varieties of *Z. jujuba*, the fruit of which, known to foreigners as Chinese dates, is much esteemed by them. *Z. lotos* is one of several plants supposed to be the lotus of the lotophagi. An African species, *Z. Baclei*, has a fruit which tastes like gingerbread.

JUJUY. I. A province of the Argentine Republic, bounded N. by Bolivia, E. by the Gran Chaco, S. by the province of Salta, and W. by Bolivia; area, about 30,000 sq. m.; pop., in 1869, including foreigners, 40,379. The whole N. W. portion is an elevated plain called the Puna, which is a continuation of the great Bolivian table land, and which terminates somewhat abruptly to the south and east in a mountain chain extending due N. from Salta, and presenting a few snow-covered peaks of about 14,000 ft. E. of these mountains the territory gently inclines toward the plains of the Chaco, with a few inconsiderable mountains. The valleys bounded by the several ridges, especially those of the east, are exceedingly fertile, owing to abundant irrigation, an advantage not enjoyed in the Puna and the W. country generally. The principal river is the San Francisco or Grande, which flows in a semicircle forming the southern boundary of the province, receives numerous tributaries, and joins the Bermejo 25 miles S. of Oran. In the Puna are two lakes, Toro in the south and Casabindo in the north, both of considerable extent, and the second furnishing inexhaustible quantities of salt, much of which is exported. Asphalt, petroleum, gold, silver, copper, iron, and quicksilver abound in most districts; but for want of suitable means of transportation no mines have as yet been worked. Although mostly comprised within the tropics, this province has a mild and salubrious climate. The arboreal vegetation is luxuriant, and includes the maté, dragon's blood, and Peruvian balsam trees, and many kinds of timber and cabinet woods.

Jujube (*Zizyphus vulgaris*).

Asia, belonging to the *rharnaceæ* or buckthorn family. The Arabic name of the tree is *zizuf*, from which is derived the generic name,

Rice, maize, the sugar cane, and tobacco are largely cultivated. The principal industries are agriculture, the rearing of cattle, mules, sheep, goats, llamas, and vicuñas, spinning, and weaving. Coarse woollen stuffs are extensively manufactured. There are schools in every town, but at the time of the census, of 6,021 children aged from 6 to 14 years, only 1,383 attended; and of the whole population, only 4,309 read and 3,376 wrote. Formerly Jujuy was a part of the adjoining province of Salta.

II. San Salvador de, a city, capital of the province, situated on the right bank of the Rio San Francisco, in a fertile valley 4,000 ft. above the sea, 870 m. N. W. of Buenos Ayres; pop. in 1869, 7,629. It has no edifices worthy of mention. The industries of the place are chiefly conducted by Indians and mestizos; there is a weekly fair for cattle and agricultural products. In the vicinity are saline hot springs, the waters of which are efficacious against chronic rheumatism.

JULIAN (FLAVIUS CLAUDIUS JULIANUS), surnamed the Apostate, a Roman emperor, born in Constantinople, Nov. 17, A. D. 331, died in Persia, June 26, 363. He was the son of Julius Constantius, the grandson of Constantius Chlorus, and the nephew of Constantine the Great. When Constantius II. ordered the male descendants of Chlorus by his second wife Theodora to be put to death, he made an exception in favor of Julian and his half brother Gallus, whose tender years did not excite his apprehension; but he banished them to certain cities of Ionia and Bithynia, and ultimately confined them in the strong castle of Macellum near the Cappadocian Cæsarea. During the period of their restraint Julian was instructed in the doctrines of the Christian faith, and was taught to fast, to pray, and to fill the office of reader in the church of Nicomedia. In 351 Gallus was taken from prison, invested with the dignity of Cæsar, and made prefect of the East. Through his mediation Julian was liberated, and permitted to fix his residence in any of the Asiatic cities. He now first became acquainted with those Platonic philosophers who ere long induced him to abandon Christianity for paganism; but he did not make a public avowal of his apostasy till he could do so with safety. After the murder of Gallus he again became an object of distrust to Constantius, who had him transported to Italy and imprisoned at Milan, whence having been liberated by the intercession of the empress Eusebia, he retired to Athens. Constantius soon recalled him, and on Nov. 6, 355, proclaimed him Cæsar, and gave him his sister Helena in marriage. He was at the same time invested with the government of all the transalpine provinces, and with the command of the forces which were to drive the German invaders of Gaul beyond the Rhine. Having effected this latter undertaking, and checked the rapacity of the local governors, he acquired such popularity that when the jealous Con-

stantius in 360 commanded him to send his best soldiers to the Persian war, the troops proclaimed him emperor. Julian crossed over into Germany, and made an admirable march along the forest-covered valley of the Danube, intending to advance against Constantinople; but the sudden death of Constantius gave him undisputed possession of the empire. On Dec. 11, 361, he made his triumphal entry into the capital, amid the acclamations of the soldiers, the citizens, and the senate. He now openly avowed his abandonment of Christianity, which had long before been known to his friends, and his Christian subjects apprehended a cruel and relentless persecution. Shortly after his accession, however, he published an edict which granted perfect toleration to all sects and religions. But the spirit of this edict was not respected even by Julian himself. He excluded Christians from civil and military offices, forbade them to teach grammar and rhetoric in the schools, compelled them to contribute to the building and repair of pagan temples, permitting at the same time the Jews to rebuild their temple at Jerusalem, and wrote a voluminous treatise against the assumed errors of Christianity. Amid the licentious priests and lascivious dancers who thronged the pagan temples, he was frequently seen bearing the wood, kindling the fire, slaughtering the victim, and divining from the entrails of the expiring animal. He was nevertheless worthy in other respects to wield the sceptre. Immediately after his accession he applied himself to reform the luxury and extravagance of the imperial court. He ordered the laws to be equitably administered, and instituted a tribunal for the trial of such officials as had been guilty of peculation or oppression in the former reign. The incursions of the Persians upon Roman territory led him to declare war against that people, and in 363, having crossed the Euphrates at Hierapolis, he advanced with the main body of his army against Ctesiphon. Under the walls of this place he gained a brilliant victory over a division of the enemy; but having been induced by the representations of a Persian noble, who affected to be a fugitive, to postpone the siege, and to march into the desert in search of Sapor, the Persian monarch, he was surprised by the enemy, and received a wound from an arrow which proved mortal in the evening of the same day. Jovian was proclaimed his successor on the battle field. In his manner of life Julian emulated the temperance and simplicity of the primitive Romans; he was indefatigable in the discharge of his public duties, and in his intervals of leisure was devoted to study and philosophy. He possessed rhetorical and literary talents of a high order, and wrote much and well on various subjects. The ablest if not the most important of his extant works are: "The Cæsars," or "The Banquet," a satirical composition in which the different Roman emperors are made to appear at a celestial banquet

where old Silenus censures their vices and crimes; and the "Misopogon," or the "Beard-Hater," in which the emperor exposes the licentiousness and effeminacy of the citizens of Antioch, who had ridiculed the beard of their sovereign, such appendages not being fashionable in that city. His treatise against the Christians has been lost, except those extracts preserved in the refutation of it by Cyril of Alexandria. The best collective edition of the works of Julian is that of Spanheim (Leipsic, 1696). The most celebrated modern lives of Julian are by Gibbon in his "Decline and Fall of the Roman Empire;" by the abbé de la Bletterie, *Histoire de l'empereur Julien l'Apostat* (Paris, 1735); and by Neander, *Ueber den Kaiser Julianus und sein Zeitalter* (Leipsic, 1812).

JÜLICH (Fr. *Juliers*), a town of Prussia, in the province of the Rhine, capital of a circle celebrated for fertility, in the district and 17 m. N. E. of the city of Aix-la-Chapelle; pop. in 1871, 5,244. It is in a fertile plain, surrounded by low swampy grounds which make it unhealthy. Among its manufactures are common and white leather, soap, and vinegar. It has also some trade in cattle and in country produce. Coal is mined in its neighborhood.—The town was the Juliaeum mentioned in the "Itinerary" of Antoninus. One of the imperial counts of Jülich, Gerhard I., assisted Henry the Fowler in his warfare against the Hungarians, and the county of Jülich was raised to the rank of a duchy in favor of Gerhard's descendants by the emperor Charles IV. (1357). For a long time afterward Jülich was one of the independent duchies on the Rhine, until the beginning of the 16th century, when the male line of hereditary dukes became extinct, and Jülich was united through the female line with Cleves, having previously been united with Berg. After the expiration of the house of Cleves in 1609, the contest about "the Jülich succession" formed one of the preludes to the thirty years' war. The dispute was not settled before 1666, when Jülich and Berg were given to the counts palatine of Neuburg. Jülich was annexed by the French republic, and by the congress of Vienna allotted to Prussia, with the exception of a few localities annexed to the Dutch province of Limburg. The razing of the fortress of Jülich was begun in 1860.

JULIEN, Stanislas Aignan, a French orientalist, born in Orleans, Sept. 20, 1799, died in Paris, Feb. 14, 1873. He was the son of a noted mechanician. After completing his classical studies in his native town, he went to Paris, where he studied several living European languages and perfected his knowledge of ancient Greek. Gail, professor of Greek in the collège de France, appointed him his substitute in 1821; and to vindicate his claims to this distinction, he published in 1823 a critical edition of the poem of Coluthus, 'Ελένης Ἀρπαγῆ, with translations in Latin, French, Italian, Spanish, English, and German. In

1824, under the title of *La lyre patriotique de la Grèce*, he produced a French translation of the lyrical poems of the modern Greek poet Calvos of Zante. A young Scotchman inspired him with a taste for the Chinese language, and introduced him to Sir William Drummond, who supplied him with the means of studying it. He also attended the lectures of Abel Rémusat, and mastered the Chinese with such uncommon rapidity that within a year he was able to translate into Latin the writings of Mencius. In 1832 he succeeded Abel Rémusat as professor of the Chinese language and literature, and afterward did much toward making the literature of China known in Europe, publishing translations of many Chinese tales, poems, dramas, and other books. His most important publication, under the general title *Voyages des pèlerins Bouddhistes* (3 vols., Paris, 1853-8), throws much light on the early history, geography, and religion of India. In 1869 was published his *Syntaxe nouvelle de la langue chinoise*, and at the time of his death he was engaged in the preparation of a complete Chinese dictionary.

JULIERS. See JÜLICH.

JULIUS, the name of three popes. **I. Saint**, born in Rome, died there, April 12, 352. He was chosen pope, Feb. 6, 337. He sustained Athanasius in his contest with the Arians, and summoned a council in 342, in which the course of Athanasius was approved, and the pope addressed a letter in his defence to the church of Alexandria. At his instance a general council was held at Sardica in 347, for the purpose of averting the threatened schism between the churches, at which it is asserted that the right of arbitration in cases of deposition of bishops was reserved to the see of Rome. The feast of St. Julius is celebrated on April 12. Two letters of his are given in the *Epistolæ Romanorum Pontificum*. **II. Giuliano della Rovere**, born at Albisola Marina in 1441, died Feb. 21, 1513. He was bishop successively of Carpentras, Albano, Ostia, Bologna, Avignon, and Mende, and was made cardinal by his uncle Sixtus IV., who also gave him command of the papal troops sent against the revolted Umbrians. His success in this war so increased his popularity, that Alexander VI. on assuming the tiara banished him from Rome. Julius returned to the camp, and contributed an important part in the conquest of Naples by Charles VIII., the rising of the Genoese, and the expulsion of Luigi Sforza. On the death of Alexander, Aug. 18, 1503, he caused the election of the aged Pius III., who survived his elevation only 26 days, and Julius himself was then chosen on the first ballot. His first care on coming to the throne was to drive out Cæsar Borgia from the Papal States, his next to strengthen and extend the power of the holy see. The refractory nobility at home were soon reduced to obedience, but the Venetians, who held Ravenna, Rimini, and other territories of the church, were a more formidable

enemy. After fruitless negotiations, Julius joined in 1509 the famous league of Cambrai, formed by the emperor Maximilian, Louis XII. of France, and Ferdinand of Aragon, for the dismemberment of the Venetian republic. The troops of the league were everywhere successful; the doge sued for peace, and the pope, who had now got what he wanted, grew jealous of Louis, and willingly united with the Venetians to expel the French from Italy. Ferdinand was also led to view the success of Louis with uneasiness, and became a party to the "holy league," which was signed in October, 1511, and of which Henry VIII. of England afterward became a member. Julius took the field in person, and, after several campaigns of varying success, drove out the "barbarians," as he termed his former allies. He could not so easily rid himself of the Swiss, German, and Spanish troops by whom he had effected this result, and in the midst of the disorder raised by his warlike and ambitious policy, he died without achieving for the holy see that preëminence which had been the whole aim of his pontificate. Julius was in heart and action a thorough soldier. He "made his tiara a helmet and his crosier a sword," and his disposition is well expressed in an old epigram:

Cum Petri nihil efficiant ad prelia claves,
Auxilio Pauli forsitan ensis erit.

He was nevertheless regarded by the Italians as a friend to the liberation of their country, and the justice and wisdom of his internal administration gained him their affection. He laid the corner stone of St. Peter's church, and was a patron of Michel Angelo, Bramante, and Raphael. It was Julius II. who granted Henry VIII. a dispensation to marry Catharine of Aragon. He was succeeded by Leo X. **III. Gian Maria del Monte**, born in Arezzo, Sept. 10, 1487, died March 23, 1555. He belonged to a noble family, held several high offices under the papal government, was made cardinal in 1536, and succeeded Paul III. in 1550. He reopened the sittings of the council of Trent, which had been discontinued under his predecessor, and confirmed the institution of the Jesuits. He took part with Charles V. in his quarrel with Ottavio Farnese and the French, but was compelled to sign a truce with his enemies in April, 1552, soon after which he declared the suspension of the council of Trent, which had already been broken up by the Protestants, and retired to his luxurious villa near Rome. He reconciled England under Queen Mary with the holy see. He was succeeded by Marcellus II.

JULIUS, Nikolaus Heinrich, a German physician, born in Altona, Oct. 3, 1783, died in Hamburg, Aug. 20, 1862. With a view of examining the condition and management of prisons, he explored many parts of Europe and the United States, delivered lectures, and published a variety of works on this and kindred subjects, as *Die Amerikanischen Verbesserungssysteme* (Leipsic, 1837), *Nordamerikas sittliche Zustände*

(1839), and *Beiträge zur britischen Irrenheilkunde* (1844). He also edited the *Jahrbuch der Straf- und Besserungsanstalten* (Berlin, 1829-'48), and in concert with Gerson the *Magazin der ausländischen Literatur der gesammten Heilkunde* (Hamburg, 1821-'35). In 1849 he returned to Hamburg, where he had previously practised his profession. His German translation of Ticknor's "History of Spanish Literature" appeared in 1852 (2 vols., Leipsic), and in 1866 a supplementary volume, edited by A. Wolf, was published.

JULIUS AFRICANUS. See AFRICANUS.

JULLIEN, Louis Georges, a French composer, born at Sisteron, Basses-Alpes, April 23, 1812, died in Paris, April 16, 1860. At six years of age he was a skilful performer on the violin, and about 1830 gained admittance as a pupil into the *conservatoire* at Paris, where he was instructed by Cherubini. In 1839 he went to England, and for a number of years directed promenade concerts in London with great success. In 1853 he produced at Covent Garden theatre an opera entitled *Pietro il Grande*; and in the same year, accompanied by a large orchestra, he visited the United States, in the chief cities of which he gave concerts. His subsequent career was less prosperous, and he died in a charitable institution.

JULY (Lat. *Julius*), the seventh month of the year, consisting of 31 days. By the Romans it was originally called Quintilis (*quintus*, fifth), it being the fifth month in the original Latin year, which before Numa began with March. The name was changed to July, by proposal of Mark Antony, in honor of Julius Cæsar, who was born on the 12th of this month. In the Athenian calendar, the latter part of Scirophorion and the first part of Hecatombæon correspond to July. The Anglo-Saxons called it *mæd monath* (mead month), because the meads were then in bloom, and *litha æftera* (latter mild month), June being known as the "earlier mild month." Charlemagne gave it the name of *Heumonath* (hay month). The French revolutionary calendar merged it in the last part of Messidor and the first of Thermidor.

JUMNA, a river of Hindostan, and the principal tributary of the Ganges. It rises in Gurwhal, near the S. base of the Himalaya, in lat. 31° N., lon. 78° 32' E. at the foot of a group of hills called the Jumnotri peaks, near which it receives the overflow of several hot springs. It is here a violent torrent, having for 16 m. an average descent of 314 ft. per mile. After a S. W. course of about 60 m., during which it is joined by several large mountain streams, it receives the Tonse in lat. 30° 30', lon. 77° 53'. About 97 m. from its source it enters the plain of Hindostan, flowing S., and divides into several branches. It here becomes navigable by rafts. After passing Delhi, where it is crossed by a bridge of boats, its general course is S. E. It joins the Ganges at Allahabad, 619 m. below Delhi, and 860 m. from its source. In the lower part of its course

the Jumna is sometimes 2 or 3 m. wide. Its banks are rocky and precipitous, and its current is rapid. Navigation is attended with much difficulty, but many of the most serious obstructions have been removed, and vessels can now ascend to Calpee. Its principal affluents are the Chumbul, Sinde, Betwa, Cane, and Hindaun. Delhi, Agra, Muttra, Etawah, Calpee, and Allahabad are the most important places on its banks.—There are two extensive systems of irrigation connected with the Jumna. The western Jumna canal comprises the ancient canal of Feroze Shah and the Delhi canal, on the right bank of the river, which were restored between 1823 and 1843 by the British authorities, who built many additional branches. This system waters the country along the western bank of the Jumna, from a point called Hathni Kund, just north of the 30th parallel, down to Delhi. The aggregate length of its main lines is 445 m., and in 1866-'7 the area irrigated comprised 447,171 acres, in 797 villages. The net receipts from water rates in 1871-'2 were £74,518, being 26 per cent. on the outlay for construction. The eastern Jumna canal irrigates a district about 120 m. long and 15 m. broad on the left of the river, and extends from a point in the main stream near the head of the western system, southward to Delhi, flowing for 40 m. between embankments, at a height of from 6 to 12 ft. above the general level of the land. It was projected by Shah Jehan, between 1628 and 1659, but had long been disused when it was restored by English engineers in 1830. The main channel is itself 130 m. long, and feeds 619 m. of distributory streams. The area of irrigation in 1871-'2 was 192,749 acres, and the net revenue £32,881, being 16·6 per cent. on the outlay.

JUNE, the sixth month of the year, consisting of 30 days. The name is variously derived from *juniores* (the young men), to whom Romulus is said to have assigned it, as he assigned May to the elders; from Juno, whence it was sometimes called Junonialis; from Junius Brutus, the first consul; and from *jungo* (to join), with reference to the union of the Romans and Sabines, or because it was considered the most suitable time for marriage. It was the fourth month of the old Latin calendar, and originally had but 26 days. Romulus is said to have given it 30 days. Numa made it the fifth month and deprived it of one day, which was restored by Julius Cæsar. In the Athenian calendar, the latter half of Thargelion and the first half of Scirophorion correspond to June. The Anglo-Saxons called it *litha ærra* (earlier mild month), also *sear monath* (dry month) and *midsummer monath* (midsummer month). It was named by Charlemagne *Brachmonat* (fallow month). In the French revolutionary calendar it corresponds to the last part of Prairial and the first of Messidor.

JUNEAU, a S. central county of Wisconsin, bounded E. by the Wisconsin river, and drained

by Lemonweir, Yellow, and Baraboo rivers; area, about 800 sq. m.; pop. in 1870, 12,372. The surface is undulating and the soil fertile. Timber is abundant. The La Crosse division of the Chicago, Milwaukee, and St. Paul railroad crosses it. The chief productions in 1870 were 192,304 bushels of wheat, 115,393 of Indian corn, 197,005 of oats, 97,755 of potatoes, 26,904 lbs. of wool, 527,027 of hops, 221,003 of butter, and 15,499 tons of hay. There were 2,040 horses, 2,846 milch cows, 3,982 other cattle, 8,406 sheep, and 4,959 swine; 3 manufactories of carriages, 2 of sash, doors, and blinds, 6 of tin, copper, and sheet-iron ware, 4 flour mills, and 11 saw mills. Capital, New Lisbon.

JUNE BERRY, one of the common names for *amelanchier Canadensis*, a rosaceous shrub or small tree, which botanically differs from *pyrus*, the genus of the apple and pear, only in the number of cells in the fruit. This species is found as far north as Hudson bay, and extends throughout the United States; running through such a wide geographical range, it presents a great variety of forms; more than a dozen species were described by the early botanists, but Torrey and Gray, in their "Flora of North America," very properly reduced all these to a single polymorphous species, of which there are half a dozen forms sufficiently marked to be regarded as varieties. These differ in stature, in the shape and pubescence of the leaves, size of petals, and size and abundance of the fruit. A mountain variety, *pumila*, is only 3 or 4 ft. high, while the variety *botryapium* reaches 30 ft. in height. The leaves in all are simple, heart-shaped, or oval, with white flowers in pendulous racemes, which appear just as the leaves are opening. In some parts of the country the different varieties are known as shad flower or shad bush, as the flowers appear at the time the shad ascends the streams, and also as service berry. The fruit is globular or pear-shaped, the size of a large pea, purplish, sweet and edible. From the character of the fruit the bush is known in some localities as the sugar pear, but more generally, from the time of its ripening, as June berry. Some plants produce fruit abundantly, which is mostly eaten by birds. The dwarf variety has been brought into cultivation in some of the western states as a market fruit, and is there known as "mountain whortleberry;" it has been tried by amateurs at the east, who find that the birds reap the harvest. All forms of the species are worthy of cultivation as ornamental trees or shrubs, on account of their early and abundant flowering; a well formed specimen, completely sheathed with white, is not exceeded in beauty by any exotic. There is a European species, known in Savoy as *amelancier*, from which the name of the genus is derived.

JUNG, or *Jungius*, *Joachim*, a German philosopher, born in Lübeck, Oct. 22, 1587, died in Hamburg, Sept. 23, 1657. He was professor of mathematics at Giessen from 1609 to 1614.

He subsequently studied medicine and took his degree at Padua in 1618, but again filled a chair of mathematics at Rostock in 1624. He was prevented by the thirty years' war from accepting a professorship of medicine at Helmstedt, and lived in retirement at Brunswick and Rostock till 1629, when he became rector of the Hamburg Johanneum. Leibnitz ranks him, on account of his perspicacity in opposing the scholastic school of philosophy, next to Copernicus and Galileo, and not far below Descartes. His works include *Geometria Empirica* (Hamburg, 1688). Johann Vaquet edited his MS. *Joachim Jungius Isagoge Phytoscopica, &c.* (Hamburg, 1678), in which he anticipated Linnæus in suggesting technical terms relating to botany and in other respects.—See Guhrauer, *Joachim Jung und sein Zeitalter* (Stuttgart, 1851), and Avé-Lallemont, *Des Dr. J. Jungius aus Lübeck Briefwechsel mit seinen Schülern und Freunden* (Lübeck, 1863).

JUNG-BUNZLAU, or **Bunzlau** (Boh. *Mlada Boleslav*), a town of Bohemia, capital of a circle, on the Iser, 30 m. N. E. of Prague; pop. in 1869, 8,695. It has 16 churches and a monastery of the Piarists, with a gymnasium. The ancient castle, which is said to have been built by Boleslas II. in the 10th century, is now used as barracks. The town stands near the site of an older Bunzlau, founded by Boleslas I., and destroyed in the Hussite and thirty years' wars.

JUNGERMANNIA, a genus of cryptogamous plants belonging to the family *hepaticæ* or liverworts, which is closely related to the mosses; there are about 20 species in the United States, all small delicate plants, the general structure of which is described under **LIVERWORT**.

JUNGFRAU (the "Maiden" or "Virgin"), a picturesque mountain, or rather group of mountains, in Switzerland, forming one of the ridges of the Bernese Alps, and separating the cantons of Valais and Bern. It is 13,671 (according to others 13,718) ft. high, and derives its name either from the pure mantle of snow which covers its crest, or from the fact that until the present century it was deemed inaccessible. In 1811, however, the brothers Meyer of Aarau claimed to have ascended it. In 1828 the highest peak was reached by some peasants from Grindelwald, and in 1841 by Agassiz, accompanied by Prof. Forbes of Edinburgh and others. Although the thermometer fell to $6\frac{1}{2}^{\circ}$ below zero, lichens were found on the highest exposed points. The highest peak rises in a sharp point, its summit being not more than 2 ft. broad. The Silberhörner, which are inferior peaks on the W. side, are remarkable for their graceful forms.

JUNGHUHN, Franz Wilhelm, a German naturalist, born at Mansfeld, Oct. 26, 1812, died at Lembang, Java, April 24, 1864. He studied medicine, botany, and geology in Halle and Berlin, and became assistant surgeon in the Prussian army. Having fought a duel, he was sentenced to 20 years' imprisonment, but es-

caped to France. He then received a pardon, and went in 1835 to the Dutch East Indies, was employed in Batavia for a year as military physician, and afterward explored the islands, especially Java and Sumatra, under the auspices of the government. In 1849-'55 he was in Holland, preparing his observations for publication, and then returned to Java. His *Topographische und Naturwissenschaftliche Reisen* were edited by Nees von Esenbeck (Magdeburg, 1845). German and Dutch editions of his *Battaländer in Sumatra* appeared in Berlin and Leyden in 1847; and a German version by Hasskarl of his *Zurückreise von Java nach Europa* in 1851. His most important work, considered by many the best on the subject, treats of the botany, geography, and geology of Java (*Java, seine Gestalt, Pflanzen-decke und innere Bauart*, German ed. by Hasskarl, 3 vols., Leipsic, 1852-'4). In 1853 appeared his *Landschaftsansichten von Java nach der Natur aufgenommen*. In 1851 was begun, under the supervision of several distinguished naturalists, a large work entitled *Plantæ Jung-huhnianæ*, giving a description of the plants and fossils discovered by him in Java and Sumatra.

JUNGMANN, Jozef Jakob, a Slavic philologist, born at Hrdlitz, Bohemia, July 16, 1773, died in Prague, Nov. 14, 1847. He was the son of a poor farmer, but received a superior education, and completed his studies at the university of Prague. He was teacher at the gymnasium of Leitmeritz from 1799 to 1815, and afterward connected with the gymnasium and university of Prague till 1845, the last five years as rector of the latter institution. In 1820 he published a Bohemian chrestomathy (*Slowesnost*, 2d ed., 1846); in 1825 a history of the Bohemian language and literature (2d ed., 1848); and in 1835-'9 a complete Bohemian-German dictionary (*Slownik Cesko-Nemecky*).

JUNG-STILLING (JOHANN HEINRICH JUNG), a German mystic, born at Im-Grund, Nassau, Sept. 12, 1740, died in Carlsruhe, April 2, 1817. After being successively a charcoal burner, tailor, and teacher, he began to study medicine at Strasburg, where he became acquainted with Goethe, who in his autobiography has given a fine analysis of his character. He operated for cataract with eminent success at Elberfeld, was professor of rural economy at Lautern (1778), Marburg (1787), and Heidelberg (1804), and at his death was a privy councillor of Baden. The best known of his writings is an autobiography, *Stilling's Jugend, Jünglingsjahre, Wanderschaft, Lehrjahre, häusliches Leben und Alter* (published in three parts, 1777, 1789, and 1817), a curious work, containing many profound thoughts, and marked by an eccentric religious and moral enthusiasm. He wrote several allegorical and mystical tales, as the *Geschichte des Herrn von Morgen-thau* (1779), *Geschichte Florentins von Fahlen-dorn* (1781), *Leben der Theodore von Linden* (1783), *Das Heimweh* (1794), and *Theobald, oder der Schwärmer* (1797). In his autobiog-

raphy he takes a sentimental delight in picturing his three successive wives, and love and marriage are treated with special enthusiasm in his romances. In his later works he appears as a ghost-seer and theosophist. The most important of them are: *Theorie der Geisterkunde* (1808), and *Apologie der Theorie der Geisterkunde* (1809), full of marvellous but not carefully authenticated narratives; *Scenen aus dem Geisterreich* (1817), consisting of conversations in heaven, and inculcating a sort of worship of genius; and the poem *Chrysaon, oder das goldene Zeitalter* (1819), descriptive of the millennium. His various works were collected in 14 vols. (Stuttgart, 1838).

JUNIATA, a river of Pennsylvania, formed in the S. central part of the state, by the junction of the Little Juniata and Frankstown branch, which rise at the foot of the Alleghany mountains, in Blair and Bedford counties. Its general course is E., with many deviations; and after passing through a mountainous country, it joins the Susquehanna 14 m. above Harrisburg. Nearly its whole course is celebrated for its picturesque scenery. Including the Frankstown branch, it is about 150 m. long. It is not navigable. The Pennsylvania canal and railroad follow its banks throughout its whole extent, the latter crossing the river many times.

JUNIATA, a central county of Pennsylvania, watered by the Juniata river; area, 360 sq. m.; pop. in 1870, 17,390. It has a mountainous surface, with many fertile valleys. The Pennsylvania railroad and canal pass through it. The chief productions in 1870 were 230,624 bushels of wheat, 329,231 of Indian corn, 347,054 of oats, 69,520 of potatoes, 16,938 lbs. of wool, 299,575 of butter, and 19,809 tons of hay. There were 4,215 horses, 9,160 cattle, 6,315 sheep, and 7,164 swine; 4 manufactories of agricultural implements, 13 of carriages, 8 of lime, 18 tanneries, 9 flour mills, and 2 saw mills. Capital, Mifflintown.

JUNIPER (*juniperus*, the ancient Latin name), a genus of evergreen shrubs and trees, of the cypress subfamily of the order *conifera*. The leaves in this genus are awl-shaped or scale-like, rigid, and sometimes of two shapes in the same tree; the flowers, mostly dioecious, are in small axillary aments; the sterile aments consist of shield-shaped scales, beneath each of which are three to six anther cells; the fertile have three to six fleshy, one-ovuled, coalescent scales, and in ripening become a berry-like fruit. The common juniper (*J. communis*), also a native of Europe, is abundant in the northern states, especially on dry sterile hills near the coast, where it is not rare to find plants only a foot or two high spreading close to the ground, and forming a circular mat 30 ft. in circumference. It sometimes rises to the height of 5 to 10 ft., and old specimens attain a much greater size. One at the Bartram garden, near Philadelphia, a few years ago, measured 35 ft. The leaves are articulated with the stem in whorls of three, spreading and

prickly-pointed; the upper surface is glaucous white, the under dark green. The berries are about the size of a pea, and dark purple; they contain a brownish pulp, with three seeds; their taste is sweetish, warm and bitterish, with a peculiar terebinthinate flavor; they contain a volatile oil (oil of juniper), which is separated by distillation. The berries are stimulant and diuretic, and have long been used for urinary diseases; they are used in the manufacture of gin, and give to that liquor its peculiar flavor and diuretic properties. In Europe a kind of tar is prepared from the wood, which under the name of oil of cade is used for cutaneous diseases. The common juniper varies greatly; in a bed of seedlings it is difficult to find two alike; some of its forms are useful in ornamental planting. A very prostrate form, the variety *alpina*, found along the great lakes and northward, is a useful plant for rockwork. The well known Irish (var. *Hibernica*) and Swedish (var. *Suecica*) junipers are remarkably erect varieties of this species; these, especially the latter, are much used in ornamental planting, where their columnar forms afford a marked contrast to other trees. They are liable to be bent out of shape by the accumulation

Pistillate and Staminate Flowers.

of snow among their dense erect branches; this can be prevented by winding the tree with a cord or fine wire at the approach of winter. A related species from the south of Europe, *J. hemisphærica*, is remarkably dwarf, a plant ten years old being not over a foot high; this is known as the hedgehog juniper, and is a favorite with planters for the decoration of small grounds.—The section of savin junipers differs from the true junipers, to which the foregoing belong, in having their leaves opposite and not articulate with the stem. A prominent representative of this section is the red cedar (*J. Virginiana*), which is found from Canada to the gulf of Mexico. Few trees present in their wild state a greater variety of form; in some localities every specimen takes an erect habit and forms a dark green column, tapering but slightly from the base, and as regular in outline as if artificially pruned; in other places, especially inland, the tree has a clear trunk and handsome open head, with somewhat pendulous branches; those which grow

in exposed situations, upon sterile soil near the sea, are of slow growth, and often assume picturesque and even fantastic forms; along the coast it is rarely more than 30 ft. high, but at the west it reaches 60 and even 90 ft. Upon the old branches the leaves are small, scale-like, and appressed; but those on the young plant and on the young shoots of old trees are much longer, sharp and spreading. The wood is light, close-grained, and very durable; the sap wood white, and the heart wood of a dark red, a fact recognized in the common name. The durable character of the wood adapts it for fence posts, and this together with the forms assumed by the branches makes it the most desirable material for rustic fences, summer houses, pavilions, and the like; it is much used in the manufacture of pails and tubs; it is employed by the pencil makers in place of the more rare pencil cedar, *J. Bermudiana*. Much more use is made of the red cedar as a tree for planting in the western states than at the east, as it grows more rapidly there. It was at one time highly recommended for hedges and windbreaks; but as it soon becomes ragged at the base, it has fallen into disrepute. The true savin is *J. sabina*, a native of Europe; it differs from the red cedar mainly in its larger fruit, which is nodding upon a recurved peduncle-like bractlet. A prostrate form of this, var. *procumbens*, is found from Maine to Wisconsin, along the great lakes, and northward. This has a dense, closely spreading habit, and a dark green color, which makes it much prized as an ornamental plant; it is known as the prostrate juniper, *J. prostrata* of the nurseries. The leaves of the savin have a limited use in medicine, as the active ingredient in savin cerate, a stimulant application to ulcers. The Rocky mountain juniper is *J. occidentalis*, not over 40 ft. high, and found from the Rocky mountains westward.—There are several exotic species in cultivation, most of which are of uncertain hardiness in the northern states; among the hardy ones are *J. squamata*, a shrub-like species from the Himalayas, and the Chinese juniper (*J. Chinensis*), the two sexes of which have leaves so unlike that they appear like different species; the sacred juniper of India (*J. religiosa*) is hardy in some localities.

JUNIUS, the signature of an English political writer, the author of letters which appeared in the London "Public Advertiser" newspaper between Jan. 21, 1769, and Jan. 21, 1772. As acknowledged in the first authorized collection, the series consisted of 44 letters by Junius and 15 by Philo-Junius, an auxiliary part being assumed under the second name for the purpose of supporting and defending the principal character, but with the design of being ultimately avowed. There have been preserved also 62 brief business letters which he addressed to Woodfall, the publisher of the "Public Advertiser," between April 20, 1769, and Jan. 19, 1773, and 10 letters written by him in private correspondence with John Wilkes between

Aug. 21, and Nov. 9, 1771. To the same hand are attributed also 113 letters, on various political subjects and under different signatures, as Mnemon, Atticus, Lucius, Brutus, and Domitian, published in the "Public Advertiser" between April 28, 1767, and May 12, 1772. Some of these are of doubtful authenticity, and few of them are so elaborately finished and polished as the letters of Junius, to which signature he adhered for his most important addresses after the extraordinary effect produced by the first letter under it, apparently employing others when he wrote for explanatory and collateral purposes. The utmost period in which the agency of Junius can be traced is thus less than six years, and the period in which he wrote his acknowledged letters is about three years. These letters, directed against the ministry and the leading public characters connected with it, contain some of the most effective specimens of invective to be found in literature. Their condensed and lucid diction, studied and epigrammatic sarcasm, dazzling metaphors, and fierce and haughty personal attacks, arrested the attention of the government and of the public. Not less startling was the immediate and minute knowledge which they evinced of court secrets, making it believed that the writer moved in the circle of the court, and was intimately acquainted not only with ministerial measures and intrigues, but with every domestic incident. They exhibited indications of rank and fortune as well as scholarship, the writer affirming that he was "above a common bribe" and "far above all pecuniary views." When Woodfall was prosecuted in consequence of Junius's letter to the king, the author promised to make restitution to him of any pecuniary loss. The authorship of Junius was the greatest secret of the age. Every effort that the government could devise or private indignation prompt was in vain made to discover it. The earl of Mansfield and other legal advisers of the crown had many consultations as to how this "mighty boar of the forest," as he was called by Burke, could be most adroitly ensnared in the network of the law. The host of enemies whom he aroused in every direction were eager in plotting schemes for his detection. But, aware that his power and perhaps his personal safety depended upon concealment, he continued to astonish every one by his secret intelligence and to assail the government with undiminished intrepidity and rancor, revealing his apprehensions and precautions only in his private notes to Woodfall. His security was doubtless due in large measure to the forbearance and honor of this publisher, who followed strictly the imperative and precise orders of his correspondent. In one of his letters to a public character Junius gave as a reason for his concealment: "Though you would fight, there are others who would assassinate." In a letter to Woodfall he writes: "I must be more cautious than ever. I am sure I should not survive a discovery three

days; or if I did, they would attain me by bill." In other letters he speaks with the utmost confidence. "As to me, be assured that it is not in the nature of things that they, or you, or anybody else should ever know me, unless I make myself known; all arts, or inquiries, or rewards would be equally ineffectual." And in his dedication to the English nation he declared: "I am the sole depository of my own secret, and it shall perish with me." Junius appears to have written in a disguised hand. Various prescribed signals, as "C.," "A letter," or a scrap of Latin poetry, were made to him in the notices to correspondents in the "Public Advertiser." Answers and parcels from the printer were left for him according to his orders in a great variety of places, addressed to different names. Who the person was who thus foiled the scrutiny of his own age has been the subject of more than 100 volumes or pamphlets, and of a vast number of essays in periodicals. Efforts have been made at different times to identify him with Sergeant James Adair, Col. Isaac Barré, Hugh Macaulay Boyd, Edmund Burke, Bishop John Butler, Lord Camden, Lord Chatham, Lord Chesterfield, J. L. De Lolme, John Dunning (Lord Ashburton), Samuel Dyer, Henry Flood, Dr. Philip Francis, Sir Philip Francis, Edward Gibbon, Richard Glover, Henry Grattan, William Greatrakes, George Grenville, James Grenville, William Gerard Hamilton, James Hollis, Sir William Jones, John Kent, Gen. Charles Lee, Charles Lloyd, Thomas Lord Lyttelton, Laughlin McLean, the duke of Portland, Gov. Thomas Pownall, Sir Robert Rich, John Roberts, the Rev. Philip Rosenhagen, Lord George Germaine (Viscount Sackville), the earl of Shelburne, Earl Temple, John Horne Tooke, Horace Walpole, John Wilkes, Alexander Wedderburn (Lord Loughborough), Dr. James Wilmot, and Daniel Wray. Several of these laid claim to the honor of which they were ambitious, while the real author may have declined to accept a brilliant literary fame with the stigma of an almost fiendish malignity of character. The first attempt to fix the authorship upon Sir Philip Francis was made in 1816 by John Taylor, in his "Identity of Junius with a Distinguished Living Character Established," and it has from that time been more generally ascribed to him than to any other. According to Macaulay, "the case against Francis, or, if you please, in favor of Francis, rests on coincidences sufficient to convict a murderer." Besides numerous and constant coincidences in dates and circumstances, and resemblance of character and handwriting, it should be observed that he never directly denied the charge. In answer to an inquiry, he wrote evasively: "Whether you will assist in giving currency to a silly malignant falsehood is a question for your own discretion." Lady Francis affirms that his first gift to her after marriage was an edition of Junius, which he bade her take to her room, keep from sight,

and never to speak on the subject; and he made a posthumous present to her of a sealed copy of Taylor's "Identity of Junius," found in his bureau. According to her statement, also, Sir Philip made himself known as Junius to the king, Lord North, and Lord Chatham, under an engagement of secrecy, and received in consequence his Indian appointment; and the secret was faithfully kept by each of the contracting parties, who were equally interested in not divulging it. Since the publication of the facsimiles of the feigned handwriting of Junius, facts have come to light which seem to prove conclusively the identity of Francis with him. A lady recognized the handwriting as the same as that of an anonymous note which she received in 1770 at Bath, enclosing a copy of verses written in a different hand. When the life of Francis was published (1867), two lines of these verses were found quoted in a letter from Richard Tilghman of Philadelphia, dated Sept. 29, 1773, in a manner implying that Francis would recognize them. Renewed examination proved that the lady's copy of verses was in Tilghman's handwriting. Tilghman, who was a law student in the Temple in 1769 and 1770, was a near relative and intimate friend of Francis, and was with him at Bath when the verses were delivered. This led to a careful examination of the note in which the verses were enclosed by experts, who unhesitatingly pronounced it to be written in the feigned hand of Junius. Now Tilghman could not have been Junius, for the letters were begun before he left America, and continued after his return home. It follows then that Francis was the writer of the note and consequently Junius.—Complete editions of his letters were published by George Woodfall, son of the original printer of them (3 vols., London, 1812 and 1814), to which an elaborate preliminary essay was prefixed by Dr. John Mason Good. A new edition (1850-'55), by John Wade, forming two volumes in Bohn's "Standard Library," contains the whole of Woodfall's edition. The most complete bibliography of Junius is given in Lowndes's "Bibliographer's Manual," vol. iii. (London, 1860). Merivale's "Memoir of Sir Philip Francis" (2 vols. 8vo, London, 1867) contains much new evidence concerning the authorship. See also Chabot and Twistleton's "Handwriting of Junius Professionally Investigated" (4to, London, 1871). Sir Alexander Cockburn, lord chief justice of England, in a work announced for publication in 1874, is said to prove almost conclusively the identity of Sir Philip Francis with Junius.

JUNIUS. I. FRANCISCUS (FRANÇOIS DU JON), a Protestant theologian, born in Bourges, France, in 1545, died in Leyden in 1602. He was designed for the law, but having embraced the doctrines of the reformation, he went in 1562 to Geneva, where he studied theology. He became minister of a Walloon congregation in Antwerp in 1565, and took a prominent part

in the early history of the reformation in the Netherlands, but was obliged to seek refuge in Germany. In 1573 he was invited by the elector palatine to Heidelberg, where, in conjunction with Tremellius, he made a Latin translation of the Old Testament, which is highly esteemed by critics (5 parts, Frankfort, 1575-'9; many times reprinted, last in Zürich, 1764). Subsequently he became professor at Leyden. He wrote many theological books, and an autobiography (1595). His *Opera Theologica* were published in 2 vols. fol. (Geneva, 1607). **II. Francisus**, a philologist, son of the preceding, born in Heidelberg in 1589, died in Windsor, England, Nov. 19, 1677. He studied at Heidelberg and Leyden with a view to the profession of a military engineer, and in 1603, after the death of his father, joined the army; but leaving it on the truce of 1609, he devoted himself to study and literature. In 1620 he went to England, and for 30 years filled the office of librarian to the earl of Arundel. During this period he studied the Teutonic languages, and came to the conclusion that the Gothic was the parent of them all. He published an edition of the Gothic Gospels of Ulfilas, with a commentary; but his greatest work was his *Glossarium Gothicum*, in five languages, the Saxon department of which has since been issued separately under the title of *Etymologicum Anglicanum*. He also wrote a treatise *De Pictura Veterum*, which he translated into English himself. He died while residing in the house of his nephew, Isaac Vossius. He bequeathed all his MSS. to the Bodleian library at Oxford.

JUNKIN, George, D. D., LL. D., an American clergyman, born near New Kingston, Pa., Nov. 1, 1790, died in Philadelphia, May 20, 1868. He graduated at Jefferson college in 1813, studied theology, and in 1819 became pastor of the Associate Reformed church in Milton, Pa. During his pastorate he was active in establishing the Milton academy, and in 1828-'9 edited "The Religious Farmer." He was afterward a prominent leader in the Old School Presbyterian church. In 1830 he became principal of the Manual Labor academy at Germantown, and in 1832 president of Lafayette college, Easton, Pa., which, though chartered in 1826, was first organized by him. He was president of Miami university from 1841 to 1844, when he returned to Lafayette college. In 1848 he became president of Washington college, Lexington, Va., which office he resigned April 18, 1861, on account of his opposition to secession, and afterward resided in Philadelphia. Among his numerous works are: "The Vindication," a reply to the "Defence" of the Rev. Albert Barnes (1836); "The Educator," a periodical (1838-'40); "Treatise on Justification" (1839); "Lectures on the Prophecies" (1844); "Political Fallacies" (1862); "Treatise on Sanctification" (1864); "Two Missions, the Apostolic and the Evangelical" (1864); and "The Tabernacle, or the Gospel according to Moses"

(1865). His biography has been written by his brother, the Rev. D. X. Junkin, D. D. (8vo, Philadelphia, 1871).

JUNO, called by the Greeks **HERA**, in ancient mythology, a daughter of Saturn and Rhea, and the sister and wife of Jupiter. She was surnamed, by the Greeks and Romans respectively, *Βασίλεια* and Regina, as the celestial queen; *Γαμήλια* and Pronuba, as the patroness of marriage; *Ειλειθνια* and Lucina as presiding over childbirth. Juno was the mother of Mars, Hebe, and Vulcan. The chief seats of her worship were Argos, Samos, Sparta, and Rome. Her most celebrated Hellenic temple, situated near Argos, contained a colossal statue of the goddess, made of ivory and gold. At Rome her principal temple was on the Capitoline hill, and her great festival, the *matronalia*, was celebrated on March 1 by the wives and matrons of the city. She was the great goddess of nature, the impersonation of maternity.

JUNOT. See **ABRANTÈS**.

JUPITER (Lat. gen. *Jovis*, whence the English form Jove), called **ZEUS** by the Greeks, the greatest of the Greek and Roman gods, son of Saturn and Rhea, and brother of Neptune, Pluto, Vesta, Ceres, and Juno. As Saturn was wont to devour his children as soon as they were born, his wife Rhea, when she found herself pregnant with Jupiter, entreated Cœlus and Terra (Uranus and Ge) to save the life of the child. On their advice she fled to Crete, and concealed him in a cave of Mt. *Ægæon*. As he approached maturity Jupiter gave evidence of the divinity of his nature. He delivered the Cyclops from the bonds with which they had been fettered by Saturn; gave liberty to the hundred-handed giants Briareus, Cottys, and Gyes; subdued the Titans, and shut them up in Tartarus; and finally dethroned his father, and obtained the empire of the universe, which he shared with his brothers Neptune and Pluto. Jupiter fixed his residence on the summit of Olympus, and took successively to wife Metis, by whom he became the father of Minerva; Themis, who bore him the Horæ and the Parcæ; Eurynome, who was the mother of the Graces; Ceres and Mnemosyne, whose offspring were Proserpine and the muses; Latona, who became the mother of Apollo and Diana; and Juno, whose children by him were Mars, Hebe, and Vulcan. Jupiter was the most powerful of the gods, the supreme ruler both of mortals and immortals. His most distinctive epithets were *Ὀλυμπικός*, or Olympian, *Capitolinus*, from his principal temple at Rome on the Capitoline hill, and *Κεραυνίος*, or *Tonans*, "the thunderer." The most celebrated Hellenic temples of Jupiter were those of Dodona and Olympia, the latter containing the famous colossal statue of the god by Phidias.

JUPITER, the largest member of our planetary system, and the fifth in order of distance from the sun, so far as the primary members of the system (omitting the asteroids) are concerned. It is designated by the sign ♃. Jupiter travels

at a mean distance of 475,692,000 m. from the sun, his greatest distance being 498,639,000 m., and his least 452,745,000 m. When he is in opposition, his distance from the earth is reduced by the whole amount of the earth's distance from the sun at the time; and as it chances that the perihelion and aphelion of his orbit lie almost directly opposite the parts of the earth's orbit where she is at her mean distance (91,430,000 m.), it follows that when in opposition Jupiter's distance from the earth varies between 407,209,000 m. (498,639,000 - 91,430,000) and 361,315,000 m. (452,745,000 - 91,430,000), a very noteworthy difference. It may be mentioned that Jupiter's perihelion lies in about lon. 12°, so that oppositions occurring when the earth's heliocentric longitude is about 12° (in other words, during the first week in October) are under ordinary circumstances the most favorable occasions for the study of this planet. Nor is the advantage so slight that the oversight of the circumstance in our ordinary text books of astronomy can be readily understood. At an opposition of this kind the apparent area of Jupiter's disk exceeds the apparent area at an opposition early in April, roughly in the proportion of (407)² to (361)², or as 430 to 338—say as 5 to 4; and in addition, Jupiter is more fully illuminated by the sun in the proportion (still roughly) of (499)² to (453)², or as 522 to 430—say as 6 to 5; and as the comparatively small illumination of Jupiter limits the magnifying power which can be applied with any given telescope under the most favorable conditions, we may fairly combine these two ratios, and regard 3 to 2 as representing the proportion in which an October observation of Jupiter surpasses an April observation, the planet being in either case in opposition. Jupiter circles round the sun in a mean period of 4,332.5848 days; and his mean synodical period (that is, the interval separating his successive returns to opposition) has a mean value of 398.867 days. Various estimates have been obtained of Jupiter's dimensions; but we may take 85,000 m. as the most probable extent (in round numbers) of his equatorial diameter. His polar diameter is considerably less, the compression of the planet being variously estimated at from $\frac{1}{12}$ to $\frac{1}{17}$. We may assume $\frac{1}{15}$ as approximately correct, according to which estimate his polar axis would be about 5,700 m. less than an equatorial diameter. His volume is about 1,235 times as great as the earth's; but his density being only about one fourth of the earth's, his mass does not exceed that of the earth in so considerable a proportion. Nevertheless, the disproportion still remains very great, since the mass of the planet exceeds the earth's more than 301 times. It must be remarked that this number 301, being deduced from the observed motions of the planet's satellites, may be relied on as approximately exact, whereas the number 1,235, representing Jupiter's volume (the earth's being 1), depends only on the estimated diam-

eter and compression of the planet, and therefore cannot be regarded as exactly determined. The estimated density is necessarily affected by any inaccuracy which may exist in the determination of the volume; but a moment's consideration will show that the probable limits of error in the determination of the density are not wide. Jupiter rotates on his axis in rather less than 10 hours. The period given by Beer and Mädler (see their *Beiträge zur physischen Kenntniss der himmlischen Körper im Sonnen-systeme*, Weimar, 1841) is 9 h. 55 m. 26.5324 s.; but no reliance can be placed on the last four digits in this result: first, because it is doubtful whether any markings exist on Jupiter which can be recognized after the lapse of long intervals of time; and secondly, because if such marks exist, none have been observed during periods long enough to insure that even the seconds in the rotation period should be rightly assigned.—Jupiter is the centre of a noble scheme of dependent bodies, called his satellites, which circle round him at the distances indicated in the accompanying table, which presents the chief elements of this interesting system:

ELEMENTS OF JUPITER'S 'SATELLITES.

NO.	Sidereal revolution.	Distance in radii of 2f.	Inclination of orbit to 2f's equator.	DIAMETER.		Mass, that of Jupiter being 1.
				Apparent.	In miles.	
I....	d. h. m.					
I....	1 18 20	6.05 0' 7"	1.02"	2,352	0.000017828	
II....	3 13 4	9.62 1 6	0.91	2,099	0.000023235	
III....	7 3 43	15.35 5 3	1.49	3,436	0.000088497	
IV....	19 16 32	26.99 0 24	1.27	2,929	0.000042659	

The densities of the satellites have usually been stated incorrectly in the text books of astronomy at respectively 0.114, 0.171, 0.396, and 1.468 (where the density of water is unity). Whence these values were originally derived we do not know; but they are unquestionably incorrect. The following values of the densities have been calculated by the present writer from Laplace's estimates of the masses, combined with the values of the diameters above stated:

Satellite	Density (earth's as 1).	Density (water as 1).
I.....	0.198	1.148
" II.....	0.374	2.167
" III.....	0.325	1.883
" IV.....	0.253	1.468

Thus all the satellites have a greater mean density than Jupiter. Probably their real densities are greater than those here tabulated, since irradiation would increase their apparent diameters. The motions of the satellites of Jupiter have been studied with scrupulous care by astronomers, from the time when Galileo in 1610 first discovered these bodies. They had not been long observed in this way before a peculiarity was recognized which Römer was the first to interpret. It was found that pre-

dicted phenomena of the satellites occurred earlier when Jupiter was in opposition than when he was in quadrature, and that in fact the further Jupiter was from opposition up to the time when he was so near conjunction that his satellites could no longer be observed, the later these phenomena occurred. It was at length suggested by Römer that the discrepancy was due to the increase of distance, the light which brings to our earth information of the phenomena taking longer in reaching the earth when the planet is further away. Repeated observations confirmed this theory, which at first astronomers of repute ridiculed as too fanciful for serious consideration. Bradley's discovery of the aberration of light placed the theory beyond the possibility of question.—The appearance of Jupiter's disk is such as to suggest the idea that the planet is enveloped in a deep vaporous atmosphere, heavily laden with cloud masses. A series of broad bands or belts, alternately dark and light, and differing in color, lie across the disk, agreeing generally in position with the latitude parallels of the planet. On a close study with telescopic power, these belts are found to present peculiarities of structure exceedingly interesting. Rounded clouds appear to float separately within the deep atmosphere, and from time to time changes of shape and of color are noticed which seem to imply the action of forces of great intensity. Theoretical investigations applied to the subject of an atmosphere of great depth, attracted by the strong gravity of Jupiter, suggest that conditions of pressure would exist incompatible with the gaseity of the envelope. And the known small density of the planet, combined with the result just mentioned, suggests that in the case of Jupiter, as in that of the sun, the increase of pressure and therefore of density, which we should expect from the mere mass of the planet, is counteracted by the expansive effects of intense heat. This view of the planet's condition has been adopted recently by Prof. Benjamin Peirce on independent mathematical grounds, and may be regarded as altogether more probable than the old-fashioned but quite unsupported opinion that the planet's condition resembles generally that of our own earth.

JUPITER AMMON. See AMMON.

JURA, an island off the W. coast of Argyleshire, Scotland, one of the inner Hebrides; area, about 85 sq. m.; pop. in 1871, 761. It is separated from the mainland on the east by the sound of Jura, about 5 m. wide, from the island of Islay on the southwest by a narrow strait $1\frac{3}{4}$ m. wide, and from the island of Scarba on the north by the gulf and strait of Corryvreckan. Its length is 27 m., and its greatest breadth 7 m. On the west the coast line is broken by a narrow deep indentation, called Loch Tarbert, which nearly cuts the island in two, penetrating to within a mile of Tarbert bay on the east. The western shores are bleak and rugged, but the eastern are more pleasing,

having green slopes and a belt of plain. A ridge of rugged mountains traverses the entire length of the island, rising at three points, into high conical peaks, called the Paps of Jura, the highest of which is 2,566 ft. There is little arable land, only 600 acres being under cultivation. Oats, barley, potatoes, and flax are raised, and large flocks of sheep and goats are fed upon the mountains. From 1,000 to 1,200 head of cattle are exported annually. There are excellent slate quarries and a very fine sand for glass making. The island is famous for its red deer, and for remarkable caverns on its E. coast. With some adjacent islands it forms the united parish of Jura and Colonsay.

JURA, a range of mountains between Switzerland and France, extending about 180 m. in length, from the waters of the Rhône in the department of Ain on the S. W. to those of the upper Rhine in a N. E. direction. The great valley of Switzerland and the lake of Neuchâtel lie along its S. E. base, and over these from its summits may be seen Mont Blanc and the principal peaks of the Alpine chain. The Jura, like the Appalachian chain of the United States, consists of parallel ridges including narrow longitudinal valleys, along which the rivers flow in one or the other direction, occasionally passing through a break in the mountains into the next valley. In their external form, and the wave-like arrangement of the stratified rocks of which they are composed, the resemblance is still more striking. They occupy a belt of country averaging about 30 m. in width; and the highest summits, which are mostly in the S. part of the range, attain nearly the same elevation as the White mountains in New Hampshire. The principal summits are Crêt de la Neige, Reculet de Toiry, Mont Tendre, Dôle, Pié de Marmiers, Chasseron, Chasseral, Credo, and Colomb; the first named of which is 5,653 ft., and the last 5,200 ft. high. The principal strata are limestones of the oölite formation, named the Jura from their abundance in this range, and with them are associated shales and sandstones, including beds of gypsum. The highest summits of the Jura lose their snowy winter covering in the summer, and are then green with dense forests of fir. The growth below is in great part of walnut, groves of which surround almost every village. In the valleys are found some of the richest pasture lands in Switzerland, where are produced the Gruyère and other cheeses famed throughout Europe. Great numbers of cattle are reared and fed on the mountains. The Jura and the intermediate undulating country abound in wooded hills, among which rocky masses project at intervals above the fertile slopes, which by the aid of irrigation yield three crops of grass annually. The most picturesque scenery is presented by the Val Moutiers, or Münster Thal, between Basel and Bienne, the pass of Klus at the foot of the Ober-Hauenstein, and the lac de Joux.—The name Jura has also a wider application than

to the mountain range above described; the continuation of the same limestone country through Swabia and Franconia being distinguished as the German Jura, situated between the Rhine and Main, and divided by the rivers Danube and Altmühl into three parts, viz.: the Black Forest Jura (*der Schwarzwald-Jura*), situated between the Rhine and Danube; the Swabian Jura (*der Schwäbische Jura*), on the Danube and Altmühl, and designated by various names in various localities, as Ober-Hohenberg, Rauhe Alp, &c.; and the Franconian Jura (*der Fränkische Jura*), between the Altmühl and Main, traversed by the Ludwig's canal, and noted for its bone caves.

JURA, an E. department of France, in Franche Comté, bordering on Switzerland and on the departments of Haute-Saône, Doubs, Ain, Saône-et-Loire, and Côte d'Or; area, 1,926 sq. m.; pop. in 1872, 287,634. The name is derived from the mountains which cover two thirds of the department. The surface presents three divisions, viz.: the western part, consisting of a low plain about 7 m. in width; the first mountain elevation rising suddenly from the plain and forming a plateau nearly 10 m. wide; and the high mountain district, consisting of lofty summits and deep valleys. The highest summits are Reculet, La Dôle, and Mont Poupet, which rise between 5,000 and 6,000 ft. above the sea. Among the numerous rivers are the Ain, Loue, and Doubs, which are navigable. The Bienne is the most important of the smaller rivers. There are many marshes and lakes. The Rhône and Rhine canal traverses the N. part of the department, and there are several lines of railway. Large quantities of squared timber are floated in rafts down the small rivers into the Saône and thence to Lyons. The forests abound with pine and oak timber. Agriculture is highly advanced, and dairy farming is extensively carried on, one of the chief productions being Gruyère cheese. The annual production of wine amounts to 8,500,000 gallons; the best wines are those of Lons-le-Saulnier and Poligny. Coal and iron mines are worked. Lithographic stone, marble, and alabaster are quarried, and there are extensive salt works at Montmorot and Salins. The department is divided into the arrondissements of Lons-le-Saulnier, Poligny, Sainte-Claude, and Dôle. Capital, Lons-le-Saulnier.

JURIEU, Pierre, a French theologian, born at Mer, Orléanais, Dec. 24, 1637, died in Rotterdam, June 11, 1713. He was sent to England to complete his education under his maternal uncle, Peter Du Moulin, and while in that country was ordained. He succeeded his father in the pastorship of the Reformed church at Mer, and afterward was made professor of divinity and Hebrew at the academy of Sedan. When that institution was suppressed in 1681 he retired to Rotterdam, where he became minister of the Walloon church. He passed the remainder of his life there, engaged in

bitter controversy with friends and enemies, especially Bayle. Jurieu got the better of the philosopher, and caused his dismissal from his professorship. He was the author of various works, highly esteemed in their day, several of which have been translated into English. Among these are: *Histoire du Calvinisme et du papisme* (2 vols., Rotterdam, 1682); *Lettres pastorales* (3 vols., 1686-'7); *Accomplissement des prophéties, ou la délivrance prochaine de l'Église* (2 vols., 1685); *Apologie pour l'accomplissement* (1687); *Tableau du Socinianisme* (the Hague, 1691); and *La pratique de la dévotion* (2 vols., Rotterdam, 1700). His principal work is *Histoire critique des dogmes et des cultes bons et mauvais qui ont été dans l'Église depuis Adam jusqu'à Jésus-Christ* (Amsterdam, 1704; with supplement, 1705; English translation, 2 vols., London, 1705).

JURY, a chosen body of men whose duty it is either to judge or determine certain questions of fact submitted to them, or to inquire into the existence of certain alleged facts. Upon the jury a very large proportion of the whole procedure for the trial of actions in England and America rests. Its intrinsic importance has made the inquiries into its early origin and history interesting; and they are the more so, because they are found to be closely interwoven with investigations into the political, legal, and social institutions of many nations. Different writers have come to very different conclusions, perhaps because they began from different points of departure, and viewed their facts under different aspects. In almost all the results thus presented there is some truth; but we apprehend that they have erred in attributing the institution of juries to some one or two only of the many origins from which it has arisen, and the many influences which have combined to give to it its present form in England and in the United States. Its principal source has been found in the *δικαστήριον* of Athens, or in the *judices* of Rome, or in the compurgators of the Saxons, or in the trial by the vicinage of the Romans, or in the Norwegian *Gulathing*. We apprehend that it would be, if not impossible, at least so difficult to determine which among all these things may be considered as having contributed most to form the trial by jury, that the inquiry is not worth the time and labor it costs; for it must end in the conclusion that all have contributed, and importantly, to this result. The essence of the trial by jury is the determination of questions arising in actions at law by a select body of persons, who, without holding permanent judicial offices, come from among the people for this purpose, and, after their work is done, return to them. In Asia we find nothing of this at any time; and nothing of it in history, until the *δικαστήριον* of Athens was regulated if not introduced by Solon. The *dicasts* were a large body of men, numbering some thousands, who were selected or appointed from among the freemen of Athens, in some

way under if not by the archons. From this large body a smaller number was selected, perhaps by lot, for each case, to hear and determine the questions which might arise in that case, under the direction of a presiding archon or other magistrate. Before proceeding to hear any case, they were sworn to discharge their duty faithfully. After hearing the case, they gave their votes by depositing them in urns or vases, from which the presiding magistrate took them and announced the verdict. In this there is much resemblance to the jury of our own day; the principal difference being in the large number who sat in each case, which appears to have been sometimes as many as 500. This body the advocates addressed, beginning their speeches with *ἄνδρες δικασταί* (as we see in Demosthenes, Æschines, and Lysias), in the same manner as our advocates say, "Gentlemen of the jury." It cannot be doubted, we think, that the judicial procedure of Rome was, to a great extent, derived from and formed by that of Athens. We are accustomed to translate the word *judex* by "judge," but there was no officer or magistrate known to the Romans who discharged precisely the duties which with us belong to the judge; the prætor came nearest to it; but *judex* would be much better translated by the word jurymen. When the plaintiff (*actor*) came before the prætor or other magistrate having jurisdiction, he made his complaint, and the defendant (*reus*) answered it. The prætor then referred the case to the judges to determine the facts; usually stating, in this reference, that such or such conclusions of law would follow from such or such conclusions of fact. The number of judges usually sitting is not known, and sometimes even an important case was tried before a single *judex*; as we know that Cicero delivered his oration *Pro Quintio* before one *judex*, assisted by a *consilium*. The judges generally were aided by juriconsults who sat with them. The whole number of persons from whom could be selected the judges of each case was in Rome as in Athens large, amounting to some thousands; but by whom or on what principle it was appointed, or how or by whom the smaller number was appointed for each case, is not certainly known. There was sometimes an agreement of the parties as to the *judex* or judges, who were sometimes called *arbitri*, and who then answered to our arbitrators; and there was a method of objecting to judges appointed by lot or otherwise (*recusatio judicis*), which answered very exactly to our challenges. As we know that, as soon as Rome conquered a province, it introduced at once the provisions and the forms of its own law (its *jura et instituta*), in part perhaps because the province might be thus most effectually bound to the empire, and in part also because they were always better than those of the conquered nation; and as we know therefore that institutions, which resembled in so many particulars our jury, were in full force

in England for more than three centuries, it would seem to be unreasonable to deny them an important influence in creating the trial by jury. But, on the other hand, the Saxons brought into England the trial by compurgators. Then the party accused, or in later times the party plaintiff or defendant, appeared with his friends, and they swore, he laying his hand on theirs and swearing with them, to the innocence of the accused, or to the claim or defence of the party. Little is certainly known either of the origin or of the extent, in point of time or of country, over which the trial by compurgators prevailed; but it must have had great influence upon the subsequent forms of procedure. If in nothing else, it fixed the number of the traverse jury at 12, that being the common number of compurgators, whence the old mediæval phrase *jurare duodecima manu*; and this was a great improvement on the varying and sometimes very large number in Greece and Rome. Besides this, however, recent investigation has shown, among the Norman legal usages, traces of trial by jury, more numerous and more nearly resembling that trial as now conducted, than anything known to have existed among the Anglo-Saxons. Moreover, it is now known that, with much variety of form, modes of trial essentially similar to that by jury prevailed among both the Teutonic and Scandinavian nations, from a very remote antiquity. We regard it therefore as certain that all these influences contributed to establish this mode of trial in England, and to shape it as we know it to exist there. Indeed, it was not until all of them had had an opportunity of completing their work, that we find what we should now call a jury certainly existing. Glanville represents it, in one of its most important forms and purposes, as introduced in the reign of Henry II.; he calls it "a royal benefit conferred upon the people by the goodness of the sovereign, with the advice of the nobility." So many of the attendant circumstances indicate that it was a Norman institution, bestowed upon his English subjects by a Norman king, that Sir Francis Palgrave has not hesitated to consider our jury trial as derived directly from Norman law.—One mistake in regard to a clause in Magna Charta is so common, and perhaps so important, that it should be corrected. The great charter says that no freeman shall be arrested or imprisoned, or exiled, or otherwise destroyed, *nisi per legale iudicium parium suorum, vel per legem terræ*. This has been held to mean, "unless by lawful trial by jury;" and an argument has been drawn from it against the legality of any conclusive procedure against any person but on the finding of a jury. But the *iudicium parium* of Magna Charta did not mean a judgment or verdict of a jury. Even in Magna Charta itself we read of *juratores*; and the phrase *verdictum legalium hominum*, and others by which a jury is indicated, are common in the law language of

that day. But the *judicium parium* was the peculiar and well known feudal process, by which the lord with his vassals sat to try questions of title between others of his vassals. It is quite probable, however, that the alternative phrase, *per legem terræ*, was intended to include trial by jury.—In Greece and Rome, in the Teutonic and Scandinavian nations, and probably among the Normans, the agreement of a majority of a jury, or of the body which represented a jury, was sufficient; but from the earliest times unanimity has been required in an English traverse jury, and also in this country.) The origin of this peculiarity is quite unknown. The most plausible conjecture, for which indeed there is some authority, is, that originally there were or might be more than 12 jurymen, but the agreement of that number was required; and when the number of the jury finally settled down at 12 and no more, unanimity became requisite. There have been, in perhaps all ages, doubts whether the advantages of this rule were sufficient to compensate for the mischiefs which sometimes result from it; but no very strenuous effort has ever been made to change it. In Scotland, however, by statute 22 and 23 Victoria, the verdict of nine or more of the jurors may be received if unanimity is found impossible after three hours' deliberation.—There is, in respect to the evidence on which a jury acts, a circumstance strikingly illustrative of the change which has taken place in the constitution and in the functions of a trial jury. (Now, they have nothing to do but to hear and weigh the evidence offered to them in open court; and anything beyond this is a departure from their duty; and if one of their number happens to know anything about the facts of the case, he ought not to communicate it to the others, and they ought not to be influenced by it, unless he is sworn as a witness and examined as a witness; so anxious is the law to keep from the jury all evidence which does not rest upon an oath, and has not been submitted to examination. It is however certain that, in the beginning of jury trials, and until the 15th century, the jury themselves were the witnesses, and the only witnesses, they being selected to determine the questions of the case because they were supposed to know the facts, and no other witnesses being examined, and no evidence whatever being offered to them. Nor was it until about the middle of the 16th century that there is any trace of any process known to the law for the summoning of witnesses. (See *Summers v. Mosely*, 2 Crompton and Meeson, p. 485.)—As the jury must not pay any attention to any evidence not lawfully before them, so they must not go beyond the evidence, and inquire into the law, for that is the exclusive province of the court. In civil cases, no one has ever doubted this; that is, no one has ever doubted that in civil cases it was the duty of the court to state the law to the jury, and the duty of the jury to receive and obey the law thus given to them.

But of late a question has arisen in regard to criminal trials, which has assumed, at least in many of the United States, an aspect of much importance. There are those who insist that in all criminal cases the juries shall be judges of the law as well as of the fact; and such is the rule by decision in some states and by statute in some others, and it prevails generally in prosecutions for libel by express constitutional or statutory provisions. (—Juries are either grand juries or petit juries. Nearly all that has been said in this article relates only to petit juries, which are sometimes called traverse juries, and sometimes trial juries. A grand jury tries no question, and finds no verdict. The proper authority of the state, usually the attorney for the government, brings before the grand jury a case of supposed crime or wrong, with a bill of indictment, and the evidence on the subject. This they consider *ex parte*, or without hearing the accused; and if they think that the evidence is sufficient, they approve or "find" the bill, and present the accused to the court. If they do not think it sufficient, they "ignore" the bill (as it is termed), and no indictment is presented. The usual method of "finding" a bill is for the foreman (whom the jury choose) to write on the back of the bill, "A true bill," with his signature and the date; and when a bill is rejected, the foreman writes upon it: "*Ignoramus*," with signature and date. Sometimes the government attorney prepares no bill, but brings before them the case and evidence, and prepares a bill only when they direct him to do so. The grand jury are the exclusive judges of the weight and force of the testimony offered before them. The grand jury is generally more numerous than the petit jury. The more usual number is 23; originally it was 24, but as unanimity is not necessary, although at least 12 must agree to an indictment, to avoid the inconvenience of having 12 for and 12 against a bill, one less than 24 is the common number. Besides bills of indictment, and specific offenders, the grand jury may present to the court any public wrongs they think should be brought to its notice, and sometimes exercise a wide liberty in this respect. None are present with the grand jury during their deliberations but the officer of the government; and it is a part of their oath that they shall keep secret "the commonwealth's counsel, their fellows', and their own." But there is a reasonable limit to this, for it is no uncommon thing for a grand juror to take the witness stand in a trial of a case, and testify as to what some person has said as a witness before the jury. A grand jury constitute a regular body, recognized as such by the law, having what may be called a jurisdiction coextensive with that of the court to which they make presentments.—Jurors, both grand and petit, are returned by the sheriff of each county (or, for the United States courts, by the marshal of each district), in obedience to a writ, called a *venire*, which com-

mands him ^{to} summon to come (*ut facias venire*, in the old law Latin) to the court at the appointed time the proper number of persons. The authorities of every city and town, or sometimes county, put into a box the names of all persons therein, or a certain proportion thereof, qualified and bound to serve as jurors. Usually these are all persons qualified to vote, with some special exemptions. From the number so returned the requisite number for grand and petit jurors is drawn by lot, and the persons so selected are then summoned by the sheriff or marshal. The whole list or schedule of a jury is called the "panel." (In the Scotch law, the word "panel" means the accused, or the party on trial.) The grand jury is "impanelled" when sworn and organized. A petit jury is impanelled when the names are called over, and the first 12 who are present, and are not excused or objected to, are sworn, and set apart as the jury. It is common in most of our courts having much business to impanel two juries; that sitting on the right hand of the court being called "the first jury," and that on the left hand "the second jury." Sometimes, when the urgent pressure of business requires it, a third jury is impanelled. The purpose in impanelling more than one jury is, that while one is charged with a case and is deliberating, another case may be tried before another jury. Upon trials before a jury, the court are the exclusive judges of the admissibility or competency of evidence; but if it be admitted, the jury are the judges of its value. For about a quarter of a century changes of an important nature have been gradually creeping into the system of jury trial in the United States by statutory modifications. One of these very generally adopted is the trial of cases by fewer than 12 in all courts not of record; usually six, but sometimes a still smaller number. One more important, however, is the trial of all questions of fact as well as of law in all civil cases by the judge without a jury, unless a jury is demanded by one of the parties or specially ordered by the court. Where this change has been introduced it is found that in the large majority of cases the parties are satisfied to submit their disputes to the court.—We may remark that the institution of the grand jury certainly existed, substantially the same or nearly the same as at present, among the Saxons; and it is from this grand jury that some suppose the petit or trial jury to be derived; and doubtless this is in some degree true.

JUSSIÉU, De, a French family of natural philosophers who have been styled the "botanical dynasty" of France. The most celebrated are the following. **I. Antoine**, born in Lyons, July 8, 1686, died in Paris, April 22, 1758. He took the degree of M. D. at Montpellier, and went to Paris in 1708, where he commenced practice, was appointed professor of botany at the *jardin du roi*, entered the academy of sciences in 1711, and contributed several papers to its *Mémoires*,

the most curious of which is perhaps his *Recherches physiques sur les pétrifications qui se trouvent en France de diverses parties de plantes et d'animaux étrangers*. In the course of a journey through southern France and Spain he made a valuable collection of plants previously very imperfectly known. Among his published essays is a *Discours sur les progrès de la botanique* (Paris, 1718). He edited Barrelier's posthumous work on the plants of France, Spain, and Italy, and published a new edition of Tournefort's *Institutiones Rei Herbariæ*, with an appendix (Lyons, 1719). His *Traité des vertus des plantes*, a synopsis of his lectures at the faculty of medicine, was published in 1772. **II. Bernard**, brother of the preceding, born in Lyons, Aug. 17, 1699, died in Paris, Nov. 6, 1777. In 1722 he was appointed assistant demonstrator of botany at the *jardin du roi*. A man of contemplative disposition, abstemious habits, and no ambition, he never rose above this subordinate office, but gradually obtained the reputation of one of the first botanists in Europe. In 1725 he edited Tournefort's *Histoire des plantes des environs de Paris*, with additions and annotations, which were considered so valuable that he was made a member of the academy of sciences, although he was only 26 years of age. To its *Mémoires* he contributed very few papers, and these on subjects of secondary importance, but remarkable for precision, ingenuity, and thorough method. He devised a system of classification based upon the natural affinities of plants, and applied it in 1759 to the arrangement of a botanical garden at Trianon, which had been ordered by Louis XV. His catalogue has been regarded, as the foundation of the "natural system," afterward expounded by his nephew Antoine Laurent Linnæus entertained the highest opinion of his acquirements. **III. Antoine Laurent**, nephew of the preceding, born in Lyons, April 12, 1748, died in Paris, Sept. 17, 1836. He was called to the metropolis in 1765 by his uncle Bernard, and studied medicine, but ultimately devoted himself to botany. As early as 1773 he presented to the academy of sciences a *Mémoire sur les renonculacées*, in which the first principles of the "natural system" are clearly perceptible; and the next year he reduced the system to practice in the replanting of the botanical division in the *jardin du roi*. In 1778 he commenced the publication of his great work, *Genera Plantarum secundum Ordines Naturales disposita, juxta Methodum in Horto Regio Parisiensi exaratum, anno 1774*, which was not completed till 1789. To bring together all those plants which are allied in all essential points of structure, and to take into account the true affinities of plants on a comparison of all their organs, is the leading feature of the "Jussieuan system," which has finally superseded the artificial or sexual system of Linnæus. In 1790 he was elected a member of the municipal council of Paris, and intrusted with the supervision of the hospitals and charities, which

office he held for two years. In 1793, when the *jardin du roi* was reorganized as the museum of natural history, he was raised to a professorship, and while director of that institution he laid the foundation of its library, which is one of the best, if not actually the best of its kind in Europe. In 1804 he was appointed professor of *materia medica* at the faculty of medicine, and life member of the council of the university, but was deprived of both these offices after the restoration. In 1826 his failing health and partial blindness caused him to resign his chair of botany in favor of his son Adrien. From 1804 to 1820 he published in the *Annales du Muséum* a series of valuable papers prepared with reference to a new edition of his *Genera Plantarum*. Besides the works above mentioned, he wrote several historical notices of the museum of natural history, and a number of valuable articles on botany in the *Dictionnaire des sciences naturelles*, among which the one upon the "Natural Method of Plants" deserves special notice. **IV. Adrien**, son of the preceding, born in Paris, Dec. 23, 1797, died June 29, 1853. On taking his degree of M. D. in 1824, he defended a thesis *De Euphorbiacearum Generibus*. He succeeded his father as professor at the museum in 1826, and soon achieved a distinguished rank among botanists by his lectures and publications. In 1831 he was elected to the academy of sciences, and in 1845 was appointed to the chair of the organography of plants at the Sorbonne; his lectures there, which he continued till his death, were both brilliant and attractive. His most important work is a *Cours élémentaire d'histoire naturelle: Partie botanique* (Paris, 1848; translated by I. H. Wilson, "Elements of Botany," London, 1849), which is a most valuable elementary treatise on botany. His treatise on botanical taxonomy, in the *Dictionnaire universel d'histoire naturelle* (1848), is also very valuable. Among his papers printed either in the *Annales du Muséum* or the *Comptes rendus de l'académie des sciences*, one of the best is his *Monographie des malpighiacées* (1843). A very interesting essay, *De la méthode naturelle et des Jussieu*, was published by P. Flourens in his *Éloges historiques*, second series. **V. Laurent Pierre**, cousin of the preceding, born in the department of Isère, Feb. 7, 1792. He was a member of the chamber of deputies from 1839 to 1842, and became known by educational and other popular works, including *Simon de Nantua, ou le marchand forain* (1818), which has been translated into many languages and passed through upward of 30 editions; that of 1860 contained also his *Œuvres posthumes de Simon de Nantua*, for which he received the Montyon prize, and similar honors were accorded by various institutions to the former and other works. New editions of his *Les petits livres du Père Lami* (6 vols.) appeared in 1853, and of his *Fables et contes en vers* in 1864.—His brother **ALEXIS**, a political writer and functionary, born in 1802, died in 1866.

JUSTE, Théodore, a Belgian historian, born in Brussels in 1818. He is secretary of the Belgian board of education, and member of many learned societies. His principal works are: *Histoire élémentaire et populaire de la Belgique* (Brussels, 1838; 3d and enlarged ed., 1848); *Histoire de la révolution belge de 1790* (3 vols. 12mo, 1846); *Précis de l'histoire du moyen âge* (5 vols. 12mo, 1848); *Les Pays-Bas sous Philippe II.* (2 vols. 8vo, 1855); *Charles-Quint et Marguerite d'Autriche* (8vo, 1858); *Les Pays-Bas au XVI^e siècle* (2 parts, 1858-'63); *Histoire du soulèvement des Pays-Bas contre la domination espagnole* (1862-'3); *Histoire des États généraux des Pays-Bas* (2 vols. 8vo, 1864); *Les fondateurs de la monarchie belge* (1865 and 1871); *Le soulèvement de la Hollande en 1813, et la fondation du royaume des Pays-Bas* (1869); and *Notes historiques et biographiques* (1871).

JUSTI, Karl Wilhelm, a German author, born in Marburg, Jan. 14, 1767, died there, Aug. 7, 1846. He was professor of theology at Marburg, wrote the *Nationalgesänge der Hebräer* (5 vols., Leipsic, 1803-'18), published an enlarged edition of Herder's *Geist der Ebräischen Poesie* (2 vols., 1829), several historical and miscellaneous writings, including a life of St. Elizabeth, and some volumes of poetry.

JUSTICE OF THE PEACE. In the English law, justices of the peace are "judges of record appointed by the king's commission to be justices within certain limits, for the conservation of the peace and the execution of divers things comprehended within their commission and within divers statutes committed to their charge." Before the institution of this office there existed in England by the common law certain officers appointed for the maintenance of good order, and called *conservatores pacis*, keepers of the peace. Some of them exercised their functions by virtue of their tenures, and some by virtue of their offices; others were chosen by the freeholders of their counties. The period at which this office ceased, and justices of the peace were first created, has been disputed; but the better opinion seems to fix it at the beginning of the reign of Edward III. At that time the new king, fearing that some risings or other disturbances might take place in protest against the manner of his accession to the crown, sent writs to all the sheriffs in England commanding that peace be kept throughout their bailiwicks on pain and peril of disinheritance and loss of life and limb; and in a few weeks after the date of these writs it was ordained in parliament that, for the better maintaining and keeping of the peace in every county, good men and lawful which were no maintainers of evil or barrators in the county should be assigned to keep the peace. (Black. Com., i. 350.) From that time the election of the conservators of the peace was taken from the people, and their creation resided thenceforth in the assignment of the crown. It was only, however, by subsequent statutes that the

conservators of the peace acquired a judicial character and functions. By 4 Edward III. c. 2, they were empowered to "take indictment," and by 34 Edward III. c. 2, they were commissioned to "hear and determine" in cases of felonies and trespasses. It is probable that not until then were these officers called justices. The office, as constituted and defined by these and later statutes, occupies an important place in the English judicial system. It was adopted in the several states of this country at their settlement, and may be considered to possess here the general character and functions allowed to it in England by force of statutes. But it is to be remarked that in all the states legislative enactments have so fully enumerated the powers and duties of justices of the peace, both in civil and criminal affairs, as perhaps to preclude reference to the English law on the subject.—Justices of the peace are in some states elected by the people, and in others receive their appointment from the executive. Their jurisdiction is determined by their commissions and the provisions of various statutes. These are to be strictly construed, and no authority can be implied. Without attempting a recital of all the particular functions exercised by these officers, it will suffice for our present purpose to mention, under their criminal jurisdiction, that when they are not limited by the existence of special courts, they possess still their ancient common law powers as conservators of the peace, and as such may suppress riots and affrays and apprehend all disturbers of the peace. Then they may punish them by fine, and take recognizances for their future good behavior. By virtue of their criminal authority they may also issue their warrants for the arrest of offenders. If the offence be a trifling one, they may themselves determine in the matter. If, however, it be of an aggravated nature, they commit or bind over the criminal for trial in a regular court. They may judge in civil suits when but a small amount is involved, but not generally in cases of libel, slander, or malicious prosecution, or when title to real property comes in question. As further examples of their usual powers, it may be added that they may issue summonses for witnesses to appear in their own courts, and to answer in civil suits pending before other courts; they may administer oaths in all cases in which an oath is required; they may celebrate marriages; and may make examinations and issue warrants in cases of bastardy. They also exercise certain functions under the poor laws. The justice must have jurisdiction of the parties and of the matter, or his interference is a trespass. But when he acts within his jurisdiction and by color of his office, he is responsible in a civil suit only when he has acted from corrupt or malicious motives. He may be impeached, and in some states removed by petition and hearing of the charges made against him before a higher court. A justice must keep a record of his proceedings, and may ad-

journal his court from day to day. The pleadings before him are, for the benefit of suitors, treated with great liberality.—In the decree for the reorganization of the judicial system of France (Aug. 24, 1790) *juges de paix* were created in imitation of the English officers of the same name. They were to decide summarily, without expense to suitors and without the intervention of counsel, affairs of slight importance, and especially those which involved disputed facts rather than contested points of law. The decree of September, 1791, concerning criminal procedure, invested the *juges de paix* with police functions; at a later period they were called to the presidency of those police tribunals which took cognizance of minor offences. Under the law of May 25, 1838, the French justices are empowered to decide finally in all causes purely personal, and involving no more than 100 francs, but subject to appeal in all such causes involving from 100 to 200 francs. With similar limitations they have jurisdiction in actions between landlords and tenants; in suits for damages to fields, fruits, and harvests; between laborers and their employers, and between servants or apprentices and their masters; and in civil suits for verbal defamation, and in those breaches of the peace and assaults which are not expressly provided for in the criminal law. Their decrees are subject to appeal in all possessory actions, in cases involving questions of boundaries, and in those arising out of the use of mill privileges and streams applied to irrigation. As officers of the judicial police and auxiliary to the prosecuting officer of the government (*procureur du roi*), they receive informations and make examinations into charges of flagrant crime committed within their jurisdiction.

JUSTIN (FLAVIUS ANICIUS JUSTINUS). **I.** The Elder, Byzantine emperor, born of a family of barbarian peasants at Tauresium, a village near Sardica (now Sophia), in Bulgaria, in 450, died in 527. He went with two other youths on foot to the capital to enter the army, and on account of his strength and stature was placed among the guards of the emperor Leo I. Under the reigns of Zeno and Anastasius he emerged to wealth and honors. Having served in the Isaurian and Persian wars, and been promoted successively to the ranks of tribune, count, and general, and the dignity of senator, he was commander of the imperial guards at the time of the death of Anastasius (518). The eunuch Amantius, who then reigned in the court, being bent on setting one of his creatures, Theodatus, on the throne, intrusted an ample donative to Justin, with which to gain the suffrage of the guards for his purpose. Justin employed the bribe in his own favor, and was proclaimed emperor at the age of 68. Brave, but ignorant, according to Procopius, even of the alphabet, he intrusted the quaestor Proclus with the affairs of the state, and adopted Justinian, his nephew, and a native of his village, who, however, was educated in Constantinople.

There are some dark stains on Justin's character. Amantius was executed on charges of conspiracy and heresy, Theodatus was murdered in prison, and Vitalian, a Gothic chief, who had become popular by his civil war against Anastasius in defence of the orthodox faith, was treacherously murdered at a banquet. Both Justin and his successor Justinian (during part of his reign) were defenders of the orthodox creed. **II. The Younger**, nephew of Justinian I., succeeded him in 565, and died Oct. 5, 578. He was of a very crafty disposition, and while his cousins Justin and Justinian, the sons of Germanus, were absent in the campaign against the Persians, he remained in Constantinople and courted the aged emperor. On assuming the imperial authority after the death of Justinian, he won popular favor by the expression of virtuous and generous sentiments. He granted a general pardon to offenders, liquidated all the debts of Justinian, and issued an edict of universal religious toleration. But he soon showed his true character. He instigated the murder of his cousin Justin, of whom he had become jealous, sold offices and positions without disguise, and recovered by rapacity and oppression the sums used in satisfying the creditors of his predecessor. While he was thus arousing the indignation of the Greeks at home, Italy was in a deplorable state. Narses, who had been removed from the exarchy through the hatred of the empress Sophia, revenged himself by inviting an invasion of the Longobards, who overran the country. At the same time Justin was involved in a war with the Persians, who ravaged Syria and took Dara. On the receipt of this news he exhibited symptoms of insanity, and the government devolved on the empress Sophia, who persuaded the emperor (574) to adopt Tiberius, the captain of his guards. The latter became virtually the ruler from that time, although Justin did not create him Augustus until Sept. 26, 578.

JUSTIN (JUSTINUS), a Latin historian, of whose personal history nothing is known. It is probable that he lived at Rome in the 3d or 4th century. He is the author of a work entitled *Historiarum Philippicarum Libri XLIV.*, founded on a lost work of Trogus Pompeius, a historian of the Augustan age. The original work, though professing to give only an account of the Macedonian monarchy, was hardly less than a universal history, and was of great value. Justin seems rather to have compiled selections from it than to have abridged it systematically, and his history contains a great variety of information that would not otherwise have been preserved, carelessly arranged, but written in a clear and sometimes elegant style. The first edition of Justin was printed at Venice by Jensen in 1470. The latest editions are those of Gutschmid (Leipsic, 1857), Hartwig (Brunswick, 1860), Pierrot and Boitard (Paris, 1862), and Domke and Eitner (Breslau, 1865). The English translations are by Codrington

(1664), Brown (1712), Bayley (1732), Clark (1732), and Turnbull (1746).

JUSTINIAN. I. (FLAVIUS ANICIUS JUSTINIANUS), surnamed the Great, a Byzantine emperor, born at Tauresium, a village near Sardica (now Sophia), in Bulgaria, in 482 or 483, died Nov. 14, 565. He was the son of a poor barbarian family, but his elevation was promoted by his uncle Justin I., who shortly before his death in 527 adopted him as co-emperor at the request of the senate. Justinian, who had effectively and unscrupulously promoted his uncle's elevation, was possessed long before the decease of the latter of all power in the state, as well as of a large private fortune. He shared both his power and wealth with Theodora, a beautiful, crafty, and unscrupulous woman, the daughter of a keeper of wild beasts, who had been long known as a comediant and prostitute, and despised by the people of the capital as one of the vilest of her sex. Having married her in spite of all opposition, he not only seated her on his throne, but made her an equal colleague; and her demoralizing, corrupting, and despotic influence remained powerful till her death in the 22d year of their reign. In the questions of creed in the church and of color in the games of the charioteers in the hippodrome, then distracting the empire, Justinian and his wife were agreed in zealously supporting the orthodox and the blue parties. In the capital and most of the provinces heresy was totally powerless, but the faction of the greens was often able to resist by open violence the arrogance of their opponents and oppressors. In 532, after a fierce contest between the factions, in which Constantinople was almost laid in ashes, they momentarily combined their forces against the government, and proclaimed Hypatius, a nephew of the emperor Anastasius, emperor. The resolute spirit of Theodora and the bravery of Belisarius triumphed. The blues returned to allegiance, the greens were crushed with dreadful slaughter, Hypatius and his principal accomplices were executed, and tranquillity was restored. Justinian now turned his chief attention to the external interests of his vast empire. Purchasing at an immense sum a truce from Cosroes I. of Persia, after a war of a few years waged with varying success, he sent Belisarius with a fleet and an army against Gelimer, who had usurped power in the kingdom of the Vandals of Africa, and as an Arian ruler oppressed his Catholic subjects. A series of victories soon brought Carthage and the person of Gelimer himself into the power of the Byzantines. Gelimer was sent a captive to Constantinople, the kingdom of the Vandals destroyed, and the Arian worship suppressed. The conquest of the province of Africa and the adjoining provinces procured new influence and some strong stations in Spain, and paved the way for the reëstablishment of the Roman imperial power in Italy, where Theodatus had succeeded (535) the regent Amalasontha, who usurped the

power on the death of her son Athalaric, the profligate grandson of Theodoric the Great. Belisarius successively reduced Sicily and conquered Naples; Theodatus was deposed by his people and assassinated; and Rome opened its gates to the army which fought in its name (536). In 539 Ravenna was reduced, but Justinian from envy recalled the conqueror. Chosroes, king of Persia, was driven from Syria in 541, and Belisarius, after a short period of disgrace, was again sent into Italy to prevent the capture of Rome by Totila. The attempt to relieve it was unsuccessful, and Belisarius was finally succeeded in the command by Narses. In 552 Justinian once more received the keys of the ancient capital, which in his reign had been five times taken and recovered. Totila had fallen in the battle of Tagina, and his successor Teias, the last of the Ostrogothic kings, shared the same fate on the Sarnus in the following year. Another great victory of Narses over the Franks and Alemanni, who then invaded Italy, secured the possession of that country, which he governed as exarch, residing in Ravenna. In the East, Justinian terminated a protracted war with the Persians by a peace (561), in which Chosroes extorted the ignominious promise of an annual tribute. The northern frontiers of the empire were in part secured against the invasions of the barbarians by similar treaties, and a vast line of fortifications, especially along the Danube, was added from a feeling of precaution which the degeneracy of the empire made but too natural. The imperial armies themselves consisted mainly of barbarian hirelings. In the interior the reign of Justinian was marked by tyranny, extortion, and lavish expenditure, especially in the erection of sumptuous buildings, of which the rebuilt church of St. Sophia was the most magnificent; by a continual meddling in the affairs of the church, and the severe persecution of heretics, Samaritans, Jews, and pagans, involving the dissolution of the Athenian school of philosophy; and by uninterrupted intrigues at the court, which, among others, finally succeeded in ruining Belisarius. Justinian, however, who was fond of studies as well as of arts, has the great merit of having, through Tribonian and other lawyers, prepared that code of Roman laws which bears his name and is the great monument of his reign. (See CIVIL LAW.) The introduction of silkworms from China through some missionaries, who brought the eggs in hollow sticks, is another of its lasting merits. Justinian was patient, frugal, and diligent, but vain, selfish, and ungrateful. "He was neither beloved in his life nor regretted at his death." He was succeeded by Justin II., his nephew. II. Surnamed RHINOTERMES (Shorn Nose), a Byzantine emperor, born in 669, died in December, 711. He succeeded his father Constantine IV. (Pogonatus) in 685. His reign was marked chiefly by wars with the Saracens, persecutions of the Manichæans, and the rapacity and exactions of his ministers. In 688 he

broke the peace which his father had made with the Bulgarians, and, although at first successful, was finally routed by them in the defiles of Mount Rhodope, and narrowly escaped with his life. The Arabs, equally provoked, invaded Africa and ravaged Cyprus, subsequently overran Asia Minor and Mesopotamia, and conquered Armenia. In 695 his general Leontius drove him from the throne, cut off his nose, and banished him to the Crimea. Leontius was soon after deposed by Tiberius Apsimerus, who reigned seven years. In 705 Justinian recovered his throne through the assistance of the Bulgarians, and put to a cruel death Leontius and Tiberius, and many others. His atrocities at last aroused a new rebellion, and he was dethroned and killed by Philippicus Bardanes, who succeeded him.

JUSTIN MARTYR (FLAVIUS JUSTINUS), the earliest of the church fathers after the apostolic age, born at Flavia Neapolis (the modern Nablus), in Samaria, about 105, died in Rome about 165. His parents were Greeks who had joined the colony sent by Vespasian to the desolated city of Shechem, which was now called after him Flavia. He appears to have been educated in the schools of Asia Minor, Greece, and Egypt, and to have studied first under a Stoic, whose teaching on the nature of God left him unsatisfied. He then attached himself to a Peripatetic, who disgusted him by his greed for money; and, unwilling to undergo the mathematical course exacted by the Pythagoreans, he finally embraced the Platonic philosophy. The objections raised by an aged Christian against its doctrines led him to study the Old Testament writings, and the heroism of the Christian confessors and martyrs induced him to profess Christianity (about 132). He appears to have continued to wear his philosopher's mantle after his conversion. About 145 he composed a polemical work against heretics, particularly against Marcion. During the persecution of Antoninus Pius he addressed a first plea (*ἀπολογία*) for the Christian cause to that emperor and the Roman people. About 150 he met, probably at Ephesus, but according to some at Corinth, with a learned Jew named Tryphon, who was attracted by Justin's philosophical garb, and had a discussion with him on the divinity of the Christian religion, which was soon afterward published. The persecution of the Christians being renewed under Marcus Aurelius, Justin addressed to that emperor a second and supplementary plea. At this time his usual residence appears to have been at Rome; and his zeal in unmasking the hypocrisy of one Crescentius, a prominent persecutor of the Christians, is thought by Eusebius to have been the occasion of his imprisonment and death. Besides the two "Apologies" and the "Dialogue with Tryphon," the authenticity of which is generally acknowledged, three other works have been attributed to him, an "Address to the Greeks," an "Admonition to the Greeks," and

a "Letter to Diogenetus" on the characteristics of the Christian worship compared with paganism and with Judaism. His feast is celebrated by both the Latin and Greek churches. The principal editions of his works are those of Robert Stephens (Paris, 1551, completed by Henry Stephens, 1592 and 1595); Friedrich Sylburg, with a Latin translation (Basel, 1565); and Prudent Maran (Paris, 1742). The best modern collection of all his works, with the acts of his martyrdom, is found in the first five volumes of Otto's *Corpus Apologetarum Christianorum Sæculi Secundi* (Jena, 1842; 2d ed., 1847-'50). His apologies were translated into English by William Reeves ("The Apologies of the Christian Fathers," London, 1709), and they are also included in a collection of translations published at Cambridge (2d ed., 1851); his "Dialogue with Trypho" by Henry Brown (London, 1755; new ed., Cambridge, 1846).—See *Justin der Märtyrer*, by Karl Semisch (2 vols., Breslau, 1840-'42; translated into English by J. E. Ryland, Edinburgh, 1843); "Some Account of the Life and Writings of Justin Martyr," by Bishop Kaye (London, 1836); and *St. Justin, philosophe et martyr*, by L. Aube (Paris, 1861).

JUTE, the fibre of *corchorus capsularis* and other species; the name is also applied to the plant which furnishes the fibre. The genus *corchorus* belongs to the order *tiliaceæ*, of which the linden or basswood is a familiar representative; the species furnishing the fibre are annuals, natives of Asia, and grow about 10 or 12 ft. high. *C. capsularis* has straight stems about as large as the little finger, branching only near the summit; the lanceolate leaves

Jute (*Corchorus capsularis*).

are about 6 in. long, nearly 2 in. broad at the base, sharply serrate on the margin, with the lower serrature on each side prolonged into a thread-like point; the yellow flowers have five sepals and petals, numerous stamens, and a single pistil which becomes a globular, flat-

topped capsule. Another species, *C. olitorius*, has a general resemblance to the preceding, but differs in its fruit, which is cylindrical, and about 2 in. long; its specific name has reference to the use of the young shoots as a pot herb, for which purpose the plant is cultivated in Egypt and Syria, and has thus become naturalized in most parts of the East as far as the Mediterranean. It is known as the Jews' mallow, and yields a portion of the jute fibre. The fibre is contained in the bark of the stems, which are cut when the plant begins to blossom, as it is then of finer quality than when the plant is older; the stems are macerated in water until the fibre readily separates; the latter is from 8 to 12 ft. long, appearing like hemp, but much more soft and silky; it is capable of minute subdivisions, and when used with silk in the manufacture of cheap fabrics it readily escapes detection. Jute does not stand exposure to the weather, and hence is not suited for the manufacture of cordage; yet it is said to be sometimes mixed with hemp for this use, and can only be regarded as an adulteration. Coarse cloth, like burlaps, matting, and cheap carpeting, are made of the fibre; and when large *chignons* were in vogue, no considerable quantity of jute was consumed in the manufacture of "switches." The great use for the fibre, however, is in the manufacture of the coarse bagging known as gunny; bags made of this are largely used in packing rice, coffee, and other eastern merchandise for shipment, and they are scarcely less in demand in this country for the transportation of our agricultural products. Cotton is largely baled in gunny cloth, and as it requires seven yards to the bale, the consumption for this product alone is very great. In India the spinning of the fibre to form gunny twist is done by men, women, and children, the material being kept at hand, to occupy the spare moments of the household; and boatmen and others who are likely to have intervals of leisure engage in the occupation. Jute butts, which are the thick ends of the stems, about 9 in. long, are used for paper making, and are also worked into a coarse fabric; the refuse fibre as well as old gunny bags furnish stock for the manufacture of coarse paper. The value of jute and its various products imported into the United States in 1873 was nearly \$4,500,000. The experiments in jute culture that have been made in some of the southern states show that fibre of a fine quality can be produced there, and there can be little doubt that when proper relations are established between producer and manufacturer, this will become an important item in our agriculture. In California, where the demand for bags to transport the immense grain crops is large, the experiments in raising jute have been encouraging. In India, the stems after stripping are utilized for making enclosures to gardens, for coarse basket work, and even for producing a fine charcoal for gunpowder and fireworks.

JUTLAND (Dan. *Jylland*), an irregular peninsula, forming a province of the kingdom of Denmark, lying between lat. 55° 18' and 57° 45' N., and lon. 8° 5' and 10° 57' E., bounded N. by the Skager Rack, E. by the Cattegat and the Little Belt, S. by Schleswig, and W. by the North sea; area, 9,788 sq. m.; pop. in 1870, 788,119. It is the main part of the ancient Cimbric Chersonese, and the country of the Jutes. The Jutes were a Germanic or Scandinavian tribe, of whose presence in this quarter we have evidence as early as the 5th century. According to Mannert, they were identical in race with the Guthi of Ptolemy, and came from the opposite Scandinavian coast. They were the earliest Teutonic invaders of Britain after the departure of the Romans. Jutland is divided into four districts called *Stifts*: Aalborg in the north, Aarhus in the east, Viborg in the centre, and Ribe in the south and west. The capital is Viborg. The N. and part of the W. coast are low, flat, and sandy, presenting long lines of dangerous banks, broken on the west by several large fiords which may be said to form lagoons. The E. shores are more rocky and have some good harbors. The Liim or Lym fiord entirely insulates the N. part of the peninsula. There are many ponds and marshes scattered over the surface, but few rivers. The largest streams are the Guden, which flows into the Cattegat, the Lonborg, which enters the Ringkøbing fiord, and the Konge, which partly separates Jutland from Schleswig. There are no mountains, and the hills are little more than accumulations of sand, seldom exceeding 100 ft. in height. The Himmeljberg, the highest point, is only 550 ft. above the sea. The soil on the east and west is fertile, but the central districts are sandy and sterile, and the N. coast is covered with drifting sands, which are planted with reeds to prevent them from being borne by the wind over the cultivated lands. On the east there are considerable forests of oak, fir, and birch, but the province has been nearly stripped of its timber, with which it was covered in the 11th century. Agriculture is in a very low state, but efforts have been made with some success to improve it. The chief products are corn, hemp, flax, and tobacco. The climate is temperate but variable, with frequent fogs and rains. The industry of the inhabitants is directed chiefly to husbandry, the coast fisheries, and domestic manufactures. There are manufactories of woollen goods, fire-arms, and earthenware. Commerce is active, and is much facilitated by the long fiords. The principal commercial emporium is Aarhus, which is connected by railway with Viborg, Holstebro, Aalborg, and Veile.

JUVENAL (JUVENALIS), **Decimus Junius**, a Roman satirical poet, flourished in the latter part of the 1st century A. D. and in the first quarter of the 2d. The only certain facts in his personal history are that Aquinum was either the place of his nativity or his chosen residence, and that he was an intimate friend of Martial,

who addresses him in three of his epigrams. According to the oldest memoir of him, ascribed with little probability to Suetonius, he was either the son or the *alumnus* of a wealthy freedman, occupied himself till middle age as a pleader, and was led to devote himself to satirical composition by the success of some verses which he wrote upon a pantomimist named Paris; after much hesitation he recited his satires before numerous audiences, which were received with so much favor that he ventured to insert in one of them his attack on Paris; this was construed into an attack on an actor at that time in high favor at court, and he was therefore, although 80 years of age, appointed to command a cohort of infantry in Egypt, and soon died of vexation and grief in this honorable exile. The pantomimist Paris, a favorite of Domitian, was put to death in A. D. 83; and as it is established that one of the satires of Juvenal was written not earlier than 96 and another not earlier than 100, he could not have been sent to Egypt in the lifetime of Paris, unless he afterward returned, in which case it is strange that his works contain no allusion to his exile. The story of his banishment is therefore questioned by some critics. Juvenal disputes with Horace the honor of being the greatest Roman satirist. Living amid the vices of a declining state, under the tyranny of Nero and Domitian, and seeing the humiliation of his countrymen, his compositions are much more purposely and formally severe than the easy and good-humored satires of Horace. Each of them is an elaborate and sonorous piece of declamation, which confirms the statement of some of his biographers that in youth he diligently attended the schools of the rhetoricians, and that he was accustomed to declaim at the forum during many years of his life. His extant works are 15 satires, and a fragment of doubtful authenticity, all in heroic hexameters. There are numerous very early editions, six of which may claim to be the *princeps*. Among the most complete editions are those of Ruperti (Leipsic, 1819), Heinrich (Bonn, 1839), and Otto Jahn (Berlin, 1851). Jahn holds that only the first 9 satires and the 11th are Juvenal's, and that these contain many interpolations; see also Ribbeck's *Der echte und der unechte Juvenalis* (Berlin, 1865). The English metrical translators are Holyday, Stapleton, Dryden (of five satires), Gifford, Hodgson, Badham, and Evans; there is also a literal prose translation, with notes, by J. D. Lewis (London, 1873).

JUXON, **William**, an English prelate, born in Chichester in 1582, died June 4, 1663. He was educated at the merchant taylors' school, and at St. John's college, Oxford. Originally destined for the law, he studied theology, and became vicar of St. Giles's, Oxford, in 1609, and rector of Somerton in 1614. He was president of his college in 1621, and vice chancellor in 1626 and 1627. He became successively dean of Worcester and prebendary of Chichester,

bishop of Hereford, and in the same year, 1633, bishop of London. In 1635 he was appointed lord high treasurer, but in 1640 earnestly solicited leave to resign the office, and returned to the charge of his diocese. He was attached to the king, whom he attended in the isle of

Wight, at his trial, and to the last upon the scaffold. After the king's execution he was deprived of his bishopric, and imprisoned for refusing to disclose his last conversation with the king. After the restoration he was made archbishop of Canterbury (1660).

K

K, THE 11th letter of the Phœnician and other Semitic graphic systems, named *kapḥ* (hollow of the hand), is also the 11th of the English and many other European alphabets, although the letters preceding it do not exactly coincide in both systems. It is the 10th (*κάππα*) in Greek. In ancient Latin, as long as C was used as the sign of G, it was the 9th; but after the innovation of C for the hard guttural in all positions, and the introduction of G as its corresponding soft guttural, it became the 10th letter, though used only in a few abbreviations, such as K. for *Cæso*, *kal.* for *calendæ*, &c. It is erroneously said to be the 11th in some modern Latin grammars. Sallust, a grammarian of Rome, attributes its introduction into the Latin to one Salvius. Quintilian denies it a place in the Latin, and blames its use even before *a*, as in *kalendæ*, *kalumnia*, although it was burnt in upon the forehead of slanderers. It was represented by *qu* in ancient French, in all positions, though in modern French only in *que* and *qui*; while in the same language the K is maintained only in a few foreign words, and in proper nouns. The sound of K is produced like that of G, with this difference, that the larynx does not oscillate during the sudden explosion of the sound.—Some proper nouns are written either with K or C; as, for instance, in German, Carl, Cöln, or Karl, Köln; or in French, Coran, Colocotroni, or Koran, &c. In German, *ck* is written for *kk* (in Polish it is pronounced *tsk*, as in *Potocki*), and the initial *k* before consonants is frequently the hardened particle *ge* deprived of *e*, as in the words *Knecht*, servant, from *ge-neigt*, bent, subject to; and *klug*, prudent, from *ge-lug*, looking out.—As a numeral sign, K denotes 20 in the Semitic, Greek, Georgian, and Cyrillic (and hence in the Russian) systems; 40 in the Glagolitic; 60 in the Armenian; 250 (along with E) in the period of Rome's decline. A dash over it raises these values to as many thousands. In rubrication it marks 10, the *j* not being counted. On Roman coins and other monuments it stands for *Kaisar*, *Karthago*, *kaput*, and many other words beginning with *Ca* in the later Latin. On French coins it designates Bordeaux; on those of Austria, K. B. signify Körmöcz-Bánya or Kremnitz mine.

KAABA, or **Caaba**. See **MECCA**.

KABBALAH. See **CABALA**.

KABYLES. See **ALGERIA**.

KAF. See **CAF**.

KAFFA, or **Kafa**, a country of E. Africa, lying S. of Abyssinia and W. of Somauli. It consists of an extensive table land, between two branches of the river Gojeb or Godafo, at an elevation of about 5,000 ft. above the sea. The country is under the sway of an absolute king, or *tata*, who it is said can raise 10,000 horsemen, and who is frequently at war with his neighbors. The inhabitants are of an Abyssinian type, and profess to be Christians; their language belongs to the Hamitic group of tongues. They cultivate the soil, which is fertile in palms, cotton, and coffee. The staple food of the people is the *ensete*, a plant resembling the banana. The cereals are not raised, and the appellation of "grain-eater" is used as a term of contempt. Trade is carried on with the merchants of Enarea, who exchange rock salt, copper, horses, cattle, and silks for coffee, cotton, and slaves. Coffee, which is supposed to have received its name (Turk. *kahve*) from this country, is indigenous, as is a species of tea plant called *khat*. The brothers Abbadie, in 1843, were the first Europeans who penetrated into the country. The chief town is Bonga, lat. 7° 12' 30" N., lon. 36° 4' E.; it contains 6,000 or 7,000 inhabitants.

KAFFA, **Caffa**, or **Feodosia** (Theodosia), a seaport of S. Russia, on the S. E. coast of the Crimea, 60 m. E. by N. of Simferopol; pop. about 10,000, exclusive of the garrison. It is built on a wide, open bay of the Black sea. The inhabitants, consisting of Russians, Tartars, Greeks, Armenians, Germans, and Jews, are mostly engaged in fishing and the manufacture of salt. Caviare is made there. Wool and hides are exported. It is the seat of a Greek archbishop, and has, besides Greek churches, a Roman Catholic church, two synagogues, two mosques, a public library, museum, botanic garden, theatre, custom house, and quarantine buildings. It is near the site of ancient Theodosia, which was founded by the Milesians, and was one of the towns of the ancient kingdom of Bosphorus. The Genoese established a colony here in the 13th century, and its commerce became so important that the Italians called the Crimean peninsula "Isola di Caffa." In the 14th century it was surrounded by formidable fortifications, the remains of which are still to be seen. The Turks captured it in 1475, and although it declined under their rule

in the middle of the 17th century, it had a population of 80,000, and 400 ships were to be seen in its harbor. It was taken by the Russians in 1770, and was ceded to them by the

Kaffa.

treaty of Jassy in 1792. Recently the place has obtained considerable importance for its sea bathing, and it is a favorite resort of the higher classes of Simferopol.

KAFFRARIA, or **Kafirland**. See **CAFFRARIA**.

KAFIRISTAN, a country of central Asia, lying between lat. 35° and 36° N., and lon. 69° 20' and 71° 20' E., bounded N. by Badakhshan, E. by Chitral, and S. and W. by Cabool; area, about 7,000 sq. m.; pop. unknown. The surface is very rugged, and the climate exhibits great extremes of temperature. In the north the snow-crested spurs of the Hindoo Koosh range divide the country into narrow valleys and rocky chasms, which form the beds of torrents; but in the south it is more level. There are no roads but narrow foot paths, and the two passes through the mountains into Badakhshan are open only during the summer months. This wild and almost inaccessible region derives its name from the epithet *kafirs* or infidels applied by the surrounding Mohammedans to its people. They assert that they are descendants of the troops of Alexander the Great, and differ in features, customs, and creed from the neighboring tribes. They are fair in complexion, blue-eyed, of regular features, intelligent, social, kind, and hospitable. They believe in one God, but worship various intercessory idols. Their language is a dialect of the Persian. Domestic slavery is practised, the slaves being sometimes those taken in feuds with hostile tribes and sometimes orphans of their own tribe. In the working of metals, which abound in their mountains, they exhibit much skill, and their silver drinking cups are often of elaborate and tasteful designs. They are almost continually at war with their Moham-

edan neighbors, who make annual incursions into their territory for slaves. Their weapons are bows and barbed arrows, which are sometimes poisoned, and for close conflict daggers and knives; but they have recently begun to use firearms. Their principal occupation is the raising of cattle and sheep, of which large herds are fed on the hills. In the valleys are raised wheat and millet, and various kinds of fruit, particularly grapes. They make excellent wine, and both sexes indulge in it to excess. Their favorite amusement is dancing to the music of the pipe and tabor. It is not known that they have any regular government, nor have they any general name for their nation; but they are divided into tribes, each

with its separate name, and all matters affecting the common welfare are settled by consultation among the chief men. They are sometimes distinguished as black Kafirs and white Kafirs, from peculiarities in their costume, the former being clad in black goat skins with the hair outside, the latter wearing a dress of white cotton.

KAGOSHIMA, or **Kagosima**, a town of Japan, in the S. part of the island of Kiushiu, renowned for its landlocked harbor, 40 m. long and from 10 to 12 m. wide at the upper part, and about 5 m. at the entrance. Kagoshima is the capital of the feudal prince Satsuma, and it was bombarded in 1863 by the English, to whom reparation had been denied for the murder of Mr. Richardson, a British subject. Three of Satsuma's steamers were sunk during the engagement, and much damage was inflicted upon the town before the prince submitted to pay an indemnity of £25,000, and to execute the murderers. The fortifications have since been repaired, and the manufactory of arms and munitions has been restored.

KAHLENBERG, a mountain of Austria, on the Danube, between Vienna and Klosterneuburg, consisting of the Kahlenberg proper, or Josephsberg, and the Leopoldsberg, and rising to a height of about 1,000 ft. above the river. It is also known as the Wiener Wald, and is the most N. E. continuation of the Noric Alps. On the Leopoldsberg is a ruined castle, with a church where Charles of Lorraine, Sobieski, and other warriors prayed for success in the battle against the Turks, in September, 1683. At the foot of the same mountain, 6 m. above Vienna, is the *Kahlenberger Dörffel*, associated with the humorous priest Wigand (*der Pfaffe*

from *Kahlenberg*), who is said to have lived here in the first part of the 14th century.

KAHNIS, Karl Friedrich August, a German theologian, born in Greitz, Dec. 22, 1814. He studied at Halle, graduated in Berlin, and became professor in Breslau, and in 1850 in Leipsic. He was regarded as a leader of the orthodox Lutherans until the publication of his *Lutherische Dogmatik* (2 vols., Leipsic, 1861-'4), which placed him in antagonism with the views of Hengstenberg and other orthodox theologians, and in nearer relation with the Reformed church. His works are numerous.

KAITEUR FALL. See *GULIANA*.

KAIRWAN, Kairvan, or El Kirwan, a city of Tunis, Africa, 80 m. S. of the city of Tunis; pop. estimated at 15,000. It is situated on a height commanding a large sandy plain, and is surrounded by a crenellated wall having four gates. It is well built and contains many elegant structures, including numerous mosques and tombs of marabouts. The Akbar mosque is a magnificent edifice, covering nearly the whole of one of the quarters. Its roof is supported by 312 columns of marble, granite, and porphyry, of the Roman period. The town is badly supplied with water, the main dependence being a capacious open reservoir of Saracenic origin, called the cistern of Ibrahim ben Aglab, a polygon of 64 sides, each of six yards. Kairwan was founded by the Arabs about A. D. 670, and was from 802 to 970 the capital of their independent African dominions. It is regarded by the Mohammedans as the most holy city of Africa, and no Christian or Jewish merchant is permitted to take up his residence there. According to Arabian historians, its population was once 60,000. It is noted chiefly, in a commercial point of view, for the manufacture of yellow morocco boots and slippers.

KAISARIYEH, a city of Asia Minor, capital of a district of the same name, in the vilayet and 160 m. S. E. of the city of Angora; pop. variously estimated from 25,000 to 50,000. It is situated in a recess of the Arjish mountains, at an elevation of 3,200 ft. above the sea. An extensive plain, watered by the river Kara-su, and fertile in cotton, fruits, and wine, stretches N. from the hills. The town is walled, and the houses are mostly of stone, but the streets are narrow and dirty. It is the emporium of an extensive export trade. The chief industry is the manufacture of cotton yarn, cloth, and yellow morocco leather.—This place, anciently called Mazaca, was the capital of Cappadocia until that country was formed into a Roman province, when the name of the city was changed to Cæsarea (whence its modern name), under which latter appellation it gave title to a Christian bishop from the early times of the church. (See *CÆSAREA*, II.)

KAISERSLAUTERN, a town of Bavaria, in the Palatinate, on the Lauter, 32 m. W. N. W. of Spire; pop. in 1871, 17,867. It has a Catholic and two Protestant churches, a Latin school, a Protestant normal school, several other educa-

tional institutions, and a richly endowed hospital. There are manufactories of tobacco, cotton, and hosiery, and several iron works. On Nov. 30, 1793, the duke of Brunswick gained here a victory over Hoche. The French also suffered defeats here in May and September, 1794.

KAISERSWERTH, a town of Prussia, in the province of the Rhine, on the river Rhine, 6 m. N. N. W. of Düsseldorf; pop. in 1871, 2,223. It is noted for the house of evangelical deaconesses founded by Pastor Fliedner, which has now branches in all countries of the Protestant world. (See *DEACONESS*.)

KAKODYLE, or Cacodyle ($As_2C_4H_{12}$), a coupled compound of arsenic and methyle, expressed by the name arsenidimethyle. The substance is a highly poisonous liquid, heavier than water, gives forth vapors of specific gravity 7.1, which have a most disgusting odor, and takes fire spontaneously on exposure to the air. It boils at 338° F., and solidifies in square prisms at 43° F.; it is soluble in alcohol or ether, but scarcely so in water. It unites as a base directly with oxygen, and probably with sulphur and chlorine also; and it furnished the first instance of the isolation of an organic metallic basyle. It is obtained by decomposing its chloride by granulated zinc, or its sulphuret by means of mercury. The preparation of the compounds of kakodyle is difficult and dangerous. The oxide obtained by distilling equal parts of dried acetate of potash and arsenious acid is an impure quality of the fetid liquid formerly known as Cadet's fuming liquor, or alkarsine, which inflames spontaneously on exposure to the air.

KALAFAT, a walled town of Roumania, in Little Wallachia, on the left bank of the Danube opposite Widin, 155 m. W. S. W. of Bucharest; pop. about 2,500. It has a town hall, a custom house, a quarantine, and cavalry barracks. The town is built on a plain of the same name, skirted by hills. Its fortifications describe an arc of a circle around the town, the Danube forming the chord. It is important in a strategic point of view, and has figured more than once in Turkish military annals. Here the Russians in 1829 lost 10,000 men in their operations against the Turks. Severe engagements took place in its vicinity in the early part of January, 1854; and an assault of the Russians was repulsed by the Turks on April 19.

KALAMATA, a town of Greece, capital of the nomarchy of Messenia and of an eparchy of the same name, about 1 m. from the gulf of Koron in the south of the Peloponnesus; pop. about 6,200. It is the seat of the bishop of Messenia, and of a court of the first resort, and has a busy trade. Its chief exports are wool, oil, cheese, raw silk, and figs. A kind of handkerchief is manufactured here, which is in great demand in the Levant. Kalamata is supposed to be built on the site of Pheræ, one of the maritime cities in the time of the Trojan war. During the crusades it was one of the

most important places of the Peloponnesus, and was annexed to the possessions of Venice. It passed into the hands of the Turks at the beginning of the 18th century. It was among the first towns delivered by the Greeks in 1821, and the first where a Grecian legislative assembly was convened. In 1825 it suffered from the attack of the Egyptians under Ibrahim Pasha, but the damage then inflicted upon the town has been gradually repaired.

KALAKAUA, David, seventh king of the Hawaiian Islands, born in Honolulu, Nov. 16, 1836. He is the son of C. Kapaakea and Keohokalole, and is descended on his mother's side from Keawe, an ancient king of the island of Hawaii. He received an English education, with Prince Lunaililo and about 15 other hereditary chiefs, in the royal school at Honolulu. In 1860 he visited California. On Dec. 19, 1863, he married the chieftainess Kapiolani. On the death of Lunaililo, Feb. 3, 1874, without proclaiming a successor, both Kalakaua and the queen dowager Emma, relict of Kamehameha IV., announced themselves as candidates for the throne. The legislature was summoned in extra session to elect a king. On Feb. 12 Kalakaua received 39 electoral votes out of 45, the remaining 6 being given to Queen Emma; and the former was consequently declared king. On hearing the result a mob of Queen Emma's partisans broke into the court house and attacked the legislature still sitting there. The authorities asked help from the American and British ships of war then lying in port, and the insurgents were promptly dispersed by parties of marines from the Tuscarora, Portsmouth, and Tenedos. Kalakaua was installed as king on the same day. On the 14th he proclaimed his brother, Prince William Pitt Leleiohoku, heir apparent.

KALAMAZOO, a S. W. county of the S. peninsula of Michigan, drained by the Kalamazoo and affluents of St. Joseph's river; area, 576 sq. m.; pop. in 1870, 32,054. The surface is level or undulating, with rich prairies, fertile plains dotted with oak timber, and thick forests. It is traversed by the Michigan Central and its South Haven division, the Grand Rapids and Indiana, the Kalamazoo division of the Lake Shore and Michigan Southern, and the Peninsular railroads. The chief productions in 1870 were 844,284 bushels of wheat, 143,817 of Indian corn, 226,942 of oats, 312,777 of potatoes, 299,532 lbs. of wool, 29,392 of hops, 714,969 of butter, and 40,784 tons of hay. There were 8,583 horses, 7,182 milch cows, 7,634 other cattle, 76,699 sheep, and 18,748 swine; 5 manufactories of agricultural implements, 5 of brick, 15 of carriages, 10 of cooperage, 4 of iron castings, 2 of engines and boilers, 2 of musical instruments, 1 of printing paper, 12 of saddlery and harness, 2 of sash, doors, and blinds, 6 of tin, copper, and sheet-iron ware, 1 of woollen goods, 4 breweries, 5 planing mills, 15 saw mills, 10 flour mills, and 4 tanneries. Capital, Kalamazoo.

KALAMAZOO, a village and the county seat of Kalamazoo co., Michigan, on the left or W. bank of the river of the same name, about 65 m. from its mouth in Lake Michigan, 60 m. S. W. of Lansing, and 143 m. W. of Detroit; pop. in 1850, 2,507; in 1860, 6,070; in 1870, 9,181. It is pleasantly situated, in the midst of a beautiful and fertile country, and is regularly built with broad streets shaded by fine oak, maple, and elm trees. It contains many elegant residences and fine business structures. The Grand Rapids and Indiana railroad, the main line and South Haven division of the Michigan Central, and the Kalamazoo division of the Lake Shore and Michigan Southern railroads intersect here. The manufactories, which are run partly by water power furnished by the river and partly by steam, include two founderies, an extensive paper mill, two marble works, two carriage factories, a wagon shop, a piano and billiard-table leg factory, a fanning mill factory, three planing mills, a plough and cultivator factory, manufactories of furniture, steel springs, burial caskets, washing machines, and morocco, tanneries, &c. There are two national banks, with a capital of \$400,000, and a state bank. Kalamazoo is the seat of the state insane asylum; of Kalamazoo college (Baptist), organized in 1855; and of Michigan female seminary (Presbyterian), organized in 1866. Kalamazoo college has a preparatory and a collegiate department, the latter including classical and scientific courses, and in 1872-'3 had three professors, 6 instructors, and 192 students, of whom 116 were males and 76 females, 26 collegiate and 166 preparatory, and a library of 2,000 volumes. Michigan female seminary is a collegiate institution, having in 1873-'4 10 instructors and 57 students. There are six public schools, employing more than 40 teachers, a private school for young ladies, a daily and two weekly newspapers, a monthly periodical, and 16 churches.—The village was first settled in 1829, and was organized in 1831. It was known as Bronson, from the first settler, till 1836.

KALAMAZOO RIVER, a river of Michigan, which rises in Hillsdale co., in the S. part of the state, and after a circuitous course of nearly 200 m. flows into Lake Michigan, in Allegan co., 98 m. in a direct line from its source. Its general direction is W. N. W. It is 300 or 400 ft. wide at its mouth, and navigable at all seasons by vessels of 50 tons to Allegan, 38 m. from the lake. It drains a rich level country, affording extensive water power.

KALCKREUTH, Friedrich Adolf von, count, a German general, born at Sottershausen, Feb. 22, 1737, died in Berlin, June 10, 1818. He entered the army in 1752, and in reward of distinguished services was made a count in 1788. In 1793 he compelled Mentz to capitulate, and shared in the victories at Kaiserslautern (1793-'4) and in subsequent successes. In 1807 he defended Dantzic against the French, was allowed to surrender under the same hon-

orable conditions which he had accorded at Mentz, and was made field marshal. In the same year he concluded a truce with Berthier at Tilsit, preliminary to the treaty of peace which he and Goltz negotiated in July with Talleyrand. In 1810 he became governor of Berlin, which office he resumed in 1814, after having been governor of Breslau.—His son, Count FRIEDRICH, published in 1825 *Dramatische Dichtungen*; and a nephew of the latter, Count STANISLAUS (born Dec. 25, 1820), became a landscape painter and director of the school of art at Weimar.

KALEIDOSCOPE (Gr. *καλός*, beautiful, *εἶδος*, a form, and *σκοπεῖν*, to see), an optical instrument for multiplying the reflected images of small colored objects, producing by the symmetry of their arrangement patterns of great beauty. An instrument on this principle was originally described by Battista della Porta and Kircher; and in a work by R. Bradley, published in 1717, entitled "New Improvement of Planting and Gardening," it was recommended for aiding in the production of designs for garden plots and fortifications. Its true principles were first developed, however, by Sir David Brewster, who devised the proper method of its construction, and in 1817 took out a patent for it.—When two oblong mirrors of the same dimensions are placed so as to hinge together along an edge of each, their reflecting surfaces facing each other, and are then opened, so as to make an angle which is an aliquot part of 180°, an object placed between the planes of the mirrors, or in contact with one of the extremities of the pair, is reflected from one mirror to the other, and produces as many images as the angle of the opening is contained in 360°. These images are arranged in symmetrical order around a circular area, the radius of which is the width of the mirror, and the centre the point of meeting in the two planes. The perfect symmetry of their arrangement depends on the angle of the opening being an aliquot part of two right angles, and that usually employed is either 18° or 20°. Another requisite is, that the line of junction of the two mirrors should be fine and smooth, as any irregularities would produce imperfections. As usually constructed, the mirrors are strips of glass blackened on one side. They are kept together by a piece of cloth glued over the edges in contact, and the proper angle is preserved by securing them in a tube of suitable shape. The open side of the triangular prism formed by the two mirrors is closed by a strip of black velvet of suitable width glued to the backs of the two mirrors. The cylindrical tube is of the diameter of the larger end of the prism, and the angle formed by the meeting of the two planes at the other extremity is nearly coincident with the centre of the circular end of the tube. Through the cover of this a small aperture is made exactly in the angle, to which the eye is to be applied in using the instrument. At the other extremity a

plain disk of thin transparent glass is fitted close to the ends of the mirrors, and outside of this is another disk, the two kept apart by a ring set in between them. In the intervening space the objects to be reflected are placed. These may be small fragments of colored transparent glass intermixed with a variety of other small bright objects. But care must be taken not to fill the case too full for the objects to move freely among themselves while the tube is made to turn in the hand upon its axis. By looking into the circular aperture made for the eye, the most gorgeous figures are perceived symmetrically arranged, and all forming one complete pattern.—Kaleidoscopes are also made with three, four, five, or more mirrors, and are then termed polycentral. To produce symmetry and regularity of form in the images of these kaleidoscopes, the angles which the mirrors make with each other must necessarily be aliquot parts of 180°; and as their number is increased, the range of the instrument in the variation of these angles is diminished. Thus three mirrors only should be arranged to make the three angles of 60° each, or two of 45° each and one of 90°, or one of 30°, one of 60°, and one of 90°. By the first arrangement, the images appear in groups of three repeated throughout the pattern. This instrument is called the triascope. By the second arrangement, the instrument, called the tetrascope, produces a pattern divided into square compartments. By the third arrangement, the pattern, of hexagonal form, presents a remarkable symmetry, and the instrument is termed a hexascope. The last two forms are especially useful to the draughtsman.

KALERGIS, Demetrius, a Greek soldier, born in Candia about 1803, died in Athens, April 24, 1867. He was educated in Russia, distinguished himself in the war of Grecian independence, was one of the promoters of the revolutionary movement of 1843, into which he entered as a partisan of Russia, and subsequently became general and adjutant of King Otho, but resigned in 1845. In London he became acquainted with Louis Napoleon, which led to his being appointed Greek ambassador at Paris in 1861, after having in the interval acted for some time as minister of war.

KALGAN, or Changkiakan, a town of China, in the province of Chihli, 110 m. N. W. of Peking; renowned as a commercial station between Russia and China, and as one of the great market towns of the empire. It extends several miles along the W. bank of a tributary of the Yangho, the stream breaking through a narrow gorge and forming a natural outlet for the highway of N. Asia. Remains of a gate of the great wall are visible on either side of the gorge, and the scenery is fine.

KALEVALA, the national epic of Finland. See FINLAND, vol. vii., p. 203.

KALIDASA, an Indian poet, who, according to tradition, lived at the court of King Vikramaditya, in the 1st century B. C. He was one

of the poets called the nine precious stones of the court. Vikramaditya (sun of strength) is a title given to several Hindoo monarchs, and many scholars believe Kalidasa to have flourished in the 11th century A. D. at the court of King Bhoja. The works attributed to him are so various that the existence of several poets of his name at different periods has been supposed. His best production is the drama *Sakuntalá*, which was translated into English by Sir William Jones in 1789, and immediately excited in Europe a lively interest in Sanskrit literature. It was translated into German by Forster (1790), Herder (1803), and others, and into French by Chézy (published with the Sanskrit original, 1830). He is the author also of the drama *Vikramurasi* (translated into English by H. H. Wilson; published with a Latin translation by Lentz, Berlin, 1833); the comedy "Malavika and Agnimitra" (published with a Latin translation by Fallberg, Bonn, 1840); the epical poem *Raghuvansa* (published in Sanskrit and Latin by Stenzler, London, 1832); the *Kumára-Sambháva* (also edited by Stenzler, London, 1838); the *Megha-dúta*, or "Cloud Messenger" (translated into English verse by H. H. Wilson, Calcutta, 1813, and London, 1843); and other dramatic and lyrical pieces.

KALISCH. See KALISZ.

KALISCH, David, a German humorist of Jewish parentage, born in Breslau, Feb. 23, 1820, died in Berlin, Aug. 21, 1872. He began his literary activity in Paris, and in 1848 founded in Berlin the *Kladderadatsch*, the German "Punch," which toward the close of his life he edited jointly with Dohm. He was the author of several popular plays, among the best known of which are *Hunderttausend Thaler*, *Berlin bei Nacht*, *Doctor Peschke*, and *Berlin wie es weint und lacht*. His pieces have been played with great success. There is a collection of his works entitled *Berliner Leierkasten*.

KALISPELS, or **Pends d'Orelles**, a tribe of Indians, of the Selish family, living in Montana, Idaho, Washington territory, and British America. They are a brave but peaceable and good-tempered race, willing to work, and, though originally a miserable half-starved race, have made great improvement, chiefly under the influence of the missions founded among them by Father P. J. De Smet in 1844. They have been exposed to inroads of less civilized tribes, and have been forced from lands which they had cultivated and deemed secured to them. A treaty made in July, 1855, ceded the lands of the Montana band, but no consideration was paid; this treaty was approved in 1859, and the Kalispels were left on a reservation in Bitter Root valley till 1871, when, under a clause in the treaty of 1855, President Grant ordered them to be removed to Jocko reservation. His action was approved by act of congress, June 5, 1872. The houses for chiefs promised by the treaty of 1855, and an agricultural school also promised, were never begun. In 1872 this band numbered 1,000. They had 70

farms under cultivation in Bitter Root valley, had 800 cattle, 2,000 horses, and many hogs, raised large quantities of wheat, oats, potatoes, and corn, and had to a considerable extent adopted the dress of the whites. The band in Idaho numbered 700, and were alternately on British and on American soil. The band in Washington territory, numbering about 400, were in Kalispel valley, east of the Cascade mountains, and were reported as the most peaceable and quiet tribe in the territory, cultivating about 400 acres, and having numerous horses, cattle, and poultry. An executive order of July 2, 1872, directed their removal to a reservation north and west of the Columbia, although they remonstrated against it.

KALISZ (Ger. *Kalisch*). **I.** A W. government of European Russia, in the kingdom of Poland, bordering on the governments of Plock, Warsaw, and Piotrków, and the Prussian province of Posen; area, 4,200 sq. m.; pop. in 1867, 601,029. **II.** One of the oldest towns of Russian Poland, capital of the government, between two branches of the Prozna, on the Prussian frontier, 130 m. S. W. of Warsaw; pop. in 1867, 13,602, of whom one fifth were Jews. It has several higher schools, a theatre, and a fine promenade. It was conspicuous during the wars of the Polish and Silesian princes in the middle ages, and was taken in 1656 by the Swedes. The Russians and Saxons gained a victory here over Charles XII. in 1706, and the Russians over the French in February, 1813. A few days after the latter event an alliance was formed here between the czar and the king of Prussia.

KALKASKA, a N. W. county of the S. peninsula of Michigan, drained by the Manistee and Grand Traverse rivers; area, 576 sq. m.; pop. in 1870, 424. Capital, Clearwater.

KALKBRENNER. **I. Christian**, a German composer, born in Minden, Sept. 22, 1755, died in Paris, Aug. 10, 1806. He was for a number of years in the service of Prince Henry of Prussia, the brother of Frederick the Great, as composer; and subsequently he officiated as singing master in the academy of music in Paris. He is the author of a number of operas and pianoforte pieces, and of a history of music, not completed at his death, which is considered valuable authority on whatever relates to Hebrew and Greek music. **II. Friedrich**, son of the preceding, born in Cassel in 1784, died at Enghien-les-Bains, near Paris, June 10, 1849. His musical education commenced at an early age, and was completed in Paris, where in 1802 he gained two prizes at the conservatory. As a pianoforte performer he was one of the most eminent of his time, and his compositions for that instrument are still in great estimation. During several years he resided in England as a teacher, but in 1823 he fixed himself permanently in Paris. Among his works are many pieces of chamber music for a variety of instruments. He arranged the symphonies of Beethoven for the pianoforte.

KALM, Peter, a Swedish botanist, born at Osterbotten in 1715, died in Abo, Nov. 16, 1779. He was educated at Upsal, and on the suggestion of Linnæus he was selected in 1745 by the Swedish government to make a botanical tour of North America. He arrived in Philadelphia in the summer of 1748, and remained in America till 1751, travelling and gathering specimens of plants in Canada, New York, and Pennsylvania. On returning to Sweden he published *En resa til Norra Amerika* (3 vols., Stockholm, 1753-'61), translated into English by John Reinhold Forster under the title of "Travels in North America" (2d ed., 2 vols., London, 1772); it was also translated into German and Dutch. He was made professor of natural history at Abo, and published numerous dissertations covering a wide range of botanical subjects.

KALMAR. See CALMAR.

KALMIA, a genus of handsome flowering, evergreen, North American shrubs of the order *ericaceæ*, named in honor of Peter Kalm. They are popularly known as laurels, but are not related to *laurus*, the true laurel. The best known and most conspicuous species is the mountain laurel (*K. latifolia*), a fine shrub, sometimes forming a small tree 15 or 20 ft. high; it is found upon rocky hills, in mountain ravines, as well as in damp rocky pastures, from Canada to Florida. The leaves are scattered, or in whorls or tufts, 2 to 4 in. long,

Kalmia latifolia.

ovate-lanceolate, petioled, somewhat reflexed on the margins, of a bright green color and a leathery texture. The flowers, which vary from pure white to deep rose color, are borne in large terminal heads, and are externally so viscid as to adhere to each other when carelessly plucked. The corolla is beautiful both before and after it opens; in its unexpanded state it has been compared to a "ten-angled casket;" it is monopetalous and salver-shaped or shallow bell-shaped. There are ten stamens, the long filaments of which are arched by each anther being caught in and held by a depression

in the corolla; a slight disturbance, such as the entrance of an insect, dislodges the anthers from their niches, and the bowed stamens spring violently upward, the jerk scattering the pollen, which is in this genus liberated from a hole or pore in the apex of each anther cell. This is one among the many contrivances for securing cross fertilization. The stems and roots afford a favorite material for rustic work; the wood is close-grained and hard, and is used for turning handles for tools and other small wares; from its use in carving, it is in some places called spoonwood, and it is also sometimes called calico bush. The mountain laurel is in Europe one of the most highly prized of American plants, but is rarely seen in our gardens. It is commonly supposed to be impossible to transplant it; but if the head of the tree be severely cut back so that nothing but naked branches are left, and the plant removed to good garden soil in early spring, it will soon throw out new shoots and by autumn be well clothed with foliage. The flowers may be had late in winter by placing bud-bearing branches in water in a warm room. The other species have the same structure in the flowers as the one already described. The low laurel, sheep laurel, or lamb-kill (*K. angustifolia*) is equally widely distributed, but is much smaller, not growing above 3 ft., and often forming tufts in low grounds. Its leaves are opposite or in threes, light green above, and pale or whitish below; the small deep crimson flowers are in corymbs, which appear lateral by the growth of the present season's shoots. As indicated by its common names, this shrub has the reputation among farmers of being poisonous to sheep; some have attributed the ill effects upon sheep to the indigestibility of the leaves; but there seems to be no doubt that the foliage of this and the preceding species produces poisonous effects on man, including nausea and temporary blindness, and similar symptoms are observed in sheep, which are relieved by an emetic. The pale laurel (*K. glauca*) is found in cold peat bogs, usually on mountains from Pennsylvania northward. It is about one foot high, with a straggling stem, opposite, nearly sessile leaves, which are very glaucous beneath, and few-flowered corymbs of lilac-purple flowers. A species peculiar to the southern states from Virginia to Florida is popularly called wicky (*K. hirsuta*); it differs from the others in having solitary axillary flowers; it does not grow over 18 in. high, and has very small leaves, a decoction of which is used by the negroes to cure diseases of the skin. The only other species is *K. cuneata*, a rather uncommon low shrub found in North and South Carolina.

KALOCSA, a town of Hungary, near the E. bank of the Danube, in the county and 69 m. S. of the city of Pesth; pop. in 1869, 16,302. It is the seat of a Roman Catholic archbishop, and has an episcopal seminary and a gymnasium. The inhabitants are chiefly engaged in agriculture and the cultivation of wine.

KALUGA. I. A central government of Russia, bordering on Smolensk, Moscow, Tula, and Orel; area, 11,927 sq. m.; pop. in 1867, 984,255. The surface is in general very level. It is watered by numerous rivers, the principal of which is the Oka. The soil is of a sandy or strong clayey nature, and only moderately fertile. More than half of this province is under forest. The climate is one of the mildest in Russia. Iron, coal, chalk, and gypsum are found. Woollens, linens, sail cloth, &c., are manufactured. **II.** A city, capital of the government, on the left bank of the Oka, 95 m. S. W. of Moscow; pop. in 1867, 36,080. It is irregularly built, being 7 m. in circumference, though not containing more than 4,000 houses, chiefly of wood. It is surrounded by a rampart which has been converted into a public promenade. It contains 23 churches, a theological college, nunnery, hospital, gymnasium, government house, orphan asylum, public library, and theatre. It is a place of considerable trade, and the chief seat of the manufactures of the province. A commercial bank was founded here by a public-spirited citizen in 1859, the profits to be applied to charitable purposes. Political offenders of high rank have been banished to Kaluga for many years past. Shamyl was removed to Kaluga in 1859.

KALW. See CALW.

KAMA, a river of Russia, the principal affluent of the Volga. It rises in a branch of the Ural mountains in the N. E. part of the government of Viatka, runs first N. and N. E., then takes a S. and S. W. direction through the governments of Perm and Kazan, forming immediately the boundary between Viatka and Ufa, and joins the Volga, after a course of about 1,200 m., 40 m. from the city of Kazan, almost doubling the volume of the Volga. It receives in its course the tributary rivers Visher, Tchusovaya, Bielaya, and Ik on the left, and the Obva and Viatka on the right. The Kama is navigated by barges to Perm, and by flatboats much higher. Its waters at Perm have a depth of 23 ft. less at the end of summer than in the freshets of spring. It is connected with a branch of the Dwina by a canal 12 m. long, establishing water communication between the Caspian and White seas.

KAMEELA, or **Kamala**, the glandular powder and hairs obtained from the capsules of *Rottlera tinctoria*, a small tree of the order *euphorbiaceæ* growing in the East Indies. The finest, consisting of roundish three-celled capsules, is gathered in February and March, and the light, mobile, brownish red powder formed by the glands and hairs, brushed off. This consists in a large proportion (78 per cent.) of resins, one or more of which is supposed to be the active principle. Kameela is actively purgative in full doses, sometimes acting violently, and occasionally causing nausea, but seldom vomiting. It has been long used in India in the treatment of tapeworm, and seems to have been found very efficient by the British practitioners in

that country. It has, however, only within a few years been used in Europe and America. It is given, without previous preparation of the patient, in the dose of from one to three drams, suspended in water, mucilage, or sirup. A tincture has been employed. The bark of another species of the genus, *R. Schimperii*, growing in Abyssinia, has been supposed also to possess anthelmintic properties. When kameela is administered in cases of tapeworm, the worm is usually expelled with the third or fourth stool.

KAMEHAMEHA, the name of a line of sovereigns of the Hawaiian islands. **I.** Called Nui (the Great), born in 1753, died at Kailua, on the island of Hawaii, May 8, 1819. He was the son of Keoua, a powerful chief among the different leaders of tribes who governed the islands in the early part of the 18th century. He was at first ruler of the western part of Hawaii, and conceiving the idea of a united government, he conquered the remainder of that island, and ultimately the whole group, the last island submitting to him in 1809. Having established his authority in 1796, he adopted liberal measures, such as the partial abolition of the *tabu* system and of human sacrifices, the introduction of many reforms, and the encouragement of agriculture and commerce. Some of these measures were owing to the suggestions of Vancouver, the explorer, who gained the king's friendship and exercised great influence over him. **II.** Son of the preceding, called Iolani or Liholiho, born on Hawaii in 1797, died in London, July 14, 1825. When he came to the throne the old native religion and customs were fast giving way before foreign ideas and innovations; and the American missionaries, who arrived in the islands March 31, 1820, met with immediate success. During the early part of his reign he completed the abolition of the *tabu* and of idolatry, accorded many privileges to the missionaries, and encouraged their endeavor to educate the people. On Nov. 27, 1823, Kamehameha, who had long desired to visit foreign countries, sailed for England with his queen Kamehamalu and suite. They received much attention in London, and met with a cordial reception from George IV. As they were about to return, however, several members of the party were attacked by a malignant form of measles, to which both the king and queen succumbed. Their bodies were carried to the islands by H. M. S. Blonde, arriving at Honolulu May 6, 1825. Kamehameha II. not having appointed a successor, a council of chiefs elected his younger brother to the vacant throne. **III.** Called Kaiuikaouli, brother of the preceding, born March 17, 1814, died in Honolulu, Dec. 15, 1854. From his accession, June 6, 1825, he reigned under the regency of Kaahumanu, queen dowager of Kamehameha I. She died in 1832, and in the early part of 1833 he assumed full control of the kingdom. He granted a liberal constitution to his subjects, and greatly encouraged

the advancement of education and civilization among them. During his reign, however, the Roman Catholic missionaries were banished from the islands. He suffered greatly from the efforts made by officers of several foreign powers, especially by the English Capt. Belcher and the French admiral du Petit-Thouars, to intimidate him, and force him to consent to measures favorable to their own nationalities; but he successfully resisted their attempts.

IV. Son of Kekuanaoa, governor of Oahu, and adopted son of the preceding under the name of Alexander Liholiho, born Feb. 9, 1834, died in Honolulu, Nov. 30, 1863. In 1850 he visited Europe with his elder brother, afterward Kamehameha V.; and soon after his return he succeeded to the throne (1854). In 1856 he married Emma, the daughter of a high native

chief by an English woman, and the adopted daughter of an English physician at the islands, Dr. Rooke. Both the king and queen had thus enjoyed the benefit of a good education by Americans, and were of much greater refinement and broader culture than their predecessors. A son was born to them May 20, 1858, but he died when but four years old. In a fit of intoxication the king wounded one of his companions by a pistol shot. Remorse for this act, and grief at the death of his son, hastened the progress of his last illness. During his later years he translated the "Book of Common Prayer" into Hawaiian, omitting the Athanasian creed. **V.** Called Lot, elder brother of the preceding, born Dec. 11, 1830, died in Honolulu, Dec. 11, 1872. Succeeding his brother in 1863, he made great changes in the affairs of the kingdom. In 1864 he set aside the constitution given by Kamehameha III., and proclaimed instead of it a more absolute one, which was accepted only after much parliamentary opposition. His reign was prosperous, but comparatively uneventful. He died unmarried, and the direct line of the Kamehamehas ended with him. He failed to nominate a successor, as provided by the constitution; and after his death Prince Lunalilo, of a high family of native chiefs, was elected to succeed him.

KAMENETZ, Kamieniec, or Kamenetz-Podolskoi, a town of Russia, capital of the government of Podolia, 12 m. N. of the Dniester, on the left bank of its confluent the Smotritza, 235 m. N. W. of Odessa; pop. in 1867, 22,490; of whom half are Jews. It is the seat of a Greek eparchy and a Roman Catholic see. The prin-

cipal buildings are the cathedral of Peter and Paul and four other Greek churches, several convents, one Armenian and three Roman Catholic churches, a Greek theological seminary, a gymnasium, two public schools, and a government library. The town has some manufac-

Kamenetz.

tures and a considerable trade, especially in peltries with Moldavia. Its fortifications were razed in 1812; it has still a citadel and a detached fort. This place was the strongest bulwark of the Poles toward their Turkish frontier. The Turks took it in 1672, and held it till the peace of Carlovitz in 1699.

KAMENZ. See CAMENZ.

KAMES, Henry Home, lord, a Scottish jurist, born at Kames, Berwickshire, in 1696, died Dec. 27, 1782. He was educated at the university of Edinburgh, and, after nearly 30 years' practice at the bar, was in 1752 elevated to the bench as a judge of the court of session. In 1763 he was made a lord of justiciary. Under the title of Lord Kames he filled both offices with ability and integrity until the close of his life. As an author he is known by numerous works on law, metaphysics, criticism, agriculture, &c., covering a period of more than 50 years. To legal literature he contributed a series of reports, consisting of an abridgment of the "Decisions of the Court of Session" from its foundation, arranged like a dictionary (2 vols. fol., 1741), "Remarkable Decisions of the Court of Session" (2 vols. fol., 1728-'66), covering nearly the whole period between 1716 and 1752, and "Select Decisions of the Court of Session from 1752 to 1768" (1 vol. fol., 1780); "Statute Law of Scotland abridged, with Historical Notes" (8vo, 1757); "Principles of Equity" (fol., 1760), &c. In 1747 he published "Essays on several Subjects concerning British Antiquities," and in 1751 appeared his "Essays on the Principles of Morality and Natural Religion," a work of ability,

but which gave offence to the Scottish church from the supposed irreligious tendency of some of the author's views. The work upon which his reputation chiefly rests is his "Elements of Criticism" (3 vols. 8vo, 1762), which was greatly admired at the time of its appearance, possessing, in the opinion of Dugald Stewart, "infinite merits," but of which Goldsmith once said, "It is easier to write that book than to read it." He also published "Sketches of the History of Man" (2 vols. 4to, 1774); "The Gentleman Farmer, being an Attempt to improve Agriculture by submitting it to the Test of Rational Principles" (1776); and "Loose Hints on Education" (8vo, 1781), written the year before his death. As a member of the board of trustees for the encouragement of manufactures, fisheries, and arts, and a commissioner for the management of forfeited estates, he labored earnestly to promote the material prosperity of Scotland. In 1807 appeared an account of his life, by Lord Woodhouselee (2 vols. 4to).

KAMIENIEC. See KAMENETZ.

KAMMIN. See CAMMIN.

KAMOURASKA, an E. county of Quebec, Canada, bounded S. E. by the state of Maine and N. W. by the river St. Lawrence; area, 1,017 sq. m.; pop. in 1871, 21,254, of whom 21,038 were of French descent. It is drained by Du Loup, Kamouraska, and Ouele rivers, and other small tributaries of the St. Lawrence, and by some affluents of the St. John. The surface is diversified, and in the south mountainous. Wheat, rye, barley, oats, and potatoes are the principal productions. It is traversed by the Rivière du Loup division of the Grand Trunk railway. Capital, Kamarouska.

KAMPEN, a town of the Netherlands, in the province of Overysssel, on the Yssel, 8 m. W. N. W. of Zwolle; pop. in 1869, 15,653. It has a gymnasium and an industrial school, machine shops, iron founderies, and manufactories of stockings and cigars. It is traversed by a canal, and its river trade is rapidly increasing. There is regular connection by steamship with Amsterdam, Zutphen, Nimeguen, Arnhem, Emmerich, and Cologne.

KAMPEN, Nikolaas Godfried van, a Dutch historian, born in Haarlem, May 15, 1776, died March 14, 1839. As a youth he acquired in a book store, where he was employed, a knowledge of literature, and mastered several languages. He then became teacher of German, editor of the "Leyden Gazette," and finally professor of the Dutch language, literature, and history, first at the university, and then at the athenæum in Leyden. He was the author of numerous works, many of which, translated into German, have a European reputation.

KÄMPFER, or **Kaempfer, Engelbrecht**, a German traveller, born in Lemgo, Lippe-Deimold, in 1651, died in Detmold, Nov. 2, 1716. He studied at Königsberg, and accompanied as secretary a Swedish ambassador to Persia. In 1685 he entered as surgeon the naval service

of the Dutch East India company, and sailed for Batavia, whence in 1690 he was despatched to Japan as physician to the embassy. He remained in Japan two years, and gathered materials for his great work on the history, resources, &c., of that empire. In 1693 he returned to Europe. He was the author of various valuable works, but published nothing himself, save his *Amœnitates Exoticæ* (1712), which contains much curious matter touching the natural history, antiquities, &c., of Persia and other countries of western Asia. His account of the Japanese empire has never been published in the original, but an English translation of it, under the title of "History of Japan and Description of Siam," appeared in London in 1727, and from this the French and German versions have been taken.

KAMPTZ, Karl Albert Christoph Heinrich von, a Prussian jurist, born in Schwerin, Sept. 16, 1769, died in Berlin, Nov. 3, 1849. He acquired renown as minister of justice and as one of the most voluminous and best writers on law. His works include *Die Provinzial- und statuarischen Rechte in der preussischen Monarchie* (3 vols., Berlin, 1826-'8), and *Zusammenstellung der drei Entwürfe des preussischen Strafgesetzbuchs* (in 3 parts, 1844-'5).

KAMTCHATKA, a large peninsula of the Russian empire, in the N. E. of Asia, about 800 m. long from N. to S., and of irregular breadth, the maximum, along the 56th parallel of latitude, being about 250 m.; area, about 100,000 sq. m.; pop. about 20,000. It is bounded N. by the country of the Tchuktehs, E. by the sea of Kamtchatka, S. by a strait separating it from the Kurile islands, and W. by the sea of Okhotsk. Since 1856 it has been united with the Trans-Yablonic district and the recently acquired Amoor territory to form the maritime province of Eastern Siberia. The coasts are dangerous of approach on account of outlying reefs. A lofty range of volcanic mountains traverses the country in a S. W. direction, with many peaks between 7,000 and 16,000 ft. high. The snow line, in lat. 56° 40', is at an elevation of 5,260 ft. This range is a portion of the great volcanic chain extending from the Yablonnoi mountain range to the Kurile islands. Dittmar, a Russian traveller (1851-'3), traced five successive formations and found 17 volcanoes still in active operation. Numerous rivers rise in the heights. The Kamtchatka, with its affluent the Yelovka, is navigable for 150 m. The most fertile portion of the peninsula for agricultural purposes lies along the valley of this river. The Russian settlers here raise oats, barley, rye, potatoes, and garden vegetables, but the rest of the country is little adapted for culture. The climate is very severe; the winter lasts nine months, and frost is common at all seasons. The mean annual temperature at Petropavlovsk on the E. coast is 28.5°, while at Tigil on the W. it is 43°. The average temperature of summer at the former place is 55.5°, and that of winter 19°,

but the thermometer has been known to fall as low as -25° . Earthquakes are frequent and violent. Animal life is very abundant, and until recently the inhabitants supported themselves wholly on the products of the chase; but since the game has diminished they find plenty of aliment in fish, which swarm in the seas and rivers. The wild animals yet abundant in the more sequestered localities are bears, wolves, reindeer, argalis or wild sheep, black, red, and gray foxes, ermines, sables, and otters. Wild fowl are very numerous. The principal varieties of fish are herrings, cod, and salmon. Whales are often seen in the adjacent seas. The mountains are covered with forests of birch, larch, pine, and cedar, of considerable size in the south, but diminishing northward until the northernmost portion of the territory is covered only with reindeer moss.—The Kamtchatdales, the principal native tribe, are of diminutive stature, but stout, with flat features, small eyes, thin lips, lank black hair, and scarcely any beard. They are a peaceable, honest, lazy, and intemperate race. In winter they live in sunken huts, in summer in huts raised on poles some 13 ft. from the ground. Their dress is equally adapted to the changes of temperature, being of fur in winter and nankeen in summer. They are nominally governed by their own *toions* or chiefs, under the jurisdiction of the Russian *ispravnik*, or chief commissary. Dog trains are used as the means of transport. The other principal tribe are the Koriaks, who live north of lat. 58° . While the Kamtchatdales are hunters and fishermen, with fixed habitations, the Koriaks are a wandering tribe, subsisting on the produce of the reindeer, and differing from them in language and mode of life. The commerce of Kamtchatka is chiefly with Okhotsk. Its exports are furs, oil, &c. Its imports are flour, sugar, dry goods, whiskey, rice, and coffee, almost all passing through the port of Petropavlovsk, the capital, on Avatcha bay. The other ports are Bolsheretsk, on the W. coast, and Lower Kamtchatka, on Kamtchatka river, with 220 inhabitants. Kamtchatka is one of the principal places of deportation in the Russian empire.—See Kennan, "Tent Life in Siberia" (New York, 1870), and Bush, "Reindeer, Dogs, and Snow Shoes" (New York, 1872).

KANABEC, an E. county of Minnesota, drained by Snake river, a branch of the St. Croix; area, 540 sq. m.; pop. in 1870, 93. The surface is uneven and partly covered with forests. Capital, Brunswick.

KANAGAWA, a town of Japan, on the W. side of a harbor in the bay of Yedo, and 16 m. S. S. W. of Tokio (Yedo); pop. about 4,000. In the town and vicinity are several famous temples and remains of old fortifications. Its former military, ecclesiastical, and strategic importance arose from the fact of its situation at the point where the great highway of Japan, the Tokaido (East Sea road), strikes the bay of Yedo. Along this road the daimios, or territorial nobles, and the envoys of the mikado

made their official journeys to and from Yedo, prior to 1868. Kanagawa was to have been opened as a treaty port, July 1, 1859; but the shogun's officials, not wishing to have foreigners live on the Tokaido, chose Yokohama, and had jetties, custom houses, storehouses, &c., already built when the foreign merchants and diplomats arrived. A few missionaries, consuls, and merchants lived for a short time at Kanagawa, but finally the entire foreign settlement was made at Yokohama. Hence arose the official fiction that the consulates of the treaty powers are at Kanagawa. Kanagawa gives its name to the *ken* or prefecture which includes the country round Yokohama, the 25-mile circuit in which foreigners are allowed to travel. Like many Japanese towns, Kanagawa consists chiefly of one long street. It has a fort, military barracks, and telegraph and railway station. A causeway connects it with Yokohama. It has lost its former importance.

KANAWHA, a S. W. county of West Virginia, intersected by the Great Kanawha and drained by Elk, Coal, and Pocatalico rivers; area, about 1,100 sq. m.; pop. in 1870, 22,349, of whom 2,184 were colored. The surface is mountainous, and the uplands are mostly covered with timber. The valleys are fertile. It is traversed by the Chesapeake and Ohio railroad. The chief productions in 1870 were 46,000 bushels of wheat, 406,826 of Indian corn, 96,268 of oats, 44,300 of Irish and 7,905 of sweet potatoes, 412,469 lbs. of tobacco, 20,457 of wool, 163,142 of butter, and 2,840 tons of hay. There were 2,426 horses, 3,400 milch cows, 1,078 working oxen, 4,011 other cattle, 9,879 sheep, and 15,714 swine; 4 manufactories of saddlery and harness, 9 of salt, 1 of woollen goods, 1 of iron castings, 39 of cooperage, 3 of flour mills, and 11 saw mills. Capital, Charleston, which is also the capital of the state.

KANAWHA RIVER. See GREAT KANAWHA.

KANDIYOHI, a S. W. central county of Minnesota; area, 864 sq. m.; pop. in 1870, 4,921. Since the census the former county of Monongalia has been united with it. The statistics are for the county as at present constituted. The surface, which is dotted with numerous small lakes, is undulating or level; the soil is productive. The St. Paul and Pacific railroad passes through it. The chief productions in 1870 were 97,315 bushels of wheat, 5,418 of Indian corn, 56,831 of oats, 27,744 of potatoes, 93,030 of butter, and 14,032 tons of hay. There were 788 horses, 1,864 milch cows, 2,924 other cattle, 3,210 sheep, and 821 swine. Capital, Kandiyohei.

KANE. I. A N. E. county of Illinois, drained by Fox river; area, 540 sq. m., pop. in 1870, 39,091. The surface consists chiefly of rolling prairie, diversified by numerous small tracts of timber. The soil is fertile and rests on a bed of limestone. The Chicago and Northwestern, the Chicago and Iowa, and the Chicago, Burlington, and Quincy railroads pass through it. The chief productions in 1870 were 189,151

bushels of wheat, 674,333 of Indian corn, 785,608 of oats, 137,407 of barley, 211,048 of potatoes, 173,264 lbs. of wool, 758,893 of butter, 124,928 of cheese, 945,351 of flax, and 73,255 tons of hay. There were 8,923 horses, 16,034 milch cows, 13,312 other cattle, 36,186 sheep, and 14,942 swine; 7 manufactories of carriages, 1 of cars, 10 of cheese, 1 of nails and spikes, 9 of iron castings, 8 of machinery, 3 of paper, 9 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 1 of watches, 3 of woollen goods, 12 flour mills, 2 tanneries, 1 currying establishment, and 1 distillery. Capital, Geneva. **II.** A S. E. county of Utah, bounded E. by Colorado, and S. by Arizona; area, 7,500 sq. m.; pop. in 1870, 1,513. It contains a portion of the great cañon of the Colorado river, which crosses the county and is joined within its borders by the San Juan river. There is some arable land at the base of the Wasatch mountains in the west, and in the valley of the Virgin river. The chief productions in 1870 were 1,663 bushels of wheat, 5,188 of Indian corn, and 6,225 of potatoes. There were 308 horses, 557 milch cows, 828 other cattle, 909 sheep, and 103 swine. Capital, Toquerville.

KANE, Elisha Kent, an American arctic explorer, born in Philadelphia, Feb. 3, 1820, died in Havana, Feb. 16, 1857. He was the son of Judge John K. Kane of Philadelphia. In 1836 he entered the Virginia university, and was rapidly qualifying himself for the profession of a civil engineer, when in 1838 he left the institution owing to a disease of the heart, from which he never fully recovered. He began in 1839 the study of medicine in Philadelphia, and on Oct. 19, 1840, he was elected, while still an undergraduate and not of age, resident physician in the Pennsylvania hospital. His health still continuing bad, his father obtained for him the post of surgeon in the navy, and he sailed in the frigate *Brandywine* with Commodore Parker, in May, 1843, as physician to the embassy to China. The American legation being delayed for several months at Bombay, Dr. Kane visited the cave temples of Ellora and Carlee, and travelled in Ceylon. While the expedition remained for nearly seven months at Macao, Dr. Kane crossed the China sea to Luzon, where he made a more complete examination of the Philippines than any foreigner had at that time effected. He traversed Luzon from Manila to the Pacific coast, and descended the crater of the great volcano of Tael. "Only one European had attempted this before, and he without success." He afterward displayed great courage and remarkable activity in visiting Chinese cities and their environs. He remained after the legation had left China, and was engaged for six months in successful practice as a physician at Whampoa, but at the close of 1844 he resolved on account of his health to return home. Before doing so he visited Borneo, Sumatra, and Ceylon, and spent several months in travelling through India, including

the Himalaya mountains. He afterward passed through Persia and Syria, traversed Egypt as far south as Sennaar, and became acquainted with Lepsius. He lost his baggage and papers, was wounded in fighting with Bedouin robbers, and returned to Alexandria, where he had an attack of the plague. Scarcely recovered, he set out for Greece, which he traversed on foot, and then passed from Patras to Trieste. He now travelled through Germany and Switzerland, making in the latter country careful studies of the glaciers, which he afterward found of service in illustrating his theories of the arctic regions. From Switzerland he went to Italy, France, and England, and from England returned home. On May 25, 1846, he sailed in the frigate *United States* for the coast of Africa. Having in Brazil in 1843 obtained letters of introduction from the famous slave dealer Da Souza to his agents in Africa, Dr. Kane was enabled to inspect the factories, and joining a caravan visited Dahomey, where he became acquainted with the sovereign. But in returning to the coast he was attacked by the fever of that region, and finally reached Philadelphia, April 6, 1847, much weakened in health. Having obtained a transfer from the naval to the military staff, he set out on Nov. 6 for Mexico. Being desirous of reaching the American army in time to take part in the war, he went from Perote with a guerilla spy company. On the way he was concerned in a desperate encounter with a Mexican party, performing feats of heroism in defence of prisoners against his own men after the victory. Generals Gaona and Torrejon were among the persons thus saved. Kane received a lance wound and had his horse killed under him. He was most kindly tended by the family of Gaona, and having been carried to Mexico on a hospital ambulance was there invalided and returned home. In January, 1849, he sailed in a store-ship to Rio Janeiro, Lisbon, and the Mediterranean, returning in October. In May, 1850, he sailed from New York as surgeon and naturalist to the expedition under Lieut. De Haven, fitted out at the cost of Mr. Henry Grinnell, to search for Sir John Franklin. (See *ARCTIC DISCOVERY*, vol. i., p. 674.) Of this expedition he published an account, "Narrative of the Expedition in Search of Sir John Franklin" (New York, 1854). The disappointment which had attended the return of the unsuccessful English and American expeditions had only increased the public desire to ascertain the fate of Franklin. More vigorous efforts were to be made, and Dr. Kane was desirous of taking part in them. When so ill as to be incapable of writing a long letter, he wrote to Mr. Grinnell, offering his services. Finally, through the liberality of Mr. Grinnell and Mr. George Peabody, \$10,000 and a brig (the *Advance*) were secured. Kane contributed his own pay (about \$3,000) and the proceeds of the lectures which he delivered in 1852-'3. The *Advance* sailed from New York under Dr.

Kane's command, May 30, 1853, and the surviving officers and crew reached home again in October, 1855, having been forced to abandon the brig in the ice, and to travel with sledges and boats for 84 days to the Danish settlements on the coast of Greenland, where they met the expedition sent out for their relief under Capt. Hartstene. No traces of Sir John Franklin's party had been found. The most striking result of the voyage was the discovery of what was supposed to be an open polar sea, the existence of which Dr. Kane had maintained in a paper read before the American geographical society, Oct. 14, 1852. The story of the sufferings and discoveries of this heroic band of explorers was told by Kane in his "Second Grinnell Expedition in Search of Sir John Franklin" (2 vols. 8vo, Philadelphia, 1856). Gold medals were awarded to him by congress, by the legislature of New York, and by the royal geographical society of London. He also received the queen's medal given to arctic explorers between the years 1818 and 1856, and a testimonial from the British residents of New York city. Dr. Kane's health now gave way again, and soon after completing his narrative he sailed for England. In London he grew rapidly worse. Finding himself sinking, he sailed on Feb. 17 for St. Thomas, whence he went to Havana, suffering during the voyage a paralytic stroke. On Dec. 25 he reached Havana, where he died as he was about to be removed to the United States.—See "Life of Dr. E. K. Kane," by William Elder, M. D. (Philadelphia, 1857).

KANE, Sir Robert, an Irish chemist, born in Dublin in 1810. He was early appointed chemical clerk to the Meath hospital, and in 1830 obtained a prize for the best essay "On the Pathological Condition of the Fluids in Typhus Fever." In 1831 he published "Elements of Practical Pharmacy." In 1832 he received the title of M. D. from Trinity college, Dublin, and in the same year projected the "Dublin Journal of Medical Science." In 1841 he was elected a fellow of the Irish college of physicians, and published the first part of his "Elements of Chemistry;" the third part, completing the work, appeared in 1842. This was for many years a text book in colleges. An edition by Prof. John W. Draper was immediately published in New York. In 1844 he published a work on "The Industrial Resources of Ireland." He was professor of natural philosophy to the royal Dublin society from 1844 to 1847, and in the latter year the royal academy awarded him the Cunningham gold medal for useful discoveries in chemistry, especially for researches on the coloring matter of lichens. In 1845 he was appointed, in conjunction with Professors Lindley and Taylor, to investigate the cause and means of prevention of the potato disease, but their labors were unsuccessful. In 1846 he was knighted by the lord lieutenant, and was appointed one of the Irish relief commissioners. In the

same year the measures recommended by him for the formation of a museum of Irish industry were carried out, the museum at St. Stephen's Green was established, and he was appointed a director. A second edition of his "Chemistry" appeared in 1849. He received the appointment of president of Queen's college, Cork, and delivered the inaugural address at the opening, Nov. 7, 1849, but resigned in 1864.

KANGAROO, a marsupial animal, whose numerous species constitute the family *macropodidae*, peculiar to Australia and the neighboring islands. (See MARSUPIALS.) The dentition is as follows: incisors $\frac{2}{2}$, canines none or one on each side in the upper jaw, premolars $\frac{1}{1}$ - $\frac{1}{1}$, molars $\frac{4}{4}$ - $\frac{4}{4}$; the upper incisors are large and broad, some of them resembling those of man, often arched, grooved, and dilated at the end; the lower incisors are horizontal, compressed, lanceolate, with cutting margins; the molars are broad, tuberculated, with nearly quadrangular crowns; in many of the species the lower incisors may be separated by means of the loose connection of the branches of the jaw at the chin. The head is elongated, the upper lip cleft, the muzzle entirely or nearly naked, ears large, eyelashes springing directly from the lids; the clavicles weak and slender, especially in the large species; fore limbs usually very small in proportion to the hind; the hands naked beneath, with five well developed fingers, each armed with a strong curved claw; the hind legs large and powerful; the foot long, four-toed, the first or inner toe being absent, the second and third long, slender, and so united by integument as to resemble a single toe with a double nail; nails distinct and hollow beneath; fourth hind toe much developed, with a large solid claw, the fifth smaller with a strong claw; tail long, thick at the base, and usually very powerful; the marsupial pouch well developed and opening forward; mammae usually four; stomach complex, and cæcum long and simple. Kangaroos are vegetable feeders, browsing like ruminants, and like these, according to Owen, occasionally chew the cud; they vary in height from that of a man to that of a hare, but when browsing apply the fore feet to the ground; at other times they rest upon the tripod formed by the hind legs and powerful tail, with the fore part of the body inclining slightly forward. They are the only marsupials which are not of nocturnal habits.—Of the 30 species described, the largest and the best known is the great kangaroo (*macropus giganteus*, Shaw), discovered in 1770 on the coast of New South Wales during Cook's first voyage; an adult male in the British museum measures 5 $\frac{1}{4}$ ft. from tip of nose to root of tail, the latter being 3 $\frac{1}{2}$ ft. additional, the head 8 $\frac{1}{2}$ in. to the ears, ears about 5 in., length of forearm and hand (without the claws) 17 in., and of tarsus alone 15 $\frac{1}{2}$ in.; the female is about one third smaller. The hair is moderately long and soft, of a general gray brown above

and paler below, toes and end of tail black. It prefers low grassy hills and plains and open districts, where it browses upon the herbage and low bushes, retiring from the heat of mid-day under the shelter of the ferns and tall grasses. At the least alarm it raises itself on the hind legs and tail, its height enabling it to command a very extensive view; exceedingly timid, with acute senses of smell and sight, it is difficult to approach, but occasionally falls a victim to the spears and traps of the natives who hunt it for food; the English colonists pursue it so successfully with hound and gun that it is now rarely seen except in the interior. The kangaroo sometimes turns upon his canine enemies, and will either rip them open with the sharp hind feet, or clasp one in his fore paws leap to some water hole and drown it; the unwary human hunter may meet a similar fate. One of the principal uses of the peculiar Australian weapon, the boome-

Great Kangaroo (*Macropus giganteus*).

rang, which may be made to fall in advance of or behind the thrower, is to destroy the timid and wary kangaroo. Though nearly as awkward as a bat when browsing, it is a most fleet and graceful animal when making its enormous bounds, sometimes clearing a rod at a leap. The fore feet are prehensile, and are used in the various offices connected with the care of the young. Kangaroos are not generally gregarious. The skin is valuable for leather, which is esteemed for shoes and gloves; the flesh is also considered a delicacy. Prof. Owen has ascertained that the gestation in the *M. giganteus* is 29 days; the young when first born resemble, according to observations made at the London zoological gardens by him, earth worms in color and semi-transparency, the body being bent upon itself, the short tail tucked in between the hind legs, and these last one third shorter than the fore legs; the whole length, when stretched out, was $1\frac{1}{4}$ in. As soon as born, the young are placed in the

mother's pouch, which is held open by her fore paws while they are taken up by her mouth. There is no vascular connection between the young kangaroo and the nipple; when separated by force the milky secretion is seen oozing out; the young seem unable to regain the nipple, which is sometimes replaced in the mouth by the mother; the teat has a circular enlargement at the tip, which makes it easy to be retained. Though the young can firmly grasp the nipple by the lips, it cannot draw the milk without the aid of the mother, which by the action of a muscle in the mammary gland can inject this fluid into the mouth of the suckling; lest the act of injection, when not coinciding with that of suction, should endanger the life of the fœtus from suffocation, the cartilages of the larynx are so arranged that the opening of the glottis is placed at the top of a cone which projects, as in whales, into the posterior nostrils, so that the stream of milk passes on each side into the gullet without the possibility of entering the wind-pipe.—The subgenus *lagorchestes* (Gould) includes a few small kangaroos with the muffle clothed with velvet-like hairs; *halmaturus* (F. Cuv.) comprises those in which the muffle is naked in front; *heteropus* (Jourdan) contains the rock kangaroos, with compact body, hind feet comparatively short and rough beneath, hairy tail, and naked muffle. In the tree kangaroos (*dendrolagus*, Muller) the fore legs are almost as long and strong as the hind legs, with pointed claws, and the tail is long, bushy, and cylindrical; they ascend trees with facility. The rat kangaroos constitute the genus *hypsi-prymnus* (Illiger), called also potoroos; they are about the size of a rabbit, with upper canines, compact body less elongated anteriorly, and with the toes of the fore feet unevenly developed, the three central ones the longest, with solid nails compressed and broadest above; they feed on roots which they dig up with their fore paws.—Fossil kangaroos have been found in the limestone caverns and alluvial deposits of Australia, of which the *M. Atlas*, *Titan*, and *Goliah* (all of Owen) were at least one third larger than any living species. The fossil genera *diprotodon* and *nototherium* of Owen, the former superior and the latter equal to the rhinoceros in bulk, found in the alluvial deposits of the Australian Condamine river, are considered to have been marsupials coming near the kangaroos and the wombats.

KANKAKEE, a N. E. county of Illinois, bounded E. by Indiana, and drained by Kankakee and Iroquois rivers; area, about 590 sq. m.; pop. in 1870, 24,352. It has a level surface, and consists chiefly of prairie with some swamps. Coal and limestone are found. The Chicago branch of the Illinois Central, the Chicago, Danville, and Vincennes, the Cincinnati, La Fayette, and Chicago, and the Chicago and Alton railroads pass through it. The chief productions in 1870 were 103,946 bushels of wheat, 637,399 of Indian corn, 772,408 of oats,

118,451 of potatoes, 122,891 lbs. of flax, 36,760 of wool, 714,666 of butter, and 73,585 tons of hay. There were 13,514 horses, 12,075 milch cows, 17,166 other cattle, 4,397 sheep, and 16,158 swine; 11 manufactories of carriages, 1 of cheese, 2 of iron castings, 3 of machinery, 1 of linseed oil, 1 of paper, 7 of tin, copper, and sheet-iron ware, 1 of sash, doors, and blinds, 1 of woollen goods, and 5 flour mills. Capital, Kankakee City.

KANO, a city of central Africa, capital of a province of the same name in Houssa, situated on a fertile plain in lat. $12^{\circ} 0' 19''$ N. and lon. $8^{\circ} 40' E.$; pop. about 40,000, nearly half of whom are slaves. In busy times the influx of foreigners and merchants swells the population to upward of 60,000. The city is surrounded by a well built clay wall 30 ft. high, having 14 gates defended by guard houses,

and making a circuit of more than 15 miles; but not more than a third of the space enclosed by the walls is occupied by houses, the remainder being appropriated to gardens and cultivated fields. It has large markets well supplied with all the necessaries of life. The principal article of commerce is the cotton cloth woven and dyed here of various colors, and which is exported to many parts of central and northern Africa. The fine cotton fabrics in such extensive demand in Timbuctoo, and which have been supposed to be produced there, are derived chiefly from Kano. Tanning and the manufacture of leathern jars and sandals are also carried on to a considerable extent. Among other articles of export are hides, dyed sheepskins, the kola nut, ivory, &c. The slave trade is an important branch of native commerce, and about 5,000 slaves are an-

Kano.

nally exported, besides many sold for domestic use. The principal European goods imported are printed muslins and calicoes from Manchester, silks, beads, sugar, needles, razors, sword blades, and various other kinds of hardware. —The province of Kano comprises a large and fertile district, with a population of more than 500,000, of whom about one half are slaves.

KANSAS, a tribe of Indians of the Dakota family, who have given their name to one of the states of the Union. They are an offshoot of the Osages, and resemble them in person, character, customs, and language. They were first heard of by Marquette, who lays them down on his map in 1673 as on the Missouri, beyond the Missouris and Osages. They soon opened friendly intercourse with the French, who in 1700 prevented the Illinois and their allies from attacking them. They were

visited in July, 1724, by De Bourmont, who was on his way to the Comanches, and was well treated by the Kansas. A Jesuit mission among them is spoken of in 1728. They finally made peace with the Osages in 1806. After Louisiana was ceded to the United States, government made a treaty of peace with the Kansas, Oct. 28, 1815. They were at this time on the river Kansas at the mouth of the Saline, having been forced from the right bank of the Missouri by the Sioux. They numbered about 1,500 in 130 earthen lodges. They had been hostile, but were then friendly. They defended themselves bravely against the Pawnees and Ottoes, but in 1819, at the instance of Major Long, their chief Herochshe made peace with the Ottoes and other tribes. Some chiefs accompanied Major O'Fallen to Washington about 1820. By the treaty of June 3, 1825,

Nampawarrah, or White Plume, and other chiefs, ceded all their lands in Missouri and some west of that state, retaining a reservation 30 m. wide on the Kansas river. Thirty-six sections of good land were to be sold, and the proceeds invested as a school fund. In return government was to give them an annuity of \$3,500 for 20 years, and aid them with domestic animals and farming implements to adopt an agricultural life. They were at this time uncontaminated with the vices of the whites, but were indolent and averse to all improvement. The buffalo was their great dependence, although game of all kinds was beginning to diminish rapidly. Their houses were conical, 40 ft. in circumference and 10 ft. high, formed of poles, covered with bark, and then with sods a foot thick. The frame was supported by wooden posts. Their features were nearly European; they shaved the head, except the scalp lock, which passed through a bone ring, and was adorned with a crest of deer's hair. They had discarded buffalo robes for blankets, and were expert with the rifle. The Methodists began a mission among them in 1835, and labored many years, but failed to produce any impression, or to make their school successful. In 1838 the Kansas had divided into three towns, two on the north bank and one on the south. They could not be induced to cultivate the soil, and being constantly at war with the Pawnees, and in their hunts frequently attacked by other tribes, they lost rapidly in numbers. By the treaty of January, 1846, they ceded certain lands for \$200,000, 5 per cent. on which amount was to be paid annually, and a reservation of 20 m. square was assigned to them on the head waters of the Neosho, S. of the Shawnees and W. of the Sacs and Foxes. In 1849 they had gathered on the Neosho, began to use liquor freely, and to plunder the trains on the Santa Fé road. As Kansas began to be settled their reservations were invaded by whites. In 1856 the half-breeds, who were all Catholics, were forced from their reservation by the squatters, aided by officials. Neither the Kansas nor the half-breeds took any part in the Kansas troubles. Railroad companies, by a treaty of 1854, obtained a right of way through the reservation. During the civil war 80 or 90 entered the United States army, and did good service. In 1862 stone houses were erected, a school was begun by the society of Friends, and an attempt was made again to induce them to cultivate the soil; but these efforts proved ineffectual. Peace was indeed made with the Pawnees, but their reservations were now overrun, and out of 80,000 acres they had only 225 in cultivation; the Indians, with the annual appropriation of \$10,000, were actually starving. They sought to move to Indian territory. A treaty was made with commissioners at Washington in 1867, and another in March, 1869; but by the act of May 8, 1872, government directed their reservation of 80,000 acres, and

their trust lands of 137,000 acres, to be sold, half the proceeds to be invested for their benefit, half to be spent in providing and improving new homes for them within the Osage reservation in Indian territory. Besides the money to arise from this source, they have 5 per cent. on \$200,000 under the treaty of 1846, and the interest on \$27,485 stocks held for them by government. The tribe about 1850 numbered 1,300; in 1860, 803; in 1872, 593.

KANSAS, a western state of the American Union, the 21st admitted, lying between lat. 37° and 40° N., and lon. 94° 40' and 102° W., bounded N. by Nebraska, E. by Missouri, S. by Indian territory, and W. by Colorado. A portion of the boundary on the northeast, adjoining Missouri, is formed by the Missouri river. The state has the general form of a rectangle, extending 410 m. E. and W. and about 210 m. N. and S., and containing 81,318 sq. m. It is divided into 104 counties, of which 31 in 1874 were unorganized, as follows: Allen, Anderson, Arapahoe, Atchison, Barbour, Barton, Bourbon, Brown, Buffalo, Butler, Chase, Cherokee, Cheyenne, Clark, Clay, Cloud, Coffey, Comanche, Cowley, Crawford, Davis, Decatur, Dickinson, Doniphan, Douglas, Edwards, Ellis, Ellsworth, Foote, Ford, Franklin, Gore, Graham, Grant, Greeley, Greenwood, Hamilton, Harper, Harvey, Hodgeman, Howard, Jackson, Jefferson, Jewell, Johnson, Kansas, Kearney, Kingman, Kiowa, Labette, Lane, Leavenworth, Lincoln, Linn, Lyon, Marion, Marshall, McPherson, Meade, Miami, Mitchell, Montgomery, Morris, Nemaha, Neosho, Ness, Norton, Osage, Osborne, Ottawa, Pawnee, Phillips, Pottawattamie, Pratt, Rawlins, Reno, Republic, Rice, Riley, Rooks, Rush, Russell, Saline, Scott, Sedgwick, Sequoyah, Seward, Shawnee, Sheridan, Sherman, Smith, Stafford, Stanton, Stevens, Sumner, Thomas, Trego, Wabunsee, Wallace, Washington, Wichita, Wilson, Woodson, Wyandotte. The cities of Kansas, as reported by the federal census of 1870, were: Atchison, which had 7,054 inhabitants; Baxter Springs, 1,284; Emporia, 2,168; Fort Scott, 4,174; Lawrence, 8,320; Leavenworth, 17,873; Ottawa, 2,941; Paola, 1,811; Topeka, the capital, 5,790; and Wyandotte, 2,940. Kansas had 8,501 inhabitants in 1855, 107,206 in 1860, and 364,399 in 1870. Township and city assessors are required to make every year an enumeration of inhabitants. According to the state census of 1873, the number of inhabitants in the organized counties was 605,063; the population in the unorganized counties was estimated at 5,800, making the total population of the state 610,863, a gain of 246,464, or 67.63 per cent. in three years. Of the total population in 1870, 202,224 were males and 162,175 females; 316,007 were native and 48,392 foreign born; 346,377 were white, 17,108 colored, and 914 Indians. Of those of native birth, 63,321 were born in the state, 35,558 in Illinois, 13,073 in Iowa, 16,918 in Kentucky, 29,775 in Missouri, 18,557 in New York, 38,205 in Ohio, and 19,-

287 in Pennsylvania. Of the foreigners, 5,324 were natives of British America, 6,161 of England, 10,940 of Ireland, 1,274 of France, 12,774 of Germany, 4,954 of Sweden, and 1,328 of Switzerland. The density of population was 4.48 persons to a square mile. There were

State Seal of Kansas.

72,493 families, with an average of 5.03 persons to each, and 71,071 dwellings, with an average of 5.13 persons to each. In the S. W. part of the state is a settlement of Mennonites. The increase of population from 1860 to 1870 was 239.9 per cent., a much larger gain during that period than is shown in any other state; the relative rank rose from 33 to 29. The number of male citizens 21 years old and upward was 99,069. There were in the state 108,710 persons from 5 to 18 years of age, and 95,002 males from 18 to 45. The total number attending school was 63,183; 16,369 persons 10 years of age and over were unable to read, and 24,550 could not write. Of the 105,680 male adults in the state, 8,894, or 8.42 per cent., were illiterate; and of the 69,645 female adults, 9,195, or 13.2 per cent., were illiterate. The number of paupers supported during the year ending June 1, 1870, was 361, at a cost of \$46,475. Of the total number (336) receiving support June 1, 1870, 190 were natives and 146 foreigners. The number of persons convicted of crime during the year was 151. Of the total number (329) in prison June 1, 1870, 262 were of native and 67 of foreign birth. The state contained 128 blind, 121 deaf and dumb, 131 insane, and 109 idiotic. Of the total population 10 years of age and over (258,051), there were engaged in all occupations 123,852 persons; in agriculture, 73,228, including 21,714 agricultural laborers and 50,820 farmers and planters; in professional and personal services, 20,736, of whom 538 were clergymen, 4,481 domestic servants, 72 journalists, 7,871 laborers not specified, 682 lawyers, 906 physicians and surgeons, and 6,012 teachers not specified; in trade and transportation, 11,762; in manufactures and mechanical and mining industries, 18,126, including 4,138 blacksmiths, 625 boot

and shoe makers, 5,064 carpenters, and 1,466 brick and stone masons. The total number of deaths returned by the census of 1870 was 4,596; there were 413 deaths from consumption, or one death from that disease to 11 from all causes; 599 from pneumonia, 354 from scarlet fever, 240 from intermittent and remittent fevers, and 204 from enteric fever. The Indians remaining in Kansas, not enumerated in the census of 1870, are the Kickapoos, 290 in number, on a reservation of 19,200 acres in the N. E. part of the state; the prairie band of the Pottawattamies, about 400, on a reservation of 77,357 acres 14 m. N. of Topeka; and about 56 Chippewas and Munsees, who own 5,760 acres of land about 35 m. S. of Lawrence. —The general surface of Kansas is an undulating plateau, which gently slopes from the western border, where the altitude above the sea is about 3,500 ft., to the eastern line, which is elevated about 750 ft. above the sea at the mouth of Kansas river. The river bottoms are generally from one fourth of a mile to 3 m. wide, but toward the western part of the state, on the Arkansas and Republican rivers, they are from 2 to 10 m. wide. Back from the bottom lands, bluffs rise to a height of from 50 to 300 ft., with a slope of 20° to 30°. From the summits of these bluffs may be seen a succession of rolls, or upland prairies, whose tops are from a quarter of a mile to a mile apart, and from 20 to 80 ft. above the intervening valley. The general inclination of the ridges is N. and S. There is no portion of the state which is flat or monotonous. The surface of eastern Kansas is chiefly undulating, and presents a succession of rich prairies, grass-covered hills, and fertile valleys, with an abundance of timber on the streams. The western half is not so diversified in its scenery, but it has a rolling and varied surface, with every requisite for a fine grazing country. Kansas is well supplied with rivers. On the E. border of the state the navigable Missouri presents a water front of nearly 150 m. The Kansas is formed by the confluence of the Republican and Smoky Hill rivers near Junction City, whence it flows in an E. course about 150 m. to the Missouri near Kansas City. It is not navigable, though steamboats have ascended to Junction City on the Smoky Hill. The latter has its source near the Rocky mountains in Colorado; it receives from the north in Kansas the Saline river, about 200 m. long, and the Solomon, 300 m. The Republican river rises in Colorado, and after flowing through N. W. Kansas into Nebraska, enters Kansas again about 150 m. W. of the E. border of the state; it is more than 400 m. long from its source. The Kansas receives from the north the Big Blue river, which rises in Nebraska and is about 125 m. long, and the Grasshopper, about 75 m.; on the south, it receives near Lawrence the Wakarusa, which is nearly 50 m. long. About two thirds of the state lies S. of the Kansas and Smoky Hill rivers, and is there-

fore called southern Kansas, the remainder being known as northern Kansas. The Osage river rises in the E. part of the state, and after a S. E. course of about 125 m. enters Missouri. The most important rivers having a southerly course are the Neosho, which rises in the central part of the state, and after a S. E. course of about 200 m., during which it receives the Cottonwood and other streams, enters the Indian territory about 25 m. W. of the S. E. corner of Kansas; the Verdigris, which flows nearly parallel with the Neosho into the Indian territory, receiving Fall river on the west; and the Arkansas, which has its sources in the Rocky mountains in Colorado. This river runs through nearly three fourths of the length of Kansas, first E. and then S. E., and with its tributaries waters two thirds of the southern part of the state. Its windings in Kansas have been estimated at 500 m. Its tributaries on the N. or E. side include the Walnut, the Little Arkansas, and Cow creek. In the S. W. corner, the Cimarron flows for a considerable distance in the state. The above constitute only the most important of the rivers of Kansas; there are numerous tributaries of these from 25 to 75 m. long, which with the main streams make Kansas one of the best watered of the western states; but none of them are navigable.—No thorough geological survey of Kansas has yet been undertaken; but preliminary examinations have been made by Professors G. C. Swallow and B. F. Mudge. The eastern portion of the state belongs to the carboniferous system, in which are found all the bituminous coal measures of the state. The greater part of this area is the upper carboniferous, the lower carboniferous only coming to the surface in the S. E. corner. This formation is composed of many different strata of limestone, sandstone, coal, marls, shales, fire clay, slate, selenite, &c., varying in thickness, and occurring irregularly. The carboniferous system is divided by Prof. Swallow into the following series: upper coal, 391 ft. thick; chocolate limestone, 79; cave rock, 75; Stanton limestone, 74; spring rock, 80; well rock, 238; Marais des Cygnes coal, 303; Pawnee limestone, 112; Fort Scott coal, 142; Fort Scott marble, 22; lower coal, 350; lower carboniferous, 120; total, 1,986 ft. Some of these series, however, are only local. Further west is the upper and lower Permian system, having a depth of about 700 ft., and containing numerous strata of magnesian limestone and beds of gypsum. This system is supposed to extend across the state from N. to S. in an irregular belt about 50 m. wide. Adjoining it on the west is a tract belonging to the triassic system, the strata of which have a thickness of 338 ft., and are composed of limestone, sandstone, thin coal veins, gypsum, selenite, and magnesian marls and shales. West of this is the cretaceous formation, extending to the foot hills of the Rocky mountains. It crosses the state in a N. E. and S. W. direction near the mouths

of the Saline and Solomon rivers, thence covering the whole western portion of the state. Prof. Mudge says: "This is one of the richest deposits of the United States in its fossils, and possesses great geological interest. It not only abounds in well preserved fossils, similar to those of other parts of the United States, as well as of Europe, but contains many species new to science. The predominant fossils of the eastern portion of this formation are dicotyledonous leaves, of which about 50 species have been found, a dozen of which are new to science. Among these is the cinnamon, now growing only in torrid climes. More westerly are quantities of the remains of sharks and other fish, equalling in size the largest now known; also saurians and other amphibians, of large size and peculiar forms." Fifteen specimens of marine shells, three of reptiles, and five of fishes, previously unknown, were obtained here. The coal-bearing region of Kansas occupies the entire E. portion of the state, having a general width from E. to W. of about 120 m., and embracing an area of about 17,000 sq. m. Throughout this region outcroppings of bituminous coal appear. Many of the veins are thin, but some of them are 7 ft. thick and produce a good quality of bituminous coal; mining is extensively carried on at several points. Coal is also found in the W. part of the state, but of inferior quality. In this region salt also exists in large quantities in numerous springs and extensive salt marshes. The salt district embraces a tract about 80 by 35 m., crossing the Republican, Solomon, and Saline valleys. Salt is also found S. of the Arkansas river. On the W. border of the state there is an extensive deposit of crystallized salt in beds from 6 to 28 in. thick. It has not, however, been made available for commercial purposes, in consequence of the difficulty of access. Analyses of Kansas salt show it to be of remarkable purity, entirely free from chloride of calcium. Iron ores have been found in various localities, but not of a character to be profitably worked. Lead, alum, limestone suitable for hydraulic cement, petroleum, deposits of paints, lime, excellent building stone, and brick and other clays are found.—Perhaps no other western state has so pleasant and beautiful a climate as that of Kansas, or so many bright sunny days. The winters are milder than in the same latitude further east, the temperature rarely falling below zero. According to observations covering five years made by Prof. Snow, Kansas had more rain during the seven months from March 1 to Oct. 1 than any other of 19 northern and western states with which comparison was made; and less during the winter months than any other except one. In summer the temperature ranges from 80° to 100°, but the air is dry and pure, while the nights are invariably cool and refreshing. The extraordinary clearness of the atmosphere is remarked by all strangers. The most

disagreeable feature of the climate is the severe winds which sweep over the prairies during the winter months from the northwest; during summer, pleasant S. W. breezes prevail. The mean annual temperature for five years was 52·8°: spring, 52·2°; summer, 75·5°; autumn, 54·3°; winter, 29·1°. The average annual rainfall was 44·09 in.: spring, 10·82; summer, 18·6; autumn, 9·79; winter, 5·42; from March 1 to Oct. 1, 34·15. The climate of Kansas is said to be highly favorable to consumptives and those suffering with asthmatic or bronchial complaints; the central and W. portions are singularly free from the diseases which prevail in miasmatic regions and mountain districts, such as fever and ague, and rheumatic and acute febrile diseases.—The soil of Kansas is highly favorable to agriculture. On the bottom lands it is from 2 to 10 ft. deep, and on the uplands from 1 to 3 ft. In the E. half of the state it is a black sandy loam intermixed with vegetable mould. In the W. part the soil is light-colored, and is deeper than that of eastern Kansas, being from 2 to 10 ft., but it contains less vegetable mould. The soil of the entire state is rich in mineral constituents; this feature, together with an unusually good drainage, gives to it valuable qualities for the growth of vegetation. Reports covering nine years show that the average production of Indian corn per acre was 18 to 48·4 bushels, wheat 11·6 to 21·4, rye 17 to 25·8, oats 25 to 42, barley 23 to 38, potatoes 85 to 149. Fine grazing and good hay are afforded by the prairie grasses which everywhere abound, growing from 1 to 6 ft. high. The plains in the W. part of the state are covered with a small grass, which has a short curled leaf and spreads on the ground like a thick mat. It is known as buffalo grass, and is extremely sweet and nutritious. Good timber is well distributed throughout the E. part of the state, being generally found along streams and adjacent ravines. The abundance of coal and stone, however, diminishes the need of wood for fuel or building purposes. The most abundant kinds of trees are oak, elm, black walnut, cottonwood, box elder, honey locust, willow, hickory, sycamore, white ash, and hackberry. The buffalo, elk, deer, antelope, prairie dog, squirrel, horned frog, prairie hen, grouse, wild turkey, wild goose, and many varieties of small birds are found. The rearing of cattle is a prominent industry, and the W. part of the state presents unusual advantages for sheep raising.—According to the census of 1870, there were 5,656,879 acres of land in farms, including 1,971,003 acres of improved land, 635,419 of woodland, and 3,050,457 of other unimproved land. The total number of farms was 38,202; there were 5,478 containing between 10 and 20 acres, 13,744 between 20 and 50, 8,732 between 50 and 100, 5,346 between 100 and 500, 42 between 500 and 1,000, and 13 over 1,000. The cash value of farms was \$90,327,040; of farming implements and ma-

chinery, \$4,053,312; total amount of wages paid during the year, including value of board, \$2,519,452; total (estimated) value of all farm productions, including betterments and additions to stock, \$27,630,651; value of orchard products, \$158,046; of produce of market gardens, \$129,013; of forest products, \$368,947; of home manufactures, \$156,910; of animals slaughtered or sold for slaughter, \$4,156,386; of all live stock, \$23,173,185. The number of acres under cultivation was returned at 2,476,862 in 1872, and 2,982,599 in 1873; the value of farm productions in the former year was \$25,265,109. The chief agricultural productions in 1870 and 1873 were as follows:

The number of domestic animals on farms reported by the census of 1870, and the number and value of all in the state as reported by the state authorities in 1873, were:

ANIMALS.	1870.	1873.	Value in 1873.
Horses.....	117,786	176,161	\$10,393,499
Mules and asses.....	11,786	17,816	1,362,971
Milch cows.....	123,440
Sheep.....	109,088	51,166	119,728
Swine.....	206,587	380,701	2,093,552
Cattle.....	250,527	684,021	13,314,441

—Though having an abundance of water power, Kansas has not yet attained a high rank in manufacturing industry, the people being devoted chiefly to agriculture, stock raising, and fruit growing. According to the census of 1870, the total number of manufacturing establishments was 1,477, having 254 steam engines of 6,360 horse power, and 62 water wheels of 1,789 horse power, and employing 6,844 hands, of whom 6,599 were adult males, 118 adult females, and 127 youth. The capital invested amounted to \$4,319,060; wages paid during the year, \$2,377,511; value of mate-

rials, \$6,112,163; of products, \$11,775,833. The chief industries were: 195 carpentering and building establishments, capital \$146,678, products \$1,725,433; 106 flouring and grist mills, capital \$1,056,800, products \$2,938,215; 123 founderies, capital \$135,986, products \$326,420; 195 lumber mills, capital \$642,955, products \$1,736,381; 76 saddlery and harness establishments, capital \$217,205, products \$425,928; 6 woollen mills, capital \$92,000, products \$141,750. Assessors are required to collect every year statistics of agriculture, manufactures, minerals, &c., and the state board of

agriculture to publish annually a detailed statement of the various industries. Transportation facilities are afforded by the Missouri river and the numerous railroads. In 1865 there were but 40 m. of railroad in Kansas. In 1873 the entire mileage had increased to 2,131, and was being rapidly extended. The railroad assessors in the latter year returned 2,062 m., assessed at \$11,704,154. The railroads lying wholly or partly within the state in 1873, together with their termini and their assessed value in Kansas, are represented in the following statement:

NAMES OF CORPORATIONS.	TERMINI.	Miles in the state completed in 1873.	Total length of line when different from preceding.	Assessed value in Kansas.

In 1873 there were in the state 26 national banks, with a paid-in capital of \$1,975,000, and an outstanding circulation of \$1,537,496. The entire bank circulation was \$1,825,496, being \$5.01 per capita; ratio of circulation to wealth, one per cent.; ratio of circulation to bank capital, 77.8 per cent. In 1874 there were 34 fire and marine and 20 life insurance companies doing business in the state.—The executive department of the government consists of a governor, whose annual salary is \$3,000; lieutenant governor; secretary of state, \$2,000; auditor, \$2,000; treasurer, \$2,000; attorney general, \$1,500; and superintendent of public instruction, \$2,000. All of these are elected by the people for a term of two years. The legislature at present (1874) comprises 33 senators, who are elected for two years, and 105 representatives, elected for one year. Their compensation is fixed by the constitution at \$3 a day for actual service, and 15 cents a mile for travel to and from the capital; the entire per diem compensation for each member being limited to \$150 for a regular and \$90 for a special session. The sessions are annual, beginning on the second

* Leased by the Atlantic and Pacific railroad company.

Tuesday of January. A two-thirds vote of all the members elected in each branch of the legislature is required to pass a measure over the governor's veto. The judicial power is vested in a supreme court, consisting of a chief justice and two associate justices, elected by the people for a term of six years; 15 district courts, of one judge each, elected by the people of the district for four years; a probate court in each county consisting of one judge elected for two years; and justices of the peace elected in each township for two years. General elections are held annually on the Tuesday succeeding the first Monday in November. The right of suffrage is limited by the constitution to white males 21 years old and over, who are either citizens of the United States or have declared their intention to become such, and who have resided in Kansas six months next preceding the election and in the township or ward in which the vote is offered at least 30 days. Persons who have engaged in a duel are made ineligible to any office of trust or profit. The property owned by a married woman at the time of marriage, and any which may come to her afterward except from her husband, remains her separate property, not subject to the disposal of her husband, or liable

for his debts. She may convey her property, or make contracts concerning it. She may sue and be sued, in the same manner as an unmarried woman, and may carry on any trade or business and have full control over her earnings. Neither husband nor wife may bequeath more than one half of his or her estate away from the other without written consent. Divorces may be granted by the district court, among other causes, for abandonment for one year, adultery, impotency, extreme cruelty, drunkenness, gross neglect of duty, and imprisonment in the penitentiary subsequent to marriage. The plaintiff must have resided a year in the state. In actions for libel, the truth published with good motives and for justifiable ends may constitute a good defence. The legal rate of interest is limited to 12 per cent. Kansas is represented in congress by two senators and three representatives, and has therefore five votes in the electoral college. The total state debt, Jan. 1, 1874, was \$701,550; bonded school debt of counties, \$1,928,585; municipal debt, \$10,899,445; aggregate, \$13,529,580. The income and disbursements of the various funds were as follows:

SOURCES.	Receipts.	Disbursements.	Balance.
General revenue.....	\$744,856 99	\$658,855 88	\$86,001 16
Interest fund.....	146,775 11	98,408 00	58,372 11
Sinking fund.....	47,229 96	8,905 00	88,324 96
Annual school fund...	249,771 82	237,220 23	12,551 59
Permanent school fund	231,164 61	229,625 97	1,538 64

1872	127,690,937	6 1/2 "	1,085,372
1873	125,684,176	6 "	754,105

The state government is supported chiefly by a tax directly upon the people, the assessment being made upon a cash valuation of all the real and personal estate, including the property of railroad companies and other corporations. The asylums for the insane, deaf and dumb, and blind are each controlled by a board of six trustees appointed by the governor and senate. The asylum for the insane at

Osawatomie is greatly inadequate to the needs of the state. The number of patients at the close of 1873 was 121; the current expenses for the year amounted to \$28,221. Since the opening of the asylum in 1863, 378 persons have been admitted, of whom 161 have been discharged recovered, 38 improved, 26 stationary, and 19 died. The asylum for the deaf and dumb at Olathe, organized by the legislature in 1866, is intended to afford instruction, without charge for board or tuition, to all the deaf and dumb of the state between the ages of 10 and 21 years. The course of instruction covers six years, but may be extended in certain cases. Students are also required to devote time to industrial pursuits with a view of being able to obtain a livelihood after leaving the institution. By this means a considerable income is created for the asylum. In 1873 there were 5 instructors and 77 pupils, of whom 52 were in attendance at the close of the year. The amount appropriated by the legislature was \$36,604, including \$20,000 for additional buildings. The institution for the blind, founded in 1867, is at Wyandotte. It comprises educational and industrial departments, and in 1873 had 4 instructors and 33 pupils. The cost of the institution in that year was \$11,590. The state penitentiary at Leavenworth at the end of 1873 had 340 convicts, of whom 19 had been sentenced by the United States and 49 by military courts; 25 had been convicted of murder, 11 of manslaughter, 10 of assault with intent to kill, 173 of larceny, 32 of burglary, 15 of robbery, and 15 of rape. The disbursements for 1873 were \$126,267; the resources amounted to \$139,607, including \$70,000 appropriated by the legislature and \$54,232 received from prisoners' labor, boarding United States prisoners, &c. Some of the convicts are employed in various industrial pursuits within the prison, while others are employed under contract outside. Convicts may receive a percentage of their earnings. In 1873, for want of a state reform school, 75 boys from 15 to 20 years of age were confined in the penitentiary.—The constitution requires the legislature to "encourage the promotion of intellectual, moral, scientific, and agricultural improvement, by establishing a uniform system of common schools, and schools of a higher grade, embracing normal, preparatory, collegiate, and university departments." The proceeds of all lands granted by the United States to the state for schools, and of the 500,000 acres granted to each of the new states by congress in 1841, all estates of persons dying without heir or will, and such percentage as may be granted by congress on the sale of lands in this state, are made a perpetual school fund. The income of the state school funds is required to be disbursed annually among the school districts; but no district is entitled to receive any portion of such funds in which a common school has not been maintained at least three

months in each year. General educational interests are under the supervision of a state superintendent of public instruction, and there is a superintendent in each county. The board of education consists of the state superintendent, the chancellor of the state university, the president of the state agricultural college, and the principals of the state normal schools at Emporia and Leavenworth. A prominent duty of the board is to issue diplomas to such teachers as pass the examination. The state institutions of learning are governed by a board of seven regents, of whom one is an *ex officio* member and six are appointed by the governor and senate. According to the census of 1870, the whole number of schools was 1,689, having 1,955 teachers, of whom 872 were males and 1,083 females, and attended by 59,882 pupils. Of these, 1,663 were public schools, with 1,864 teachers and 58,030 pupils; 5 were colleges, with 27 teachers and 489 students; 6 were academies, with 36 teachers and 415 pupils; and 4 were private schools, with 4 teachers and 115 students. The total income of all the educational institutions was \$787,226, of which \$19,604 was from endowment, \$678,185 from taxation and public funds, and \$89,437 from tuition and other sources. In 1873 there had been organized 4,004 school districts, in which there were 3,133 school houses. The entire school population of the state (between 5 and 21 years of age) numbered 184,957, of whom 121,690 were enrolled in the public schools, the average daily attendance being 71,062. There were 1,880 male teachers, receiving an average monthly salary of \$38 43, and 2,143 female teachers, whose average monthly salary was \$30 64. The permanent school fund was \$1,013,982, including \$1,003,682 interest-bearing securities. The income from various sources for public schools amounted to \$1,657,318, including \$931,958 from district tax and \$231,917 received from state fund. The total expenditures for schools were \$1,488,676, including \$716,056 for teachers, \$51,504 for rent and repair of buildings, \$160,723 for furniture, apparatus, &c., \$515,071 for buildings and sites, and \$79,812 for miscellaneous items. The total value of school houses was \$3,408,956; of apparatus, \$33,873. Kansas has four state normal schools for the free training of public school teachers: one at Emporia, organized in 1865; one at Leavenworth, in 1870; one at Quindaro, in 1871; and one at Concordia, in 1874. The first named has a normal department, which affords a two years' and a four years' course of study, and a model department. The number of students in 1873 was 218, the disbursements \$17,829. The school at Leavenworth comprises a normal department, which affords a thorough knowledge of all subjects taught in the public schools of the state, and a model school in which the art of teaching may be practised. This model school comprises 13 grades or departments, in which in 1873 there were 1,100

pupils receiving instruction from 15 teachers. In the normal department there were 7 teachers and 63 students. The Quindaro normal school is for colored persons, and was attended in 1873 by 82 pupils. The state university is at Lawrence. The plan of the institution comprises six departments: 1, science, literature, and the arts; 2, law; 3, medicine; 4, theory and practice of elementary instruction; 5, agriculture; 6, normal department. In 1874 only one of these departments had been organized; this comprised a classical course, a scientific course, and a course in civil and topographical engineering. There were then 12 instructors and 272 pupils, of whom 73 were in the collegiate and 199 in the preparatory department. No charge is made for tuition. The university already has valuable collections in natural history, and a considerable library. The magnificent building of the institution, 246 ft. long, 98 ft. wide in the centre and 62 in the wings, contains 54 rooms, including an immense hall, to be devoted to purposes of instruction. The state agricultural college at Manhattan has received the national grant of lands made for the establishment of colleges of agriculture and the mechanic arts. The aim of the institution is to afford an industrial rather than a professional education. Four general courses of instruction are provided: the farmer's, the mechanic's, the commercial, and the woman's. The farm contains 200 acres of prairie upland, so arranged as to afford the best facilities for teaching the applications of science to agriculture and making practical experiments. The nursery of 67 acres contains the largest and most valuable assortment of fruit and forest trees west of the Mississippi river. The mechanical department embraces carpenter, wagon, blacksmith, paint, and harness shops. Women are taught sewing, printing, telegraphy, photography, and other branches. Tuition in all departments is free. The principal colleges are St. Benedict's (Roman Catholic), at Atchison, founded in 1859, which in 1873 had 7 instructors and 94 pupils; Washburn college (Congregational), at Topeka, founded in 1865, having 5 instructors and 93 students; Highland university (Presbyterian), with 4 instructors and 137 students; Baker university (Methodist Episcopal), at Baldwin City, with 8 instructors and 65 students; college of the sisters of Bethany (Episcopal), at Topeka, with 10 instructors and 83 pupils; and Ottawa university (Baptist), at Ottawa. The Kansas academy of science was organized in 1868 as a society of natural history, but was enlarged in its scope in 1871, and incorporated by the legislature the following year. In its present form it comprehends observers and investigators in every line of scientific inquiry, and aims to increase and diffuse a knowledge of science particularly in its relation to Kansas. The society has made valuable contributions to the knowledge of the state in geology, botany, ornithology, ichthyology, en-

tomology, and meteorology, and designs in time to make a complete scientific survey of the state.—According to the census of 1870, there were in the state 574 libraries, having 218,676 volumes; 364, with 126,251 volumes, were private, and 190, with 92,425, were other than private, including 4 circulating libraries with 6,550 volumes. The state library in 1874 contained about 10,000 volumes. The number of newspapers and periodicals in 1870 was 97, with an aggregate circulation of 96,803; copies annually issued, 9,518,176; 12 were daily, circulation 17,570; 4 tri-weekly, circulation 1,840; 78 weekly, circulation 71,393; and 3 monthly, circulation 6,000. The number of religious organizations of all denominations was 530, having 301 edifices, with 102,135 sittings, and property valued at \$1,722,700. The denominations were represented as follows:

DENOMINATIONS.	Organizations.	Edifices.	Sittings.	Property.
Baptist, regular.....	91	56	18,540	\$247,900
Christian	35	16	4,550	45,300

—Kansas was annexed to the United States in 1803 as part of the territory bought from France under the general designation of Louisiana. By the Missouri compromise bill of 1820 it was provided “that in all the territory ceded by France to the United States under the name of Louisiana which lies N. of lat. 36° 30' N., excepting only such part thereof as is included within the limits of the state [Missouri] contemplated by this act, slavery and involuntary servitude, otherwise than in the punishment of crime whereof the party shall have been duly convicted, shall be and is hereby for ever prohibited.” By an act of congress passed in May, 1854, the territories of Kansas and Nebraska were organized, and in section 14 of this act it was declared that the constitution and all the laws of the United States should be in force in these territories except the Missouri compromise act of 1820, “which . . . is hereby declared inoperative and void.” The question of slavery was thus left to the decision of the inhabitants of the territory. This formed the leading topic of discussion in congress, and caused a great agitation throughout the country. About a month previously the legislature of Massachusetts had incorporated the Massachusetts emigrant aid company, for the purpose of assisting emi-

grants to settle in the new territories, by giving them useful information, procuring them cheap passage over railroads, and establishing mills and other conveniences at central points in the new settlements. In July the legislature of Connecticut granted a charter to a similar company. A large immigration into Kansas from the northwestern states had already taken place, and emigrants in considerable numbers from the free states and a few from the slave states now availed themselves of the opportunities for cheap transportation offered by these companies to settle in Kansas. A party of 30 men led by Mr. Branscomb founded the town of Lawrence, and were soon after joined by 60 or 70 more led by Mr. Charles Robinson and S. C. Pomeroy. Settlers from Missouri were at the same time passing into Kansas, in many cases taking their slaves with them. On July 29, 1854, a public meeting, called by the “Platte County Defensive Association,” was held at Weston, Mo., and resolutions were adopted and published declaring that the association would hold itself in readiness, whenever called upon by any of the citizens of Kansas, “to assist in removing any and all emigrants who go there under the auspices of northern emigrant aid societies.” On Aug. 12 another meeting was held at Weston, at which resolutions were adopted, declaring in favor of the extension of slavery into Kansas. It also appears from a congressional investigation ordered in 1856, that before any elections were held in the territory a secret society was formed in Missouri for the purpose of extending slavery into Kansas and other territories. This was to be done by sending voters into the territory. Andrew H. Reeder of Pennsylvania had been appointed governor by President Pierce, and arrived in Kansas Oct. 6. An election for a territorial delegate to congress was held Nov. 29. The polls were taken possession of by armed bands from Missouri, and out of 2,843 votes cast it was subsequently estimated by a congressional investigating committee that 1,729 were illegal. On March 30, 1855, another election for members of the territorial legislature was held, and the polls were again taken possession of by large bodies of armed men from Missouri, who, after electing pro-slavery delegates from every district, returned to their own homes in the adjacent state. From the investigation by the congressional committee it appeared that out of 6,218 votes cast at this election, only 1,410 were legal, of which 791 were given for the free-state or anti-slavery candidates. From six of the districts, evidence of the illegal nature of the proceedings having been laid before Gov. Reeder, he set aside the returns and ordered new elections in those districts, which resulted in the choice of free-state delegates, except at Leavenworth, where the polls were again seized by Missourians. Gov. Reeder soon after visited Washington to confer with the federal authorities, and after his return his removal from the office

of governor was announced, July 26, for the alleged reason of irregular proceedings in the purchase of Indian lands. The territorial legislature assembled at Pawnee, July 3, but two days afterward adjourned to Shawnee mission, near the Missouri line, where they reassembled July 16, and remained in session till Aug. 30. One of their first acts was to expel the free-state men chosen at the second elections ordered by Gov. Reeder, and to give their seats to the pro-slavery men originally returned. They also passed an act making it a capital offence to assist slaves in escaping either into the territory or out of it; and felony, punishable with imprisonment at hard labor from two to five years, to conceal or aid escaping slaves, to circulate anti-slavery publications, or to deny the right to hold slaves in the territory; also an act requiring all voters to swear to sustain the fugitive slave law; and they also adopted in a body the laws of Missouri, and passed an act making Lecompton the capital of the territory. Wilson Shannon of Ohio was appointed governor in place of Mr. Reeder, and assumed office Sept. 1. A few days later a convention of the free-state party was held at Big Springs, and, after protesting against the acts of the legislature, nominated ex-Governor Reeder as delegate to congress, and appointed Oct. 9 as the time for holding the election, when Gov. Reeder received about 2,400 votes. Delegates were subsequently chosen to a constitutional convention, which assembled at Topeka Oct. 23, and sat till Nov. 12, when they promulgated a constitution for the state of Kansas in which slavery was prohibited. The contest between the free-state and pro-slavery parties now grew to such a pitch of violence that several men were killed on each side, and the people of Lawrence began to arm for self-defence. The governor called out the militia. A large number of Missourians enrolled themselves as Kansas militia, and Lawrence for some days was in a state of siege; but the difficulty was temporarily adjusted by negotiation, and the Missourians retired to their own state. On Dec. 15 the people voted upon the question of accepting the Topeka constitution, and the pro-slavery men abstaining from participation, it was accepted with only 45 votes against it, exclusive of Leavenworth, where the polling was prevented by an inroad from Missouri. On Jan. 15, 1856, an election was held for state officers and a legislature under the Topeka constitution, and Charles Robinson was chosen governor. The legislature met at Topeka March 4, and, after organizing and inaugurating the governor and other officers, adjourned to July 4. Early in April a considerable body of armed men from Georgia, Alabama, and other southern states, led by Major Buford, arrived in Kansas. On the 17th of the same month a special committee of the United States house of representatives, appointed about a month before, and charged to investigate the troubles in the ter-

ritory of Kansas, arrived at Lawrence. The result of their investigations was a report by the majority of the committee, Messrs. Howard of Michigan and Sherman of Ohio, in which they said: "Every election has been controlled, not by the actual settlers, but by citizens of Missouri; and, as a consequence, every officer in the territory from constable to legislators, except those appointed by the president, owe their positions to non-resident voters. None have been elected by the settlers, and your committee have been unable to find that any political power whatever, however unimportant, has been exercised by the people of the territory." Mr. Oliver of Missouri, the third member of the committee, made a minority report, in which he said that there was no evidence that any violence was resorted to, or force employed, by which men were prevented from voting. On May 5 the grand jury of Douglas county found indictments against Reeder, Robinson, Lane, and other free-state leaders, for high treason, on the ground of their participation in the organization of a state government under the Topeka constitution. Reeder and Lane escaped from the territory, but Robinson was arrested and kept in prison for four months. The United States marshal took Buford's men into pay, and armed them with government muskets. Lawrence was again besieged by a large force, and on May 21, under a promise of safety to persons and protection to property, the inhabitants gave up their arms to the sheriff. The invaders immediately entered the town, blew up and burned the hotel, burned Mr. Robinson's house, destroyed two printing presses, and plundered several stores and houses. A state of civil war now spread through the territory, the free-state party being furnished with contributions of arms and money from non-slaveholding states. On May 26 a fight, in which five men were killed, occurred at Pottawattamie, where John Brown with a band of free-state men was encamped; and on June 2 there was another at Black Jack, which resulted in the capture of Capt. Pate together with 30 of his men. Similar affairs, attended with loss of life, continued to occur for three or four months. Parties of emigrants from the free states on their way through Missouri were in many cases stopped and turned back. The free-state legislature met at the appointed time (July 4) at Topeka, and was forcibly dispersed by United States troops under Col. Sumner. On Aug. 14 the free-state men assailed and took a fortified post near Lecompton, occupied by Col. Titus with a party of pro-slavery men, and captured Titus and 20 other prisoners. On Aug. 17 a treaty was agreed to between Gov. Shannon and the free-state men, by which Shannon restored the cannon taken at Lawrence, and received in exchange Titus and the other prisoners. A few days later Shannon received notice of his removal from office, John W. Geary of Penn-

sylvania being appointed in his stead. Mr. Woodson, the secretary of the territory, and acting governor before Geary's arrival, on Aug. 25 issued a proclamation declaring the territory to be in a state of rebellion. He collected a considerable armed force at Lecompton, while another body, amounting to 1,150 men, assembled under the Hon. David R. Atchison, late U. S. senator from Missouri, at a point called Santa Fé. On Aug. 29 a detachment from Atchison's army attacked Osawatimie, which was defended by a small band under John Brown, who made a vigorous resistance, but were defeated with the loss of two killed, five wounded, and seven prisoners. Five of the assailants were killed, and 30 buildings were burned. The next day a body of free-state men marched from Lawrence to attack Atchison's army. On their approach the latter retired with his forces into Missouri. On Sept. 1 the annual municipal election took place at Leavenworth. A party, chiefly from Missouri, killed and wounded several of the free-state men, burned their houses, and forced about 150 to embark for St. Louis. On Sept. 8 Gov. Geary arrived at Lecompton, and Robinson and the other prisoners held on a charge of treason were released on bail. The governor on assuming office issued a proclamation calling upon all bodies of armed men to disband. He also promised protection to the free-state men, who accordingly laid down their arms. But the Missouri men immediately assembled to the number of upward of 2,000, forming three regiments with artillery, and marched to attack Lawrence, under command of a member of the Missouri legislature. Gov. Geary with a force of United States soldiers interposed between them and Lawrence, and finally prevailed upon them to retire. During their retreat a free-state man named Buffum was shot down by a man named Hanes almost in the presence of the governor, who subsequently caused the arrest of Hanes on a charge of murder. The United States district judge Lecompte, who was noted as an active partisan, liberated Hanes on bail, and afterward on *habeas corpus*. Thereupon Gov. Geary forwarded a representation to Washington demanding the judge's removal, and about the middle of December James C. Harrison of Kentucky was appointed in his place. Gov. Geary now reported to the president that peace and order were completely reestablished in Kansas. On Jan. 6, 1857, the legislature elected under the Topeka constitution met at Topeka, and organized next day. The United States marshal immediately arrested the president of the senate, the speaker of the house, and about a dozen of the leading members, whom he carried prisoners to Tecumseh on the charge of "having taken upon themselves the office and public trust of legislators for the state of Kansas, without lawful deputation or appointment." The houses, being left without a quorum, met the next day and adjourned till June. Shortly

afterward the territorial legislature, composed entirely of pro-slavery men, chosen at an election in which the free-state men had declined to participate on the ground of its illegality, met at Lecompton, and among other acts passed one providing for the election of a convention to frame a state constitution for Kansas. Meanwhile the house of representatives at Washington had passed a bill declaring void all the enactments of the territorial legislature, on the ground that they were "cruel and oppressive," and that "the said legislature was not elected by the legal voters of Kansas, but was forced upon them by non-residents." The senate refused to pass the bill, and also to confirm the appointment of Harrison in place of Lecompte, who thus remained chief justice of Kansas, never having been actually dismissed. Upon this Gov. Geary resigned his office and quitted the territory. Robert J. Walker of Mississippi was appointed by President Buchanan his successor, with Frederick P. Stanton of Tennessee for secretary. The election for delegates to the constitutional convention was held on June 15. The free-state men generally took no part in it, on the ground that the legislature which ordered it had no legal authority, and that if they attempted to vote they would be defrauded and overborne by intruders from Missouri. About 2,000 votes were cast, while the legal voters in the territory by a recent census numbered about 10,000. At the territorial election held a few months later, the free-state men, being assured by Gov. Walker of protection from intruders, went to the polls and cast about 7,600 votes, to 3,700 votes thrown by the opposite party, electing Marcus J. Parrott delegate to congress, together with 9 of the 17 councilmen and 27 of the 39 representatives. An attempt was made to change this result by means of a false return from Oxford, Johnson co., a place containing 11 houses. It was alleged that at this place 1,624 persons had voted, and a corresponding roll of names was sent in, which on examination proved to have been copied in alphabetical order from a Cincinnati directory. This return, which if accepted would have changed the party character of the legislature by transferring from the free-state to the pro-slavery side eight representatives and three councilmen, was rejected by Gov. Walker as a manifest falsification. Soon after the territorial election the constitutional convention met at Lecompton and adopted a constitution, four sections of which related to slavery, declaring the right of owners to their slaves to be inviolable, and prohibiting the legislature from passing acts of emancipation. This provision alone was to be submitted to the electors at an election to be held on Dec. 21. The ballots cast were to be endorsed "Constitution with slavery" or "Constitution with no slavery," thus securing in any event the adoption of the constitution, several clauses of which, besides those thus submitted, were highly ob-

jectionable to a majority of the people. A provision was inserted in the schedule annexed to the constitution preventing any amendment of that instrument previous to 1864. The promulgation of this constitution caused great excitement in Kansas. Gov. Walker condemned it in the strongest manner, and proceeded at once to Washington to reconstitute against its adoption by congress; but before his arrival there the act had received the approval of the president. Gov. Walker soon after his arrival in Washington resigned, and J. W. Denver of California became governor. At the election of Dec. 21 for the adoption or rejection of the slavery clause, the vote returned was 6,226, more than half of which was from counties along the Missouri border, whose total number of voters by the census did not exceed 1,000. Against the slavery clause there were 569 votes, the free-state men generally abstaining from voting. The constitution being thus nominally adopted, an election for officers under it was to be held on Jan. 4. The territorial legislature at a special session passed an act submitting the Lecompton constitution to the direct vote of the people on the same day with the Lecompton state election, and the result was a majority of 10,226 votes against it. Congress after long discussion referred the matter to the people of Kansas at an election on Aug. 3, 1858, when the Lecompton constitution was again rejected by 10,000 majority. Meanwhile the territorial legislature had called another convention to meet in April to frame a new constitution, which was submitted to the people and ratified by a large majority, though by a small total vote. Shortly after the rejection of the Lecompton constitution by the people, Gov. Denver resigned, and Samuel Medary of Ohio was appointed in his place. The territorial legislature met in January, 1859, and passed an act submitting to the people the question of calling still another constitutional convention. The election was held April 4, and the result was a majority of 3,881 in favor of holding a convention. An election was accordingly held for delegates, and the convention thus chosen met at Wyandotte July 5, and adjourned July 27, after adopting a constitution by a vote of 34 to 13, prohibiting slavery. This constitution was submitted to the popular vote Oct. 4, and was ratified by a vote of 10,421 to 5,530. The first election under it was held Nov. 8, when a delegate to congress and members of the territorial legislature were elected. On Dec. 6, 1859, a representative in congress, state officers, and members of a state legislature were chosen, the governor being Charles Robinson. On Jan. 29, 1861, Kansas was admitted into the Union under the Wyandotte constitution, which with the several amendments since passed is still the supreme law of the state. During the early part of the civil war eastern Kansas suffered much from the irregular warfare, known there as "jay-hawking," which was carried on by confed-

erate raiders from Missouri and Arkansas and the unionists who opposed them. The most prominent of these disorders was the attack made upon Lawrence, Aug. 21, 1863, by a band of confederate guerillas under Col. Quantrell, which resulted in the loss of many lives and much property. During the war Kansas furnished to the federal army upward of 20,000 men.—See "Resources of Kansas," by C. C. Hutchinson (Topeka, 1871).

KANSAS CITY, a city of Jackson co., Missouri, the second in the state in population and importance, situated on the right bank of the Missouri river, just below the mouth of the Kansas river, and near the Kansas border, 135 m. W. N. W. of Jefferson City, and 235 m. W. by N. of St. Louis; pop. in 1860, 4,418; in 1870, 32,260, of whom 3,770 were colored and 7,679 foreigners; in 1874, estimated by local authorities at 40,000. The site, which was originally very rough and uneven, has been levelled, and now presents a moderately even appearance, except where a high bluff divides the upper or hill part of the city from the "bottom" or low lands where the railroad depots are. It is not regularly laid out, but the streets are wide, and are graded and sewered, provided with sidewalks, and lighted with gas. The buildings are chiefly of brick. Waterworks are in process of construction. The Missouri is here spanned by a bridge 1,387 ft. long, resting on seven piers, erected at a cost of \$1,000,000. Four lines of street railroad, with an aggregate length of 13½ m., run to various parts of the city and to the suburbs of Wyandotte, Kan., and Westport. The surrounding country is fertile, and abounds in coal, lead, iron, zinc, salt, gypsum, fire clay, and building stone. By means of seven railroads the city commands the trade not only of W. Missouri and Kansas, but also of N. Texas and part of Colorado and New Mexico. These lines, which centre at a common passenger depot, are the Hannibal and St. Joseph; Kansas Pacific; Kansas City, St. Joseph, and Council Bluffs; Leavenworth, Lawrence, and Galveston; Missouri River, Fort Scott, and Gulf; Missouri Pacific; and St. Louis, Kansas City, and Northern. The Kansas City and Memphis and the Kansas City, Wyandotte, and Northwestern railroads are in progress from the city, and the Kansas Midland line is expected to reach this point in 1874. The number of arrivals of steamboats in 1873 was 65. The organization of a system of barge navigation has been much discussed, and promises success. The sales of merchandise at wholesale in 1872 amounted to \$13,844,440; in 1873 to \$15,695,000; at retail in the latter year, to \$5,555,000. The trade in cattle (chiefly from Texas) and in hogs is one of the most important branches. The receipts of cattle in 1871 were 120,827 head; in 1872, 236,802; in 1873, 227,669, valued at \$3,415,035; of hogs in 1871, 41,036; in 1872, 104,639; in 1873, 220,956, valued at \$2,131,177 60. The receipts of horses in

1873 were 4,202; of sheep, 5,975. The packing business is extensive, and has increased with great rapidity. The number of hogs packed in 1868 was 13,000; in 1869, 23,000; in 1870, 36,000; in 1871, 83,000; in 1872, 180,000; and in 1873, 194,944, the products being valued at \$2,339,358. The number of cattle packed in 1872 was 20,500, value of products \$615,000; in 1873, 26,549, value of products \$796,470. There are four large packing houses, with capacity, during the season from Nov. 1 to March 1, for packing 480,000 hogs, and during the year 700,000. The receipts of grain in 1872 were 1,001,293 bushels; in 1873, 1,718,280, including 750,400 of wheat, 836,300 of Indian corn, and 105,200 of oats. The shipments in the latter year were 1,130,380 bushels; products of the mills, 98,500 barrels of flour and 100,000 bushels of corn meal. Manufacturing industry is limited, and with the exception of a few branches is confined to a single establishment of a kind. The principal items are cigars, tobacco, ale and beer, saddles and harness, furniture, brass castings, scales, soap, types, roofing, lightning rods, cooperage, carriages and wagons, crackers, bricks, and blank books. There are 12 banks and branches, with an aggregate capital of \$1,257,500.—The city is divided into six wards, and is governed by a mayor and a board of aldermen. It has a well organized fire department and an efficient police force. The valuation of property in 1872 was \$11,993,060; in 1873, \$12,687,875; taxation in the latter year, \$348,916 56; expenditures, \$336,387 97. There are a city hospital and a workhouse, an orphan asylum, a woman's home, and a Catholic hospital with a large building in process of erection. The public schools are in a flourishing condition. The number of school houses in 1873 was 14, of which 9 were owned by the city and 5 rented; number of schools, 14 (1 high, 10 district, and 3 colored); rooms occupied, 59; sittings, 3,056; teachers, 59; children of school age (5 to 21), 6,636; number enrolled, 4,259; average attendance, 2,224. There are two medical colleges (the Kansas City college of physicians and surgeons and the medical college of Kansas City), a Catholic female college (St. Teresa's academy), an opera house, 2 theatres, 4 daily (1 German), 2 tri-weekly, and 8 weekly (1 German) newspapers, and 1 bi-monthly periodical. The number of churches is 28, viz.: 2 Baptist, 1 Christian, 1 Congregational, 2 Episcopal, 1 German Evangelical, 2 Jewish, 2 Lutheran (1 German), 6 Methodist, 6 Presbyterian, 3 Roman Catholic, 1 Spiritualist, and 1 Unitarian.—Kansas City was laid out in 1830, but its growth was slow till 1856. Its progress was retarded by the civil war, but has since been remarkably rapid. Improved trade relations have recently been formed with Galveston and Houston, Texas, which are expected to enhance greatly the prosperity of the city.

KANSUH, a N. W. province of China, bounded N. and N. E. by the desert of Gobi and Mon-

golia, E. by Shensi, S. by Szechuen, and W. by the mountainous districts adjoining the Koko Nor; area, 86,608 sq. m.; pop. about 15,000,000. It comprises a large portion of the ancient kingdom of Tangut. The Hoang-ho traverses the province in a N. E. direction, and receives many affluents. The Peling and Singling mountains are in some places 10,000 ft. high, and on the S. border line of Kansuh and Szechuen are the Kiu-long-shan mountains. Coal exists in the E. part, and gold, silver, copper, and jade are said to be found in the mountains. The climate is cold, and the soil is not generally fertile excepting E. of the Hoang-ho, where the cereals are cultivated to some extent. The Tartars in this province maintain large flocks and herds of sheep and cattle, and wild animals abound. Capital, Lanchow.

KANT, Immanuel, a German metaphysician, born in Königsberg, April 22, 1724, died there, Feb. 12, 1804. He was of Scotch descent; his grandfather probably emigrated from Scotland near the close of the 17th century, and settled at Tilsit. His father, John George Cant, came to Königsberg in early life, and followed the trade of a saddler. His mother, Anna Regina Reuter, of German stock, was a woman of a refined and elevated character, and of deep religious feeling. The philosopher was the fourth of their 11 children. He tells us that when a boy he was idle and a truant; yet he also showed zeal in acquiring knowledge, and his parents gave him the best education their slender means would allow. Like Schelling and Hegel, he was first destined to the theological career. From his 8th to his 16th year he was a student in the *Collegium Fredericianum* of his native city, under the care of Dr. Schulz. Ruhnken the philologist was a fellow student, and they pursued together the study of the classics. Here, too, he felt the influence of pietism, then predominant in the college; and also learned the rudiments of the abstract philosophy of Wolf, which had the speculative ascendancy in philosophical and theological schools. But as yet he showed no metaphysical talent, though he was an indomitable worker. His character was influenced by the rigid morality and independence of his father and the piety of his mother. In 1740 he entered the university as a student of theology; but his first attempts at preaching met with such poor success, that he concluded that he was destined for a different career, and applied himself with earnestness to mathematics and the physical sciences. His first essay, written in 1746, at the age of 22, was on "The True Measure of Living Forces," and contained an acute criticism of the arguments of Leibnitz and Descartes, with an attempt to mediate between the German and French schools, by distinguishing between dead and living powers. His father died in 1746; he had lost his mother 11 years before; and, that he might not be a burden upon his uncle, who had already aided him, he was compelled from

that time until 1755 to become a tutor in private families. In the last of these, that of Herr von Kaiserling of Königsberg, his great talents and acquisitions were recognized, especially by the lady of the house; and here he was introduced into cultivated society, wearing off the bashfulness and reserve of a poor student. At length, in 1755, he was able to enter upon the career of academic instructor, for which he had been preparing himself by assiduous study and multifarious reading. His inaugural dissertations, as *magister legendi*, were *De Igne* and on the "First Principles of Metaphysical Science." In the same year he published anonymously a treatise on the theory of the heavens, dedicated to Frederick the Great, and written in a clear and animated style. Here he prophesied the discovery of new planets, and that the nebulae would be resolved into stars, besides advocating the position that a mechanical construction of nature was not adverse to the belief in a God. Lambert in 1761 advanced similar views, which led (1765-70) to a correspondence between them. From the first Kant was a popular lecturer; several of his courses were always attended by many of the citizens of the active and thriving city of Königsberg, which had a high commercial and political as well as literary rank. His course on physical geography was begun in 1757, and continued to the close of his academic career, receiving fresh additions at each repetition. Kant himself never went beyond his native province, and as seldom as possible away from the city; but he was an eager student of voyages and travels, and extracted all possible information from every traveller he could come across. He also lectured on practical anthropology, the theory of teaching, natural law, the philosophy of religion, ethics, logic, and mathematics. In 1762 he published a treatise on the "False Subtlety of the four Syllogistic Figures," maintaining that only the first is "pure," the others being *ratiocinia hybrida*. The next year he wrote an essay for a prize proposed by the Berlin academy on the "Principles of Natural Theology and Ethics;" but Mendelssohn received the first and Kant the *accessit* prize. He here says that a "real system of metaphysics" had never yet been written; he was already busy with this task. In the same year appeared his work on the "Only Possible Ground of Demonstrating the Being of God," proposing a new form of the ontological proof, and rejecting the other three arguments. Existence, he says, is not a predicate conception, and therefore cannot be proved; but the non-existence of God contains a logical contradiction. The new mode of proof which he advocates, says Erdmann (*Geschichte der Philosophie*, vol. iii., p. 31), reverses the positions of the schools of Descartes and Leibnitz; instead of inferring the existence of God as a consequence from the possibility, he takes the possibility as a consequence, and reasons back to the existence as the ground; if

anything is possible, there is some real being, the seat and source of all that is conceivable.—The year 1770 is made by Rosenkranz (*Geschichte der Kantischen Philosophie*, 1840, vol. xii. of Kant's works) the dividing line between the earlier or tentative period of his speculations and the speculative and systematic period. In this year he became a professor in full in the university. For 15 years the subtlest and boldest thinker of Germany had been struggling along in obscurity, filling subordinate posts; for example, that of a subaltern in the royal library for \$50 a year, conferred on him in 1756, as an "accomplished" and "learned" person. He was indeed offered the professorship of poetry in 1764; but this does not seem to have suited him. The professorship of logic and metaphysics was given him after he had declined invitations to Jena and Erlangen; and his salary was to be \$300 per annum. He was content with his native city and university; he wanted to labor in quiet, and work out the great problems which were stirring his mind. His inaugural dissertation, *De Mundi Sensibilis atque Intelligibilis Forma et Principiis*, contains germs of his metaphysical system. He protests against the position that the knowledge of sense and that gained by the understanding are to be distinguished as respectively obscure and clear. There is, he says, a knowledge of sensible phenomena which is distinct, as there may be conceptions of the understanding which are confused. We must distinguish between the matter and the form of our knowledge of sensible objects; the form is given by the ideas of space and time, which are not objectively real, but pure intuitions; and these give us the basis of the sciences of mathematics and geometry. Intellectual knowledge is made up of pure or universal conceptions; not such as are abstracted from the phenomena of sense, but principles by which the understanding is guided, as those of necessity, possibility, causality, &c. Such are some of the positions in which he already arrays himself against materialism on the one hand and dogmatism on the other. In 1772 (Erdmann, *loc. cit.* 37) he wrote about his scheme of a transcendental philosophy, which he hoped to finish in three months; in 1776 it was to be completed the next summer; but not till 1781 did the *Kritik der reinen Vernunft* ("Criticism of the Pure Reason") make its appearance. For 11 years he had been writing and rewriting; the final draft was composed in a few months. He was already 57 years old. His system had been very slow in its growth; for a long time he was hardly conscious of what he was aiming at. He was pressed on the one hand by the abstract metaphysics of the idealism of Leibnitz as developed by Wolf; on the other hand, Hume's skepticism, as he says, "awoke him from his dogmatic slumbers." His own work was intended to give their respective rights to both idealism and realism, to metaphysics and materialism; yet, at the same time,

to serve as a new basis on which the architectonics of the whole world of knowledge might be constructed. This system produced a revolution in the world of speculation. Partly from its profoundness, partly on account of its novel nomenclature, it was at first slightly noticed, and seemed in danger of lapsing into oblivion. But Kant was now thoroughly aroused, and eager in pressing the scheme, which was the product not only of his own life, but also of the chief systems which had gone before. His philosophical productivity became as remarkable as had been his previous reserve. In 1783 appeared his "Prolegomena to every future System of Metaphysics claiming to be a Science;" a more popular exposition, and also a more complete analysis, of the questions and problems mooted in the "Criticism." He then endeavored to counteract the negative results of the system of pure reason by his *Grundlegung der Metaphysik der Sitten* ("Metaphysics of Ethics," 1785), and *Metaphysische Anfangsgründe der Naturwissenschaft* ("Metaphysical Elements of Natural Science," 1786), completing the exposition of his views in these two branches of philosophy. In 1787 the second edition of the "Criticism of the Pure Reason" was published, omitting the preface to the first edition, and altering it so as to avoid the charge of idealism which had been generally preferred against his speculations, identified, or rather confounded, by some opponents with the system of Berkeley. This second edition was afterward reprinted, with only verbal alterations, though considered as somewhat compromising the logic of his speculations; but in the two later editions of Kant's works, by Hartenstein and Rosenkranz, the contents of the first edition are also inserted. The *Kritik der praktischen Vernunft* ("Criticism of the Practical Reason," 1788) was intended to give the positive aspect of the new philosophy in relation to God, freedom, and immortality; it is a further exposition and application of what was given in outline in the "Metaphysics of Ethics," and it contributed to give currency to his system among those who had been repelled by the apparently negative conclusions of the "Criticism of the Pure Reason." Such was the rigor and such the vigor of the ethical scheme propounded, that for a time it swept away the unmanly eudæmonistic ethics and the sentimental systems of morality. Even those who thought they detected an inconsistency between the principles of Kant's "Pure Reason" and of his "Practical Reason," hailed the latter work as containing solid proofs of the real being of those supersensible objects which the critical idealism seemed to have reduced to subjective ideas. Its principles were made the basis of systems of divinity by such theologians as Tieftrunk, Stäudlin, Ammon, and somewhat later by Gabler and Wegscheider. The ethical element, the "categorical imperative," was held as the one fixed and saving

point in the midst of the jarring and opposite principles of the different schools in philosophy and theology; and this led to that rationalism, on a moral basis, which for a long time characterized German theology, a very different form of rationalism from the one which subsequently prevailed. To these works, in 1790, Kant added his "Criticism of the Judgment," which developed more fully the principles of the metaphysics of the natural sciences, and supplemented many positions in his other treatises, besides giving hints, and opening points of view, which were afterward used by those disposed to go beyond the principles of the critical philosophy.—With this work closed the productive metaphysical period of Kant's philosophic career. He was now 66 years old. In nine years he had put forth, in rapid succession, a series of works which revived the slumbering activity of German philosophy; combated equally the abstractions of the dogmatist and the doubts of the skeptic; set forth the transcendental grounds and elements of knowledge, and thus laid the foundation for a new metaphysics; and planted moral science upon a definite basis, giving it fixed and universal formulas, which already began to affect the construction of the science of Christian theology. His subsequent writings form, according to his own statement, the practical period of his career, applying to different special sciences the principles he had elaborated. His philosophy was already expounded by Kiesewetter in Berlin, Schmid in Jena, Jakob in Halle, Born in Leipsic, and many others in different parts of Germany. Its more definite conflict with the orthodox theology was aroused by the publication of his essays on "Religion within the Bounds of Mere Reason," contributed to the Berlin *Monatsschrift*, then prohibited by the censor (reëstablished in 1788), and issued in a volume in 1793. Political influences were also concerned, for Kant was in sympathy with the French revolution. Frederick William II. sent to him a missive indicating his displeasure, and the philosopher was obliged to give a pledge that he would not lecture on religious subjects "so long as he should be a subject of his majesty," the promise being so worded that he considered himself released from it on the death of that monarch. But he was so irritated by this governmental interference, that in 1794 he gave up all his private lectures, and after 1797 no longer read in the university. In 1797 appeared his "Metaphysics of Ethics," in two parts, viz.: the "Metaphysical Elements of Right" (law), and "of Virtue." The "Strife of the Faculties" (1798) is a review of the controversy about his religious opinions, with the documents concerning it. His *Anthropologie in pragmatischer Hinsicht* ("Anthropology in a Pragmatic Point of View") was published the same year. After this his friends and pupils became the editors of his writings: Jäsche of his "Logic" (1800); Rink of his "Physical Geography" (1802) and

"Pedagogics" (1803). After his death Pölitz published his lectures on the philosophy of religion (1817) and on metaphysics (1831), and Starke those on the human race (1831). He was disturbed in his later years by the symptoms of a new phase of speculation in the writings of Fichte (whom he had at first warmly welcomed, and whose work on revelation had been attributed to him), and sent forth an ineffectual protest in 1799; this showed a defect which he himself acknowledged in his power of appreciating other systems. An essay on which, in the decline of his faculties, he was for a long time employed, was found to be unintelligible, or only a repetition of what he had previously said upon the relation of physics to metaphysics. Speculation was already sweeping past the monuments he had reared.—To appreciate the character and position of the critical or transcendental philosophy of Kant, we must start with his own view of what philosophy had previously accomplished, and what he expected from his new method. In his own interpretation of the matter, it was the critical method which he instituted that formed the primary peculiarity of his scheme. All previous systems had led to dogmatism (Leibnitz and Wolf), or to skepticism (Hume). Dogmatism asserts the equal objective and subjective validity of its principles; metaphysical truths, like mathematical, hold both in reason and in fact. Skepticism, on the other hand, denies the objective validity of *a priori* truths; thus, for example, Hume could not find in experience anything corresponding to the principle of causality, for sense gives only succession of phenomena; and this truth of causality, says Kant, is only one of a class, to all of which Hume's criticism is equally applicable. Both the dogmatist and the skeptic examine ideas or truths directly, and can never agree. Is there no other way of approaching the matter? Yes, says Kant, there is also the critical method; instead of assuming that our knowledge is determined by the objects, let us see how far the objects are determined by our knowledge. He compared this method, with a proud consciousness, to that of Copernicus, who, finding that he could not explain the motion of the heavenly bodies by supposing that they revolved around himself, tried whether he could not do better by supposing that he moved and the stars stood still. The true way, then, is to start with a criticism of man's power of knowing. And since man has three prime faculties, reason, will (or impulse to action), and feeling, this criticism must be divided into three main parts: the criticism of the pure reason, the criticism of the practical reason (desire and will), and the criticism of judgment (having respect to feeling, or pleasure and pain). The first of these, however, contains the regulating principles for both the others, and gives the key to the system. The "Criticism of the Pure Reason" was not originally intended to be a system of metaphysics, but rather an inquiry into the

possibility of metaphysics; that is, it was critical. As against the skeptic, it was designed to show that there are in the human mind *a priori* or transcendental elements of knowledge, and that these are found even in the perceptions of sense and the laws of the understanding. As against the dogmatist, it was also intended to prove that even this transcendental knowledge does not attain with absolute certainty to the nature of things; it can neither demonstrate nor disprove the reality of objects corresponding to the ideas of reason. ("Transcendental" is used by Kant, not in respect to the objects of knowledge, but to the nature of the knowledge, as *a priori*.) Another, and the strictest mode of stating the question and problem, is this: Are *a priori* synthetical judgments possible? An analytical judgment is one which simply explicates, in respect to any subject, what is contained in its very notion; it reposes on the principle of identity. But such judgments give us no new knowledge. In a synthetical judgment, on the other hand, something is contained or asserted in the predicate, which is not necessarily implied in the subject; and such judgments extend the bounds of our knowledge. All *a posteriori* knowledge is of this character; and the metaphysical question is: Are such synthetical judgments also possible *a priori*? If they are, in any sphere (*e. g.*, mathematics), sensualism is refuted; if they are not in the highest sphere (metaphysics), dogmatism is refuted. In conducting this inquiry Kant divides the human mind into the three functions of sense, understanding, and reason, and subjects each to a careful criticism. The general scheme, as carried out, is:

- I. Doctrine of the transcendental elements of knowledge.
 - A. Transcendental aesthetics (*i. e.*, perceptions of sense).
 - B. Transcendental logic.
 - a. Transcendental analytics (the understanding).
 - b. Transcendental dialectics (reason, metaphysics).
- II. The transcendental method.

1. *The Transcendental Aesthetics*, or the transcendental knowledge involved in the perceptions of sense. In all knowledge there are two elements, the matter and the form. The one is given by experience, the other by the mind. Sensations without ideas are blind; ideas without sensations are empty. The dogmatist ignores the former, the materialist the latter. What is given us in sensation is ordered or arranged by the mind under the two ideas of space and time, which ideas are not the product but the regulators of the sensations. That is, even in respect to the objects of sense, we find the *a priori* ideas of space and time controlling them; and this knowledge too gives us the possibility of a science, viz., mathematics. But yet this space and time are not forms of the objects of sensation, but the subjective framework in which we put and must put all our sensations. We cannot, then, attain objectively to the knowledge of things as they are in themselves (*Dinge an sich*), because those forms by which we know them are subjective. This denial

of the objective validity of space and time is the starting point in the negative results of the "Criticism of the Pure Reason." In the first edition Kant threw out an intimation, withdrawn in the second, that the subject (*ego*) and things-in-themselves are possibly one and the same substance; this led to the subjective idealism of Fichte. 2. *Transcendental Analytics*. We pass here from the sense to the understanding, or the power of forming general notions. It is by such notions that we combine and connect what is given in experience. So that the fundamental question here is this: Is a pure science of nature possible? In order to show the possibility of experience, so far as it rests upon pure conceptions of the understanding *a priori*, we must first represent what belongs to judging generally, and the various states of understanding in the act of judging, in a complete table. For the pure conceptions of the understanding must necessarily run parallel to these states; because such conceptions are nothing more than pure conceptions of intuitions in general, so far as intuitions are determined by one or other of these ways of judging (states of understanding) in themselves (that is, necessarily and universally). Hereby also the *a priori* principles of the possibility of all experience, as of an objectively valid empirical cognition, will be precisely determined. These *a priori* principles Kant called categories of the understanding (applying Aristotle's term in a different sense). These categories, which he brought into connection with (or rather transferred and transformed from) the purely logical categories, are as follows:

	Logical.	Transcendental.
I. Quantity.	{ Universal. Particular. Singular.	Unity. Plurality. Totality.
II. Quality.	{ Affirmative. Negative. Indefinite.	Reality. Negation. Limitation.
III. Relation.	{ Categorical. Hypothetical. Disjunctive.	Substance. Cause. Reciprocity.
IV. Modality.	{ Problematical. Assertory. Apodictic.	Possibility. Necessity. Existence.

Under these 12 categories, or *a priori* notions of the understanding, we are compelled to bring all our sensible experience. Empty in themselves, they are filled up by phenomena; and they reduce the "rhapsody" of phenomena into order. But what warrants us in pursuing this process—in bringing together such different things as the obscure experience of sensible phenomena and the clear dicta of the understanding? We derive this warrant, says Kant, from the pure intuitions of space and time, in which there is an element common to both. All objective phenomena, and all subjective notions, equally fall under the dominion of these two intuitions, which thus become the *schemata* by and through which the mind interprets nature. Thus, the world does not give laws to the mind, but the mind rules the

world. We cannot even know the external world excepting by and through these *a priori* conceptions (*e. g.*, substance and time). But at the same time Kant holds with equal tenacity to the position that these judgments of the understanding do not, and cannot, disclose to us the supersensible world; we cannot through them come to the knowledge of things as they are in themselves. He does not deny their real objective being, but says that all we can know about them is through our subjective notions. He even attributes to them activity and efficiency; they force the mind to distinguish and divine; but still, these objects and what the mind says about them are totally diverse. (This is one of the chief points in which subsequent criticism and speculation have modified the position of the Kantian theory of knowledge, making a more close and vital correspondence between the laws of thought and being in order to avoid the irresistible negative results of this theory.) The general result then of the analytics, as of the aesthetics, is, that what is not in time and space cannot be known by or through the categories; that is, it leads to that form of transcendental idealism which maintains that things-in-themselves cannot be known, that only phenomena are known (*i. e.*, known through and by the categories). At the same time Kant is careful to assert that those things-in-themselves have a real existence; and he distinguishes clearly between his system and the idealism of Berkeley on the one hand and that of Leibnitz on the other. Berkeley asserted that we have a knowledge merely of "ideas;" Kant asserts that we have not merely ideas, but ideas of something which is real and independent. Berkeley said that ideas were connected empirically; Kant says, by a necessity, by law (and hence there can be a science of nature). Kant made, as Berkeley did not, a thorough distinction between the *noumena* and the *phenomena*. 3. *Transcendental Dialectics*. Here we enter upon the proper criticism of the pure or theoretical reason; and here come up the real metaphysical questions. The understanding gives us general notions; the reason, ideas. The three grand ideas with which metaphysics has to do are those of the soul, of the world, and of God, which respectively form the basis of the three sciences, rational psychology, rational cosmology, and theology. By an unnatural method, Kant makes these three ideas correspond respectively with the categorical, hypothetical, and disjunctive syllogisms. He takes a similar course, as we have seen, with the categories of the understanding. The question of the identity of logic and metaphysics is inevitably suggested. The general conclusion of this part of the system is, that these sciences, in the sense of the older dogmatism, are impracticable to reason; but there is still for man a supersensible sphere to be reached and explored in other ways. In respect to rational psychology, it is the aim of

Kant to show that we are not warranted in transferring to the soul, as an objective and immortal existence, those predicates which we apply to it as a matter of subjective consciousness; or, that the abstract demonstration of immortality, from the nature of the soul, involves paralogisms. Rational cosmology (or the sum total of the phenomena of the world, reduced to unity) leaves us in kindred contradiction as to the external world. On purely rational grounds (applying the four categories), we land in absolute antinomies, or contradictions: 1, as to quantity, we can equally prove that the world is limited and unlimited; 2, as to quality, that its elements are both simple and infinitely divisible; 3, as to relation, that it is caused by a free act, or by an infinite series of mechanical causes; 4, as to modality, that it has an independent cause, and that its parts are only mutually dependent. These antinomies, as thus developed by Kant, bring out distinctly the contrast between the infinite and the finite, between the absolute and the relative. The force of them consists in viewing the world, on the one hand, as related to the infinite and absolute; on the other hand, as related to the finite and relative. Kant's solution of them is found in his position, that the categories have subjective but not objective validity. But the antinomy in each case results from applying to one and the same subject (*viz.*, the world) at the same time both infinite and finite properties, making it both absolute and relative, which of course involves us in contradictions. These antinomies show us that reason is weak in constructing the relation between the infinite and finite, between the absolute and relative; but not that reason may not know the real being of both. In the same manner, in his "Rational Theology," the various proofs of the being of God are discussed, and shown to be invalid, *viz.*, the ontological, the cosmological, and the physico-theological. The ontological argument confounds an analytic with a synthetic judgment; the cosmological is only another form of the ontological; and the physico-theological does not prove the perfection or infinitude of the Deity. Thus on grounds of pure reason, in relation to our highest ideas, we are left in the position of being unable to demonstrate their objective validity. Yet still they are "postulates," "necessary illusions;" we are obliged to take them as "regulative" principles. We cannot prove them, nor yet can the materialist or skeptic disprove them; that is, theoretically, we can neither admit nor deny them. This criticism does not lead, he claims, to skepticism; it only shows us the bounds of reason; in fact, it carries us over into that sphere where reason has an authentic and decisive voice, that is, the sphere of the practical reason, the sphere of final causes or ends. Thus may be solved, for practical purposes, the problems which to the pure reason are simply insoluble. The methodology, which forms the second chief part of

this "Criticism of the Pure Reason," gives the rule by which reason may and ought to be guided, so that it shall not, for example, apply mathematics to incongruous subjects, nor confound the theoretical and the practical.—In the second of Kant's criticisms, that of the "Practical Reason," the unsolved problems are taken up under a different and positive point of view. His works on the "Metaphysics of Morals" and the "Metaphysical Elements of Law and of Virtue" are devoted to the same general theme. His general position is this: theoretical or pure reason gives us certain postulates, which on merely theoretical grounds cannot be proved to have a valid being; or, in other words, it gives certain problems as to the soul and its immortality, as to the unity of the cosmos, and as to the being of God, which it cannot itself resolve. But where theoretical reason is silent, practical reason speaks with authority. The sphere of this practical reason is the will; and here is where reason unfolds its whole power and significance. The practical reason is thus the highest spiritual power in man; it has the "primacy" over all the others, even over the pure reason. This practical reason or will now acts, and must act, according to certain laws or principles. Some of these principles are merely subjective, or "maxims;" others have an imperative character or universal validity. These make the "categorical imperative," which is the decisive word in Kant's ethical theory. The moral law is such a categorical imperative; and this is a dictate of reason itself; the so-called moral sense is not the source, but the product, of this superior moral law. The formula of this moral law is: "Act only on such a maxim as may also be a universal law;" or, "Act in reference to rational beings (thyself and others) as if they were ends in and for themselves, and not as if they were mere means to an end." If, now, we know and are under such an absolute law, then we must be free; such a law is possible for us only as we are free in the strictest or transcendental sense. This is the "autonomy" of the will; it is a law unto itself; what I ought to do I must be able to do. If the moral law be real, freedom must be real; and that freedom which the pure reason left as a problem is thus proved to be a reality. Still further: if there be such a moral law, there must be a moral world, and in that world the highest good must be brought about by means of the moral law. But as a matter of fact, we find that each individual is still imperfect, under the dominion of sense; that virtue is never fully realized here. But it ought to be, it must be realized; and this realization can only be effected in an endless duration of the soul; the soul, then, must be immortal. Yet again, perfect happiness is essential to the highest good; but this happiness can only be realized when nature and morality are in entire harmony and unison. As a matter of fact they are not so;

but yet they ought to be, and they must be. There must then be some power above both nature and moral agents, to connect the two together, to make virtue and happiness coincide. That is, there must be a God. Whatever may be thought of the validity of these arguments, the results contributed to give currency to the Kantian system among those who were repelled by the negative character of the deductions on the grounds of pure reason. A basis seemed to be laid for a practical and living faith in God, freedom, and immortality. The moral element attained such supremacy as in no antecedent system. But we must pass to another work of Kant's to see the use which he makes of these positions in relation to the highest objects of belief; that is, his "Religion within the Bounds of Mere Reason." Morality leads to religion. The three "Criticisms" of Kant all end with the idea of God. But religion as given in history contains elements which cannot be directly deduced from ethics. How much, now, of revelation (which he grants to be possible) can be confirmed by reason? 1. There is a "radical evil" in human nature; and this is not physical but moral. This precedes all actual sin. How can this be explained? All sin must be one's own act; and yet this moral evil is before act. The difficulty can be solved only by assuming a "timeless and intelligible act." This is the in-born, radical, yet still self-produced and guilty corruption of man. (Here is the basis for the subsequent speculations of Schelling on freedom, and of Julius Müller and others on the origin of sin.) As there is this evil in us, so in order to have virtue there must also be "a total revolution," which "may be called a new birth or a new creation;" though that this must strictly be of grace cannot be shown. 2. A reconciliation of man with God can be effected only through such a change of heart; this reconciliation is symbolized in the person and work of Christ. In Scripture, Christ represents the agony of repentance; to put on Christ is equivalent to the new life; justification means that God accepts this change of heart in view of its future fruits. 3. The victory of the good over the evil principle is seen in the kingdom of God; in the church as a visible institution. This church has the four characteristics of unity, purity, freedom, and immutability. The positive rites of this church are valuable as aids to human weakness. But in the progress of the race the faith of the church will be supplanted by a purely rational faith. The essence of the Christian revelation is found in its moral precepts; all else has only a partial and transient worth. The mysteries of religion are valuable so far as they help the life; but they make no real addition to knowledge. The Trinity means that God should be worshipped in view of his threefold moral qualities, holiness, goodness, and justice, which are specifically different from each other. Thus, in this allegorizing

method, Christianity as a rational religion is reduced to a mere theory of morals. Kant first began that construction of the truths of religion which in the later transcendentalism produced so many philosophies of religion of a much more comprehensive character. Schleiermacher disentangled the proper religious from the merely moral element; and Hegel, even in the mysteries of Christianity, found the same truths in the form of faith which his speculative system expounded in the form of philosophy.—In the third of Kant's "Criticisms," that on the "Power of Judgment," he attempts an investigation of the feelings, corresponding to that of the reason in his "Criticism of the Pure Reason," and to that of the desires (or will) in the "Practical Reason." Here, too, he advances beyond the limits of transcendental idealism, and hence this treatise became a starting point for subsequent explorers. The object of the work is to span the chasm between metaphysics (theoretical reason) and ethics (practical reason). Just as feeling (or pleasure and pain) stands between, mediates between reason and the will, so the faculty of judgment, which relates to the feelings, is to mediate between the theoretical and practical reason. This reconciliation is effected by means of the idea of a final cause or design. This idea is found equally in the two spheres subjected to the faculty of judgment, viz.: that of aesthetics, and that of teleology, or final causes in nature. 1. *Æsthetics* has to do with the beautiful and the sublime. The beautiful has no real existence in nature; it is the harmony between the imagination and the understanding. The sublime is an attempt to lay hold of the vast in nature; it does not exist in nature, but in the soul, struggling toward the infinite. The highest aspect of aesthetics is as a symbol of moral good. 2. *Teleology*. The objects of nature are all shaped for some design or end. Such instances of design are of two kinds, external and internal. Mere external-adaptations might be the result of mechanism; not so the adaptations or designs which we find in organized beings. Here all the parts are both means and ends; no mechanical law, but only a rational designer, can explain this. Nature cannot be understood excepting on this principle. By this principle of a design immanent in nature, Kant passed the boundaries of a merely subjective idealism, to which other parts of his system were always tending. Fichte developed it on the subjective side; Schelling restored nature, or the objective, to its rights. The latter (*Philosophische Schriften*, i. 114) says that "there were perhaps never so many deep thoughts compressed in so few leaves as in § 76 of the 'Criticism of the Judgment.'"—Besides his larger works and essays, Kant also wrote many minor treatises, sufficient to have made a literary reputation for most men. In 1784 he published an essay entitled "Ideas about Universal History in a Cosmopolitan Point of View;" and in 1795 a

“Project of Perpetual Peace.” A severe review in 1785 of Herder’s “Philosophy of History,” called out the *Metakritik* of that philosopher; Herder was too cautious, courtly, and vague to suit the views of the rigid moralist and metaphysician. The end of the history of the world, according to Kant, is the formation of the most perfect state constitution. Man, though free, is still bound to nature, and exists as a race. Every generation is a means of educating and developing the next generation; and man in the use of his freedom makes the powers of nature subservient to humanity. Perpetual peace among the nations can be insured only by a federation of free states. Publicity is necessary to political life and the highest good and progress of the state. The human race, as a whole, he contends, is in a constant progress to a better state. In later times this is proved by the general sympathy in the French revolution. (This is contained in his work on the “Strife of the Faculties.”) Morals will penetrate more and more into political life, and shape the destiny of the race.—This rapid and condensed outline of the works of Immanuel Kant, though necessarily imperfect, may be sufficient to show the comprehensiveness and subtlety with which he penetrated into the most abstruse regions of thought. The influence of his speculations began to be felt at the same time that the French revolution was changing the face of Europe, and when old chaos seemed to have again revisited the earth. Materialism was predominant in France; in Scotland, Reid was combating skepticism on the principles of common sense; and an abstract dogmatism ruled the German mind. Here was a philosopher who, with unmatched analytic and synthetic powers, came forward to show to each previous and prevalent system its metes and bounds. Against the materialist and the skeptic, he proved that the mind had its *a priori* principles of knowledge; against the dogmatist, he maintained that the sphere of the supersensible, though a reality, is not disclosed to positive thought. He proved that empiricism is right so far as it asserts that the matter of our ideas is drawn from without, but wrong so far as it implies that their form can also there be found. And he is allied with the principle of the common-sense philosophy in ascribing an absolute validity to those moral ideas by which life is and must be guided. The utterances of this practical reason are true and valid, whatever may be the difficulties of the theoretical reason. We must live and act in view of God, freedom, and immortality. His philosophy became the starting point for the most remarkable development of speculation since the days of the Greeks. German speculation was thoroughly quickened. Those who opposed Kant and those who espoused his views equally acknowledged his greatness. Reinhold at first defended, and then modified his system. Schulze, Beck, and Bardili tried to bring it

into more popular forms. Krug wrote a new “Organon,” and Fries a new “Criticism of the Reason.” Hamann, Herder, and Jacobi developed their systems, which made faith the basis of philosophy, with constant reference to the principles of Kant. Herbart’s positive philosophy claimed to have the true key to the Kantian metaphysics. Fichte unfolded his subjective idealism as the only logical result of the critical philosophy. And even in some of the latest products of German speculation there are not wanting attempts to show that Kant has not been superseded by any of his successors.—As a teacher of philosophy in the university, the object of Kant was, as he himself declares, not so much to give a system as to habituate his pupils to self-reflection. The teacher should not give thoughts, but lead to thought; he should not carry, but guide, his hearers; and hence the profounder parts of his system were rarely expounded to his classes. He was very simple in his whole style of lecturing. His voice was feeble, and only gradually rose with his subject. A few notes on bits of paper, or text books marked in the margin, were his materials. He always began on a subject as if thinking it out for himself; announced his topic, gave provisional explanations, illustrated it in a great variety of aspects, and thus led his hearers along with him. He despised all the arts of the rhetorician. In developing his ethical theory he often rose to the highest degree of moral earnestness, speaking to the soul against all selfishness and in favor of liberty; and then he seemed, says one of his hearers, “as if inspired by a divine flame.” To aid his thoughts he would fix his attention closely on some one auditor, and judge by him whether he was understood. Once a button on a student’s coat, which he had made his fixed point of vision, being lost, disconcerted the philosopher and interrupted the lecture. A tower on which he used to gaze in his reveries at home having become hidden by the growth of trees, he could not rest until the foliage was cut away. He was always kind to the students, but from principle would not remit their fees, lest they might lose their sense of independence. Tempting offers were made to him to quit Königsberg (a double salary at Halle in 1778 by his friend the minister Von Zedlitz), but he did not care for the money, and disliked all change. In fact, he never went more than 40 miles from his native city. In his person he was slightly built, not much over five feet in height; his chest was hollow, and his right shoulder, like that of Schleiermacher, projected much above the other. His features were fine and delicate; his complexion was light; his blue eyes expressed animation and kindness; a high and broad forehead indicated his thoughtful and speculative turn; and the lower part of the countenance showed a tenacious vitality.—The external life of the philosopher, who was thus probing the depths of human consciousness,

was one of the utmost regularity and simplicity. The "sage of Königsberg" pursued his daily avocations in as fixed a routine as that of the humblest artisan or workman. In fact, it almost seems as if his definite theory of morals shaped his whole career. He was never married; metaphysics was the passion of his soul. Summer and winter he rose at 5 o'clock in the morning, not once failing to do so for 30 years. Two hours were spent in study, and two in lectures; and then he studied and wrote till his early dinner at 1 o'clock. This meal was the great event of the day; and he ate it leisurely, almost always in the society of friends. After dinner he would walk for an hour or two, spend the evening in society or lighter reading, revise his lectures for the next day, and be in bed before 10 o'clock. In general society in his earlier life he was sometimes odd, but also genial and animated. He was a capital listener, and dexterous in drawing out the knowledge of others; but he could tell a good story, and commented on all matters of literary, philosophical, or political interest, with freedom and thoughtfulness. Often a curt phrase, a satirical remark, or a sally of wit would prevent or close a long discussion. In general literature his reading was very large; the English and French classics were familiar to him; and of all writers perhaps he was most fond of Rousseau, whose portrait was the only one that adorned his plain mansion. Of poetry he was never enamored, though a great admirer of Milton's "Paradise Lost." In the history of philosophy he was less versed than in many other parts of literature; considering, in fact, dogmatism, skepticism, and his own system to contain about all that could be well said on speculative matters. Kant was warmly enlisted in all that concerned the general interests of humanity and of justice. In his political views he sympathized with the most thoughtful spirits of the age. "Liberty, law, and public power are the elements of all social life. Law and liberty without power are anarchy; law and force without liberty make a despotism; force alone is barbarism; liberty and law, joined with force, make the republic, the only good civil constitution, which is not necessarily a democracy." He was opposed to involuntary servitude, and to a hereditary nobility. Man, he says, is born free. His great political idea was that there must be a separation of the powers in the state in order to a true social order. Princes he held to be for the people, and not the people for princes. He was also a zealous advocate of the freedom of opinion and the freedom of the press. "Liberty of thought is nothing without the liberty of speech and of writing. . . . To take away the power of freely expressing opinions is to deprive us of the only remedy for the evils which afflict humanity. . . . The prohibition of books of science and of pure theory is an offence against mankind." In his religious views, the feeling of pure obliga-

tion, of an inexorable duty, was paramount; in fact, the sense of duty was so strong as to leave little room for the religious sentiments. His ethical theory made obligation supreme, and left to the affections a subordinate place. His moral formulas are abstract; love was not to him the chief of the virtues. He was the stoic of the 18th century. His general theory of religion, too, was abstract; nor did the positive truths of Christianity as a redemptive system modify either his metaphysical or ethical theories. He gave to German rationalism a strong impulse, in making the merely moral element supreme. So far as he could, he modelled his own life upon the principles of a rigid code of ethics. He abhorred all deceit and lying; he was upright and honest in the minutest matters; every day, every hour had its appointed work. "Whoever will tell me of a good action left undone, him will I thank, though it be in the last hour of life." And in the last hour of his life he could say: "My friends, I do not fear death; I assure you before God, that if I was sure of being called away this night, I could raise my hands to heaven, and say, God be praised!" No one who has lived long in the world, he used to say, would be willing on any account to begin and live his life over again. He was benevolent from principle, often giving away nearly as much as the sum required by his own frugal household. Strict economy enabled him to lay up enough for a comfortable old age. Though a warm friend, he did not like to visit those who were sick, nor to talk about the dead. He was most careful of his own life and health; by rigid rules he kept his frail body in tolerable health, never having had a severe illness till worn out by advanced age. In 1802 his powers began to fail rapidly, and he permitted a physician to be summoned. He had frequent falling fits; his sight gradually became dim; his conversation was often incoherent. A few days before his death, he thanked his medical adviser, adding, "I have not yet lost my feeling for humanity."—The best editions of Kant's works are that of Hartenstein (10 vols., Leipsic, 1838-'9), of which a second improved edition in 8 vols. appeared in 1867-'9; that of Schubert and Rosenkranz (11 vols., Leipsic, 1840-'42); and that of J. H. von Kirchmann, forming part of the *Philosophische Bibliothek* (Berlin, 1868-'74). The second contains a full biography by Schubert, and a "History of the Kantian Philosophy" by Rosenkranz. Kirchmann's edition also contains a biography, and an able analysis of the whole Kantian system, with introductory dissertations on each of Kant's works. His life was written in 1804 by Borowsky, and by Jachmann in letters; his last years were described by Wasiansky (1804). G. S. A. Mellin published an "Encyclopædic Dictionary of the Kantian Philosophy" (6 vols., 1797). His philosophy was introduced into Holland in 1792 by Paulus van Hemert, and there elucidated by Van Bosch in 1798, and Kirker in 1800. Schmid and Phiseldek published an exposition

of it at Copenhagen, 1796-'8. It was also taught in Hungary and Poland. In Italy it was criticised by Galuppi in 1819, and later by both Rosmini and Gioberti. Montovani published in 1822 a *Traduzione della Critica della ragione pura di Kant*; Testa, in 1843-'9, an *Esame e discussione* of the same; Roggero, an analysis in his *Storia della filosofia da Cartesio a Kant* (1869); and Villa another, in his *Kant e Rosmini* (1869). Spaventa's *Filosofia di Kant e sua relazione colla filosofia italiana* (1860) is also an able work. Charles Villers published a valuable essay on Kant in French in 1801; Destutt de Tracy commented on his metaphysics before the academy; De Gérando in his "Comparative History" (1804), and Mme. de Staël in her "Germany" (1813), gave a fuller account of it. The best French account is in J. Willm's "History of German Philosophy" (4 vols., 1846-'9), a work crowned by the French academy; the first volume and half of the second are taken up with the critical philosophy. Charles de Rémusat in 1847 wrote a valuable report on this "History" for the academy of moral and political sciences. Victor Cousin's analysis, which appeared in 1842 under the title *Leçons de philosophie sur Kant*, and since the fourth edition (1863) as *Philosophie de Kant*, has been translated into English by Henderson (London, 1853; new ed., 1871). J. Tissot has translated into French the "Pure Reason" (2d ed., 1845), "Logic" (1840), "Metaphysics of Law" (2d ed., 1853) and "of Morals" (3d ed., 1854), the "Metaphysics," edited by Pölitz (1843), and "Anthropology" (1854). Trullard in 1841 gave a French version of "Religion within the Bounds of Reason;" Barni in 1846 of the "Criticism of the Judgment," and in 1848 of that of the "Practical Reason," besides a critical examination of these works (1850 and 1851), and the "Metaphysical Elements of Law," with the "Project on Perpetual Peace" (1855). Born published in Latin *Kantii Opera* (3 vols., Leipsic, 1796); Kunhardt, a Latin version of the "Prolegomena to every future System of Metaphysics" (Helmstedt, 1797); and G. L. König, *Elementa Ethica* (Gotha, 1800). The first English work on Kant was a "General and Introductory View," by Nitzsch (London, 1796). Others are: J. S. Beck (translated by an auditor), "Principles of the Critical Philosophy" (London, 1798); Willich's "Elements of the Critical Philosophy" (London, 1798); "Kant's Essays and Treatises" (2 vols., 1798); Wirgman's "Principles of the Kantian Philosophy" (1824); J. W. Semple, "Kant's Metaphysics of Ethics" (1837); John Richardson, "Metaphysical Works of Kant" ("Logic," "Prolegomena to Metaphysics," "Proofs of God's Existence," and "Theodicy," 8vo, London, 1836; printed in 1819); an "Analysis of Kant's Critick of Pure Reason," by the translator of that work (8vo, London, 1844; the translation appeared in 1841). Another and better version of the "Critique of

the Pure Reason," by M. D. Meiklejohn, was published in Bohn's "Philosophical Library" (1855). An account of his system is given in J. D. Morell's "Historical and Critical View of the Speculative Philosophy of the Nineteenth Century" (last ed., 1856), with which may be compared Wirgman in the "Encyclopædia Londinensis," and the article in the "Encyclopædia Britannica." Among recent German works may be mentioned Kuno Fischer's *Immanuel Kant: Entwickelungsgeschichte und System der kritischen Philosophie* (Mannheim, 1860); Paul, *Kant's Lehre vom idealen Christus* (Kiel, 1869); Grapengiesser, *Kant's Lehre von Raum und Zeit* (Jena, 1870); Wolf, *Die Metaphysische Grundanschauung Kant's* (Leipsic, 1870); Zimmermann, *Ueber Kant's mathematisches Vorurtheil* (Vienna, 1871); Witte, *Beiträge zur Verständniss Kants* (Berlin, 1874); and Hölder, *Darstellung der Kantischen Erkenntnistheorie, mit besonderer Berücksichtigung der verschiedenen Fassungen der transscendentalen Deduction der Kategorien* (Tübingen, 1874). An excellent collection of the most striking passages in Kant's works, designed for general readers, is Frauenstedt's *Immanuel Kant: Lichtstrahlen aus seinen Werken, mit einer Biographie und Charakteristik Kant's* (Leipsic, 1872). Among general histories of philosophy containing adequate accounts are those by Mirbt, Rosenkranz, Chalybäus, Ritter, Erdmann, and the more recent ones, Ueberweg's *Grundriss der Geschichte der Philosophie* (Berlin, 1862-'6; Eng. translation, New York, 1871-'3), and Kirchner and Dühring's *Kritische Geschichte der Philosophie* (Berlin, 1869). The most recent works of special value to English students are Mahaffy's "Kant's Critical Philosophy for English Readers" (London, 1871 *et seq.*), Abbott's "Kant's Theory of Ethics, or Practical Philosophy" (London, 1873), and Monck's "Introduction to the Critical Philosophy" (Dublin, 1874).

KANTEMIER. See CANTEMIR.

KAOLIN. See CLAY.

KAPNIST, Vasilii Vasilievitch, a Russian poet, born in 1756, died Oct. 28, 1823. He was a councillor of state, and a member of the academy of St. Petersburg; translated Horace into Russian; wrote in that language and in French ingenious though not profound criticisms of the Odyssey; and exposed official corruption in his comedy *Yabedy* (1799). His lyric poems appeared in 1806, and his tragedy "Antigone" in 1815.—His granddaughter, the countess Salias, has published stories under the name of Eugenia Tur (4 vols., Moscow, 1859).

KAPP, Friedrich, a German author, born in Hamm, Westphalia, April 13, 1824. He studied law, and in consequence of the revolution of 1848 went in 1850 to New York, where he practised his profession, attached himself to the republican party, became a presidential elector in 1860, and subsequently was commissioner of emigration. He returned to Germany in 1870, and was elected in 1872 to the Ger-

man Reichstag. He has published *Die Sklavenfrage in den Vereinigten Staaten* (Göttingen, 1854); *Leben des amerikanischen Generals F. W. von Steuben* (Berlin, 1858; English ed., New York, 1859); *Geschichte der Sklaverei in den Vereinigten Staaten* (Hamburg, 1860); *Leben des amerikanischen Generals Johann Kalb* (Stuttgart, 1862; English ed., New York, 1870); *Der Soldatenhandel deutscher Fürsten nach Amerika* (Berlin, 1864; 2d revised and enlarged ed., 1874); *Geschichte der deutschen Auswanderung in Amerika* (vol. i., Leipsic, 1868); and *Friedrich der Grosse und die Vereinigten Staaten von Amerika* (1871).

KAPPEL, a village of Switzerland, in the canton and 10 m. S. of the city of Zürich, noted for a great defeat of the Protestant army in October, 1531, when Zwingli was slain by a mercenary of Unterwalden, and his remains were burnt by the common hangman. A monument to him was erected here in 1838, on the spot where he fell.

KARA GEORGE. See CZERNY GEORGE.

KARAHISSAR. See AFIUM KARAHISSAR.

KARAITES, or **Caraites** (Heb. *Karaim*, readers, scripturists), a Jewish sect, existing in Russia (chiefly in the Crimea), Austria (Galicia), Turkey, and other countries of the East, whose distinguishing tenet is a strict adherence to the Biblical books, and the rejection, except as exegetical aids, of all oral traditions and Talmudical interpretations. They themselves retrace their origin to the time of Shalmaneser; and as that king of Assyria carried the ten tribes of Israel to the north, they hold that they must worship with the face turned toward the south. Non-Karaite historians, however, disregard their representations, and Maimonides and others have attempted to show that they were the same sect as that once known as Sadducees; but it seems that some of the doctrines of the latter were directly antagonistic to those of the Karaites. Others, especially Wolf, attribute their origin to a massacre among the Jewish doctors under Alexander Jannæus, about 100 B. C. Others again, among them Steinschneider, regard Karaism as a literary and theological development of Judaism which had its origin in Babylonia about A. D. 760, and Anan ben David as the founder of the sect; but Firkovitch has endeavored to prove from archæological and numismatic evidences that Karaites occupied the Crimea about the beginning of the 4th century. The Karaites have produced a valuable literature, not only on Biblical interpretation, dogmatics, and other subjects connected with religion, but also on philosophy and mathematics, written partly in Hebrew or Arabic, partly in a mixture of Tartaric and Turkish which is a peculiar idiom of their own in the regions bordering on the Black sea, and partly in the languages of the several countries which they inhabit. Their literature is, however, little known to the occidental world. Several of their principal writings, such as *Eshkol hakkopher*, by Judah

Hadasi (of the 12th century), and *Mib'har*, by Aaron ben Joseph (13th), have recently been published at Eupatoria, in the Crimea.—See Fürst, *Geschichte des Karäerthums* (Leipsic, 1865), and Rule, "History of the Karaite Jews" (London, 1870).

KARAJITCH, Vuk Stefanovitch, a Servian scholar, born Nov. 7, 1787, died in February, 1864. He was educated in Carlovitz, and in the war for Servian independence served as secretary to various national chiefs, most of whom were ignorant of the art of writing, and also as secretary of the national senate at Belgrade. When Servia was left to the mercy of the sultan by the treaty of Bucharest, Karajitch sought refuge in Austria (1813). He collected the popular songs of the Illyrian tongue, travelling for the purpose in Bosnia and Montenegro, and published *Narodne srpske pjesme* ("Popular Serb Songs," 4 vols., Vienna, 1814-'33; 3d ed. enlarged, 1841-'6). They were translated by "Talvj" (Mrs. Robinson, *Volkstlieder der Serben*, Halle, 1825-'6), and by Bowring ("Servian Popular Poetry," London, 1827). Karajitch also published a Serb grammar (translated by Jacob Grimm), a Serbo-German dictionary, a literary almanac under the title of *Danitza* ("Dawn," 1826-'34), a collection of "Serb Popular Proverbs," and another of "Serb Popular Tales." He was a member of the academies of Göttingen, Berlin, and Vienna, and the university of Jena conferred upon him the degree of doctor of philosophy. The Russian government bestowed on him a pension and other honors.

KARAK, a small rocky island in the Persian gulf, in lat. 29° 14' N., lon. 50° 20' E., about 15 m. in circumference, and 40 m. N. W. of Bushire; pop. about 3,000. It affords a safe anchorage, especially during the prevailing N. W. gales. The soil is fertile and the water is good, but there is no timber. The Dutch erected a fort here in the middle of the 18th century, but were soon compelled to evacuate the island. From 1839 to 1841 it was occupied by the English, and in December, 1856, the English expedition against Persia landed on its S. E. coast.

KARAKORUM, or **Mustag Mountains**, also called **Tsung Ling**, a range of central Asia, extending S. E. from about lat. 37° N. and lon. 73° E. to lat. 34° N. and lon. 79° E., and separating the British province of Cashmere from Chinese Tartary. The N. W. extremity reaches the Hindoo Koosh, and the S. E. ridges separate the western spurs of the Kuen-lun on the north from those of the Himalaya on the south. One of their peaks, the Dapsang, is 28,278 ft. high, and several others exceed 27,000 ft. The average height of the principal ridges is 25,000 ft., and even the lowest valleys are 10,000 ft. above the sea. The researches of the brothers Schlagintweit and of George W. Hayward, who was murdered in 1870 in the Karakorum valley, have demonstrated that the Karakorum mountains constitute the watershed of High Asia.

KARAMAN. See CARAMAN.

KARAMSIN (properly **KARAMZIN**), **Nikolai Mikhailovitch**, a Russian historian, born in eastern Russia in December, 1765, died in the Tauridan palace near St. Petersburg, June 3, 1826. He studied in Moscow, served for about two years in the imperial guards, travelled in Germany, Switzerland, Italy, France, and England during the first period of the French revolution, successively edited the "Moscow Journal," the "Aglaiia," a "Poetical Almanac," a "Pantheon of Foreign Literature," and a "Pantheon of Russian Literature," and was an active contributor to the "European Messenger." His "Letters of a Russian Traveller" (1797-1801) were received with great enthusiasm, and in 1803 Alexander I. appointed him historiographer of Russia. He now produced his "History of Russia" from the earliest period down to the accession of the house of Romanoff, in 12 volumes, the last completed after his death. This publication, which occupied the last ten years of Karamsin's life, met with unprecedented success in Russia, and has been translated into several languages. Alexander appointed him imperial councillor in 1824; and in 1825 Nicholas bestowed on him an annual pension of 50,000 rubles, revertible to his widow and children, and put an imperial frigate at his disposal to carry him to Italy for the restoration of his shattered health, of which however he was unable to avail himself.

KARASU-BAZAR, a town of the Crimea, in the government of Taurida, and in the circle and 28 m. E. N. E. of the city of Simferopol; pop. in 1867, 14,397, chiefly Tartars, but including also Armenians, Jews, and other nationalities. It is situated in a fertile valley near the source of the Karasu river, but there are many morasses in the vicinity. It resembles Levantine towns by the crookedness of the streets and the meanness of the buildings; but it is one of the most thriving places in the Crimea, with nearly 50 khans. The national church is a fine building in the shape of a cross, with a dome which lights the centre; and there are places of worship for Catholics, Armenians, and Jews, and more than 20 mosques. The cemeteries outside of the town are very extensive. The large estates of the Shirin family extend from this town almost all the way to Kertch, and adjoining the town are several settlements of Germans who are as advanced in agriculture as the Tartars are backward. Wine, fruit, tallow, wool, and hides are the staple articles of trade; and morocco, leather, shoes, saddles, and shaggy felt cloaks are manufactured in a superior style.—The Tartars made Karasu-Bazar their capital in 1736, but it was captured and burned by the Russians in 1737.

KARDSZAG, a market town of Hungary, in the district and formerly the capital of Great Cumania, on the Pesth and Debreczin railway, 88 m. E. S. E. of Pesth; pop. in 1870, 14,486. It has a castle, and the inhabitants are engaged in the cultivation of corn, wine, and melons.

KARELIANS. See FINNS.

KARENS, **Kayrens**, **Karlans**, or **Karrans**, a rude people of Burmah, Siam, and parts of China, supposed to extend from lat. 10° to 28° N. They inhabit the jungles and mountainous districts, and number from 200,000 to 400,000, the majority of whom live in British Burmah. The number of the Karens in Siam is estimated at 50,000. Those on the frontiers of the British possessions are called Red Karens from the usual color of their dress. They reckon themselves by families, and each family, though it should number 200 or 300 souls, has but one house. Their dwellings are built of stout posts and bamboo, and thatched with palm leaf. The floor consists of a matting of split bamboo, stretched over a strong timber framework which is raised 6 or 7 ft. above the ground. The immense edifice is divided into compartments for eating, sleeping, and other purposes, and the inmates are under a regular patriarchal discipline, which is the only form of government recognized by this people. They are described as industrious husbandmen; they raise hogs and poultry, and hunt game in the forests. A long, loose, sleeveless shirt of coarse cotton is their principal article of dress, but they are fond of ornaments, which they wear on their necks, arms, and ankles. Women among them are treated with respect, and they are said to be hospitable, frank, and more virtuous than their neighbors. The Sgau or Chegaws, and the Pgho or Pgwos, are their principal tribes. These are pagans, but some of the other tribes are Buddhists. There are evidences that at some remote period they received ideas of Scriptural history. They have a tradition of white messengers from the sea coming to teach them; they believe in one eternal Supreme Being; and besides the story of the creation and the deluge, they have an account of "the fruit of trial" appointed by God, of which two persons, deceived by the bad spirit, ate, and thereby became subject to age, disease, and death; and of a confusion of languages in consequence of disbelief in God. The labors of American missionaries among the Karens, which were commenced in 1828 by Messrs. Boardman and Judson, have been remarkably fruitful. In 1865 the numerous native churches were formed into a "Burmah Baptist Convention," which has since met once a year. At the convention held in Rangoon in November, 1872, the number of churches in connection with the convention was reported as 365, all Karen, with the exception of 19 Burman, 1 Shan, and 2 English; the Karen members numbered about 18,000. At Rangoon there is a Karen theological seminary, and since 1872 a Baptist Karen college.—The origin of the Karens is unknown. Some suppose them to be aborigines; others, immigrants from India; and others again derive them from the north, which opinion, according to Latham, is the most probable. The same authority calls their language Burmese with notable Singpho affinities.

KARLI. See CARLEE.

KARLSBAD. See CARLSBAD.

KARLSBURG. See CARLSBURG.

KARLSKRONA. See CARLSKRONA.

KARLSRUHE. See CARLSRUHE.

KARLSTADT. See CARLSTADT.

KARLSTADT, a fortified town of Croatia, in the county and 30 m. S. W. of the city of Agram, on the Kulpa, which is here navigable; pop. in 1870, 5,175. It is the seat of a Greek bishop, and has a castle, a Franciscan monastery, a gymnasium, and several Catholic churches. It was built in 1579 by the archduke Charles of Austria as a bulwark against the Turks, and has a citadel and an extensive armory. It is an important trading place, several fine roads and the Agram railway connecting it with the ports of the Adriatic.

KARNAK. See THEBES.

KARNES, a S. county of Texas, drained by San Antonio and Cibolo rivers, and by several smaller streams; area, 830 sq. m.; pop. in 1870, 1,705, of whom 279 were colored. It has a diversified surface, in most places undulating, and thinly timbered. The soil is a fertile sandy loam or black mezquite, and is suitable for Indian corn, wheat, and potatoes. The chief productions in 1870 were 35,965 bushels of Indian corn, and 24 bales of cotton. There were 8,380 horses, 57,599 cattle, 4,255 sheep, and 3,163 swine. Capital, Helena.

KARPINSKI, Franciszek, a Polish poet, born in the palatinate of Brzesc Litewski about 1760, died at Karpinczyn, in the palatinate of Lublin, in September, 1823. He was conspicuous in

the literary circles of the Czartoryskis at Pulawy, and wrote various original works, including the tragedy *Judgta*, and translations. His fame rests chiefly on his idyls, and on his poetical translation of the Psalms. His "Works" (*Dzieła*) have been published in Warsaw, Breslau, and Leipsic.

KARR, Jean Baptiste Alphonse, a French author, born in Paris, Nov. 24, 1808. He studied and taught in the Bourbon college, Paris, afterward attached himself to the staff of the *Figaro*, and in 1832 published his first prose work, *Sous les tilleuls*. This was followed by *Une heure trop tard* (1833), *Fa Dièze* (1834), *Vendredi soir* (1835), *Le chemin le plus court* (1836), &c., the last two being revelations of his private history. His *Voyage autour de mon jardin* (1845) and *La famille Alain* (1861) have been translated into English. Among his other works is *La pêche en eau douce et en eau salée* (1860). In 1860 a collection of his complete works was commenced. In 1839, while he was editor in chief of the *Figaro*, he established a monthly magazine of a satirical character entitled *Les Guêpes*, the freedom of the literary criticisms in which excited the displeasure of several of his contemporaries, one of whom, an authoress, in revenge made an attempt upon his life in 1844. He has for many years resided in Nice, devoting himself chiefly to horticulture.

KARS, a fortified city of Turkish Armenia, seat of a pasha, situated on a rugged plain, 6,000 to 7,000 ft. above the sea, on the Kars, a branch of the Arpachai, a tributary of the

Kars.

Aras or Araxes, 100 m. N. E. of Erzerum; pop. 12,000, mostly Armenians. It is defended by ramparts surrounded by a ditch, and has a strong citadel, and some works on the hills N. of the city. It is a place of transit for goods and produce to and from the interior and eastward. Formerly it contained 6,000 houses, but now has not over half that number. It was taken by the Russian general Paskevitch in 1828, and occupied for two years. In 1855,

having been strongly fortified under the direction of English engineers, it was strenuously defended by Gen. Williams and Ismail Pasha (the former Hungarian general Kmety) against the Russians under Muravieff. An attempt to capture it by assault (Sept. 29) failed after a bloody struggle, but the place finally surrendered from famine at the end of November.

KARSCH (improperly KARSCHIN), **Anna Luise**, a German poetess, born Dec. 1, 1722, died in

Berlin, Oct. 12, 1791. She was a servant, showed talent for improvisation which attracted notice, and her poverty was relieved by the sale of her select poems (1764). Frederick William II. presented her with a small house in Berlin. She was called the German Sappho. She was divorced from her first husband, who had ill-treated her. By the second, Karsch, an intemperate tailor and spendthrift, she had a daughter (K. L. von Klenke, died in 1812), who became known in literature, as did also her granddaughter (died in 1856), the wife of the French orientalist Chézy.

KARSTEN, Karl Johann Bernhard, a German mineralogist, born at Bützow, Nov. 26, 1782, died near Berlin, Aug. 22, 1853. Like many of his relatives, he acquired scientific prominence. He was for over 40 years chief of the mining department in the Prussian ministry of the interior, and published manuals and other works relating to mining, mineralogy, and chemistry.—His sons HERMANN (born in 1809) and GUSTAV (born in 1820) attained high rank in astronomy and physics, and his nephew HERMANN the younger (born in 1817) as a naturalist and traveller. The latter graduated at Berlin in 1843, explored South America during 13 years, and subsequently became professor of botany at the Berlin university. Among his works are: *Flora Columbia* (2 vols., Berlin, 1857-'66); *Die geognostischen Verhältnisse Neu-Granadas* (Vienna, 1856); *Gesammelte Beiträge zur Anatomie und Physiologie der Pflanzen* (Berlin, 1865); and *Chemismus der Pflanzenzelle* (Vienna, 1869).

KASAN. See KAZAN.

KASBIN. See CASBIN.

KASCHAU (Hun. *Kassa*), a town of N. Hungary, capital of the county of Abauj, 133 m. N. E. of Pesth; pop. in 1870, 21,742, consisting of Slovaks, Magyars, Germans, and Jews. It is situated on the Hernád, in a beautiful valley enclosed with sloping vineyards. It is the seat of a Roman Catholic bishop, is one of the best built towns of Hungary, has important schools and other institutions, and is the chief commercial link between Pesth and Debreczin on one side and Cracow and Lemberg on the other, with all of which places it is connected by railway lines. Its manufactures are unimportant. The cathedral of Kaschau, a large structure in old Gothic, is the finest building of the country in that style. Kaschau was surrounded with walls in the latter half of the 13th century, and subsequently played an important part in the wars of Hungary, especially during the struggles of the Protestants against Aus-

tria. In the last war two battles were fought before the town on Dec. 11, 1848, and Jan. 4, 1849, in both of which Gen. Schlick defeated the Hungarian troops, who were mostly undisciplined militia.

KASHAN, a city of Persia, in the province of Irak-Ajemi, about 90 m. N. by W. of Ispahan, on the route to Teheran; pop., according to Mounsey (1866), about 15,000. It stands in the midst of a barren but stoneless plain near the western extremity of the Great Salt desert. It is said to have been founded by Zobeidah, the favorite sultana of Haroun al-Rashid. Mosques and public baths are the chief buildings, though none of these are especially beautiful or noteworthy. The principal manufactures are silk brocades and copper kettles and pans. The town has an unpleasant reputation throughout western Persia, for its scorpions, by which its houses are everywhere infested. Four miles W. of Kashan, at the foot of some mountains which here project into the plain, is a beautiful palace surrounded by gardens, which has been at various times a place of retirement for Persian officials.

KASHGAR. I. A province of East Turkistan, between lat. 36° 30' and 41° N., and lon. 72° and 77° 30' E.; area, about 57,000 sq. m. It lies in the basin of the Kizil Darya and its tributaries. This river flows eastward 500 m. along the southern slope of the Tian-shan range, into the Yarkand river. Some parts of Kashgar are very fertile, and produce large crops of wheat, barley, rice, cotton, and hemp, while cultivated fruits are abundant. The

Kashgar.

province was anciently included in the great Tartar kingdom of central Asia. When that was dismembered, Kashgar, together with the rest of East Turkistan, came under the government of a local Mohammedan dynasty, whence sprang numerous factions which disputed the supremacy until the middle of the 18th centu-

ry, when the Chinese conquered the country. It remained a part of the Chinese empire 108 years. About 1863 a revolt of the Tunganis or Dungenes, Mohammedan inhabitants of mixed Tartar and Chinese descent, broke out, and was followed by a rising of the Kirghiz Tartars, which in a few years resulted in the expulsion of the Chinese and the subjection of the provinces of Kashgar, Yarkand, Khoten, and Aksu to Mohammed Yakub Beg, a military chief from Khokan, who became sovereign of East Turkistan. (See **TURKISTAN**.) **II.** A city of East Turkistan, capital of that country and of the province described above, in lat. $39^{\circ} 29' N.$, lon. $76^{\circ} 12' E.$, about 135 m. N. W. of Yarkand; pop. estimated at from 60,000 to 70,000, mostly Tartars. It is situated in an angle between two branches of the Kazul river or Kizil Darya. The northern branch, called the Tumaun, runs close to the walls, and is crossed by a bridge of 55 boats; the southern branch, over which there is a bridge of eight boats, flows between Kashgar and the fortress. The latter, which is known as the Yang-shahr, and is sometimes called the new city, is about 5 m. from the old city. Its elevation above the sea has been variously stated, as low as 4,165 ft. and as high as 5,200 ft. Kashgar is built on a plain bounded N. and N. W. by lofty mountains connected with the Pamir plateau, while level tracts stretch far toward the east. A fortified earthen wall of considerable height and thickness surrounds the city; it is pierced by five gates, and overlooked by numerous towers about 50 yards apart. There are said to be 28,000 houses within the enclosure, mostly flat-roofed and made of sun-dried bricks. The people are industrious, peaceful, and intelligent, and have attained a comparatively high degree of civilization. They are Mohammedans. Kashgar has been notorious since the days of Marco Polo for the temporary marriages which the rules of Shiah Mohammedanism permitted, as perfectly lawful, between young women of the city and travellers, for a month, a week, or even a day. This practice has, however, lately been prohibited. There are eight colleges, eleven caravansaries, and many spacious bazaars. A considerable trade is carried on in tea, chintz, cloths, and Russian manufactured goods. A coarse gunpowder is manufactured. Fuel and timber are very scarce. The climate is dry in winter, and so cold that the rivers freeze over and snow falls frequently. The city was visited by Marco Polo, who describes it under the name of Cascar. The name is written and pronounced Kâshkar by the inhabitants.—Among the first Europeans to explore the province in modern times were Adolf Schlagintweit, who was murdered there in August, 1857, and the English travellers Robert B. Shaw and George W. Hayward, who reached the new city in 1869. For accounts of these and other recent expeditions, see "Journal of the Royal Geographical Society," vols. xl. and xli. (Lon-

don, 1870 and 1871), and Shaw's "Visits to High Tartary, Yarkand, and Kashgar" (London, 1871).

KÄSTNER, Abraham Gotthelf, a German mathematician, born in Leipsic, Sept. 27, 1719, died in Göttingen, June 20, 1800. He was the son of a professor, embraced in his studies almost all branches of learning, and exerted a powerful influence in delivering mathematical and natural sciences from the bondage of antiquated text books. He was professor at Leipsic, and afterward at Göttingen. His *Anfangsgründe der Mathematik* (6th ed., 1800), and his various other writings, inaugurated a more enlightened era of scientific study in Germany. He took a conspicuous part in the formation of the celebrated union of Göttingen poets. His popularity was chiefly due to his *Sinngedichte*. His colleague, Heyne, pronounced a eulogium on him in 1804. A portion of his epigrammatic poems were included in his "Miscellaneous writings" (2 vols., 1783).

KATAHDIN, or Ktaadn, the highest mountain in Maine, situated in the central part of the state, about 80 m. N. by W. of Bangor, and 6 m. N. E. of the Penobscot river. It is in a region difficult of access except by birch canoes, the river being the only thoroughfare through this rough territory, and its course being interrupted by frequent shoals and falls. The mountain is composed entirely of granite, which stands in abrupt walls, and is exposed in naked floors covering acres of surface. Down its sides bare spots caused by slides of rock extend from near the summit almost to the base. The height of the mountain is 5,385 ft. above the sea. Upon its summit are found only lichens and a few dwarfish plants; and half way down, the birch and other forest trees are but of diminutive size. It is remarkable that over the granite rocks, even to the summit, are found boulders of trap and of other rocks not belonging to the mountain, and among them pieces of sandstone containing fossil shells, such as are met with in place many miles further N. From the summit in clear weather the view extends over a country singularly rough and wild, composed of scattered mountains which rise in the conical form of granitic peaks, and among which are interspersed hundreds of lakes, many of large size, and streams without number. Most of these are navigable by the birch canoe, and are made by temporary dams to drift down the pine logs which are cut by the lumbermen in the winter, and hauled down upon the ice in readiness to be floated as this breaks up in the spring.

KATER, Henry, an English mathematician, born in Bristol, April 16, 1777, died in London, April 26, 1835. In his youth he spent some time in a lawyer's office, but upon the death of his father in 1794 he procured a commission in a regiment stationed in India, and was for some years employed in the trigonometrical survey of that country, when he returned

to England and devoted himself to scientific pursuits. He became a captain, and retired on half pay in 1814. Among his most important discoveries were the determination of the precise length of the seconds pendulum, the investigation of the diminution of terrestrial gravity from the pole to the equator, and his employment of the pendulum for the purpose of finding the minute variations of the force of gravity in different parts of a country whose substrata consist of materials having different degrees of density. In the "Philosophical Transactions" of 1825-'8 appeared descriptions of his "floating collimator," an instrument of great importance to trigonometers, employed to determine the position of the line of collimation in the telescope attached to an astronomical circle. He also made some ingenious experiments on the relative merits of the Cassegrain and Gregory telescopes. He is the author of the greater portion of the "Treatise on Mechanics" in Dr. Lardner's "Cabinet Cyclopædia," and published "An Account of the Construction and Verification of certain Standards of Linear Measure for the Russian Government" (4to, London, 1832).

KATIF, a seaport town of Arabia, in a province of the same name in the sultanate of Nedjed, on the Persian gulf, lat. $26^{\circ} 25' N.$, lon. $50^{\circ} 10' E.$; pop. about 6,000. The town stands at the W. extremity of a bay formed by two long promontories, at the extremity of each of which is a fortress. Between these points, where the bay is 20 m. wide, lies the island of Tarut, which is well watered and covered with date palms. The castle of Katif stands on the curve of a little inner bay. The town is crowded, damp, dirty, and unhealthy. It has a weekly market, well supplied. Katif has now but little trade, the island of Bahrein, about 30 m. S. E. of it, having absorbed most of the commerce of the coast.

KATKOFF, *Mikhail Nikiforovitch*, a Russian publicist, born in Moscow in 1820. He studied in Moscow, Königsberg, and Berlin, and was for a short time professor of philosophy, and subsequently became the most influential journalist in Russia, especially since 1861 in connection with the *Moskovskiya Viedomosti* ("Moscow Gazette"). His wife is a member of a princely family.

KATMANDU, or *Catmandoo*, a town of India, capital of Nepaul, 150 m. N. of Patna; pop. estimated at from 20,000 to 50,000. It is situated in a large plain, and surrounded by ranges of the Himalaya mountains. It is the residence of the rajah, and is a place of considerable importance, with many temples and good houses, and a fine square containing a royal palace and Chinese pagoda. A considerable trade is carried on with Thibet and the Ganges. The inhabitants are mostly Newars, and in the vicinity reside the Parbutiyas in straggling villages.

KATRINE, *Loch*, a lake of Perthshire, Scotland, $9\frac{1}{2}$ m. from Callander. It is of serpentine

form, about 10 m. in length, and in some places nearly 2 m. in breadth, and is surrounded with lofty mountains and rocky ravines, displaying scenery of much grandeur and beauty. From its E. extremity flows a stream, which, after passing through the rugged defile of the Trosachs, widens into the two minor lakes of Achray and Vennachar, and becomes the river Teith, a tributary of the Forth. This lake was formerly a favorite resort of robbers, or *caterans*, and at a little distance from its shore is a small island called Eilan Varnoch, whither the freebooters used to bring their plunder, and which is the famous "Ellen's isle" of Scott's "Lady of the Lake." From this lake the city of Glasgow is supplied with water, which is carried 26 m. in pipes over a rugged and mountainous district, with 70 tunnels aggregating 13 m. in length, several aqueduct bridges in the form of iron troughs, and siphon pipes across wide and deep valleys. The works were completed in 1859, at a cost of £1,500,000, and can supply 50,000,000 gallons daily.

KATYDID (*Cyrtophyllus concavus*, Scudd.), an American grasshopper, named from the sound of its note. It is about an inch and a half long, the body being an inch, pale green, with darker wings and wing covers; the thorax is roughened, and is shaped somewhat like a saddle; the wing covers are longer than the wings, and enclose the body in their concavity, meeting above and below like the valves of a pea pod. This "testy little dogmatist," rendered familiar by the verses of Holmes, is one of the loudest and most persevering of our native musicians; silent and concealed among the leaves during the day, at night it mounts to the highest branches of the trees, where the male commences his sonorous call to the noiseless females. The sound is produced by the friction of the taborets in the triangular overlapping portion of each wing cover against

Katydid (*Cyrtophyllus concavus*).

each other, and is strengthened by the escape of air from the sacs of the body, reverberating so loudly as to be heard a quarter of a mile in a still night. These insects are now comparatively rare in the Atlantic states, but in some parts of the west their incessant noise

is almost insupportable to those unaccustomed to it. The perfect insect lays her eggs in September and October, depositing them in two contiguous rows along the surface of a twig previously prepared by her curved piercer; they resemble tiny bivalve shells, of a slate color, about one eighth of an inch long, and are eight or nine in each row; the young escape through a cleft in one end; the eggs are sometimes placed in nests in the earth, where they remain till spring; they are eaten by beetles, earwigs, crickets, ants, &c. The young are said to be injurious to roots of grasses and grains; the adults eat the interior of flower buds and the germs of fruit. Though found on almost all trees, the balsam poplar is a special favorite. They are called grasshopper birds by the Indians, who are in the habit of roasting and grinding them into a flour, from which they make cakes, considered by them as delicacies. The katydid is interesting in captivity, and will live thus, if fed on fruit, for several weeks; like other grasshoppers, after the warm season they rapidly become old, the voice ceases, and all soon perish.

KATZBACH, a small river of Prussian Silesia, which joins the Oder on its left bank, 29 m. N. W. of Breslau, after a course of 35 m. It is noted for a victory of the Prussians and Russians under Blücher over the French commanded by Macdonald, achieved on its banks near Liegnitz, Aug. 26, 1813.

KAUAI, the principal N. W. island of the Hawaiian group, in lat. 22° N., lon. 159° 30' W.; area, 527 sq. m.; pop. in 1872, 4,961. It is irregularly-circular, about 28 m. in diameter, and mountainous. Waialeale, the highest peak (about 6,000 ft.), is a little E. of the centre. West of this summit is a table land of nearly 40 sq. m. and about 3,000 ft. high; it terminates in a steep precipice on the coast. At other parts of the island the shore is generally a sandy beach interrupted by basaltic cliffs from 10 to 150 ft. high. The rock of the mountain is a compact ferruginous basalt. The shore ridges contain less iron and are more cellular; they vary in their structure from a compact phonolite to a heavy basalt. Crystals of quartz and iron pyrites are found in various parts. On the W. coast is a steep sand bank about 60 ft. high, known as the "barking sands," formed by the action of the wind, and constantly advancing on the land. Visitors slide their horses down the face of the bank, when a noise as of subterranean thunder is heard. The valleys are deep and numerous, and every ravine is a watercourse. Kauai has a larger proportion of arable land than any other of the Hawaiian islands, its lowlands being mostly on the windward or rainy side. In the valleys the soil is sometimes 10 ft. deep. Hanalei, on the N. side, is reputed to have a larger rainfall than any other place in the group. The leeward or S. W. districts are comparatively dry and barren. The largest river, the Hanalei, empties into a tolerable harbor of the same name; Ko-

loa (the principal town) and Nawiliwili have also good anchorage. Kauai is regarded, on account of the greater decomposition of its lavas, the degradation of its ridges, and the absence of recent volcanic products, as the oldest member of the Hawaiian group. The whole island, however, bears clear traces of its volcanic origin. In most parts the scenery is of extreme beauty. The chief product of Kauai is sugar; the raising of cattle is also a considerable business, hides, tallow, and wool being exported. Breadfruits, kalo, bananas, cocoanuts, oranges, and other tropical fruits grow abundantly. The native population of the island is decreasing.

KAUFFMANN, Maria Angelica, a Swiss painter, born in Coire, Oct. 30, 1741, died in Rome, Nov. 5, 1807. At the age of 15 she was taken to Milan and put under the best masters in music and painting, and in 1763 she accompanied her father to Rome. Winkelmann, whose portrait she painted, in a letter written in 1764, speaks in the warmest terms of her many accomplishments, and of her intimate acquaintance with modern languages. While in Rome she painted many portraits of distinguished people. In 1765 she accompanied Lady Wentworth to England, where she was received with every mark of attention. Upon the establishment of the royal academy she was chosen one of the 36 original members. In 1781 she married Signor Antonio Zucchi, an artist, and the following year returned to Rome, where she passed the rest of her life. Some years previous to this she had been betrayed into marriage with an impostor who assumed the title of Count Horn, from whom she procured a divorce. Many of her works were engraved by Bartolozzi. She retained her maiden name until her death.

KAUFMAN, a N. E. county of Texas, bounded S. W. by Trinity river, and drained by the E. fork of that stream; area, 950 sq. m.; pop. in 1870, 6,895, of whom 838 were colored. The surface is mostly undulating, and the S. E. part is well timbered, while the N. W. is occupied by prairies. The soil is generally good. The chief productions in 1870 were 179,658 bushels of Indian corn, 11,700 of sweet potatoes, and 1,910 bales of cotton. There were 2,605 horses, 25,643 cattle, 2,448 sheep, and 8,406 swine. Capital, Kaufman.

KAUFMANN, Constantin Petrovitch, a Russian general, born in the Baltic provinces about 1817. He is of humble origin, but early acquired distinction as a military engineer, and served for some time as chief of staff in the Caucasus. At a later period he held a post in the ministry of war, and cooperated in the thorough reform of the army. In 1864 he was appointed governor general of the military division of Wilna, including Lithuania, Livonia, and Courland; and in 1867 of the newly established division of Turkistan, which post he continued to hold in 1874 with the rank of lieutenant general. The progress of Russia in

central Asia is mainly due to his efforts. In 1873 he conducted the successful campaign in Khiva, which virtually placed that territory under Russian control by the treaty of peace which he signed with the khan on Aug. 25.

KAUFMANN, Theodor, an American painter, born at Uelsen, Hanover, Dec. 18, 1814. He served for several years as a mercantile apprentice, and studied painting in Hamburg, and under Hess in Munich. Implicated in the revolutionary movement of 1847-'9, he left Germany, and in 1850 settled in the United States. He served in the army during the civil war, and afterward resided in Boston. His works include "General Sherman near the Watch-fire," "On to Liberty," and "A Pacific Railway Train attacked by Indians." His "American Painting Book" was published at Boston in 1871.

KAULBACH, Wilhelm von, a German painter, born in Arolsen, Oct. 15, 1805, died in Munich, April 7, 1874. His mother was a superior woman, and his father was a skilful goldsmith and engraver. But the family was so poor that he and his sister were glad to accept even stale bread from the peasantry in exchange for the father's engravings; and this is said to have suggested to him his earliest work, "The Fall of Manna in the Wilderness." The sculptor Rauch procured his admission to the academy of Düsseldorf. He became the most distinguished pupil of Cornelius, and in 1825 followed him to Munich, where he spent the rest of his life, the last 25 years as director of the academy. Under the direction of Cornelius he designed (1825-'8) many frescoes for the new buildings at Munich, including "Apollo and the Muses," for the ceiling of the Odeon; designs from Klopstock's "Battle of Hermann," and from Goethe's and Wieland's poems, for the royal palace; purely classical illustrations of the story of Amor and Psyche, for the palace of Duke Max; and many allegorical figures for the arcades of the palace garden. These works established his reputation as the most admirable exponent of the idealistic school, while his "Lunatic Asylum," commenced at Düsseldorf, where he had taken a morbid delight in watching the insane, made him famous as an equally great master of realism. His next great work, the "Battle of the Huns," or "Spectre Battle," representing the legend of the continued combat in mid-air between the spirits of the Huns and of Romans who had fallen before the walls of Rome, exhibited on the largest scale his genius for the symbolical and allegorical. Count Raczynski commissioned him to paint the work in sepia, and he finished it in 1837. The king of Saxony now offered him the direction of the academy of Dresden, with a salary of 2,000 thalers; but Kaulbach preferred to remain in Munich, although he received only 800 florins from the king of Bavaria. In 1838 he finished his masterpiece, the "Destruction of Jerusalem by Titus," a colossal cartoon giving the fullest scope to his imaginative power and to

his wonderful capacity for idealizing history. It illustrates the fulfilment of the prophecies by the Roman eagle on the high altar of the temple, and by woe-stricken women and distracted priests committing suicide; the triumph of Christianity by angels who rescue the faithful from the scene of terror; and the punishment inflicted upon unbelievers by the wandering Jew pursued by demons. Having hitherto worked almost exclusively in fresco, he spent some time in Venice and a year in Rome to prepare himself for painting the cartoon in oil for the new Pinakothek, completing it in 1846. About the same time he commenced his famous designs illustrative of the history of mankind for the new museum at Berlin, which were executed by his pupils and completed in 1860. They consist of six frescoes, representing the "Tower of Babel," "Homer and the Greeks," the "Destruction of Jerusalem," the "Battle of the Huns," the "Crusaders at the gates of Jerusalem," and the "Age of the Reformation." Allegorical pictures of the progress of the various nations and figures of sages and heroes fill the surrounding compartments, and an extensive frieze running round the whole, with countless lovely boys, symbolizes in their childish sports the varied incidents of humanity since the dawn of time. A complete set of engravings of these frescoes, chiefly by Eichens, was published in 1874. To the same period belong his cartoons in the new Pinakothek of Munich, showing the progress of art during the present century, for which he incurred the censure of several artists, especially Schnorr, on account of its satirical tendency. His overflowing humor and sarcasm appear in many of his other works, especially in his designs for *Reineke Fuchs*, in which he also proves himself to be an excellent painter of animals. But the grotesque, though not unsuitable to this subject, was often mixed up with the sublime in his productions; and for this he was much blamed by rigid purists, while others compare his irrepressible disposition to present a comprehensive view of all the various phases of human character to the similar tendency in Shakespeare. His designs to Shakespeare indicate his sympathy with his genius, and his careful study of Hogarth is also attested in these illustrations, and in many others, including *Faust* and Schiller's *Verbrecher aus verlorener Ehre*. Among his other works, besides many portraits, are the "Assassination of Cæsar," the "Battle of Salamis," for the Maximilianeum at Munich, and the "Opening of the Tomb of Charlemagne by Otho the Great," which he presented to the Germanic museum at Nuremberg. His paintings in private American galleries include a "Caritas," in possession of the Longworth family in Cincinnati, and the "Meeting of Queen Elizabeth with Mary Stuart," in that of Mr. George C. Wetmore of New York. His fervent Protestantism, which alienated him in the latter part of his life from Cornelius, who was as decided a Catholic, is

most strongly expressed in his "Don Pedro de Arbuez, the Inquisitor," which, appearing at the time of the oecumenical council (1869-70), produced a great sensation, and gave rise to many controversies. Shortly before his death he was at work upon a large cartoon of "The Deluge;" and he had finished his "St. Michael, the Patron Saint of Germany," in the garb of a heavenly messenger with a radiant air of triumph, and with Napoleon III. and his son and several Jesuits cowering at his feet. This work has been characterized as a grand memorial of his nation's and of his own greatness. His death was mourned as a national calamity, and measures have been taken for the erection of a monument in his honor.—His cousin FRIEDRICH excels as a portrait painter; and he has also painted "Adam and Eve finding the Corpse of Abel," the "Coronation of Charlemagne," "Mozart performing his Requiem shortly before his Death," and other historical pictures.

KAUNITZ, Wenzel Anton, prince, count of Rietberg, an Austrian statesman, born in Vienna in 1711, died June 27, 1794. One of 19 children, he was destined for the church; but after the death of some of his elder brothers, he chose a secular career, studying at Vienna, Leipsic, and Leyden. He became a chamberlain of the emperor Charles VI., travelled for some years in Germany, Italy, France, and England, and in 1735 was appointed aulic councillor of the empire. By marriage he became the proprietor of the county of Rietberg. His influence rose under the daughter and successor of Charles, Maria Theresa, when, after various and successful diplomatic missions to Rome, Turin, and Brussels, and a short administration of the Austrian Netherlands till their occupation by the French in 1746, he signed for Austria the treaty of Aix-la-Chapelle (1748). Shortly after he became minister of state, but soon left this post, being sent as ambassador to France, where he secured the influence of Mme. de Pompadour for an alliance with Maria Theresa. This was effected in 1756, and the seven years' war began, after the conclusion of which Kaunitz, who in 1753 had been appointed chancellor, was elevated to the rank of prince of the empire. He accompanied Joseph II. to the interview at Neustadt in Moravia with Frederick the Great, when the two monarchs concerted the scheme of the first partition of Poland, but against the opinion of the minister. Frederick speaks disparagingly of him in his memoirs; and Joseph, whom he served without success in his schemes for the annexation of Bavaria, gradually withdrew his favor from the old statesman during his actual reign (1780-90). Kaunitz gained new influence during the short reign of Leopold II., but after the accession of his son Francis (1792) he resigned his offices. A taciturn and scheming diplomatist, Kaunitz was ceremoniously grave with his equals, fond of the French language, literature, and fashions, and

with much frivolity, vanity, and self-love united probity, affability toward inferiors, and fidelity to the interests of the empire.

KAVANAGH, Julia, a British authoress, born in Thurles, Ireland, in 1824. At an early age she accompanied her parents to France, where she was educated. In 1844 she took up her residence in London. She published in 1847 a tale for children entitled "The Three Paths." This was followed by "Madeleine" (1848), a story of peasant life in France, and in 1850 by a series of historical sketches, "Woman in France in the 18th Century." In 1851 appeared "Nathalie," a novel, in which the scene is also laid in France. Among her other works are: "Women of Christianity exemplary for Piety" (1852), "Daisy Burns" (1853), "Grace Lee" (1854) "Rachel Gray" (1855), "The Hobbies" (1857), "Adèle" (1858), "French Women of Letters" (1861), "English Women of Letters" (1862), "Queen Mab" (1863), "Sibyl's Second Love" (1867), and "Sylvia" (1870).

KAVANAUGH, Hubbard Hinde, an American bishop, born in Clark co., Ky., Jan. 14, 1802. At the age of 15 he was apprenticed to a printer, was licensed as a local preacher of the Methodist church in 1822, and printed a secular journal at Augusta, Ky. He joined the Kentucky annual conference in 1823, and was employed on very extensive and laborious circuits, riding on horseback 200 miles, and preaching at 25 regular appointments, every 28 days. After five years given to this circuit service, he was engaged from 1828 to 1848 in the pastorate, in the superintending of public instruction, and in college agencies. In 1854, at the general conference of the Methodist Episcopal church south, he was elected bishop, which office he continued to hold in 1874.

KAYE, John, an English bishop, born in Hammersmith, London, in 1783, died in Lincoln, Feb. 19, 1853. He graduated at Christ's college, Cambridge, in 1804, was elected master of the college in 1814, and in 1815 was made D. D. by royal mandate. In 1816 he became regius professor of divinity. He was made bishop of Bristol in 1820, and was translated to Lincoln in 1827. His writings include "Ecclesiastical History of the Second and Third Centuries illustrated from the Writings of Tertullian" (1826); "Some Account of the Writings and Opinions of Clement of Alexandria" (1835); "Some Account of the Writings and Opinions of Justin Martyr" (1836; 3d ed., 1853); and "Account of the Government of the Church during the First Three Centuries" (1855). He also published anonymously "Remarks on Dr. Wiseman's Lectures," and "Reply to the Travels of an Irish Gentleman."

KAYE, Sir John William, an English author, born in 1814. After serving for some time as lieutenant in the army in India, he returned to England in 1845, and devoted himself to literature. In 1856 he entered the home civil service of the East India company, and upon the

transfer to the crown of the government of India, he was made secretary to the political and secret department of the India office. He was knighted in 1871. He has written "History of the War in Afghanistan" (4 vols., 1851-'3; new ed., 1874); "History of the Administration of the East India Company" (1853); "Life and Correspondence of Lord Metcalfe" (1854); "Life and Correspondence of Sir John Malcolm" (1856); "Christianity in India" (1859); "History of the Sepoy War" (2 vols., 1866-'71); and "Essays of an Optimist" (1870).

KAZAN, or Kasan. I. An E. government of European Russia, bordering on Viatka, Ufa, Simbirsk, and Nizhegorod; area, 23,727 sq. m.; pop. in 1867, 1,670,337. The surface is generally flat, but in parts undulating and hilly, the S. portion being traversed by inconsiderable branches of the Ural mountains. The

principal rivers are the Volga and its affluent the Kama. The forests are very extensive, covering nearly half the surface. The woods abound in bears, wolves, and feathered game. The soil is fertile, and yields large crops of grain, hemp, flax, &c., but is not generally well cultivated. The fisheries are productive, and there are numerous distilleries, tanneries, weaving and spinning establishments, &c. The Russians form nearly one half of the population; the Tartars number about 300,000; the rest of the inhabitants are Tchevashes of Finnish origin, Tcheremisses, &c. Kazan, with the neighboring governments of Pensa, Simbirsk, Viatka, and Perm, formerly constituted part of the so-called Golden Horde, or the Kiptchak khilate, the country having successively been occupied by Finns, Bulgarians, and Tartars. The khanate was for centuries the terror of Russia,

Semiozernoi Convent, Kazan.

and resisted that power until the middle of the 16th century, when it was conquered by Czar Ivan the Terrible, and annexed as a kingdom to Russia. II. A city, capital of the government and of a circle of the same name, situated on the Kazanka, about 3 m. above its confluence with the Volga, 430 m. E. of Moscow; pop. in 1867, 78,602, about one fourth of whom were Mohammedans. It consists of the fortified town (*Kreml*) and the town proper. It contains over 30 churches, 9 convents, and 16 mosques, and is renowned for its numerous educational and literary institutions, including a university, opened in 1814, which has a special importance from the attention given in it to the study of living Asiatic languages. It possesses many important manufactories of cloth, woollen, leather, soap, and iron, and an extensive trade, being the great emporium of

the commerce between Russia and Siberia. Near Kazan is the Semiozernoi convent, with a miracle-working madonna, the patroness of the city, which is annually in July brought in procession to the city and exhibited in the *Kreml*. Kazan was destroyed by fire in 1815 and again in 1842, but it has risen from its ashes more prosperous and better built than ever.

KAZINCZY, Ferenez, a Hungarian author, born in the county of Bihar, Oct. 27, 1759, died in that of Zemplén, Aug. 22, 1831. He pursued his classical studies from 1769 to 1779 at the college of Patak, and subsequently studied law at Kaschau. On the recommendation of Count Török he was made inspector of schools, but devoted himself chiefly to literature, and especially to the restoration of the Magyar language in its purity, and the development of all its literary capabilities. With Szabó and Ba-

csányi he edited the "Magyar Museum," and subsequently alone the "Orpheus," both literary magazines published at Kaschau. Having become implicated in the democratic conspiracy of the abbot Martinovics, he was suddenly arrested at the house of his mother in Lower Regmeecz, on Dec. 14, 1794, carried to Buda, tried, and condemned to death; his sentence was commuted to imprisonment. He was kept in the dungeons of Buda, Brünn, Kufstein, and Munkács, and released in 1801. He married the daughter of his former protector, Count Török, and retired to a country residence in the neighborhood of Sátoralja-Ujhely, which he named Széphalom (Fairhill), and where he spent the remainder of his life, continuing to labor for the literary progress of his country. His works, which have twice been collected (Pesth, 1814, 1836), contain original epistles, epigrams, sketches of travel, a tragedy, &c., besides translations from Goethe, Lessing, La Rochefoucauld, Sterne, and others. He also edited the works of Zrínyi the poet, Baróczy, Dajka, and Kis, and a volume of "Hungarian Antiquities and Rarities" on grammatical subjects. In 1859 the centennial birthday of Kazinczy was celebrated throughout Hungary.

KEAN. I. Edmund, an English actor, born in London, March 17, 1787 (according to the suggestion of his biographer Mr. Procter, although other accounts make the year 1789 or 1790), died in Richmond, May 15, 1833. His father was a stage carpenter, and his mother, whose name he retained during his childhood, was Miss Ann Carey, by profession an actress, and a descendant of Henry Carey the poet. At two years of age he was taken in charge by a Miss Tidswell, who put him to school in London. A few years later his mother, who occasionally followed the business of an itinerant vender of perfumery, took him with her in her peregrinations, and brought him under the notice of a Mrs. Clarke. He had, almost as soon as he could walk, appeared at Drury Lane theatre as Cupid in the opera of "Cymon," and had subsequently taken children's parts on the stage. He made so favorable an impression upon Mrs. Clarke, that he remained for two years under her protection, and received instruction in dancing, fencing, and various other accomplishments. When about 12 years of age he enrolled himself in a strolling troop of which his mother was a member, and on one occasion at Windsor recited in the presence of George III. From the beginning of the century to the period of his first appearance in London in 1814, he was connected with strolling companies or provincial theatres, assuming every variety of character, from the leading parts in tragedy to harlequin in the pantomime, and by very slow degrees forcing his talents into notice. In 1808 he was married, and during several years experienced many vicissitudes of fortune, being frequently reduced with his family, consisting of his wife and two children, to the verge of starvation. In 1813 Dr. Drury, the

master of Harrow school, saw him act at Teignmouth, and was so impressed with his dramatic abilities that he procured him an introduction to the manager of Drury Lane theatre, by whom he was engaged for three years at a salary of £8, £9, and £10 per week for each successive year. He made his first appearance Jan. 26, 1814, as Shylock, before a meagre audience, not particularly predisposed in his favor; but so great were his powers and the vigor of his personation, that at the fall of the curtain he was greeted by applause such as had not for many years been heard in Drury Lane, his appearance, according to Hazlitt, being "the first gleam of genius breaking athwart the gloom of the stage." After his third performance of Shylock, a new engagement at a far higher salary was offered to him; and not long after he received from the committee of Drury Lane theatre a present of £500, besides numerous valuable gifts from private persons. He subsequently appeared as Richard III., Hamlet, Othello, Iago, Macbeth, Sir Giles Overreach, Sir Edward Mortimer, Lear, and in various other characters, with undiminished success, and for several years was the most eminent and popular actor on the British stage. In 1820 he made a professional tour in the United States, which at first was attended with great success; but in May, 1821, his refusal to complete an engagement in Boston, in consequence of the thinness of the houses, created an excitement which led to his abrupt departure from the city. Upon returning to England, he played his usual round of characters; but after the developments respecting his criminal connection with the wife of Alderman Cox, in the action of *Cox v. Kean*, January, 1825, in which a verdict of £800 damages was pronounced against him, he was hissed from the stage in Edinburgh and London. In 1825 he returned to the United States, and was at first received with riot and confusion wherever he attempted to act. Having tendered an apology, he appeared in New York and Philadelphia, but was not permitted to perform in Boston or Baltimore. During this visit he was elected a chief of the Tuscarora Indians by the name of Alantenouidet. Subsequent to his return to England in 1826 his health and spirits, undermined by habits of drinking, gave way rapidly, and it was only by the use of stimulants that he could still act his old parts. He was unable to master a new one, forgetting the words almost as soon as he acquired them. In February, 1833, he was announced to appear in "Othello" with his son Charles. On the night of the performance he succeeded with difficulty in getting through two acts of the play, but in the third act, while uttering the words, "Villain, be sure," &c., he fell exhausted into the arms of his son, who acted Iago, and was borne from the stage. This was his last appearance before the public. Kean was short of stature, but well formed and graceful, and his eyes were singularly black and brilliant.

His countenance was capable of wonderful variety and intensity of expression, and his action, which, as well as his conceptions of character, was the result of deep study, lifted him far above the ordinary heroes of the stage. He possessed vigor, pathos, sarcasm, and the power of communicating terror in the highest degree; and his intensity in expressing all the passions has never been excelled. His biography was written by B. W. Procter (Barry Cornwall) (2 vols. 8vo, London, 1835). **II. Charles John**, an English actor, son of the preceding, born in Waterford, Ireland, Jan. 18, 1811, died in London, Jan. 22, 1868. He was educated at Eton, whence he was withdrawn at the age of 16 in consequence of the refusal of his father to maintain him longer at school, the son having incurred his displeasure by declining the offer of a cadetship in India in order to look after the wants of his mother. In this emergency Charles Kean determined to adopt the stage as a profession, and on Oct. 1, 1827, made his début at Drury Lane in the character of Young Norval. His success was not striking, and for several years he made no impression upon the public. In 1830 he visited the United States, and after his return to England in 1833 began by degrees to assume the position of a leading actor in London. In 1839 he revisited America, returning to England in the following year; and in 1842 he was married to the actress Ellen Tree. In 1845 he made a third visit to the United States, performing with his wife in the chief cities for upward of two years. For several years after his return he played engagements at the principal theatres in London and the provinces, and in 1850 he became the sole lessee of the Princess's theatre, where for a number of seasons he produced splendid revivals of "Macbeth," "King John," "Richard III.," "Richard II.," the "Tempest," and other Shakespearian plays. As an actor he held a respectable position. As a stage manager he exhibited good taste and abundant resources, and was for several years the director of the theatrical performances at Windsor castle. In 1863 he made with his wife a professional tour to Australia, returning in 1866 by way of California. In 1859 appeared the "Life of Charles Kean," by J. W. Cole (2 vols. 8vo, London). **III. Ellen (Tree)**, an English actress, wife of the preceding, born in London in 1805. She first appeared upon the stage at Covent Garden theatre, London, in 1823, and within a few years became one of the leading members of her profession, excelling both in comedy and tragedy. In December, 1836, she made her début upon the American stage at New York, and subsequently acted with success in the chief cities of the United States and Canada. In 1842 she was married to Charles Kean, with whom she continued to appear down to the time of his death, when she retired from the stage. Among her most popular characters were Beatrice in "Much Ado about Nothing," Rosalind in "As You Like It," Portia in the

"Merchant of Venice," Viola in "Twelfth Night," Julia in "The Hunchback," and Mrs. Haller in "The Stranger."

KEANE, John, first Lord Keane, a British general, born at Belmont, county Waterford, Ireland, in 1781, died at Burton Lodge, Hampshire, England, Aug. 24, 1844. He entered the British army as ensign in his 13th year, and during the campaign in Egypt acted as aide-de-camp to Lord Cavan. He served in Spain, where he gained the rank of major general. In the autumn of 1814 he was appointed to command the land forces destined to attack New Orleans, but was superseded by Sir Edward Pakenham, under whom however he continued to serve, and was twice severely wounded. From 1823 to 1830 he was commander-in-chief of the West Indian army, and during a part of that period administered also the civil government of Jamaica. In 1833 he was sent to India, and in 1839 captured the fortress of Ghuznee in Afghanistan, till then deemed impregnable. For this exploit he was raised to the peerage as Baron Keane, in December, 1839, and received from the East India company a pension of £2,000.

KEARNEY, a S. county of Nebraska, bounded N. by the Platte river; area, about 525 sq. m.; pop. in 1870, 58. A large portion is occupied by prairies. The Burlington and Missouri River railroad traverses it. Capital, Fort Kearney.

KEARNY. I. Lawrence, an American naval officer, born in Perth Amboy, N. J., Nov. 30, 1789, died there, Nov. 29, 1868. He entered the navy as a midshipman in 1807. When the war with Great Britain broke out he was first lieutenant of the *Enterprise*, and in her he was wrecked while on a cruise from New Orleans in 1812. After the war he distinguished himself in clearing the West Indies and the gulf coast of pirates. In 1827 he sailed as commander in the ship *Warren* for the Mediterranean, where he attacked the Greek pirates, broke up their rendezvous, and dispersed them. At one time he had more than 109 pirates in chains on board his ship. Becoming a captain in 1832, he took command of the East India squadron in 1841, greatly promoted American interests in China, and returned home in 1844. He was made a commodore in 1866. **II. Stephen Watts**, an American soldier, born in Newark, N. J., Aug. 30, 1794, died in St. Louis, Mo., Oct. 31, 1848. He entered the army in 1812, in 1833 became lieutenant colonel of dragoons, in 1836 colonel, and in June, 1846, a brigadier general. At the commencement of the Mexican war he commanded the "army of the West," which marched from Bent's fort on the Arkansas westward, and conquered New Mexico. Having established a provisional civil government in Santa Fé, he proceeded to California, and in December participated with his command in the battle of San Pascual, where he was twice wounded. He subsequently commanded the sailors and marines and a detachment of dragoons in the battles of San Gabriel

and the plains of Mesa, Jan. 8 and 9, 1847. He was appointed brevet major general, and was governor of California from March to June, 1847. He was the author of a work on the "Manœuvring of Dragoons" (1837), and of "Laws for the Government of New Mexico" (1846).

III. Philip, an American soldier, nephew of the preceding, born in New York, June 2, 1815, killed near Chantilly, Va., Sept. 1, 1862. He studied law, but in 1837 accepted a commission as second lieutenant in the 1st dragoons, commanded by his uncle. Being soon afterward sent to Europe by the government to study and report upon the French cavalry tactics, he entered the military school at Saumur, then went to Algeria, joined the chasseurs d'Afrique as a volunteer, and received the cross of the legion of honor for his bravery. On his return home in 1840 he was appointed aide-de-camp to Gen. Macomb, and the next year to Gen. Scott, which appointment he held till 1844. In 1846 he was made captain of dragoons. He furnished his men with equipments and horses from his private means, and his company formed the escort of Gen. Scott when he entered Vera Cruz. He was brevetted major for gallant conduct at Contreras and Churubusco. In a charge on the San Antonio gate at the city of Mexico he lost his left arm. At the close of the Mexican war he was ordered to California, and commanded an expedition against the Indians of Columbia river. In 1851 he resigned and went to Europe, where he continued to pursue military studies. In the Italian war of 1859 he served as a volunteer aide on the staff of the French general Maurier, was in the battles of Magenta and Solferino, and received from Napoleon III. for the second time the cross of the legion of honor. On the breaking out of the American civil war he hastened home, and was placed in command of a brigade, and afterward of a division in the army. He distinguished himself at the battles of Williamsburg, Seven Pines, and Frazier's Farm, and was made a major general of volunteers July 4, 1862. He was prominent at the second battle of Bull Run. During the action at Chantilly he rode forward in advance of his men to reconnoitre, and fell in with a confederate soldier, of whom he inquired the position of a regiment. Discovering his mistake, he turned to ride away, when the soldier fired, and Kearny fell mortally wounded.

KEATS, John, an English poet, born in London in 1795 or 1796, died in Rome, Feb. 27, 1821. He was sent at an early age with his two brothers to a school in Enfield, where he remained until his 15th year. He seems to have been careless of the ordinary school distinctions, but read whatever authors attracted his fancy. He never advanced in his classical studies beyond Latin, and his knowledge of Greek mythology was derived from Lempriere's dictionary and Tooke's "Pantheon;" a singular fact considering the thoroughly Hellenic spirit which imbues some of his works. In 1810 he was re-

moved from school, and apprenticed for five years to a surgeon in Edmonton. His earliest known verses are the lines "In Imitation of Spenser." About the same time he became acquainted with Homer through Chapman's translation, and commemorated his emotions in the sonnet, "On first looking into Chapman's Homer." Upon the completion of his apprenticeship he removed to London to "walk the hospitals," and made the acquaintance of Leigh Hunt, Haydon, Hazlitt, Godwin, and other literary men, incited by whose praise he published a volume of poems, comprising sonnets, poetical epistles, and other small pieces, which excited little attention. He soon perceived that the profession of a surgeon was unfitted for him, both on account of his extreme nervousness in the performance of operations, and of the state of his health; and in the spring of 1817 he was induced by symptoms of consumption to make a visit to the country. During this absence he commenced his "Endymion," which, with some miscellaneous pieces, was published in the following year. Keats had allied himself with a political and literary coterie obnoxious to the "Quarterly Review" and "Blackwood's Magazine," and the appearance of a volume of poems by a new writer of the "cockney school" was the signal for an attack upon him by these periodicals, the bitterness of which savored more of personal animosity than of critical discernment. The insulting allusions to his private affairs and his family aroused in the poet no other feeling than contempt or indignation; and if we may judge from his letters, far from being crushed in spirit by the virulence of his reviewers, he would have been much more inclined to inflict personal chastisement upon them if he had met them. Byron in "Don Juan," and Shelley in "Adonais," have apparently confirmed the notion that his sensitive nature on this occasion received a shock from which it never recovered; but the effect of the criticism has been greatly exaggerated. His health was failing rapidly, but from other causes. His younger brother's death in the autumn of 1818 affected him deeply, and about the same time he experienced a passion for a lady of remarkable beauty, the effect of which upon a frame worn by disease was fatal. His little patrimony became exhausted, and he began to think of making literature his profession. While preparing a third volume for the press he was attacked with a violent spitting of blood. After a long illness he recovered sufficiently to think of resuming his literary avocations, but found his mind too unstrung by sickness and the passion which had such an influence over him. In this emergency he had nearly determined to accept the berth of surgeon in an Indiaman, when a return of the previous alarming symptoms made it apparent that nothing but a winter in a milder climate would offer a chance of saving his life. Before his departure he published a volume containing his

odes on the "Nightingale" and the "Grecian Urn," the poems of "Lamia," "The Eve of St. Agnes," "Isabella," &c., and the magnificent fragment of "Hyperion." In September, 1820, Keats left England with Mr. Severn, a young artist and a devoted friend, who never left his bedside. He lingered a few months at Naples and Rome, and died at the latter place after much suffering. A few days before his death he said that he "felt the daisies growing over him." He was buried in the Protestant cemetery in Rome, near the spot where Shelley's ashes were afterward interred; and upon his tomb was inscribed the epitaph, dictated by himself: "Here lies one whose name was writ in water." His modest hope that "after his death he would be among the poets of England," has been more fully realized than he could have anticipated; and his influence can be traced in the poetic development of many later writers.—See "Life, Letters, and Literary Remains of John Keats," by R. M. Milnes (Lord Houghton) (2 vols., London, 1848).

KEBLE, John, an English poet, born near Fairford, Gloucestershire, April 25, 1792, died at Bournemouth, Hampshire, March 29, 1866. He graduated at Oriel college, Oxford, in 1810, obtaining a double first in classics and mathematics, a distinction never gained before that time, except in the instance of Sir Robert Peel in 1808. For some years afterward he was a fellow, master of the schools, examiner, and college tutor. In 1815 he was ordained, and in 1823 he resigned his Oxford employments to accept the curacies of Eastleach, Burthorpe, and Southrop, the united receipts of which did not amount to more than £100 a year. In 1824 he refused an archdeaconry in the West Indies, worth £2,000 a year, which was pressed upon him by William Hart Coleridge, bishop of Barbadoes; and a year afterward he accepted the curacy of Hursley. In 1832 he was made professor of poetry at Oxford, and he held that post for two periods of five years each. His lectures were in Latin, and were published under the title of *Prælectiones Academicæ* (2 vols., 1832-'40). In 1833 he was appointed to deliver the summer assize sermon at Oxford, which was subsequently published under the title of "National Apostasy," and was memorialized by Dr. Newman in his "Apologia" as "the start of the religious movement" of that time. Of the "Tracts for the Times" (Oxford, 1833-'41), Keble wrote Nos. 4, 13, 40, and 89. In 1835 he became vicar of Hursley and rector of Otterbourne, which livings he held till his death. His principal works are: "The Christian Year: Thoughts in Verse for the Sundays and Holidays throughout the Year" (2 vols., Oxford, 1827); "The Psalter, or Psalms of David in English Verse" (1839); "Lyra Innocentium: Thoughts in Verse on Children," &c. (1846); and several volumes of academical and occasional sermons. He edited and annotated the complete works of Richard Hooker (4 vols., 1836); in 1837, with Dr. New-

man, he edited "Froude's Remains;" in 1838, with Dr. Newman and Dr. Pusey, he began the editing and annotation of the Oxford edition of the "Library of the Fathers," which in a few succeeding years grew into a series of 39 octavo volumes. He is author of the much commended article on "Sacred Poetry" in vol. xxxii. of the London "Quarterly Review." "The Christian Year" is the most remarkable of his works. It was first published anonymously, and within 25 years 108,000 copies had been printed in 43 editions. Nine months after the author's death the 100th edition was reached, with a total circulation, in English editions and American reprints, of not less than 500,000 copies. It has appeared in all sizes, and some editions, and separate poems, like the "Evening and Morning Hymns," have been profusely illustrated and illuminated. In 1867 M. Fyler produced in a quarto volume 686 illustrations of poetic imagery from "The Christian Year." A comprehensive and minute "Concordance" has been published. Charlotte Mary Yonge published "Musings on The Christian Year" (London, 1870). Keble retained his copyright till his death, and from the profits of the book, in 1846-'8, the ancient cumbrous brick church of Hursley was replaced by one of the most beautiful parish churches in the kingdom. The copyright expired March 29, 1873, and within five weeks ten different editions were issued by London publishers. Since his death Keble college, Oxford, has been founded in his honor. The best biography of Keble is by Sir John Taylor Coleridge (London, 1868; 4th ed., 1874).

KECSKEMÉT, or **Ketskemét**, a city of Hungary, in the county and 50 m. S. E. of the city of Pesth, on the railway to Szegedin; pop. in 1870, 41,195. It contains churches for the Roman Catholics, Protestants, and Greeks, a synagogue, a Catholic gymnasium, a Reformed-lyceum, and various other educational institutions. It has soap manufactories and tanneries, a lively trade in horses and cattle, and five annual fairs.

KEECHIES, a tribe of Indians, originally in Texas, apparently the same mentioned by Spanish authorities about 1780 as the Quitzeis, and then north of Bucareli. They were a small tribe numbering less than 100 men able to bear arms. In 1822 they were on Trinity river to the number of 261. After Texas became part of the United States, the Keechies and other Indians were placed on a state reservation, and remained there quietly till 1859, when organizations were formed to destroy the Indians on the reservations. To save them the United States government removed them to lands leased from the Choctaws and Chickasaws. The Keechies settled on the Canadian river, and had just begun to prosper when the civil war broke out, and they were again exposed to their enemies, and removed to the Little Arkansas in great destitution. They were restored to the leased lands in 1867. In 1872

they were with the Wichitas on Washita river, near old Fort Cobb, to the number of 126. Their language shows that, like the Wichitas, they are of the same stock as the Pawnees.

KEENE, a city, capital of Cheshire co., New Hampshire, on the left bank of the Ashuelot river, at the junction of the Cheshire and Ashuelot railroads, 43 m. W. S. W. of Concord, and 80 m. N. W. of Boston; pop. in 1870, 5,971. It is pleasantly situated, well built, and laid out with great regularity, the principal streets radiating from a central square, near which stands a handsome court house. An active trade is carried on with the surrounding country, and there is a large number of manufacturing establishments, including woollen mills, machine shops, tanneries, and establishments for manufacturing carriages, chairs, furniture, sashes, doors, and blinds, earthenware, &c. The railroad repair shops employ a large number of workmen. There are three national banks with an aggregate capital of \$500,000, two savings banks, graded public schools, including a high school, two weekly newspapers, and seven churches. Keene was settled about 1735, and called Upper Ashuelot. It received its present name in 1753, and was incorporated as a city in 1874. The population is rapidly increasing.

KEENE, Laura, an American actress, born in England in 1820, died at Montclair, N. J., Nov. 4, 1873. She was distinguished on the London stage in light comedy, and excelled particularly as Pauline in "The Lady of Lyons." She first appeared in New York, Sept. 20, 1852, played in San Francisco in 1854, and afterward in Australia. In 1855 she assumed the management of the Varieties theatre in New York, and soon afterward of a new one called Laura Keene's theatre (now the Olympic); and in October, 1858, she brought out "Our American Cousin," with Jefferson as Asa Trenchard and Sothorn as Dundreary. From 1860 to 1870 she managed a travelling company, reappeared in New York in 1870, and was last on the stage shortly before her death. Among her marked personations were Marco in "The Marble Heart" and Becky Sharp in "Vanity Fair."

KEFF, or **El-Keff**, a town of north Africa, in the regency and 88 m. S. W. of the city of Tunis; pop. about 6,000. It is the key of Tunis on the Algerian frontier, from which it is distant 27 m. It is built on an elevated plateau, and is surrounded by mountains and by forests of cedar and chestnut. The walls are kept in good repair, and the fortress mounts more than 130 cannon. The inhabitants include many warlike and occasionally troublesome mountaineers. The adjacent country is very fertile, and the scenery is beautiful. Keff possesses a Roman well and a statue of Venus. Inscriptions from here led to the supposition that it occupies the site of Sicca Veneria, a Numidian town, originally Phœnician, subsequently a Roman colony.

KEHL, a town of Germany, in Alsace-Lorraine, on the right bank of the Rhine, at its

junction with the Kinzig, opposite Strasburg; pop. about 4,000. It was fortified by the French toward the close of the 17th century, and was restored to Germany by the treaty of Ryswick (1697). Subsequently the fortifications were razed, and it became a thriving manufacturing and commercial place. During the revolution the fortifications were restored, and in 1815 again demolished, the town having been in the interval alternately in German and French possession, and endured many sieges and other vicissitudes. A new bridge over the Rhine, completed in 1861, placed Kehl in direct communication with the French railways, and trade prospered till 1870, when the Franco-German war injured the place. On July 22 the Germans began to blow up the railway bridge, and the French subsequently opened fire, destroying the handsome Gothic church, the custom house, the railway depot, and 40 private houses. Kehl belonged to the grand duchy of Baden till 1874, when it became part of Alsace-Lorraine.

KEIGHLEY, a town of England, on the Aire, and in the West Riding of Yorkshire, on the Liverpool and Leeds canal and the Preston and Leeds railway, 15 m. W. N. W. of Leeds; pop. in 1871, 15,965. It has a Latin school, a mechanics' institute, and manufactories of paper, linen, woollen, and cotton goods.

KEIGHTLEY, Thomas, a British author, born in Dublin in October, 1789, died near Erith, Kent, in December, 1872. He took his bachelor's degree at Trinity college, Dublin, in 1808, and devoted himself to literature in London. He assisted T. Crofton Croker in the "Fairy Legends of Ireland," published histories of Rome, Greece, and England, "Fairy Mythology," "Outlines of History," "Mythology of Ancient Greece and Italy," "History of India," "Scenes and Events of the Crusades," and other works, and edited the writings of Virgil, Horace, Ovid, and Sallust, and the "Life and Poems of Milton." Among his latest works was "The Shakespeare Expositor" (1867). In the latter part of his life he was pensioned by the government.

KEILL, John, a Scottish mathematician, born in Edinburgh, Dec. 1, 1671, died in Oxford, Sept. 1, 1721. He was educated at Edinburgh and Oxford, became assistant Sedleian professor of physics at Oxford in 1700, and was subsequently chosen fellow of the royal society of London. In 1709 he was appointed treasurer to the Palatines, German emigrants whom the government was sending to New England. On his return in 1710 he became Savilian professor of astronomy at Oxford. In 1711 he was appointed by Queen Anne decipherer of state papers. He was a fierce assailant of Burnet, Leibnitz, and the other opponents of the Newtonian theories. The most important of his many learned works are *Introductio ad Veram Physicam* (1701), and *Introductio ad Veram Astronomiam* (1718). The best edition of his works is that of Milan (1742).

KEIM, Theodor, a German theologian, born in Stuttgart, Dec. 17, 1825. He studied at Tübingen, and was connected with that university from 1851 to 1855, after having spent a year in Bonn. In 1857 he became deacon at Esslingen, in 1859 archdeacon, and in 1860 professor of theology at Zürich. He is prominent among liberal Protestant theologians. Among his works are several relating to the history of the reformation, and *Der geschichtliche Christus* (3d ed., Zürich, 1866).

KEITH, a S. W. county of Nebraska, recently formed, and not included in the census of 1870; area, 2,016 sq. m. It borders on Colorado, and is intersected by the forks of the Platte river. The Union Pacific railroad passes through it.

KEITH, Alexander, a British author, born at Keith Hall, Aberdeenshire, in 1791. He was educated in Scotland, and was a minister of the established church of Scotland, and after 1843 of the Free church, till ill health compelled his retirement from the pulpit. His principal work, "Evidences of the Truth of the Christian Religion, derived from the Literal Fulfillments of Prophecy" (Edinburgh, 1823), became a text book, passed through numerous editions, and has been translated into foreign languages; the later editions embody his personal investigations in the Holy Land.

KEITH. I. George, a Prussian diplomatist, born at Kincardine, Scotland, in 1685, died near Potsdam, Prussia, May 25, 1778. He was the tenth earl marischal, and the descendant of a race who had long been grand marischals of Scotland. Being outlawed and his estates confiscated for participation in the rebellion of 1715, he fled to Spain, and thence to Prussia, where he became a friend of Frederick the Great, who appointed him ambassador at Paris in 1751, governor of Neufchâtel in 1754, and envoy to Madrid in 1759. His estates were subsequently restored to him, and he also inherited in 1761 the entailed estates of the earls of Kintore. He died unmarried, and his eldest sister, wife of the earl of Wigtown, transmitted the Keith title to her daughter, who married Lord Elphinstone, and was the mother of Admiral Keith. **II. James**, brother of the preceding, born in Scotland, June 11, 1696, killed at Hochkirch, Oct. 14, 1758. He was likewise attainted of high treason on account of the rebellion of 1715, fled to France, where he studied mathematics under Maupertuis, and was admitted to the academy. In 1717 he went to Spain to serve the cause of the pretender, but the enterprise was unsuccessful, and he did not return to Madrid till 1720. He failed of obtaining employment, as he refused to abjure Protestantism. Subsequently he accompanied the duke of Leiria, the Spanish ambassador, to Russia, where he became a general, especially distinguishing himself in the war against Turkey (1736-'7), and was severely wounded at the storming of Otchakov. He afterward aided in the victories over the Swedes, and after

the peace of Abo (1743) became Russian ambassador at Stockholm, and on his return to St. Petersburg was made field marshal. The service was made so irksome to him that he tendered his resignation, which was accepted on condition of his never fighting against Russia. He went to Hamburg (1747) and tendered his services to Frederick the Great, who grasped eagerly at the offer. He became governor of Berlin in 1749, and accompanied the king in many memorable campaigns, distinguishing himself on various occasions, especially in the retreat from Olmütz, and at Hochkirch. His success was the more remarkable as he was ignorant of the German language.—See *Leben des Feldmarschalls Jakob Keith*, by Varnhagen von Ense (Berlin, 1844).

KEITH, George Keith-Elphinstone, viscount, a British admiral, born at Elphinstone, East Lothian, Scotland, Jan. 12, 1746, died at his seat of Tulliallan, Perthshire, March 10, 1823. He was the youngest son of the tenth Baron Elphinstone, and entered the navy at an early age. He received the commission of post captain in 1775, and, in command of the frigate *Perseus*, participated in the British attack on Bunker Hill, and in the capture of Fort Mifflin on the Delaware, in November, 1777. In 1793 he served under Lord Hood at Toulon, and in 1795, as rear admiral of the white, took possession of Cape Town, and subsequently conquered Ceylon, Cochin, Malacca, and the Moluccas. He completed his services in the East by capturing, in August, 1796, off Saldanha bay, a Dutch squadron, which had been despatched for the recovery of the Cape Colony. Upon his return to England in 1797 he was created an Irish peer as Baron Keith of Stonehaven Marischal. In 1799 he took command of the fleet in the Mediterranean, and in March, 1800, blockaded Genoa, then occupied by a French army under Masséna, until its surrender to the Austrians. He subsequently coöperated with Abercrombie in the military operations in Egypt. He continued in active service until after the battle of Waterloo, and for several years held command of the channel fleet as admiral of the white. It was owing to his disposition of his cruisers along the coast of France that Napoleon was induced to surrender himself a prisoner. In 1814 he was created Viscount Keith of the United Kingdom, having been a baron since 1801. Previous to his elevation to the peerage he was on several occasions a member of the house of commons. His second wife, born in 1762, was the eldest daughter and co-heir of Henry Thrale, the friend of Dr. Johnson, from whom she received her education. She died March 31, 1857. He left no sons, but his title descended to his elder daughter by his first wife, Baroness Keith, wife of Count Flahaut. (See FLAHAUT DE LA BILLARDERIE.)

KELAT, the capital city of Beloochistan, and of a province of its own name, situated on the declivity of a hill called Shah Mirdan, about

6,000 ft. above the sea, 195 m. S. by E. of Candahar; pop. about 12,000. It is surrounded by an earth wall 18 ft. high, flanked with bastions. In the vicinity is a district that produces large quantities of fruit. A number of Afghan merchants reside at Kelat, and carry on a considerable trade with Sinde, Bombay, and Candahar. The chief manufactures are muskets, swords, and spears. Kelat was captured by the British in 1839, and again in 1840, and was evacuated by them in 1841.

KELLERMANN. I. François Christophe, duke of Valmy, a French soldier, born in Strasburg, May 30, 1735, died in Paris, Sept. 12, 1820. Enlisting as a private in 1752, he served during the seven years' war and obtained the rank of captain. In 1771 he was among the French officers sent to Poland to assist the confederates of Bar, and fought bravely. In 1785 he had reached the rank of brigadier general. On the breaking out of the revolution he espoused the popular cause, and in 1791 was appointed to the command of the army in Alsace. He succeeded in keeping the Austrians from that province and Lorraine; and having joined Dumouriez, he shared in the victory of Valmy (Sept. 20, 1792), by which the Prussians were expelled from the French territory. In 1793 he commanded the army of the Alps, and defeated the Piedmontese, thus bringing about the surrender of Lyons. Becoming unacceptable to the commissioners of the convention, he was dismissed from his command, arrested, and imprisoned for 13 months. After the 9th Thermidor, being reinstated in command of the army of the Alps, which amounted to but 47,000 men, he successfully opposed the repeated attacks of 150,000 Piedmontese and Austrian troops. In the following year he received an appointment in the military bureau at Paris. Bonaparte, after the 18th Brumaire, made him a senator; and on the establishment of the empire he was made a marshal, received the title of duke of Valmy, and held important commands from 1804 to 1813. On the restoration he evinced his readiness to serve the Bourbons, and took a seat in the chamber of peers, where he favored liberal measures. **II. François Étienne**, son of the preceding, born in Metz in 1770, died June 2, 1835. He early received a commission in a cavalry regiment. In 1791 he was attached to the embassy of the chevalier de Ternant in the United States, where he spent two years. He returned to France to become aide-de-camp to his father, and lost his post after the siege of Lyons; but his well known patriotism saved him from imprisonment, and he reentered the army as a private. On the 9th Thermidor he resumed his former rank, served as adjutant general under Bonaparte in 1796, and afterward, under Masséna, distinguished himself at Bassano, Arcole, and elsewhere, was sent to Paris to present the standards taken from the enemy to the directorial government, and was appointed brigadier general. In 1800 he ac-

companied the first consul to Italy at the head of a brigade of cavalry, and participated in the battle of Marengo, where by a well timed charge he decided the victory; he was rewarded by promotion to the rank of general of division. In 1805 he fought brilliantly at Austerlitz, where he was severely wounded. He served in Portugal and Spain from 1807 to 1812, in Germany in 1813, and in France in 1814, and finally distinguished himself in the engagements that preceded the battle of Waterloo. On the return of the Bourbons he withdrew from the service. He succeeded his father as a peer, and like him inclined to liberal opinions. He wrote two pamphlets about the battle of Marengo, and left *Mémoires*, upon which his son constructed a history of the campaign of 1800.

KELLOGG, Clara Louisa, an American singer, born in Sumter, S. C., of New England parents, in 1842. At the age of seven she was able to read difficult music at sight. She was educated in this country, and at the age of 18 sang at a private morning performance of *Il Polliuto* in the New York academy of music. Her first public appearance was made at the same place, Feb. 27, 1861, in the rôle of Gilda in Verdi's *Rigoletto*; and on March 19 she made her début in Boston in *Linda di Chamounix*. Her merits were quickly recognized, and her career almost from the first was one of assured success. In 1865 she entered into an engagement for three years with the manager of the Italian opera in New York, and during this period added constantly to her fame. The most notable of her impersonations were in the operas of *Crispino, Fra Diavolo*, and *Faust*. She sang in the first performance of the last named opera in America. On Nov. 2, 1867, she appeared successfully at Her Majesty's opera, London, in *Faust*. Returning to America in 1868, she remained here for four years, appearing again at the Drury Lane opera in the spring of 1872. In the winter of 1873-'4 she organized a company and appeared in English opera in the principal cities of the United States. Her voice is a pure high soprano, pleasing in quality, remarkably firm and correct in intonation, and of considerable power. Though she has appeared in tragic as well as in comic opera, and though Marguerite in Gounod's *Faust* is one of the best of her rôles, it is in comic opera that her talents as a singer and as an actress find their best expression.

KELUNG, a town of the Chinese empire, in the N. part of the island of Formosa, situated near the head of the harbor, and important only for the trade carried on with other Chinese ports, chiefly in ricé, camphor, and tea. Coal, which is found in the neighborhood, was exported in 1870-'71 to the extent of \$500,000, chiefly to Shanghai. Kelung and Tanshui, or Tamsui, are the N. ports of the Chinese portion of the island which have been opened to foreign trade. There is also an island of Kelung, important as a landmark to the harbor, consisting of a mass of black rock 600 ft. high.

KEMBLE, the name of a family of British actors. **I. Roger**, the founder of the family, born in Hereford, March 1, 1721, died in 1802. He was during a great portion of his life an actor and the manager of provincial companies. He had 12 children, of whom the eldest was the celebrated Mrs. Siddons. (See **SIDDONS**, **SARAH**.) **II. John Phillip**, eldest son of the preceding, born at Prescott, Lancashire, Feb. 1, 1757, died in Lausanne, Switzerland, Feb. 26, 1823. He was educated at a Roman Catholic seminary in Staffordshire and at the English college in Douai, France, and made his first appearance upon the stage, for which he showed a remarkable inclination, in the tragedy of "Theodosius," Jan. 8, 1776. In 1783 he first acted at Drury Lane, of which theatre he became manager in 1790. From this time until his retirement he stood at the head of his profession. In 1803 he became a part owner of Covent Garden theatre, which he managed prosperously until its destruction by fire in 1808. The opening of the new theatre in the succeeding year under his management was the signal for a series of tumults, known as the O. P. ("old price") riots, excited by the increased prices required for admission. For upward of 60 nights Kemble and the members of his family were obliged to endure every species of insult; but a compromise was finally effected, and the theatre was liberally and successfully managed until Kemble's retirement from the stage, June 23, 1817, an occasion commemorated by the poet Campbell in one of his most finished odes. The latter part of his life was passed in Lausanne, whither he had retired for the benefit of his health. In the personation of the dramatic heroes, Cato, Coriolanus, King John, Wolsey, Macbeth, and Lear, he had no rival among contemporaneous actors; and in characters of a reflective cast generally he is probably still unequalled on the English stage. As a manager he distinguished himself by many splendid revivals of Shakespeare's plays. In private life he was highly esteemed. **III. George Stephen**, brother of the preceding, born at Kington, Herefordshire, May 3, 1758, died near Durham, June 5, 1822. He was intended for the medical profession, but, following his inclination, went upon the stage, and made his *début* in London in September, 1783. For many years subsequently he was the manager of a provincial company. He was a good actor, but in the latter part of his life became so corpulent as to be almost incapacitated for any other part than Falstaff, which he frequently acted. **IV. Elizabeth** (Mrs. Whitlock), sister of the preceding, born in Warrington, Lancashire, April 2, 1761, died Feb. 27, 1836. She first appeared at Drury Lane theatre in February, 1783, as Portia. In 1785 she was married to Charles Edward Whitlock, a provincial manager and actor, and seven years later accompanied her husband to the United States, where they performed for many years in the principal cities. Mrs. Whit-

lock became the most popular actress of the day in America, and in Philadelphia frequently performed before President Washington and other distinguished persons. She returned to England in 1807 with a competency, and retired from the stage. In personal appearance and voice she is said to have strongly resembled her sister Mrs. Siddons. **V. Charles**, the 11th child of Roger Kemble, born in Brecon, South Wales, Nov. 27, 1775, died in London, Nov. 12, 1854. He was educated at the English college in Douai, and upon returning to England in 1792 received a situation in the general post office. He soon abandoned this for the stage, and, after several trials in the provinces, made his first appearance at Drury Lane in April, 1794, playing for the occasion Malcolm to John Kemble's Macbeth and Mrs. Siddons's Lady Macbeth. For several years he took only secondary parts, and by comparatively slow degrees indicated that he possessed the dramatic genius of the family. In 1800 he first appeared as a writer for the stage in an adaptation of Mercier's *Déserteur*, entitled "The Point of Honor," and subsequently he furnished many similar pieces from the German and French for the London theatres. He began meanwhile to acquire considerable repute in his profession, and was accounted one of the best genteel comedians of his time, excelling in such parts as Benedick, Petruchio, Archer, Ranger, Charles Surface, &c.; and also in that numerous class of serious characters represented by Faulconbridge, Edgar, Cassio, Mark Antony, &c., for all of which his handsome person eminently qualified him. In 1832 he made a successful tour in the United States with his daughter, Miss Fanny Kemble, and in 1840 closed his career as an actor. Shortly afterward he was appointed examiner of plays in England. **VI. Frances Anne** (Mrs. Butler), best known as Fanny Kemble, daughter of the preceding, born in London in 1811. Her mother, long known on the English stage as Mrs. Charles Kemble, was originally a danseuse at the opera house, London, as Miss De Camp. She manifested no special predilection for the stage, but was induced, in consequence of the embarrassed circumstances of her family, to make her *début* at Covent Garden, then under the management of her father, in October, 1829. On this occasion she played Juliet, her father taking the part of Romeo and her mother that of the nurse, with complete success, notwithstanding that six weeks previous she had no thought of embarking in a dramatic career. For the three succeeding years she performed leading parts in tragedy and comedy with great applause, distinguishing herself particularly in Juliet, Portia, Bianca in "Fazio," Julia in "The Hunchback" (the latter being originally personated by her), Belvidera, Isabella, Lady Teazle, and Louise de Savoy, in her own play of "Francis the First," written when she was 17 years old, and received with great approbation. In 1832 she accompanied her

father to the United States, and met with an enthusiastic reception in the chief cities. In 1834 she was married to Mr. Pierce Butler of Philadelphia, and at the same time retired definitively from the stage. Incompatibility of tastes and temperament having rendered the union an unhappy one, a separation took place at the end of a few years, and Mrs. Butler subsequently fixed her residence in Lenox, Berkshire co., Mass. Previous to this she had published her first work in prose, "A Journal of a Residence in America" (2 vols., London, 1835), chiefly devoted to a description of her tour through the United States. It was followed in 1837 by a drama entitled "The Star of Seville," which was acted with success; and in 1844 she published a collection of her poems, a portion of which only had previously appeared. In 1846 she visited Europe, extending her travels as far as Italy, where her sister, Mrs. Sartoris, resided, and in 1847 published an account of her tour under the title of "A Year of Consolation." Shortly afterward steps were taken to procure a divorce from her husband, which was granted by the legislature of Pennsylvania in 1849, after which she resumed the name of Kemble. In the winter of 1848-'9 she commenced in Boston a series of Shakespearian readings, which drew crowded audiences; and during the next two years she repeated the course in some of the principal American cities. In 1851 she returned to England, reappeared for a brief period on the stage, and after giving readings in London and other parts of the United Kingdom, made another long continental tour. In 1856 she returned to the United States, and continued at intervals to give readings in Boston and elsewhere, till February, 1860. She then returned to England, and while residing there in 1863 she published "Residence on a Georgian Plantation in 1838-'9," in which she gives from personal observation her impressions of the system of slavery. In 1866 she returned to her former residence in Lenox, Mass., in 1868 gave public readings in various places, and in 1869 went to Europe. She returned in 1873, and has since resided near Philadelphia. **VII. Adelaide**, younger sister of the preceding, born in London about 1820, made a brilliant début at Covent Garden as an opera singer; but upon being married in 1843 to Mr. Edward Sartoris, she retired from the stage. In 1867 she published "A Week in a French Country House." Her son, Algernon Charles Sartoris, was married at Washington in May, 1874, to the daughter of President Grant.

KEMBLE, John Mitchell, an English historian, eldest son of Charles Kemble, born in London in 1807, died in Dublin, March 26, 1857. He was educated by Dr. Richardson, author of the "English Dictionary," and afterward at Bury St. Edmund's grammar school, and Trinity college, Cambridge. In 1820 he visited Germany, and at this time commenced his study of the Anglo-Saxon and kindred Teutonic dialects.

He became acquainted with Thiersch, the brothers Grimm, and other leading philologists and antiquaries of Germany. In 1830 he visited Spain in order to cooperate with the Spanish liberals against the government of King Ferdinand. Returning to England, he began to explore everywhere, in the British museum and in cathedral and collegiate libraries, for manuscripts of the Anglo-Saxon period, which he deciphered with remarkable skill. His first public effort was his lectures at Cambridge on the Anglo-Saxon literature and language in 1834-'5. About this time he published "The Anglo-Saxon Poems of Beowulf, the Traveller's Song, and the Battle of Finnesburgh, with a Glossary and Historical Preface," to the second edition of which he added a translation of Beowulf with a glossary and notes. From 1835 to 1844 he edited the "British and Foreign Review," to which he contributed many valuable anonymous articles, as he did also to the *Archæologia*, the "Cambridge Philological Museum," the "Foreign Quarterly," and latterly to "Fraser's Magazine." The article on "Jäkel's Comparative Philology" in the "Foreign Quarterly" is the best known of his contributions to periodical literature. In 1839 he commenced the publication of his collection of Anglo-Saxon charters, the *Codex Diplomaticus Ævi Saxonici*. For some years he superintended the publication of several of the archæological works of the Ælfric and Camden societies. In 1849 appeared his "Saxons in England," a work which caused Jakob Grimm to say that Kemble was the first of his disciples. From July, 1849, to May, 1855, he resided in the north of Germany, where he prosecuted his studies, and, as he wrote German with as much facility as his native language, contributed many essays to the "Transactions" of the archæological society of Hanover. In 1854 he was employed by the antiquarian society of Hanover to excavate the sepulchral barrows of pagan times on the heath of Lüneburg, resulting in large accessions to the Hanoverian museum. In 1857 appeared his last work, "State Papers and Correspondence illustrative of the Social and Political State of Europe from the Revolution (1688) to the Accession of the House of Hanover." At the time of his death he was engaged by the managers of the Manchester exhibition to form a department of Celtic and Anglo-Saxon art. His unexpected demise caused the abandonment of this design.

KEMENY, Zsigmond, baron, a Hungarian author, born in Transylvania in 1816. He was a liberal member of the upper house of the Transylvanian diet, and in 1848 a representative in the diet of Pesth. After editing several other journals, he became in 1855 the editor of the *Pesti Napló*, which since the restoration of the Hungarian constitution has been the leading organ of the Deák party. Among his principal novels are *Gyulai Pál* ("Paul Gyulai," 5 vols., Pesth, 1846) and *Zord idő* ("Rough

Times," 4 vols., 1861-'2). He is also the author of several political pamphlets and biographical sketches.

KEMPELEN, Wolfgang, baron, a Hungarian mechanician, born in Presburg, Jan. 23, 1734, died in Vienna, March 26, 1804. He entered at first upon an administrative career, and became aulic councillor. He was an excellent chess player, and was frequently invited to play with Maria Theresa, who was a passionate lover of the game. Having a great mechanical genius, he in 1769 astonished Europe with his automaton chess player. Taken to Paris in 1784, and afterward exhibited by Mr. Mälzel in England and the United States, the chess player caused an extraordinary excitement, and the problem was not explained for many years. (See AUTOMATON.) Kempelen also invented an automatic speaking human figure, which pronounced very distinctly several words; a curiosity several times successfully imitated, and of which the maker published an explanation in *Le mécanisme de la parole, suivi de la description d'une machine parlante, et enrichi de 27 planches* (1791). He wrote several German poems, *Perseus und Andromeda*, a drama, and *Der unbekannte Wohlthäter*, a comedy. He was also councillor of finance to the emperor of Austria, director of the salt mines of Hungary, and referendary of the Hungarian chancery at Vienna. Full details of the mystery of the automaton chess player, with its later history, are given in an article by Prof. G. Allen of Philadelphia in "The Book of the First American Chess Congress" (New York, 1859).

KEMPER, an E. county of Mississippi, bordering on Alabama, and drained by affluents of the Tombigbee and other streams; area, 750 sq. m.; pop. in 1870, 12,920, of whom 7,214 were colored. The soil is mostly fertile. The Mobile and Ohio railroad and its Gainesville branch pass through it. The chief productions in 1870 were 218,350 bushels of Indian corn, 36,995 of sweet potatoes, 64,010 lbs. of butter, and 4,964 bales of cotton. There were 1,140 horses, 902 mules and asses, 2,118 milch cows, 4,475 other cattle, 3,174 sheep, and 10,316 swine. Capital, De Kalb.

KEMPER, Reuben, an American soldier, born in Fauquier co., Va., died in Natchez, Miss., in 1826. He was the son of a Baptist preacher, who emigrated with his family to Ohio in 1800. Reuben subsequently removed with two of his brothers to the territory of Mississippi, where they engaged in land surveying. They were the leaders in the movement to rid West Florida of its Spanish rule, and got up an expedition to Baton Rouge in 1808 from the adjacent counties of Mississippi, which failed. The Spanish authorities caused the Kempers to be kidnapped, but they were rescued by the commander of the American fort at Pointe Coupée. The Kempers pursued with great ferocity all who were engaged in this wrong upon them, inflicting severe personal chastisement and mu-

tilation upon the parties. After these occurrences Reuben Kemper devoted himself to the task of driving the Spaniards from the American continent. He was engaged in an attempt to capture Mobile, which failed; and on the fitting out of the formidable expedition of Gutierrez and Toledo, in 1812, against the Spanish authority in Mexico, he was assigned the rank of major, and afterward chosen colonel of the force, 500 or 600 in number, which cooperated with the Mexican insurgents. The expedition advanced into Texas, fought several battles, in which Kemper and his Americans performed feats of valor, and won brilliant victories. Dissensions followed between the Mexicans and Americans, and the Spaniards taking advantage of them put the republicans to rout. The Americans, disgusted with their allies, then returned home. Kemper was engaged under Jackson in the defence of New Orleans, was detached for important and perilous duty, and added greatly to his reputation by his activity and efficiency. At the conclusion of the war he settled in Mississippi.

KEMPIS, Thomas à, a German ascetic writer, born at Kempen, near Cologne, in 1379 or 1380, died at Mount St. Agnes, near Zwolle, July 26, 1471. His family name was Hammerken, "Little Hammer" (Lat. *Malleolus*, a surname bestowed on him by several writers). At the age of 13 he entered the school conducted at Deventer by the "Brothers of the Common Life," and in 1396 became an inmate of the house of Brother Florentius Radewin, superior general of the order. In 1400 he began his noviceship at the monastery of Mount St. Agnes, near Zwolle, of which his brother John was prior, and in 1413 was ordained priest. It is thought that he composed about this time the short treatise on the eucharist which now forms the fourth book of the "Imitation of Christ." In 1425 he was elected sub-prior of the monastery, and was charged with the spiritual direction of the novices. In 1429 he and his brethren were forced to migrate to Lunekerke, in Friesland; but they returned to Mount St. Agnes in 1432, when Thomas became treasurer of the monastery. In 1448 he was again elected sub-prior, and held this post till his death. Like all his brethren, Thomas devoted himself in a special manner to the study of the Scriptures and the transcription of Biblical manuscripts. Besides his most famous work, *De Imitatione Christi*, and several ascetic treatises, he wrote the chronicle of the monastery of Mount St. Agnes down to 1471. The continuator of this chronicle says of him: "Brother Thomas à Kempis endured great poverty, labors, and trials from the foundation of this monastery. He transcribed the whole of our Bible, with many other books for our own use and for strangers. He also wrote for the benefit of young people several little treatises, in a plain and simple style, but rich in practical wisdom. During several years he applied himself lovingly to the contemplation of Christ's

passion, and was a great comforter of persons distressed or tempted." He owes his world-wide fame to the book entitled *De Imitatione Christi*, which has been many times translated into every civilized language, including Greek and Hebrew; there are upward of 60 different versions in French alone, and 500 different editions of it issued within the present century are found in a library at Cologne. The most remarkable modern edition is one in seven languages, Latin, Italian, Spanish, French, German, English, and Greek (Sulzbach, 1837). Its authorship has been ascribed to Jean Gerson, chancellor of the university of Paris, and to Gersen or Gesen, an Italian abbot; and the question has been debated somewhat with reference to national honor and the interests of ecclesiastical orders. The external evidences in favor of À Kempis are the facts that he is mentioned as the author by three writers nearly his contemporaries, that copies exist written in his own hand, and that in one ancient copy he is stated to be the author. There is said also to be a striking likeness in style and refined piety between this and the devotional works of which he is certainly the author. The first volume of the *Prolegomena* of a new edition of *De Imitatio Christi*, after the autograph of Thomas à Kempis, by Hirsche (Berlin, 1873), was followed in 1874 by the Latin edition itself; and a second volume of the *Prolegomena*, with facsimiles of documents, is in course of publication. This edition is regarded as finally settling the question of the authorship of the work in favor of À Kempis. The only complete edition of the writings of Thomas à Kempis is by the Jesuit Sommalius (3d ed., Antwerp, 1615). There is a German translation of his complete works by Silbert (4 vols., Vienna, 1834). The best biography is that of Moeren, *Nachrichten über Thomas à Kempis* (Crefeld, 1855). See also Silbert, *Gersen, Gerson oder Kempis?* (Vienna, 1828). (See GERSON.)

KEMPTEN, a town of Bavaria, in the district of Swabia and Neuburg, on the Iller, 64 m. S. W. of Munich; pop. in 1871, 10,982. It consists of the Lutheran Altstadt, which is situated in a valley and was formerly a free imperial town, and the Catholic Neustadt, on a hill. It has a castle, a gymnasium, a Latin school, an agricultural and an industrial school, and manufacturing of paper and cotton.

KEN, Thomas, an English bishop, born at Berkhamstead, Hertfordshire, in July, 1637, died at Longleat, Wiltshire, March 19, 1711. He was educated at Winchester and Oxford, took orders, visited Rome in 1674 in company with his nephew, Izaak Walton, jr., and after his return in 1679 was nominated chaplain to Mary princess of Orange, whom he accompanied to Holland. He was chaplain to Lord Dartmouth during the expedition against Tangier, and in 1684 became chaplain to Charles II., who subsequently made him bishop of Bath and Wells. Ken attended the king in his last illness. Having refused to read in his church

the declaration of indulgence issued by the government of James II., he was with the other six recusants committed to the tower. When, however, after the revolution, Ken was required to swear allegiance to the new sovereign, rather than do so he suffered himself to be deprived of his bishopric, and retired into obscurity and comparative poverty. He was the author of many devotional writings, the most popular of which are his morning and evening hymns. An edition of his works, in 4 vols. 8vo, was published in 1721.—See his "Life," by G. L. Duyckinck (New York, 1859).

KENAIANS, the name generally given to the division of the great Athabaskan family living in Alaska. The name is derived from Kenai, the peninsula between Cook's inlet and Prince William sound, but has been extended from the tribe dwelling there to include all the Indians N. W. of Copper river and W. of the Rocky mountains, except the Aleuts and the Esquimaux. They have lost greatly in numbers by wars with the Esquimaux, but as late as 1869 were estimated at 25,000. They resemble the Tartars in the practice of the Shaman religion, scarification, burning the dead, infanticide, caste, &c. As in many other nations, each tribe is divided into clans or families, there being among the Kenaians three, Chitsa, Matesa, and Ateetsa; no man can marry in his own clan, and his children belong to the mother's clan. They wear leather tunics, or pointed shirts (from which the term Chipeweyan is said to be derived), with trousers and shoes attached. The tunic of the women is rather longer, rounded in front, and trimmed with hyaqua shells. The men paint their faces and wear hyaqua shells in the nose, while the women tattoo lines on the chin. They collect wealth and have a system of barter, using hyaqua shells or beads as money. The men are fewer in number than the women, but better looking. On arriving at puberty girls are separated from the rest for a year, and wear a peculiar bonnet with fringes over the face. They generally burn their dead, collecting the ashes in a leathern bag, which is suspended on a painted pole, planted in a clear elevated spot; but some of the tribes now bury the dead or place them on elevated stages. The Kenaians embrace: 1, the Nehaunees, on the Lewis, Tahco, and Pelly, ignorant, barbarous, cowardly, and treacherous; including the Chilkahtena, the Abbatitena, and the Dahotena, the Sicanees of the *voyageurs* and the Mauvais Monde or Slavé at Francis lake; 2, the Tutchonekutchin, which means Crow Indians, called also Gens des Foux, Caribous, or Mountain Indians, on both sides of the Yukon; 3, the Ahtena, S. W. of them, on the Atna or Copper river; 4, the Kenai, called by the Russians Ugalentzi, who use birch canoes, bury their dead, and place wooden tombs over them; 5, the Hunkutchin, next to the Crows on the Yukon; 6, the Tukkuthkutchin, south of Porcupine river; 7, the Vuntakutchin, that is,

Rat Indians, north of the Porcupine, called also Loucheux, Lake Indians, and Quarrellers; 8, the Natchekutchin, that is, strong people, migratory hunters, called also Gens de Large and Loucheux; 9, the Kutchakutchin, near the Porcupine and Yukon, called also Lowland people; 10, the Tenanakutchin or Gens de Butte, on Tenana river; and on the lower Yukon the Unokhotana, Coyukhotana, and Karyukhotana, a large tribe called by the Russians Ingaliks, probably an Esquimaux name. These three tribes cannot converse with the Kutchins, though their language is similar.

KENDAL, or **Kirkby-Kendal**, a market town and parliamentary borough of Westmoreland, England, 40 m. S. of Carlisle, situated in a pleasant valley on the E. bank of the Ken; pop. in 1871, 13,442. Queen Catharine Parr was born here. Kendal is an important manufacturing town, and one of the oldest in the kingdom, the woollen manufacture having been established there by Flemish weavers, on the invitation of Edward III., in the 14th century. Its green cloth seems to have been celebrated in the time of Shakespeare. On an eminence E. of the town is the ruined castle of the ancient barons of Kendal.

KENDALL. **I.** A S. W. county of Texas, intersected by the Guadalupe river; area, 1,400 sq. m.; pop. in 1870, 1,536, of whom 101 were colored. Two thirds of the surface is covered with timber, and the remainder is prairie. It is one of the best counties for sheep raising in the state. The chief productions in 1870 were 51,245 bushels of Indian corn, 8,781 lbs. of wool, 26,458 of butter, and 381 tons of hay. There were 1,345 horses, 2,337 milch cows, 10,074 other cattle, 4,293 sheep; and 1,734 swine. Capital, Boerne. **II.** A N. E. county of Illinois, drained by Fox river and the sources of the Au Sable; area, 324 sq. m.; pop. in 1870, 12,399. It has an undulating surface, diversified by woodland and prairie. The soil is uniformly fertile. The Chicago, Burlington, and Quincy railroad passes through it, and the Chicago, Rock Island, and Pacific touches the S. E. corner. The chief productions in 1870 were 91,930 bushels of wheat, 681,267 of Indian corn, 468,890 of oats, 79,365 of potatoes, 39,884 lbs. of wool, 386,050 of butter, and 23,740 tons of hay. There were 7,275 horses, 5,988 milch cows, 8,835 other cattle, 12,236 sheep, and 14,892 swine; 12 manufactories of agricultural implements, 9 of carriages, 1 of printing paper, 5 flour mills, and 1 tannery. Capital, Oswego.

KENDALL, **Amos**, an American politician, born in Dunstable, Mass., Aug. 16, 1789, died in Washington, D. C., Nov. 11, 1869. Until the age of 16 he worked on his father's farm, and in 1807, after a little more than a year's preparation, he entered Dartmouth college, where in 1811 he graduated the first in his class, although a large part of his time had been occupied with teaching for a support. Having studied law and been admitted to the bar, in the spring of 1814 he

emigrated to Lexington, Ky. Finding his professional labors not immediately remunerative, he again resorted to teaching, and for several months was a tutor in the family of Henry Clay. Subsequently he established himself in Georgetown, where he was appointed postmaster, and in the intervals of his practice edited a local newspaper. In 1816 he was attached to the staff of the state journal at Frankfort, called the "Argus of Western America," and showed himself an able political writer. He was one of the earliest friends of common schools in Kentucky, and succeeded in procuring the passing of an act to district the state, and to set apart one half the profits of the bank of the Commonwealth to constitute a school fund. He was a firm supporter of the election of Gen. Jackson, who in 1829 appointed him fourth auditor of the treasury department. In 1835 he was made postmaster general, and in one year reorganized the financial system of the department, and freed it from the debt with which it had been embarrassed. In 1836 he procured from congress a reorganization of the department on a plan suggested by himself, which has undergone no essential alteration since. He was retained in office by Mr. Van Buren, but retired from the cabinet in June, 1840, in order to further the interests of the democratic party in the presidential election of that year. He never afterward entered public life, although a foreign mission was offered to him by President Polk, but devoted himself chiefly to his profession. For many years he was embarrassed by a suit instituted against him by certain mail contractors, which was ultimately decided in his favor in the supreme court. In 1845 he assumed the entire management of Prof. Morse's interest in the American electro-magnetic telegraph. In 1865-'6 he travelled through Europe and visited Egypt and Palestine. He is the author of "Life of Andrew Jackson, Private, Military, and Civil," begun in 1843, but never completed. He founded and was first president of the deaf and dumb asylum in Washington, and was a liberal benefactor to other religious and educational institutions. His "Autobiography," edited by William Stickney, was published in 1872.

KENDALL, **George Wilkins**, an American journalist, born in Amherst, now Mount Vernon, N. H., about 1807, died at Oak Spring, near Bowie, Texas, Oct. 21, 1867. He travelled extensively through the southern and western states, working at his trade as a journeyman printer. In 1835 he went to New Orleans, and not long afterward established there, in partnership with Mr. F. A. Lumsden, the "Picayune," the first cheap daily newspaper issued in New Orleans, which under his direction became a leading southern journal. He joined the Santa Fé expedition which in 1841 set out from Austin, Texas, and of which he published an account, embracing his own captivity and sufferings in Mexico, entitled "Narrative of the Texan Santa Fé Expedition" (2 vols. 12mo,

1844). During the Mexican war he accompanied the American forces under Taylor and Scott, and witnessed the chief conflicts during the contest. After its termination he passed two years in Europe, superintending the publication of a costly illustrated work, which appeared in 1851 in a folio volume under the title of "The War between the United States and Mexico, embracing 12 Colored Plates of the Principal Conflicts, by Carl Nebel." In 1852 he established a large grazing farm in Comal co., central Texas, where he resided until his death.

KENDRICK, Asahel Clark, an American author, born in Poultney, Vt., Dec. 7, 1809. He went when about 13 years of age to Hamilton, N. Y., and in 1831 graduated at Hamilton college, Clinton. He was immediately appointed tutor in the literary and theological institution at Hamilton (now Madison university), and the next year was made professor of Greek and Latin. Released after a few years from the Latin department, he remained the Greek professor till 1850, when, on the establishment of the university of Rochester, he was called to the Greek professorship in that institution, where he still remains. In 1852 he visited Europe, attending the lectures in the university at Athens, and visiting several Italian and German universities, returning home in 1854. Though in clerical orders, he has never had a pastoral charge. In addition to the studies of his own department, he has paid much attention to oriental learning. Besides numerous contributions to magazines and reviews, and several sermons, he has published a revised edition of Olshausen's

"Commentary on the New Testament" (6 vols., New York, 1853-'8), translating some portions for the first time; "Echoes," a small volume of translations from the French and German poets (Rochester, 1855); "Life and Letters of Emily C. Judson" (New York, 1860); "Our Poetical Favorites" (New York, 1870); and numerous Greek text books, the last of which is an edition of Xenophon's *Anabasis*, with notes and vocabulary (New York, 1873). In 1867 he translated and annotated the Epistle to the Hebrews for Lange's "Commentary." In 1868 he made a second visit to Europe. During the years 1865-'8, in addition to his duties in the university, he filled the chair of Hebrew and New Testament interpretation in the Rochester theological seminary. He is now (1874) one of the board of

New Testament revisers working in connection with the British committee appointed by the convocation of Canterbury.

KENEH, or **Gheneh** (anc. *Cænopolis*), a city of Upper Egypt, on the right bank of the Nile, 33 m. N. of the ruins of Thebes; pop. about 10,000. It is an emporium of trade with the Arabian coast, and manufactures famous water jars and bottles.

KENILWORTH, a parish and village of Warwickshire, England, about equidistant (5 m.) from Leamington, Warwick, and Coventry, containing the splendid ruins of Kenilworth castle. Of the original structure only a massive tower called *Cæsar's tower* is now standing; but there are considerable remains of subsequent additions. Among these is part of the

Cæsar's Tower, Kenilworth.

great hall erected by John of Gaunt, 86 ft. in length by 45 in width, with windows on both sides, and fireplaces at either end. The walls of *Cæsar's tower* are in some places 16 ft. thick. Kenilworth was founded by Geoffrey de Clinton, treasurer to Henry I., and, having passed to the crown, was bestowed by Henry III. on Simon de Montfort, earl of Leicester. When De Montfort was defeated and killed, his adherents held it for six months against the king, and at length made favorable terms of capitulation. Edward II. was prisoner in it for some time. Edward III. bestowed it on John of Gaunt, who built large additions to it. When his son Henry Bolingbroke became king, it was again vested in the crown, until Queen Elizabeth bestowed it on her favorite, Dudley, earl of Leicester. Elizabeth visited it

three times, the last in 1575, being the occasion so graphically narrated by Sir Walter Scott in his novel of "Kenilworth." The castle was dismantled in the time of Cromwell. After the restoration it belonged to the family of Clarendon, and is now the property of the family of Eardley-Wilnot.

KENNEBEC, a S. county of Maine, traversed from N. to S. by Kennebec river, and touched on the west by the Androscoggin; area, 1,050 sq. m.; pop. in 1870, 58,021. It has an undulating surface, diversified by numerous small lakes, and a very fertile soil. The Maine Central railroad and the Augusta division pass through it. The chief productions in 1870 were 25,822 bushels of wheat, 111,246 of Indian corn, 170,371 of oats, 122,627 of barley, 733,026 of potatoes, 137,231 lbs. of wool, 1,176,423 of butter, 154,727 of cheese, and 113,153 tons of hay. There were 7,563 horses, 13,252 milch cows, 5,481 working oxen, 12,163 other cattle, 31,975 sheep, and 4,086 swine; 11 manufactories of agricultural implements, 33 of carriages, 2 of cars, 4 of cotton goods, 4 of edge tools and axes, 6 of iron castings, 14 of machinery, 7 of marble and stone work, 5 of oil cloth, 3 of printing paper, 13 of saddlery and harness, 11 of sash, doors, and blinds, 2 of steel springs, 3 of stone and earthen ware, 14 of tin, copper, and sheet-iron ware, 4 of woollen goods, 35 saw mills, 6 flour mills, 19 tanneries, and 10 currying establishments. Capital, Augusta, which is also the capital of the state.

KENNEBEC, a river of Maine, and next to the Penobscot the most important in the state. Its principal source is Moosehead lake in the N. W. part of the state, on the boundary line between Somerset and Piscataquis counties. It issues from the lake on its S. W. shore, and after a course of 20 m. receives Dead river from the right. Its direction is then changed from S. W. to S., and from this course it has but one considerable deviation, namely, in the S. part of Somerset co., where it flows 12 m. E. It enters the Atlantic in Sagadahoc co., through Sheepscott bay, an irregular indentation of the coast studded with many islands. The largest tributary of the Kennebec is the Androscoggin, which joins it 18 m. from the ocean at Merrymeeting bay. The outlets of a number of small ponds, and Sebasticook and Sandy rivers, also flow into it. The most important towns on its banks are Bath, Richmond, Gardiner, Hallowell, Augusta, Waterville, and Norridgewock. It has falls at Waterville and at three points above, which afford excellent motive power. Its whole length is about 150 m., in which it has a descent of 1,000 ft. Large ships can ascend it to Bath, 12 m., steamboats to Hallowell, 40 m., and small craft to Waterville, 54 m. The influence of the tide extends to Augusta, 42 m. from the sea. A dam with locks has been constructed at Augusta for the purpose of improving the navigation above that point, and increasing the

water power. The river is closed by ice at Hallowell from the middle of December to about the 1st of April; below Bath it is open at all seasons except during severe winters.

KENNEDY. I. Benjamin Hall, an English clergyman, born at Summer Hill, near Birmingham, Nov. 6, 1804. He graduated at St. John's college, Cambridge, in 1827, was elected fellow and classical lecturer in 1828, became assistant master at Harrow in 1830, and was appointed head master of Shrewsbury school in 1836. In 1841 he became prebendary of Lichfield, and in 1860 was appointed select preacher to the university. He resigned his head mastership in 1866, and was appointed regius professor of Greek at Cambridge, and the next year canon of Ely. He has published "The Psalter in English Verse" (1860), "Elementary Greek Grammar" (1862), and "Public School Latin Grammar" (1871). **II. Charles Rann**, an English barrister, brother of the preceding, born in Birmingham, March 1, 1808, died in 1867. He graduated at Trinity college, Cambridge, and was elected fellow, entered Lincoln's Inn, was called to the bar in 1835, and settled at Birmingham. Besides several law books, he published "Poems, Original and Selected" (1843); in conjunction with his father, the Rev. Rann Kennedy, the "Works of Virgil," in blank verse (2 vols., 1850); "Specimens of Greek and Latin Verse" (1853); "Orations of Demosthenes," translated into English, with notes, appendices, &c. (5 vols., 1841-'63); and "Hannibal," a poem, part i. (1866).

KENNEDY, Grace, a Scottish authoress, born in Ayrshire in 1782, died Feb. 28, 1825. She passed the greater part of her life in Edinburgh, and subsequent to 1811 was an industrious writer of works of fiction of a moral and religious character, which were greatly esteemed at home and abroad. Among the most successful were "Decision," "Father Clement," "Anna Ross," "Dunallan," "Jessie Allan," &c., nearly all of which have been translated into the French and other languages. Her works were all published under an assumed name.

KENNEDY, John Pendleton, an American author, born in Baltimore, Oct. 25, 1795, died in Newport, R. I., Aug. 18, 1870. He graduated at Baltimore college in 1812, and in 1816 was admitted to the practice of the law, which he followed successfully for 20 years. In 1818-'20, in connection with his friend Peter Hoffman Cruise, he published the "Red Book," a serial in prose and verse issued about once a fortnight. He was a member of the Maryland house of delegates in 1820-'23. He warmly espoused the cause of President J. Q. Adams, and strongly advocated the protective policy. In 1832 he published "Swallow Barn, or a Sojourn in the Old Dominion," descriptive of plantation life in Virginia; and in 1835 "Horse-shoe Robinson, a Tale of the Tory Ascendancy," the most successful of his writings. In 1838 he published "Rob of the Bowl, a Legend of

St. Inigoe's," relating to the Maryland province in the days of Cecilius Calvert. All three works, revised and illustrated, were republished in New York in 1852. Mr. Kennedy was elected to congress in 1838, and one of the whig presidential electors in 1840. He was re-elected to congress in 1841 and 1843, was defeated by a small vote in 1845, and in 1846 was returned to the Maryland house of delegates, and chosen speaker. In 1849 appeared his "Life of William Wirt, Attorney General of the United States." In 1852 President Fillmore appointed him secretary of the navy, in which position he warmly favored Perry's Japan expedition and Kane's second arctic voyage in search of Sir John Franklin. He retired in March, 1853. Of his occasional writings and addresses, the best known are "Quodlibet" and "Defence of the Whigs." During the civil war he wrote "Mr. Ambrose's Letters on the Rebellion" (New York, 1865). At his death he was provost of the university of Maryland, vice president of the Maryland historical society, chairman of the trustees of the Peabody academy, and a member of various literary and scientific institutions. His "Life," by H. T. Tuckerman, was published in 1871.

KENNET, White, an English bishop, born in Dover in 1660, died in Peterborough in 1728. He was educated at Oxford, and was made bishop of Peterborough in 1718. He left a number of works, among which are: "Ecclesiastical Synods and Convocations historically stated and vindicated against Dr. Atterbury" (London, 1701); "The Case of Impropriations, and of the Augmentation of Vicarages and other insufficient Cures, stated by History and Law" (1704); "History of England, from the Accession of Charles I. to that of Queen Anne," published in the collection of English histories compiled by John Hughes (1706); "*Bibliotheca Americana Primordia*, an attempt toward laying the Foundation of an American Library" (1713); and "A Register and Chronicle, Ecclesiastical and Civil" (1728). His "Life" was published in 1730. He left a valuable collection of manuscripts, purchased by Lord Shelburne, and now part of the "Lansdowne manuscripts" in the British museum.

KENNICOTT, Benjamin, an English clergyman, born in Totness, Devonshire, April 4, 1718, died in Oxford, Sept. 18, 1783. He was of humble parentage, and certain gentlemen contributed funds to send him to Oxford in 1744. Here he so distinguished himself by the publication of two dissertations on the "Tree of Life" and the "Oblations of Cain and Abel," that he obtained his degree of B. A. before the regular time. Soon afterward he was chosen fellow of Exeter college, and in 1767 he became keeper of the Radcliffe library at Oxford. He undertook to purify the Hebrew text of the Old Testament, maintaining, in an essay entitled "The State of the Hebrew Text of the Old Testament considered," that the extant MSS. contained important errors, and that the

text of the standard Hebrew Bible was in many parts corrupt. The publication of this dissertation excited a violent controversy. Among his opponents were Rutherford, professor of divinity at Cambridge, Bishop Warburton, and Horne, afterward bishop of Norwich. At Kennicott's suggestion a subscription of £10,000 was raised to defray the cost of making a collation of all extant MSS. of the Old Testament. Several eminent scholars engaged in the work, Kennicott himself examining and collating all the MSS. of Great Britain and France, and Prof. Bruns those of Germany, Switzerland, and Italy. The task occupied nine years, during which 16 Samaritan and over 600 Hebrew MSS. were either wholly or in part collated; and the materials resulting from this investigation filled when transcribed 30 folio volumes. As the result of this labor, Kennicott published his *Vetus Testamentum Hebraicum cum Variis Lectionibus* (2 vols. fol., Oxford, 1776-'80), founded chiefly on the text of Van der Hooght.

KENOSHA, a S. E. county of Wisconsin, bounded E. by Lake Michigan and S. by Illinois, and drained by Des Plaines and Fox rivers; area, 306 sq. m.; pop. in 1870, 13,147. It has a level and thinly timbered surface, with a fertile soil resting on beds of limestone. The Kenosha and Milwaukee divisions of the Chicago and Northwestern railroad pass through it. The chief productions in 1870 were 214,567 bushels of wheat, 269,036 of Indian corn, 359,343 of oats, 45,473 of barley, 134,463 of potatoes, 13,377 of flax seed, 395,670 lbs. of flax, 242,611 of wool, 480,599 of butter, 308,600 of cheese, and 44,404 tons of hay. There were 4,707 horses, 7,169 milch cows, 7,150 other cattle, 49,277 sheep, and 6,290 swine; 8 manufactories of carriages, 4 of cheese, 2 of iron castings, 1 of machinery, 2 of malt, 3 of saddlery and harness, 2 breweries, 3 tanneries, 3 currying establishments, and 2 flour mills. Capital, Kenosha.

KENOSHA, a city and the county seat of Kenosha co., Wisconsin, on Lake Michigan and on the Kenosha and Milwaukee divisions of the Chicago and Northwestern railroad, 30 m. S. of Milwaukee; pop. in 1870, 4,309. It is built on a bluff, and has a good harbor with piers extending into the lake. It has an extensive trade in the products of the surrounding country, which is fertile and well cultivated. The manufactures are important. The principal establishments are two founderies, three tanneries, two breweries, three malt houses, marble works, a flax mill, a planing mill, a machine shop, three manufactories of hardware, one of telegraph insulators, one of cheese boxes, two of ploughs, eight of boots and shoes, one of fanning mills, three of cabinet ware, three of sash and doors, and one of pumps. There are a national bank, three public schools including a high school, a female seminary, two weekly newspapers, and 10 churches. Kenosha was settled in 1836.

KENRICK. I. Francis Patrick, an American Roman Catholic prelate, born in Dublin, Dec. 3, 1797, died in Baltimore, July 8, 1863. He received a classical education in the schools of his native city, and at the age of 18 was sent to Rome to study. He spent two years in the house of the Lazarists and four at the college of the Propaganda, where he was ordained priest. In 1821 he came to the United States, having been chosen on the recommendation of the Propaganda to conduct an ecclesiastical seminary just established at Bardstown, Ky. In the duties of this office he passed nine years, visiting also from time to time the scattered missions of the diocese. He published in 1828 "Letters of Omicron to Omega," in reply to the Rev. Dr. Blackburn, who had attacked, under the signature of Omega, the Roman Catholic doctrine of the eucharist. On June 6, 1830, he was consecrated at Bardstown bishop of Arath *in partibus infidelium*, and coadjutor to the Rt. Rev. Dr. Conwell, bishop of Philadelphia, with powers of administrator. On Dr. Conwell's death in 1842 Bishop Kenrick became his successor. During the anti-Catholic riots in 1844, he caused an address to be posted up throughout the city calling upon the Catholics to preserve peace and charity, and made every exertion to calm the agitation of both parties. He founded the theological seminary of St. Charles Borromeo in Philadelphia, and in 1849 introduced into his diocese the sisters of the Good Shepherd, who devote themselves to the care of Magdalen asylums. In 1851 Bishop Kenrick was appointed archbishop of Baltimore, in place of Archbishop Eccleston, deceased. The pope named him "apostolic delegate" to preside over the first plenary council of the United States, convened at Baltimore in May, 1852, and in 1859 conferred upon him and his successors the "primacy of honor," which gives them precedence over all other Roman Catholic prelates in this country. At the beginning of the civil war Archbishop Kenrick labored earnestly to inculcate peace and submission to the laws and the constituted authorities. Until his death he read publicly in his cathedral the prayer for the president of the United States. His theological works are regarded as classical in America, and used as text books in several seminaries. In Europe they are also held in great esteem, and referred to as standard authorities in all religious questions that are purely American. At the time of his death he was engaged on a revised English translation of the Bible, with copious notes, and had published the whole of the New Testament and the greater part of the Old. His principal works are: *Theologia Dogmatica* (4 vols. 8vo, Philadelphia, 1839-'40; 2d ed., 3 vols. 8vo, Mechlin, 1858, with valuable additions); *Theologia Moralitatis* (3 vols., Philadelphia, 1841-'3; 2d ed., Mechlin, 1859); "The Primacy of the Apostolic See Vindicated" (4th ed., Baltimore, 1865); "The Catholic Doctrine on Justifica-

tion explained and vindicated" (Philadelphia, 1841); "Treatise on Baptism" (New York, 1843); "Vindication of the Catholic Church" (Baltimore, 1855); "The New Testament" (2 vols., New York, 1849-'51); "The Psalms, Book of Wisdom, and Canticle of Canticles" (Baltimore, 1857); "Job and the Prophets" (Baltimore, 1859); and "The Pentateuch" (Baltimore, 1860). He also wrote the article on the "Roman Catholic Church" in the "New American Cyclopædia." **II. Peter Richard**, archbishop of St. Louis, brother of the preceding, born in Dublin in 1806. He was educated at Maynooth, and, having been ordained priest in Ireland, he came to Philadelphia, where his brother was already coadjutor. Mr. Kenrick was there employed in pastoral and literary labor; the "Catholic Herald," at the period of its highest reputation, was under his charge, and he wrote a number of translations and original works. He was also promoted to the rank of vicar general, and was consecrated bishop of Drasa *in partibus infidelium*, and coadjutor of St. Louis with right of succession, Nov. 30, 1841. By the death of Bishop Rosati two years after (1843), Dr. Kenrick became bishop of St. Louis; and in 1847 he became the first archbishop of that city. At the commencement of his administration Bishop Kenrick found the finances of his diocese in a deplorable condition; but by skilful measures he gradually extricated the diocese from this situation, and finally rendered it one of the most flourishing in the United States in a financial point of view. The archbishop also received in 1858 a large bequest, which has enabled him to accomplish many beneficial enterprises. The hospital under the care of the sisters of charity, by his munificence, has been made free, and dispenses its benefits alike to all, without distinction of faith, creed, or color. The orphanage of St. Philomena, the convents of the Visitation and the Good Shepherd, and numerous other institutions either of charity or education, attest the prosperity of the church under his government. He has adorned the environs of St. Louis with a cemetery which in beauty and extent of the grounds is one of the finest in the world. Archbishop Kenrick was present at the Vatican council, and was one of the foremost of the American prelates in maintaining the inopportune of defining the doctrine of papal infallibility. The speech which he had prepared was published in Naples in 1870, and in New York in 1872. He however acquiesced in the definition, and promulgated it, together with the other decrees of the council, in his diocese. Besides a number of translations, and editions of devotional works, he has published "The Holy House of Loreto, or an Examination of the Historical Evidence of its Miraculous Translation" (12mo), and "Anglican Ordinations" (8vo). The latter work elicited several rejoinders; by Roman Catholics it is generally regarded as conclusive in the controversy.

KENSETT, John Frederick, an American artist, born in Cheshire, Conn., March 22, 1818, died in New York, Dec. 16, 1872. He studied engraving under his uncle Alfred Daggett of New York, and for several years executed vignettes for bank notes, occasionally attempting painting as a recreation. In 1840 he visited England, and in the spring of 1845 exhibited in the royal academy, London, his first picture, a distant view of Windsor castle, the purchase of which by a prize holder of the London art union encouraged him to persevere in his new profession. He subsequently passed two winters in Rome, sending home occasionally pictures of Italian scenery, several of which became the property of the American art union. His "View on the Anio" and "Shrine," exhibited at the academy of design in New York in 1848, first brought him prominently before the public, and established his reputation. After an absence of about seven years he returned to America, and settled in New York. He produced many representations of American scenery under various aspects, those in which rocks, trees, or water are prominent features being among his most characteristic and successful works. The mountainous regions of New England and New York, the rivers and lakes of the middle states, and the seashore furnished him with frequent subjects. Among his most popular works are his "View of Mt. Washington from North Conway" (1849), "Franconia Mountains" (1853), "October Day in the White Mountains" (1855), "Hudson River from Fort Putnam" (1856), "Falls of the Bashpish," "Sunset on the Coast" (1858), "Eagle Cliff, Manchester, Mass." (1859), "Sunset in the Adirondacks" (1860), and subsequently numerous views on the Genesee and Hudson rivers and Lake George, and several taken in the vicinity of Newport, R. I. In 1859 he was appointed a member of the national art commission having the direction of the ornamentation of the capitol at Washington, and the superintendence of the works of art deposited there. In 1848 he was elected an associate and in 1849 a member of the national academy of design.

KENT. I. A central county of Rhode Island, bounded E. by Narragansett bay, and W. by Connecticut; area, 186 sq. m.; pop. in 1870, 18,595. It has a diversified surface and a good soil, and is drained by Flat, Pawtuxet, Moosup, and Wood rivers. The Hartford, Providence, and Fishkill, and the Stonington and Providence railroads pass through it. The chief productions in 1870 were 5,152 bushels of rye, 31,707 of Indian corn, 4,955 of oats, 94,035 of potatoes, 103,227 lbs. of butter, and 10,234 tons of hay. There were on farms 1,081 horses, 2,380 milch cows, 1,882 other cattle, 1,509 sheep, and 2,001 swine; 9 manufacturing of clothing, 23 of cotton goods, 9 of drugs and chemicals, 2 of iron castings, 4 of cotton and woollen machinery, 5 of tin, copper, and sheet-iron ware, 4 of woollen goods,

4 print works, 2 bleaching and dyeing establishments, 17 saw mills, and 5 flour mills. Capital, East Greenwich. **II.** A central county of Delaware, bounded E. by Delaware bay; and W. by Maryland; area, 640 sq. m.; pop. in 1870, 29,804, of whom 7,164 were colored. It has an undulating surface and a fertile soil, and is drained by Choptank and Marshy Hope rivers. It is traversed by the Delaware, the Delaware and Maryland, the Smyrna branch, and the Junction and Breakwater railroads. The chief productions in 1870 were 321,954 bushels of wheat, 885,178 of Indian corn, 145,238 of oats, 81,788 of Irish and 25,418 of sweet potatoes, 15,195 lbs. of wool, 221,212 of butter, and 7,239 tons of hay. There were 5,232 horses, 1,436 mules and asses, 6,222 milch cows, 1,274 working oxen, 5,235 other cattle, 5,316 sheep, and 11,421 swine; 6 manufacturing of agricultural implements, 4 of baskets, 6 of bricks, 21 of carriages, 3 of canned and preserved fruits, 6 of iron castings, 1 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 3 tanneries, 2 currying establishments, 13 saw mills, and 6 flour mills. Capital, Dover, which is also the capital of the state. **III.** A N. E. county of Maryland, bounded E. by Delaware and W. by Chesapeake bay, and drained by Sassafra and Chester rivers; area, 240 sq. m.; pop. in 1870, 17,102, of whom 7,732 were colored. The surface is slightly diversified, and the soil moderately fertile. The Kent County railroad passes through it. The chief productions in 1870 were 473,601 bushels of wheat, 723,824 of Indian corn, 143,653 of oats, 44,003 of potatoes, 26,550 lbs. of wool, 155,974 of butter, and 4,380 tons of hay. There were 4,535 horses, 3,518 milch cows, 5,218 other cattle, 6,154 sheep, and 12,866 swine; 2 manufacturing of packing boxes, 5 of carriages, 3 flour mills, and 1 saw mill. Capital, Chestertown. **IV.** A W. county of the S. peninsula of Michigan, drained by Grand, Rouge, and Thornapple rivers; area, 900 sq. m.; pop. in 1870, 50,403. The surface is moderately uneven, and the soil, which is very fertile, consists of deep vegetable loam on a substratum of clay. It is well timbered, and contains limestone, gypsum, and salt. It is traversed by six railroads. The chief productions in 1870 were 704,089 bushels of wheat, 405,281 of Indian corn, 343,556 of oats, 480,999 of potatoes, 251,721 lbs. of wool, 25,944 of hops, 86,336 of maple sugar, 862,309 of butter, and 47,983 tons of hay. There were 8,386 horses, 9,095 milch cows, 2,009 working oxen, 8,586 other cattle, 63,360 sheep, and 13,199 swine. There were 45 saw mills, 18 flour mills, 7 iron founderies, and many other manufacturing establishments, chiefly in Grand Rapids, the capital.

KENT. I. A S. W. county of Ontario, Canada, bounded S. E. and S. by Lake Erie, W. by Lake St. Clair, and N. W. by Big Bear creek; area, 951 sq. m.; pop. in 1871, 40,634, of whom 12,531 were of English, 8,893 of

Irish, 7,452 of Scotch, 3,693 of French, 3,969 of African, and 2,788 of German descent. It is traversed by the Great Western and Canada Southern railways, and intersected by the river Thames. The surface is generally level, and the soil, especially in the river bottoms, is fertile. Wheat, maize, oats, and tobacco are the principal productions. Capital, Chatham. **II.** An E. county of New Brunswick, Canada, bordering on the gulf of St. Lawrence and Northumberland strait; area, 1,720 sq. m.; pop. in 1871, 19,101, of whom 10,701 were of French, 3,041 of Scotch, 2,564 of Irish, and 2,486 of English descent. The Richibucto and Cocagne or Cocayne are the principal rivers. The coasts are broken by several good harbors, which afford excellent opportunities for ship building. Nearly half the county is unsettled, and the most valuable production is timber, which is exported in large quantities to England. Capital, Richibucto.

KENT, a maritime county of England, forming the S. E. extremity of Great Britain, bordering on Essex (from which it is separated by the Thames and its estuary), Middlesex, Surrey, Sussex, the North sea, and the strait of Dover; area, 1,624 sq. m.; pop. in 1871, 847,507. The northern border is skirted by broad marshes; and the N. E. coast is made very irregular in outline by the estuaries of the Thames and Medway. A large peninsula projects between the two, its northern portion forming the district called the Isle of Grain. A branch of the Medway, called the Swale, cuts off from the mainland a large tract known as the Isle of Sheppey. The E. end of the county, separated from the rest by the narrow river Stour, forms the Isle of Thanet, terminating in the North Foreland, and having an area of about 40 sq. m. The surface of the county is hilly, the range terminating at many points on the E. and S. E. coast in high chalk cliffs. Elsewhere (especially in Pegwell bay and at Romney marsh, near the S. end of the county) the shore is low. Both the N. E. and S. E. coasts are rendered dangerous by outlying sand banks, the best known and most dreaded being the celebrated Goodwin Sands, lying off the shore between the Isle of Thanet and the South Foreland, a cape projecting into the strait of Dover. The county has several important ports, the chief of which are Dover, Folkestone, and Gravesend. The Downs, between the Goodwin Sands and the mainland, furnishes the most frequented roadstead of the English coast. Several of the minor coast towns are well known watering places, among them Margate and Ramsgate. The Medway is the principal river having its entire course in the county; of the smaller streams, the Swale and Stour are important from their positions. Kent is mainly an agricultural county, its alluvial soil and pleasant climate insuring a large production. Hops are raised to a great extent. Estates are small, and are mostly inherited equally by all the sons of intestates,

under the Saxon law of gavelkind, now nearly peculiar to this county. The chief towns, besides the ports already named, are Canterbury, Rochester, Greenwich, Maidstone, and Chatham.—The authentic history of Kent extends further back than that of almost any other part of England. The Romans made their first landing on the coast of this county, and the region, called by them by the Latinized form (Cantium) of its name, was regarded with special favor and included their earliest settlements. Later, the legendary Saxon chiefs Hengist and Horsa are said to have landed in Pegwell bay; and the earliest battles of the Saxon invasion were undoubtedly fought in Kent, which afterward constituted one of the kingdoms of the heptarchy. It was again the scene of important battles at the Norman invasion, against which the Kentish men made a desperate and long continued resistance. The insurrections of Wat Tyler and Jack Cade broke out in Kent; it was the scene of important events during the wars of the roses; and a third rebellion, that of Sir Thomas Wyatt, arose here under Queen Mary. The county is very rich in Roman and Saxon antiquities, historic buildings, and ruins; and its ecclesiastical edifices, including Canterbury cathedral, Aylesford priory, and others, are of great celebrity and beauty.

KENT, Edward Augustus, duke of, fourth son of George III. of England, and father of Queen Victoria, born Nov. 2, 1767, died Jan. 23, 1820. He joined the army, and was under the command of Sir Charles Grey in the attack on the French West India islands, where he was noticed for his bravery; and in compliment to him the name of Fort Royal in Martinique was changed to Fort Edward. Soon afterward he was made governor of Nova Scotia, created duke of Kent and Strathearne, with a seat in the house of lords, and appointed commander-in-chief of the British forces in North America. The island of St. John changed its name in his honor to Prince Edward island, which it still retains. In May, 1818, he married the widow of the prince of Leiningen, youngest daughter of the duke of Saxe-Coburg. Alexandrina Victoria, now queen, was the only child of this union.

KENT, James, an American jurist, born in Philippi, Putnam co., N. Y., July 31, 1763, died in New York, Dec. 12, 1847. His grandfather, the Rev. Elisha Kent, whose family was early established at Suffolk, Conn., became in 1740 the Presbyterian clergyman of Philippi. His father, Moss Kent, Esq., was a lawyer, and for some years surrogate of Rensselaer co. James Kent graduated at Yale college in 1781, studied law, was admitted in 1785 as an attorney, and in 1787 as a counsellor, and commenced the practice of his profession in Poughkeepsie. He soon became remarkable among his contemporaries for his legal learning and literary attainments. He was elected successively in 1790 and 1792 a member of the legis-

lature for Dutchess co. The country was then excited by political discussions, arising from the adoption of the federal constitution, and Mr. Kent became an active and leading federalist, attracting the notice and confidence of Hamilton and Jay. It was by Hamilton's counsel that the reading of the young lawyer was directed to the doctrines of the civil law, and the treatises of the jurists of continental Europe; and thus he acquired the deep knowledge of the works of Pothier, Emerigon, and other civilians, which is to be traced throughout his own writings. In 1793 he was an unsuccessful candidate for a seat in congress for Dutchess co., and in the same year removed to New York, and was appointed by Gov. Jay one of the two masters in chancery for that city. In 1796 he was elected a member of the legislature, and also professor of law in Columbia college. Three of his lectures in the latter capacity, forming together an introduction to his general course, were published in 1797, and attracted the favorable notice of the legal profession. In 1797 he was appointed recorder of the city, an officer then administering a court of civil jurisdiction; and the extraordinary ability he exhibited in the office induced Gov. Jay in 1798 to nominate him a judge of the supreme court of the state. He continued a member of this tribunal till 1814, having been from 1804 chief justice. The supreme court at that time was formed after the model of the English king's bench, being composed of five judges, who rode the circuits to try jury cases, and convened during the year at four appointed terms to decide reserved questions of law. Both the court and the law itself were in a rudimental state. There were no American law books, and no reports of American decisions, except those of Mr. Dallas, which were just commenced. The proceedings of the court were languid and dilatory; and resort was had for rules of procedure and principles of law almost exclusively to English precedents and decisions. The accession to the bench of a young, energetic, and able judge produced a striking change. It was the difficult task of the court to expound the principles of the common law as applicable to American institutions; to define and limit our new constitutional provisions; to construe recent statutes; to bring the principles of commercial law to bear upon transactions of trade and commerce; to devise rules of practice; and in short to adapt to a young and rising nation a complicated yet practical code of laws. That this work was well accomplished, and that a large portion of its success must be attributed to the unremitting energy and talent of the chief justice, will appear from the reports of Mr. Parsons, and the 14 volumes, entitled "Johnson's Cases" and "Johnson's Reports," of the decisions of the supreme court during the time of Mr. Justice Kent. By the constitution of New York as it then existed an important political duty was imposed on the ju-

diciary of the state. The judges of the supreme court and the chancellor formed with the governor a council of revision, possessing a qualified veto on the acts of the legislature. This council was abolished by the constitutional convention of 1822, the judges themselves acquiescing in the change. They felt that, though the council was often a salutary check upon hasty and unwise legislation, the effect upon the judiciary was unfavorable, as exposing it to the influence and excitements of political parties. The subsequent publication of the proceedings of the council of revision displays Mr. Kent as prominent and efficient in the discharge of his political, as he had been in performing his judicial duties. In 1814 Chief Justice Kent was appointed chancellor. Up to that time the court of chancery had been of secondary importance in the jurisprudence of the state. This was partly owing to the nature of its business. Complicated trusts and intricate settlements of property, which form the peculiar subjects of chancery jurisdiction, belong to an advanced period of national growth. But the proceedings of the court had been dilatory; its mode of practice was circuitous and expensive, and the court was regarded with disfavor both by the profession and the community. The change effected by Chancellor Kent was aptly described in an address presented to the chancellor by the members of the bar, on his retirement from the office after nine years' administration of its duties. They compared him to Lord Nottingham, the English chancellor, who was described by Blackstone as the founder of the equity system of England, and who was "enabled in the course of nine years to build a system of jurisprudence and jurisdiction upon wise and national foundations." The seven volumes of Johnson's "Chancery Reports" contain the decisions of Chancellor Kent, and present a profound and extended exposition of the whole system of equity law. In 1822 he was elected a member of the convention called to revise the constitution of the state. He took an active part in the discussions of this body, and displayed a power of debate remarkable for one so long retired from forensic discussions. His opinions were strongly conservative. He opposed without success the extension of the right of suffrage, and other democratic innovations; but his personal influence and character preserved for the time the court of chancery, which he believed to be a useful means of administering justice. In 1823 his official term ended; and, having attained the age of 60, he found himself, by the then existing constitution of the state, prevented from holding judicial office. Still in vigorous health, he soon formed for himself new occupations. Returning to the city of New York, whence he had removed on becoming a judge, he was reelected professor of law in Columbia college, and for several years he delivered courses of lectures on law to numerous classes, which were embodied in his "Com-

mentaries on American Law" (4 vols. 8vo, 1826-'30). This work has since passed through many editions, and has acquired a world-wide celebrity. It has assumed in the United States the position long filled in England by Blackstone's "Commentaries on the Laws of England." It embraces not merely the jurisprudence of the federal Union, but the municipal law, written and unwritten, of the several states. Vast and comprehensive in plan, elaborate and minute in research, the beauties of its style and its historical learning commend it to the general reader, while it has been proved to be the best guide to the law student, and a valuable aid to the practical lawyer. The last years of Chancellor Kent's life were passed in tranquil pursuits, in enlarging and correcting his "Commentaries," in giving opinions on legal subjects, in advising and deciding on controversies submitted to him, and performing all the duties of an active and patriotic citizen. In 1836 he wrote and published, at the request of the common council of the city, a compendious treatise on the charter of New York and the powers of the municipal officers.—His son WILLIAM, born in 1802, was prominent as a lawyer and judge in New York, and in 1846-'7 was professor of law in Harvard university. He died at Fishkill, N. Y., Jan. 4, 1861.

KENT, William, an English artist, born in Yorkshire about 1685, died April 12, 1748. He was apprenticed to a coach painter, but found patrons who enabled him to study in Rome, where in 1716 he met the earl of Burlington, with whom he returned to England, and whose guest he remained during the rest of his life. He was much employed as an artist, but neither as a painter nor sculptor rose above mediocrity. He became, however, the founder of modern landscape gardening in England, by laying out Kensington gardens in accordance with principles of perspective and light and shade, thus putting an end to the bad taste which had up to that time disfigured English pleasure grounds. As an architect he is said to have designed the admirable structures, Holkham house and the temple of Venus at Stowe.

KENTON, a N. county of Kentucky, separated from Ohio by the Ohio river, and bounded E. by Licking river; area, 140 sq. m.; pop. in 1870, 36,096, of whom 1,657 were colored. The surface is very uneven, but the soil is fertile. Much of it is laid out in market gardens, whose products are sold in Cincinnati. The Kentucky Central and the Louisville and Cincinnati railroads pass through it. The chief productions in 1870 were 33,564 bushels of wheat, 30,870 of rye, 374,165 of Indian corn, 69,489 of oats, 80,545 of potatoes, 360,983 lbs. of tobacco, 16,538 of wool, 226,128 of butter, and 3,875 tons of hay. There were 2,847 horses, 2,698 milch cows, 2,558 other cattle, 5,598 sheep, and 13,838 swine; 2 manufactories of agricultural implements, 7 of brick, 5 of carriages, 9 of cooperage, 2 of cordage and twine, 1 of glass ware, 4 of iron forged and cast, 3 of

marble and stone work, 5 of saddlery and harness, 2 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 9 of tobacco and snuff, 1 of wire work, 4 distilleries, 4 breweries, 1 saw mill, and 2 flour mills. Capitals, Independence and Covington.

KENTON, Simon, an American pioneer, born in Fauquier co., Va., April 3, 1755, died in Logan co., O., April 29, 1836. At the age of 16 he had an affray with a young man arising out of a love affair; and believing he had killed his adversary, he fled beyond the Alleghanies and became a companion of Boone and the other early pioneers of Kentucky. For a time he acted as a spy of Gov. Dunmore, and subsequently participated in the warfare waged against the British and the Indians west of the Alleghanies, showing remarkable courage, sagacity, and endurance. In 1782, learning that his rival was living, he returned to his native place, and soon after removed with his father's family to Kentucky. He was frequently engaged in Indian warfare, until the expedition under Wayne in 1793-'4 restored tranquillity to the western frontier. As the country began to fill up with settlers, his lands, to which, in consequence of his ignorance of or indifference to legal forms, he had never secured perfect titles, were taken from him, and by repeated lawsuits he was reduced to penury. He nevertheless took up arms in the war of 1812, and fought with the Kentucky troops at the battle of the Thames. In 1824 he appeared in Frankfort in tattered garments to petition the legislature of Kentucky to release the claim of the state upon some mountain land owned by him. His appearance at first excited ridicule, but upon being recognized he was treated with much distinction; his lands were released, and a pension of \$240 was procured for him from congress. He died near the spot where, 58 years previous, he had narrowly escaped death, at the hands of the Indians.

KENTUCKY, an interior state of the American Union, and the second admitted under the federal constitution, between lat. 36° 30' and 39° 6' N., and lon. 82° 2' and 89° 40' W. It is bounded N. W. and N. by the Ohio river, which separates it from Illinois, Indiana, and Ohio; E. by West Virginia and Virginia, from which it is separated by the Big Sandy river and the Cumberland mountains; S. by Tennessee, along a conventional line mostly on the parallel of 36° 35' N.; and W. by the Mississippi, separating it from Missouri; greatest length E. and W. 350 m., greatest breadth 178 m.; area, 37,680 sq. m., being 1.28 per cent. of the whole surface of the United States (excluding Alaska). The state is divided into 116 counties, viz.: Adair, Allen, Anderson, Ballard, Barren, Bath, Bell, Boone, Bourbon, Boyd, Boyle, Bracken, Breathitt, Breckenridge, Bullitt, Butler, Caldwell, Calloway, Campbell, Carroll, Carter, Casey, Christian, Clarke, Clay, Clinton, Crittenden, Cumberland, Daviess, Edmonson, Elliott, Estill, Fayette, Fleming, Floyd, Franklin,

Fulton, Gallatin, Garrard, Grant, Graves, Grayson, Green, Greenup, Hancock, Hardin, Harlan, Harrison, Hart, Henderson, Henry, Hickman, Hopkins, Jackson, Jefferson, Jessamine, Johnson, Kenton, Knox, Laurel, La Rue, Lawrence, Lee, Letcher, Lewis, Lincoln, Livingston, Logan, Lyon, McCracken, McLean, Madison, Magoffin, Marion, Marshall, Martin, Mason, Meade, Menifee, Mercer, Metcalfe, Monroe, Montgomery, Morgan, Muhlenburg, Nelson, Nicholas, Ohio, Oldham, Owen, Owsley, Pendleton, Perry, Pike, Powell, Pulaski, Robertson, Rock Castle, Rowan, Russell, Scott, Shelby, Simpson, Spencer, Taylor, Todd, Trigg, Trimble, Union, Warren, Washington, Wayne, Webster, Whitley, Wolf, and Woodford. Louisville (pop. in 1870, 100,753) is the largest city and the commercial emporium of the state; Frankfort (5,396) is the capital; Lexington (14,801) is the most important inland city. Maysville (4,705), Covington (24,505) and New-

native and 63,398 foreign-born. Of the colored, 177,499 were blacks and 44,711 mulattoes, and there were 108 Chinese. Of the natives, 875,415 whites, 205,583 colored, and 83 Indians were born in the state, 12,877 in North Carolina, 19,533 in Ohio, 49,952 in Tennessee, and 44,102 in Virginia and West Virginia. The foreign-born comprised 30,318 born in Germany, 21,642 in Ireland, 4,173 in England, 2,052 in France, 1,147 in Switzerland, and 1,019 in Scotland. The density of population was 35.33 to a square mile. There were 232,797 families, with an average of 5.67 persons to each, and 224,969 dwellings, each containing an average of 5.87 persons. The increase in the aggregate population from 1860 to 1870 was 14.30 per cent., while there was a loss of 5.91 per cent. in the colored population. The number of male citizens 21 years old and upward was 282,305. There were 249,567 persons 10 years old and upward who were unable to read, and 332,176 could not write. Of the 201,077 white illiterates, 57,766 were from 10 to 15 years of age, 36,760 were from 15 to 21, and 106,551 were 21 years old and over, of whom 43,826 were males and 62,725 were females. There were 131,050 colored illiterates, of whom 24,958 were from 10 to 15 years old, 24,926 were from 15 to 21, and 81,166 were 21 and over, of whom 37,889 were males and 43,277 females. There were also 49 Indian illiterates. Among male adults the percentage of illiterates to the total number was 28.23; among female adults, 37.08. The number of paupers supported during the year ending June 30, 1870, was 2,059, at a cost of \$160,717. Of the total number (1,784) receiving support June 1, 1870, 1,080 were white and 704 colored. The number of persons convicted of crime during the year was 603. Of the total number (1,067) in prison June 1, 1870, 624 were white and 443 colored. The state contained 978 blind, 723 deaf and dumb, 1,245 insane, and 1,141 idiotic. Of the total population 10 years of age and over (930,136), there were engaged in all occupations 414,593; in agriculture, 261,080, of whom 127,911 were agricultural laborers, and 131,598 farmers and planters; in professional and personal services, 84,024, including 1,080 clergymen, 41,368 domestic servants, 24,981 laborers not specified, 1,552 lawyers, 2,414 physicians and surgeons, 2,961 teachers not specified; in trade and transportation, 25,292; and in manufactures and mechanical and mining industries, 44,197. The total number of deaths from all causes in 1870 was 14,345; there were 2,500 deaths from consumption, the number of deaths from all causes to one from consumption being 5.7; the deaths from pneumonia numbered 1,514, there being 11.7 deaths from all causes to one from that disease; 334 deaths resulted from intermittent and remittent fever, 661 from enteric fever, and 880 from diarrhoea, dysentery, and enteritis.—The western part of Kentucky is nearly level, the broad plains being varied

State Seal of Kentucky.

port (15,087), on opposite sides of the mouth of Licking river, and facing Cincinnati, Ohio, Henderson (4,171), and Paducah (6,866) are the most important cities on the Ohio river, all of which are the termini of railroads from the interior. The other cities of the state, according to the census of 1870, are Franklin, with 1,808 inhabitants; Hopkinsville, 3,136; Owensboro, 3,437; and Paris, 2,655. Harrodsburg and Boonesborough are the oldest towns.—The population of the state at decennial periods has been as follows:

U. S. CENSUS.	White.	Free colored.	Slave.	Total.	Rank.
1790.....	61,138	114	11,880	73,077	14
1800.....	179,871	741	40,343	220,595	9
1810.....	324,237	1,713	80,561	406,511	7
1820.....	434,644	2,941	126,732	564,317	6
1830.....	517,787	4,917	165,213	687,917	6
1840.....	590,258	7,317	182,258	779,828	6
1850.....	761,418	10,011	210,981	982,405	8
1860.....	919,484	10,684	225,483	1,155,684	9
1870.....	1,098,692	222,210	1,321,011	8

Of the total population in 1870, 665,675 were males and 655,336 females; 1,257,613 were

by gentle undulations. The southeast is broken by the Cumberland mountains and their offshoots. Narrow, deep, and gloomy valleys intervene between the ridges. None of the summits attain a greater altitude than 3,000 ft., and their mean elevation does not exceed 2,000 ft. The whole of this region is well wooded, especially the foot hills and valleys. N. and W. of the hilly region lies what may be called an upland, which extends from the Big Sandy river to lon. 86° W., and comprehends more than half the whole area of the state. Its surface is gently undulating, but it is intersected by numerous narrow and deep valleys in which the rivers run. Though this upland is sparingly provided with spring water, its soil is of the first quality and equal to any in the Union. It is included in the tract of blue limestone which extends from the Ohio river, between a point about 40 m. above Louisville and the eastern limits of Mason co., about 10 m. above Maysville, southwardly to the Cumberland river, and is known as the "blue grass region." The W. portion of the state is divided between the "barrens" and a country which is partially hilly. The barrens, which occupy chiefly the tract between the Green and Cumberland rivers, in their natural state are generally destitute of trees, resembling in this respect the prairies N. of the Ohio river; but the level surface is diversified by low round-topped hills, called "oak knobs" on account of the trees which cover them. This tract was formerly considered the least fertile portion of the state, but the value of its red calcareous soils has greatly increased. The alluvial bottoms between these hills and the Ohio and its affluents are exceedingly rich. On the north and west the barrens are margined by a more broken and hilly country, which gradually passes to the low flats which skirt the Ohio and Mississippi rivers. This tract is superior in fertility to the barrens, but cannot be compared with the upland country.—Kentucky is amply provided with noble streams. The Mississippi forms its W. limit for 80 m. Along the N. W. and N. boundary runs the Ohio in a winding course for nearly 600 m., navigable throughout, and affording with its chief affluents water communication to all parts of the state. The Mississippi receives from Kentucky only a few inconsiderable tributaries. Of the streams which flow into the Ohio, the most eastern is the Big Sandy, which has its sources in Virginia and West Virginia; where it approaches Kentucky it turns nearly due N., and continues in that direction to its outlet, forming the boundary between Kentucky and West Virginia; it is navigable only for a short distance, owing to falls which occur where it issues from the mountain region. The Licking rises in Floyd co., flows with many windings in a N. W. direction for more than 200 m., and falls into the Ohio between Covington and Newport, opposite Cincinnati; in winter and spring it is navigable for about 70 m. The dif-

ferent branches of the Kentucky river rise in the Cumberland mountains, and form by their union a considerable stream, which flows first N. W., then S. W., and at last N. N. W.; its course is about 260 m., and though very rapid it may be navigated by steamboats 80 m. to a point 20 m. above Frankfort, and by small boats for 100 m. higher. Green river rises in the W. districts of the upland region, and flows W. for a great part of its course, to its junction with its chief affluent, the Big Barren, where it turns N. W. and finally N., joining the Ohio about 50 m. above the Cumberland; its length is about 300 m., and it is navigable for steamboats to Greensburg, 200 m., and for boats nearly to the heads of the stream. Navigation was obstructed by falls about 50 m. above its mouth, but a lock and dam at that point has obviated the difficulty. Cumberland river rises in the valley between the Cumberland and Laurel mountains; it traverses both the mountain and the upland regions, generally in a westerly direction, but on approaching the barrens it turns S. and enters Tennessee, where it makes a large bend and then reenters Kentucky with a N. W. course, and so continues to the Ohio, which it enters about 10 m. above the mouth of the Tennessee; it is nearly 600 m. long, and as its current is comparatively gentle it offers an easy navigation for sloops and steamboats as far up as Nashville, Tenn., 200 m. from its mouth, and at high water to Burkesville, Ky.; for boats of 15 tons it is navigable for 300 m., and for river boats much higher. The Tennessee flows only about 70 m. through Kentucky; it admits steamboats to Florence, Ala., 300 m. from its mouth.—Kentucky lies wholly in the great region of stratified rocks of the west. These traverse the state in layers so nearly horizontal, that often over broad districts no dip is perceptible to the eye. Through the central portion of the state, from N. to S., the Silurian groups, which are here almost exclusively calcareous, thus overspread the surface for nearly 100 m. in width, and form the great central axis of the lowest rocks. At Louisville they disappear by reason of their very gentle westward dip, and pass beneath the limestones of the Devonian age, which here lie exposed in horizontal strata, forming the bed of the river and the reefs which occasion the falls at this place. They are succeeded by the carboniferous limestone; and still further W. the coal measures, commencing at Rome on the Ohio river, are traced almost to the mouth of this river. This is the southern end of the coal field of Illinois and Indiana, which extends S. nearly across the western portion of Kentucky. (See COAL.) In this portion occurs the Breckenridge coal, formerly extensively used in the manufacture of kerosene. To the east, about 100 m. from Louisville, the same repetition of the formations is encountered, as the Silurian rocks dip E. on this side of the axis; and the coal measures

which occupy the whole eastern portion of the state are a part of the great Appalachian coal field which overspreads western Virginia and Pennsylvania. The limestones abound in fossil remains, and those of the falls at Louisville are especially famous for their remarkably fine coralline productions. The hydraulic limestone is found here, and largely used in the manufacture of cements. When the river is low the rocks in its bed appear like the coral reefs produced by living zoöphytes, the softer portions being worn away, so that the hard calcareous corals stand out in relief precisely as if they were living. Fine selected specimens being placed in juxtaposition with others of recent growth, none but a zoölogist would be able to guess which were ancient and which modern. These limestones also abound in caves, some of which are among the most remarkable of these curiosities. Upon their walls are found incrustations of saltpetre, which in some instances have been profitably collected. The Mammoth cave, near Green river, in Edmonson co., is the largest in the world. It has been explored through winding passages more than 10 m. (See MAMMOTH CAVE.) In some of the superficial depressions of the limestone are found the low swamps known as "licks," frequented by deer and elk, and in ancient times by the buffalo, and in a still more distant epoch by the extinct species of elephant, horse, mastodon, megalonyx, &c., whose bones are occasionally found near the saline springs of these quagmires. One of the most remarkable of these localities is the Big Bone lick, 23 m. S. W. of Cincinnati. Lead ores have been worked to a small extent heretofore, but considerable efforts are now in progress for their development. Salt springs occur in many places among the sandstone rocks, and sulphur, saline, and chalybeate springs are numerous. On Goose creek in Clay co., and in Meade co., salt is largely manufactured from brine procured by boring. The "hanging rock" iron region comprises a portion of N. E. Kentucky and of S. Ohio; it is about 15 m. wide, and extends about 30 m. from the Ohio river into Kentucky, and about 50 m. N. into Ohio. The ores of this region are mostly brown hematite; they lie in strata which dip to the east with a slight deviation to the south. There are two clearly defined strata, the lower being from 10 to 30 in. thick and yielding block ore. Above this, at distances varying from 30 to 75 ft., lies the stratum known as the limestone ore, which is from 12 to 50 in. thick. These ores contain from 40 to 65 per cent. of iron, which is found to be remarkably well adapted for the manufacture of car wheels. Numerous iron furnaces are in operation in this region. Besides iron ores, large deposits of superior coal, fire clay, moulding sand, limestone, building stone of superior quality, potter's clay, and sand suitable for making glass are found. Extensive deposits of hydrated oxides of iron exist in the S. W. counties, bordering on the Ten-

nessee and Cumberland rivers; and different ores of iron are found all through the coal fields and in the slate and subcarboniferous limestone regions.—The blue limestone region, which was originally covered with forests of large trees and a dense undergrowth of reeds, contains the richest soil in the state, and that part of it between the Ohio and the vicinity of Lexington is commonly called the "garden of Kentucky." The barrens are thinly wooded with trees which have grown up almost wholly since the settlement of the state, but produce good pasturage, so that the average fertility of Kentucky may be considered equal to that of any other state in the Union. The climate is remarkably pleasant, but variable. The mean annual temperature is about 55° F.; in winter the thermometer frequently falls to 20° or 15°, and occasionally below zero, and in summer rises to 94° or 100°. Winter sometimes continues from late November to early April, but snow seldom lies long on the ground, and cattle and sheep are abroad throughout the coldest seasons. In spring and summer S. W. winds prevail, and the weather is delightful. The N. W. wind produces the greatest winter cold. Rain falls abundantly in winter and spring, but is sometimes scanty in summer and autumn, the weather in those seasons being characteristically dry and constant.—There are still extensive forests in Kentucky. In the mountain and upland region are found chiefly tulip trees, elm, oak, ash, hickory, walnut, cherry, &c.; those of the barrens are chiefly oaks, chestnuts, and elms. Among the most useful trees are the sugar maple, black and honey locust, wild cherry, and the several varieties of oak and walnut, which in the early settlement of the state furnished household staples of great value. The principal fruit trees are the apple and peach. Besides being a great grain-growing state, Kentucky produces more than half of the hemp grown in the Union, and four sevenths of the flax. In the S. W. districts, along the Tennessee, Cumberland, and Mississippi rivers, some cotton is raised; and the tobacco grown in these regions and in the rich soil further E. supplies a valuable material to the commerce of the state. As an agricultural state Kentucky holds a very high rank. Of the total production of hemp (12,746 tons) in the United States in 1870, as reported by the federal census, 7,777 tons were contributed by Kentucky; while of the entire yield of tobacco in the United States (262,735,341 lbs.) 105,305,869 lbs. were the product of this state. In the same year only five states produced more Indian corn, four more rye, two more honey, and three more wax, and only three contained more swine. According to the census of 1870, there were in the state 118,422 farms; of these, 33,939 contained between 20 and 50 acres, 29,731 between 50 and 100, 25,490 between 100 and 500, 616 between 500 and 1,000, and 164 contained 1,000 acres and over. The

average size of farms was 158 acres. The total amount of land in farms was 18,660,106 acres, of which 8,103,850 were improved and 10,556,256 unimproved, 9,134,658 acres of the latter being woodland; the percentage of unimproved to total land in farms was 56.6. The cash value of farms was \$311,238,916; farming implements and machinery, \$8,572,896; total amount of wages paid during the year, including value of board, \$10,709,382; total (estimated) value of all farm productions, including betterments and additions to stock, \$37,477,374; of orchard products, \$1,231,385; of produce of market gardens, \$527,329; of forest products, \$574,994; of home manufactures, \$1,683,972; of all animals slaughtered or sold for slaughter, \$24,121,861; of all live stock, \$66,287,343. The chief agricultural productions were 38,532 bushels of spring and 5,690,172 of winter wheat, 1,108,933 of rye, 50,091,006 of Indian corn, 6,620,103 of oats, 238,486 of barley, 3,443 of buckwheat, 119,926 of peas and beans, 2,391,062 of Irish and 802,114 of sweet potatoes, 2,551 of clover and 35,896 of grass seed, 14,657 of flaxseed, 204,399 tons of hay, and 7,777 of hemp, 1,080 bales of cotton, 105,305,869 lbs. of tobacco, 2,234,450 of wool, 237,268 of flax, 11,874,978 of butter, 115,219 of cheese, 1,345,779 gallons of milk sold, 49,073 of maple and 1,740,453 of sorghum molasses, 62,360 of wine, 269,416 lbs. of maple sugar, 1,171,500 of honey, and 32,557 of wax. There were on

farms 317,034 horses, 99,230 mules and asses, 247,615 milch cows, 69,719 working oxen, 382,993 other cattle, 936,765 sheep, and 1,838,227 swine. In 1870 16 states ranked higher than Kentucky in the total value of manufactured products. In distilled liquors, the state ranked first in the number of establishments, second in the amount of capital invested, and fourth in the value of products, as appears from the following statement:

STATES.	No. of establishments.	Capital.	Products.
Kentucky	141	\$2,670,700	\$4,582,730
Illinois	45	2,513,000	7,883,751
Ohio	63	2,829,700	7,022,656
Pennsylvania	108	2,504,557	4,618,223

The manufacture of distilled liquors is almost wholly confined to whiskey, the amount of highwines made being very small. The total number of manufacturing establishments reported by the census was 5,390, using 1,147 steam engines of 31,928 horse power, and 459 water wheels of 7,640 horse power, and employing 30,636 hands, mostly male adults. The total amount of capital employed was \$29,277,809; wages paid during the year, \$9,444,524; materials consumed, \$29,497,535; products, \$54,625,809. The chief industries are shown by the following table:

INDUSTRIES.	Number of establishments.	Steam engines, horse power.	Hands employed.	Capital.	Wages paid.	Value of materials.	Value of products.
Agricultural implements.....	44	270	624	\$633,025	\$287,590	\$673,176	\$1,834,917

—Kentucky has little direct foreign commerce, but its domestic commerce is very extensive. The chief commercial places are Maysville, Covington, Louisville, Owensboro, Henderson, and Paducah, on the Ohio, Columbus on the Mississippi, and Lexington in the interior. The principal exports are hemp, flax, tobacco, horses, mules, hogs, cattle, bagging, and rope. There

are two United States customs districts, of which Louisville and Paducah are the ports of entry. The total number of vessels registered, enrolled, and licensed in 1873 was 55, of 13,807 tons, at Louisville, and 15, of 2,878 tons, at Paducah. Of those at Louisville, 44 were steamers and 11 barges, while the entire number at Paducah were steamers. Boat building

is carried on at both of these points; 24 boats were built in 1873, including 17 steamers at Louisville and 4 at Paducah. Internal improvements have been well attended to, and several of the large rivers have been rendered navigable for considerable distances above their natural heads of navigation; the works on the Kentucky and Green are the most important. The completion of the Louisville and Portland canal around the falls of the Ohio at Louisville

enables boats 300 ft. long and 80 ft. wide to pass through nearly the whole year. As early as 1841 Kentucky had 28 m. of railway. The mileage had increased to 549 in 1861, 852 in 1869, and 1,123 in 1871. In 1873 the total number of miles of main track in the state was 1,228, and other roads were in process of construction and projected. The railways, with their termini and the number of miles in operation in 1873, were:

In 1873 there were 36 national banks in operation, with a paid-in capital of \$8,263,700 and an outstanding circulation of \$7,021,900. The entire bank circulation of the state was \$7,637,900, being \$5 78 per capita. The ratio of circulation to wealth was 1.3, and to the bank capital 84.4.—The present constitution of Kentucky was adopted in 1850. Every free male citizen 21 years of age, who has resided in the state two years, in the county one year, and in the precinct 60 days next preceding an election, is entitled to vote. The general election is fixed by law on the first Monday in August, and voting is *viva voce*, except in the election of representatives to congress, when it is by ballot. The legislature consists of a senate of 38 members, and a house of representatives of 100. Senators must be 30 years of age, and are chosen for four years, one half every second year. Representatives must be 24 years of age, and hold office two years. The sessions of the legislature are biennial, beginning on the first Monday of December in every odd year, and lasting not longer than 60 days unless by vote of two thirds of both houses. Members are paid \$5 a day, and 15 cents a mile for travel. The governor is chosen for four years. He must be 35 years of age, a citizen of the United States, and have been resident in the state for six years. He is ineligible to the office for the four years succeeding his term. A majority vote in each house is sufficient to pass a bill

over the governor's veto. The lieutenant governor, auditor, attorney general, register of land office, and superintendent of public instruction are also elected for four years. The lieutenant governor, with the same qualifications as the governor, is *ex officio* president of the senate. If a vacancy occurs in the office of governor during the last half of the term, the lieutenant governor, and failing him the speaker of the senate, acts as governor; but if during the first half of the term, then a new election is held. The treasurer is elected by the people every two years. The secretary of state is appointed by the governor, by and with the advice and consent of the senate, and holds office during the governor's term. The official salaries are: for the governor \$5,000, secretary of state \$1,500, auditor \$2,500, register of land office \$2,000, treasurer \$2,400, and superintendent of public instruction \$3,000. The secretary of state, auditor, and register of the land office also have certain fees. The pay of the lieutenant governor is \$8 a day during attendance at the legislative session. The judiciary consists of the court of appeals, which has appellate jurisdiction only, circuit and county courts. The state is divided into four appellate judicial districts and 16 circuit court districts. Louisville has separate chancery and common pleas courts, and additional courts have been established in several districts. The court of appeals consists of a chief justice and three judges, a clerk, sergeant, and

reporter. The judges have each \$5,000 a year, and the attorney general \$500 and fees. The Louisville chancery court consists of a chancellor (salary \$3,000), a clerk, and a marshal (fees). The judges of circuit are paid \$3,000, and attorneys \$500 and fees. The judges of the Louisville courts are paid in addition \$1,000 each by the city. All judges and other officers of courts are elected by the people. Judges of the court of appeals and the circuit courts must have had eight years' experience in law to be eligible to the bench. Kentucky is represented in congress by two senators and 10 representatives, and is therefore entitled to 12 votes in the electoral college. According to the federal census of 1870, the assessed value of real estate was \$311,479,694, and of personal \$98,064,600; total assessed value of property, \$409,544,294; true value of real and personal estate, \$604,318,552. The total taxation not national amounted to \$5,730,118, including \$2,254,413 state, \$1,307,833 county, and \$2,167,872 town, city, &c. The total receipts into the state treasury during the fiscal year were \$2,107,149, the most important sources being: direct taxes, \$1,491,775; corporations, banks, and insurance companies, \$332,992; and licenses, \$78,551. The total disbursements amounted to \$1,824,392. The bonded debt of the state in 1872 was \$966,394. In 1874 it was entirely free from debt except the amount due the school fund, \$1,628,123 08, which is made by the constitution a permanent debt of which the interest only is to be paid. A direct tax of 45 cents on every \$100 in value of real and personal property is annually collected for various purposes of state government, of which 20 cents goes to the school fund and the remainder to general purposes. Stock in banks and other moneyed corporations is taxed 50 cents on each share of \$100. Railroads are taxed for the benefit of the state, on a valuation of \$20,000 a mile, at the rate of 45 cents on every \$100. The same rate of tax is also paid by toll bridge, mining, manufacturing, gaslight, street railroad, and waterworks corporations. Express, telegraph, and turnpike companies are also taxed.—The superintendent of public instruction is required to set forth in his annual report the condition of the institutions for the blind, the deaf and dumb, and the feeble-minded. The asylum for the education of the blind in Louisville, opened in 1842, is intended to afford board and tuition free of charge to the blind of the state between the ages of 7 and 17 years. Not only the totally blind, but those whose eyesight is so defective that they cannot see to read, may be received and educated at the expense of the state. Besides the ordinary branches, instruction is given in industrial pursuits. In 1873 there were 5 teachers and 59 pupils. The institution for deaf mutes in Danville, organized in 1823, is open to all persons of this class in the state, without charge for board or tuition. Pupils supported by the

state are expected to remain five years. The average number of pupils in 1873 was 78, instructors 5; number of pupils received since the opening of the institution was 590, of whom 344 were males and 246 females. Provision is made by the state for the education of feeble-minded persons in the institution for this class in Frankfort, which has been in existence since 1860. It is designed for the education of imbecile children, and not as an asylum for hopeless idiots. Those unable to pay may be educated free of charge. The whole number of pupils in 1874 was 104. The state penitentiary in Frankfort, in 1874, had 650 convicts. In 1873 the legislature passed an act vesting the management of each of the charitable institutions of the state, except that for the deaf and dumb, in a board of nine commissioners, who are appointed by the governor and senate, and must be residents of the county where the institution is situated. It was also provided that the asylum for the insane at Lexington should be known as the first Kentucky lunatic asylum, that at Hopkinsville as the second Kentucky lunatic asylum, the institution for the education of feeble-minded children as the third Kentucky lunatic asylum, and the state house of reform for juvenile delinquents at Anchorage as the fourth Kentucky lunatic asylum. The two institutions first named are to be devoted to the treatment of "lunatics afflicted with acute mania," and the other two to cases of "chronic mania or epilepsy."—Under the new school law of 1873, the general educational interests of the state are intrusted to a board of education, comprising the superintendent of public instruction, secretary of state, and attorney general, together with two professional teachers to be elected by them. The more immediate supervision of the schools is vested in the superintendent of public instruction (who is elected by the people for four years, and receives an annual salary of \$3,000), a commissioner of common schools in each county, and a trustee for each school district; only teachers who have obtained certificates are employed. The annual revenue of the common school fund comprises the interest at the rate of 6 per cent. per annum on the state school bond of \$1,327,000, the dividends on 735 shares of the stock of the bank of Kentucky, the annual tax of 20 cents on each \$100 in value of the property of the state, and certain fines and forfeitures. This income is distributed each year among the counties and districts according to the number of white children between the ages of 6 and 20 years. The amount available in 1873 was nearly \$1,000,000. The *pro rata* amount to each child during the year ending June 30, 1874, was \$1 60, and \$2 20 for the preceding year. The entire income of the school fund is devoted to educating white children. The legislature of 1873-'4 passed an act establishing a system of common school education for colored children, to be under the supervision of the

superintendent of public instruction and the state board of education. The funds for its support are derived chiefly from the annual revenue tax of 25 cents, and 20 cents in addition on each \$100 in value of the taxable property owned or held by colored persons, which tax shall be applied to no other purpose whatever; a capitation tax of \$1 on each male colored person above the age of 21 years; and all the fines, penalties, and forfeitures imposed upon and collected from colored persons due the state, except the amount thereof allowed by law to attorneys for the commonwealth. The act in effect appropriates all taxes levied on colored people or their property to the education of colored children. The total taxable property of the colored people of the state in 1873 was \$3,569,040, and the number of male colored persons over 21 years of age was 45,604. The number of colored children of school age reported to the auditor in 1873 was 41,289. In 1873 the whole number of persons of school age in the state was 416,763, and the number of schools 5,381. The state teachers' association meets annually, and teachers' institutes are held at intervals during the year. According to the census of 1870, the total number of white children in the state between the ages of 5 and 18 years was 454,539, and of colored 78,720. Of the latter, only 7,702 were attending school. There were 5,149 educational institutions, public and private, with an aggregate of 6,346 teachers, of whom 3,972 were males and 2,374 females, and 245,139 pupils, of whom 125,734 were males and 119,405 females. The total income of all these institutions was \$2,538,429, of which \$393,015 was derived from endowment, \$674,992 from taxation and public funds, and \$1,470,422 from tuition and other sources. There were 4,727 public schools, with 5,351 teachers and 218,240 pupils; the income amounted to \$1,150,451, of which \$24,885 was from endowment, \$604,905 from taxation and public funds, and \$520,661 from tuition and other sources. The number of colleges was 42, having 223 teachers and 5,864 pupils; and there were 95 academies, with 286 teachers and 6,224 pupils, and 195 private schools, with 302 teachers and 7,948 pupils. Kentucky has (1874) no state normal school, but efforts have been made for the establishment of one. Normal instruction, however, is afforded by several colleges. The Kentucky university, established in 1858, embraces a college of arts, the agricultural and mechanical college, the college of the Bible, a commercial college, and a college of law. Each college is under the immediate government of its own faculty and presiding officer. The general supervision of the university is committed to the regent, who is chosen from the curators. In 1865 the agricultural and mechanical college, established by means of the congressional land grant, was made a part of the university, and the citizens of Lexington having given \$100,000 for the purchase of an experimental and model farm

and the erection of buildings for the agricultural college, the university was removed to that city. The tract of land occupied by the agricultural college contains 433 acres, and embraces Ashland, once the home of Henry Clay. The endowment and real estate of the university amount to about \$800,000. Students are employed in industrial pursuits at a good rate of compensation. The Kentucky military institute in Frankfort, organized in 1846, is under the direction of a board of visitors appointed by the governor. Among the most prominent educational institutions are Berea college, at Berea, at which students are received without regard to sex or color; Bethel college (Baptist), at Russellville; Cecilian college (Roman Catholic), at Elizabethtown; Centre college (Presbyterian), at Danville; Eminence college, at Eminence, open to both sexes; Georgetown college (Baptist), at Georgetown; and St. Mary's college (Roman Catholic), at St. Mary's Station. The leading institutions for the education of women are Daughters' college (Christian), at Harrodsburg; Georgetown female seminary (Baptist); Lebanon female college; Logan female college (Methodist Episcopal), at Russellville; Hocker female college (Christian); Lexington Baptist female college, St. Catherine's academy (Roman Catholic), and Christchurch seminary (Episcopal), at Lexington. Instruction in theology is afforded by St. Joseph's seminary (Roman Catholic), at Bardstown, Western Baptist theological institute at Georgetown, college of the Bible, Kentucky university, and the theological departments of Georgetown and Bethel college; in medicine, by the medical department of the university of Louisville and by the Louisville medical college.—According to the census of 1870, there were 89 newspapers and periodicals published in the state, having an aggregate circulation of 197,130, and issuing 18,270,160 copies annually. There were 6 daily, with a circulation of 31,000; 4 tri-weekly, circulation 3,500; 4 semi-weekly, circulation, 4,100; 68 weekly, circulation 137,930; and 7 monthly, with a circulation of 19,700. In 1873 the publications were 9 daily, 6 of which issued also weekly editions, 1 tri-weekly, 4 semi-weekly, 80 weekly, and 9 monthly. The total number of libraries in 1870 was 5,546, containing 1,909,230 volumes; 4,374, with 1,590,245 volumes, were private, and 1,172, with 318,985 volumes, were other than private, including two state libraries, with 9,200 volumes; 10 town, city, &c., with 13,436; 218 court and law, with 61,590; 18 school, college, &c., with 20,675; 717 Sunday school, with 160,377; and 207 church, with 53,707. The principal libraries in 1874 were that of the Kentucky university at Lexington, which had 10,000 volumes; the Lexington library company's, 18,300; the state library in Frankfort, 7,000; Danville theological seminary, 7,000; public library of Kentucky, at Louisville, 31,250; St. Joseph's college and seminary in Bardstown, 5,000; Centre college

in Danville, 5,000; Georgetown college, 5,000; Episcopal theological library 2,000; and Louisville library association, 5,690. The museum of natural history of Kentucky university contains more than 40,000 specimens, and the museum attached to the public library of Kentucky contains over 100,000, which, however, are only partially classified. The total number of religious organizations was 2,969, having 2,696 edifices, with 878,039 sittings, and property valued at \$9,824,465. The leading denominations were as follows:

DENOMINATIONS.	Organizations.	Edifices.	Sittings.	Property.

—The earliest exploration of Kentucky was made by John Finley and a few companions from North Carolina in 1767. In 1769 Daniel Boone, Finley, and four others visited the region, and in 1770 Col. James Knox, with a party from S. W. Virginia, explored the country along the Cumberland and Green rivers. In 1773-4 a party locating bounty warrants extended their surveys to the north fork of the Licking, up the Kentucky as far as Dix river, and over a considerable territory near the falls. In 1774 James Harrod built a log cabin on the present site of Harrodsburg, and the next year he established a station there. The fort at Boonesborough was built by Daniel Boone in 1775. The country of Kan-tuck-kee, “the dark and bloody ground,” was not occupied by the aborigines except as a common hunting ground for the tribes north and south of it. The intrusion of white settlements met with determined and bloody opposition. In March, 1775, Boone concluded a treaty with the Cherokees at Wataga, by which Kentucky was sold to Col. Richard Henderson and his company. As it lay within the charter limits of Virginia, that state would not recognize Henderson’s purchase, but finally compromised by giving him 200,000 acres at the mouth of Green river. In 1776 Kentucky was made a county of Virginia, and in 1777 the first court was held at Harrodsburg. In 1779 the Virginia legislature passed a law which caused a great influx of population. In 1783 Kentucky was formed into one district, and a district court established. The conclusion of the war of independence left the settlers in constant danger of Indian outrage, and the citizens found themselves obliged to undertake their own protection. Richmond, Va., the

capital, was too far distant to be relied on for assistance in times of need, and hence the conventions held at Danville in 1784-’5 recommended a peaceable and constitutional separation from Virginia. The third convention sent a petition to Richmond, and in 1786 an act was passed by the legislature complying with the desires of Kentucky; but from several causes the separation was not then completed, chiefly from an inclination of the people to obtain an independent nationality. A fourth convention only served to inflame the people against the central government; and a report having gained currency that Mr. Jay, when minister to Spain, had ceded the navigation of the Mississippi to that country, the utmost ill feeling was aroused. A fifth convention met, and on petition Virginia allowed the Kentuckians to send a delegate to congress; but the constitution having in the mean while been adopted, the whole subject was referred to the new government. Taking advantage of this position of affairs, Spain clandestinely proposed through her minister peculiar commercial favors to Kentucky in case of her forming an independent government. These propositions met with some favor; but after a sixth and a seventh convention were assembled, an address to congress was ultimately voted. Two more conventions were subsequently held, and the question was determined by Kentucky becoming in 1790 a separate territory, and its admission into the Union on June 1, 1792. The population at this time was about 75,000. Indian wars continued to disturb the frontiers, and complaints of the inefficiency of the federal government were again heard. The whisky tax also became oppressive, and the American policy toward the French republic was denounced in every cabin. The old idea of independence was again mooted, but the storm passed over. In the 10 or 12 years which succeeded, and which included the period of negotiation for the navigation of the Mississippi, and then for the purchase of Louisiana, Kentucky was again agitated. The treaty of 1795 with Spain gave to the United States the right of deposit at New Orleans and the freedom of the river. Pending the negotiations the governor of Louisiana had approached some leading Kentuckians with a view to a different treaty; but action on these promises was stayed by federal interference, and the faithlessness of the Spaniards soon became evident. Seven years now passed in comparative quiet and prosperity, when the whole nation became excited by the intelligence that the Spaniards had violated the treaty of 1795 by a denial of the rights secured by its provisions, and it became known that even Louisiana had been retroceded to France. Its subsequent purchase by the United States put an end to all pending troubles. In the war of 1812 Kentucky took an active part. Upward of 5,000 volunteers were called into active service, and at one time more than

7,000 Kentuckians are said to have been in the field. After the treaty of 1814 Kentucky was undisturbed by any stirring events. The progress of the state, however, was rapid, and the development of agriculture and other branches of industry within her borders signally well sustained. The second constitution took effect in 1800, and continued in force until the adoption of the present one in 1850. At the beginning of the civil war, Kentucky, favoring an amicable adjustment of the difficulties between the north and the south, assumed a position of neutrality, and determined to resist the invasion of the state by either the federal or the confederate forces. At the presidential election in 1860, 66,058 votes had been cast for Bell, 53,143 for Breckenridge, 25,651 for Douglas, and 1,364 for Lincoln. In February, 1861, the legislature, refusing to call a state convention to consider the subject of secession, passed resolutions appealing to the southern states to stop the revolution, protesting against federal coercion, and favoring the calling of a national convention for proposing amendments to the constitution of the United States. The requisition upon Kentucky for volunteers, made by the secretary of war immediately after the attack on Fort Sumter, was met by a refusal on the part of Governor Magoffin to furnish any troops. However, Lieut. William Nelson of the navy, a native of the state, began to recruit volunteers for the national service, and toward the end of July established a camp of organization in Garrard co., which he called Camp Dick Robinson. Volunteers rapidly assembled, and by the end of September three full regiments of infantry and one of cavalry were ready for service, besides one full regiment of refugees from East Tennessee, and one nearly full. Recruiting for the national service was carried on during the same time at other points. Governor Magoffin protested against this, and urged the general government to withdraw these forces from the state. President Lincoln refused to do so, on the ground that he "did not believe it was the popular wish of Kentucky that this force should be removed beyond her limits." At elections held in May and June it was shown that a great majority of the people were in favor of the Union. Early in September the state was invaded by a strong confederate force from Tennessee, under Gen. Polk, who occupied and fortified Hickman and Columbus, important points on the Mississippi river. About the same time a confederate force under Gen. Zollicoffer advanced from Tennessee into southeastern Kentucky, and Bowling Green was occupied by a large body of confederate troops under command of Gen. Buckner. Federal forces also began to concentrate at several points in large numbers. Gen. Robert Anderson was appointed to the command of this department, but was soon succeeded by Gen. Sherman, upon whose resignation Gen. Buell assumed command. During the latter part of 1861 there were numerous

skirmishes and unimportant engagements between the opposing forces in the state. In November 200 persons, not elected by any constituency, but coming from 51 counties of the state, assembled in convention at Russellville, then within the confederate lines, and organized a provisional government consisting of a governor, legislative council of ten, a treasurer, and auditor. George W. Johnson was chosen for governor. He was subsequently killed at the battle of Shiloh, and Richard Hawes was chosen in his place. In January, 1862, Gen. Buell, having concentrated a large army at Louisville, sent a division under Gen. George H. Thomas to attack the confederate force in southeastern Kentucky, which had been reinforced by the division under Gen. Crittenden. In the battle of Mill Spring (Jan. 19) which ensued, the confederate forces were defeated, and Gen. Zollicoffer was killed. At the same time a large force was concentrated at Paducah, Cairo, Ill., and St. Louis, Mo., under command of Gen. Halleck, for operations in Kentucky and Tennessee. After the success of the expedition under Gen. Grant against Forts Henry and Donelson in February, the confederate forces abandoned Bowling Green and Columbus and withdrew from the state. Governor Magoffin resigned in August, and was succeeded by James F. Robinson, speaker of the senate. In September Gen. Bragg at the head of a large confederate force invaded the state from East Tennessee, and advanced rapidly toward Louisville, to which place the governor and legislature retired with the state archives. By forced marches Gen. Buell succeeded in getting between Louisville and Bragg's army, and on Oct. 8 a battle was fought at Perryville, Boyle co., with heavy loss on both sides. Bragg then withdrew his forces from the state, having meanwhile occupied Frankfort and all the country north of the Kentucky river, apparently threatening Cincinnati. Steps had been taken for inaugurating the provisional confederate state government at the capital, but the ceremonies were interrupted by the advance of the Union troops, and that organization disappeared. The state continued to be disturbed by raids, and martial law was declared by President Lincoln, July 5, 1864. The civil authority was restored by President Johnson on Oct. 18, 1865. In 1869 and in 1870 the legislature refused by a large majority to ratify the 15th amendment to the federal constitution.

KENTUCKY, a river of the state of the same name, rising in the Cumberland mountains on the S. E. frontier. Its principal feeders are the North, Middle, and South forks, which unite in Lee co., near the village of Proctor. The stream then takes a N. W. direction to the S. boundary of Fayette co., where it turns S. W. After keeping on this course for 15 or 20 m. it resumes its former direction, and preserves it until it enters the Ohio in Carroll co. Its length from the junction of its head streams

to its mouth is 260 m., but the distance in a straight line between these two points is only 108 m. The scenery on the banks is famous for its romantic beauty. For a great part of its course the river flows between perpendicular limestone rocks, through which it appears to have gradually worn its way. The Kentucky has no large tributaries. It is navigable by means of locks and dams by steamboats 40 m. above Frankfort (62 m. from its mouth), and by flatboats 100 m. higher. Cannel and other kinds of bituminous coal, iron ore, and an excellent variety of marble are found along the banks of the river.

KENYON, John, an English poet, born in the island of Jamaica about 1783, died at Cowes, in the isle of Wight, Dec. 3, 1856. His father was a wealthy planter, and he graduated at Peterhouse college, Cambridge. He cultivated the acquaintance of Coleridge, Southey, and Wordsworth, and in 1815 visited Italy and other parts of the continent of Europe. After his return to England he married Miss Caroline Curteis, whom he addresses as "Nea" in the "Verses written in a Churchyard," and whom he survived many years. His first volume of poetry, entitled "A Rhymer's Plea for Tolerance" (1833), was followed in 1838 by "Poems, for the most part Occasional." His last work was entitled "A Day at Tivoli, with other Verses." He used his large fortune with great generosity, and is said to have left legacies to 80 persons, many of whom were his old literary friends, including B. W. Procter (Barry Cornwall) (£6,000) and Mr. and Mrs. Robert Browning (£10,000).

KENYON, Lloyd, lord, a British jurist, born at Gredington, Flintshire, Oct. 5, 1732, died in Bath in 1802. He was the son of a Welsh squire, and after a very imperfect education at a free grammar school was articled to an attorney at Nantwich in Cheshire. Being disappointed in his expectation of becoming a partner in the business of his master, he went to London, entered the Middle Temple, and in 1756 was called to the bar. He attended the courts at Westminster regularly, and went the North Welsh circuit, but at the expiration of ten years was so little advanced in professional repute that he was desirous of taking orders. At this juncture Dunning, who had been his fellow student, and who was now in the enjoyment of a lucrative practice, employed him, and opinions written by Kenyon, which Dunning never read, were signed by the latter as his own. As it gradually became known that Dunning's opinions were prepared by Kenyon, the attorneys began to employ him, and cases soon came to him in large numbers. His rise out of his chamber seclusion was probably in consequence of some useful observations which he made as *amicus curiæ* in the presence of Lord Thurlow, then attorney general, who thereafter promoted his advancement in various ways. To this powerful friend he owed his appointment to the chief justiceship of

Chester. The sneers of Kenyon's rivals at this appointment incited his patron to push his fortunes still further. In 1782 he was made attorney general, and two years after master of the rolls. Finally, on the retirement of Lord Mansfield, he was made by Pitt chief justice of the king's bench, with the title of Lord Kenyon, baron of Gredington. This appointment, which he held until his death, was not popular with the bar, and during his whole judicial career he was disliked for his overbearing disposition, and his irritating and even insolent manners. On the other hand, he was in high favor with the public on account of the rigid impartiality of his decisions. He was deeply learned in the law, and successfully resisted Lord Mansfield's attempts to bring about a fusion of law and equity. He accumulated by his professional labors a fortune of £300,000. His memoirs are contained in Lord Campbell's "Lives of the Chief Justices." A new life, by his grandson, George J. Kenyon, the design of which is to free the character of Lord Kenyon from the alleged injustice of Lord Campbell, has been published (London, 1873).

KENYON COLLEGE. See GAMBIER.

KEOKUK, a S. E. county of Iowa, drained by Skunk river; area, 576 sq. m.; pop. in 1870, 19,434. The surface consists partly of prairie, interspersed with groves of timber, and the soil is generally fertile. The Sigourney branch of the Chicago, Rock Island, and Pacific railroad terminates at the county seat. The chief productions in 1870 were 342,876 bushels of wheat, 1,297,459 of Indian corn, 236,410 of oats, 97,943 of potatoes, 91,713 lbs. of wool, 517,665 of butter, and 35,833 tons of hay. There were 11,253 horses, 21,458 cattle, 27,551 sheep, and 32,225 swine, 11 carriage factories, 2 woollen factories, 3 flour mills, and 9 saw mills. Capital, Sigourney.

KEOKUK, a city of Lee co., Iowa, situated in the S. E. corner of the state, at the foot of the lower or Des Moines rapids of the Mississippi, here crossed by a railroad and wagon bridge, and 2 m. above the mouth of the Des Moines, 205 m. above St. Louis, and 135 m. S. E. of Des Moines; pop. in 1850, 2,478; in 1860, 8,136; in 1870, 12,766. It is built partly at the foot and partly on the summit of a bluff 150 ft. high, which contains excellent limestone, and has broad regular streets with many handsome houses. It is the terminus of the Des Moines Valley railroad; and the Toledo, Wabash, and Western, the Toledo, Peoria, and Warsaw, the Chicago, Burlington, and Quincy, the Mississippi Valley and Western, and the Missouri, Iowa, and Nebraska railroads also centre here. The Keokuk and Kansas City and Keokuk and Mt. Pleasant railroads are in course of construction. The rapids in the Mississippi, extending 12 m. with a fall of 24 ft., render Keokuk the natural head of navigation for steamers of the largest class, and furnish abundant water power. The United States is now constructing a canal around them. The city was made

a port of delivery in 1854, and has an important trade. The business of pork packing is carried on to some extent, and there are flouring mills, iron founderies, &c., three banks with an aggregate capital of \$400,000, and a savings bank. The college of physicians and surgeons, established in 1849, in 1872 had 10 professors and instructors and 105 students. The Keokuk library association possesses 7,000 volumes. The public schools, including a high school, are well organized and largely attended. There are two daily and three weekly (one German) newspapers, and 17 churches.

KEPLER, Johann, a German astronomer, born at Magstatt, near Weil, Württemberg, Dec. 27, 1571, died in Ratisbon, Nov. 15, 1630. He was a sickly child, and during his whole life suffered periodically from fevers and other ailments. His father, a man of noble origin and at one time a soldier in the Netherlands under the duke of Alva, having been reduced by the loss of his property to the condition of an innkeeper, young Kepler was during a portion of his childhood employed by him in a menial capacity. In 1586 he entered the monastic school of Maulbronn, whence he was transferred to the university of Tübingen, where in 1591 he took his degree of master. Subsequently he devoted himself to the study of astronomy under Möstlin, a disciple of Copernicus, and in 1594 was called to the professorship of mathematics in the university of Gratz in Styria. Here in the same year appeared his first publication, an almanac for 1595, followed in 1596 by his "Cosmographical Mystery," containing a fanciful theory regulating the order of the heavenly bodies. In 1597 he married a young widow named Barbara Muller von Mulech, and soon after, in consequence of domestic dissensions, and of religious troubles which threatened the safety of the Protestant professors in Gratz, of whom he was one, he accepted Tycho Brahe's invitation to go to Prague and assist him in the preparation of a new set of astronomical tables. The work was done by order of the emperor Rudolph II., who intended to substitute tables having his own name for those calculated on the Ptolemaic and Copernican systems. Tycho shortly afterward died, and Kepler succeeded him as principal mathematician. He was thenceforth constantly involved in pecuniary difficulties, in consequence of the inability or neglect of the emperor to pay him the full amount of his salary. For this reason he was obliged to eke out a subsistence by casting nativities and writing popular almanacs. In his "Principles of Astrology" (1602) he describes the power of certain harmonious configurations of suitable planets to control human impulses. In his day such a belief was regarded as in accordance with just conceptions of the attributes of the planets, and Kepler's most profitable employment at this time was drawing the horoscopes of the princes. In his optical treatise, "A Supplement to Vitellio," published in 1604 at

Prague, although unable to discover the precise law of refraction, he was nevertheless singularly successful in his inquiries respecting vision, and in analyzing the structure of the eye. In this work he also described the mode of calculating eclipses which obtains at the present day. In his subsequent work on optics, entitled "Dioptrics" (Augsburg, 1611; reprinted in London, 1653), which, according to Sir David Brewster, "laid the foundation of the science," he explained the method of tracing the progress of rays through transparent bodies with convex and concave surfaces, and of determining the foci of lenses, and of the relative positions of the images which they form and the objects from which the rays proceed. Hence he was led to describe the astronomical telescope, having two convex lenses, by which objects are seen inverted. These discoveries, however, are obscured by the greatness of those announced in his "New Astronomy, or Commentaries on the Motions of Mars" (Prague, 1609), which were founded on the astronomical data prepared by Tycho. After many fruitless attempts to represent the orbit of Mars by combinations of uniform circular motion (that is, by epicyclic curves), he discovered, by comparing together seven oppositions of that planet, that its orbit is elliptical, whence he concluded that the orbit of each planet is an ellipse, with the sun placed in one of its foci. Having next ascertained the dimensions of the orbit of Mars, he found that the radius vector, or line joining the planet and the sun, described equal areas in equal times, and that the same was true of the other planets. These results constitute the first two of the three great laws of planetary motion known as Kepler's laws, the third of which was discovered nine years later. The labor and patience with which Kepler conducted these investigations will be best appreciated when it is considered that the calculations were made without the assistance of logarithms, which were a later invention, and that each calculation of an opposition of Mars, filling 10 folio pages, was repeated 10 times, so that 7 oppositions produced a folio volume of 700 pages. In view of such difficulties, the remark of Prof. Playfair is particularly pertinent, "that the discoveries of Kepler were secrets extorted from nature by the most profound and laborious research." Notwithstanding the reputation which these brilliant discoveries gained for him, his worldly circumstances showed no signs of improvement. Not only did his arrears of salary remain unpaid, but the emperor Rudolph refused to allow him to accept the professorship of mathematics at Linz; and to add to his embarrassments, his wife died and his children were attacked by the smallpox, which proved fatal to the eldest. At this time also Prague was occupied by Austrian troops, and the plague devastated the city. Upon the accession of the emperor Matthias, in 1612, he was allowed to accept the professorship at Linz, and three years later he

was married for the second time, chiefly for the sake of his children. It has been well remarked by Sir David Brewster, that the narrative of Kepler's search for a wife "is one of the most curious chapters in his history. No fewer than eleven ladies were presented to his choice," his patient scrutiny of their respective claims being comparable with his analysis and successive rejection of the epicyclic theories of Mars. In a jocular letter to Baron Strahlendorf he describes their various characters, and the negotiations preceding his marriage. During the preparations for the wedding, his wine-merchant having incorrectly measured the contents of the wine-casks, Kepler investigated the matter and produced his work on gauging; the first in which the modern analysis is employed. About the same time he presented to the diet at Ratisbon his views on the reformation of the calendar, the substance of which he published in a short essay. In 1616 appeared his *Ephemerides* 1617-1620, the expense attending the preparation of which he confessed he had been obliged to defray "by composing a vile, prophesying almanac, which is scarcely more respectable than begging, unless from its saving the emperor's credit, who abandons me entirely, and would suffer me to perish from hunger." He nevertheless declined an invitation to fill the mathematical chair in Bologna, preferring poverty and the limited degree of freedom of speech and opinion he enjoyed in Germany, to the prospect of bettering his fortune in Italy. Between 1618 and 1622 appeared the seven books of his "Epitome of the Copernican Astronomy," which was placed by the inquisition on the list of prohibited books; and in 1619 he published his "Harmonies of the World," dedicated to James I. of England, which is memorable in the history of science as containing the third of his celebrated laws, viz.: that the squares of the periodic times of the planets are proportional to the cubes of their mean distances from the sun. Such was the transport with which this discovery, which for 17 years had baffled all his skill and patience, filled him, that he marked the day and year, May 15, 1618, when it became known to him; and, speaking of the book which promulgated it, he said: "It may well wait a century for a reader, as God has waited 6,000 years for an observer." The accession in 1619 of the emperor Ferdinand II., who promised to pay the arrears of his salary, and to furnish the means of publishing the Rudolphine tables, seemed to open a more favorable era for the prosecution of Kepler's scientific labors; but such were the drains upon the imperial treasury caused by the religious wars which then began to convulse Germany, that it was not until several years afterward that he was enabled to collect even a part of the sums promised him. In 1620 he was strongly urged by Sir Henry Wotton, the English ambassador at Venice, to take up his residence in England,

but declined the offer. Finally in 1627, after more than a quarter of a century's delay and amid difficulties of all kinds, the Rudolphine tables were published in Ulm. They were the first ever calculated on the theory of the ellipticity of the planetary orbits, and are so remarkable a monument of patience and industry, that had Kepler done nothing more than compute them, he would be regarded as one of the benefactors of science. In 1629, for the sake of avoiding the religious dissensions which distracted Linz, at the invitation of Wallenstein, he removed with his family to Sagan in Silesia, and soon afterward secured a professorship in the university of Rostock. In the following year he went to Ratisbon, and made a final but fruitless effort to obtain from the imperial assembly his arrears, which now amounted to 8,000 crowns. The vexation which this occasioned, combined with fatigue of mind and body, brought on a fever which proved fatal. His remains were interred in St. Peter's churchyard, Ratisbon, and in 1803 a monumental temple to his memory was erected on the spot by the prince bishop of Constance. The following epitaph, composed by himself, was engraved on his tombstone:

Mensus eram cœlos, nunc terræ metior umbras:
Mens cœlestis erat, corporis umbra jacet.

—The ardor and patience with which Kepler pursued science have found few parallels among modern philosophers. Ever prone to indulge in fanciful theories, he never lost sight of the precise object of his search, and ingeniously renounced any hypothesis that he could not reconcile with his advancing knowledge of phenomena. Of his manifold attempts in various branches of science Delambre says: "Those which have failed seem to us only fanciful, while those which have been more fortunate appear sublime." The history of science presents no discoveries more original, or which were deduced with so little assistance from the speculations of preceding philosophers, as his three celebrated laws, from which the discoveries of Newton subsequently sprung, thus completing the great chain of truths which constitute the laws of the planetary system. He computed correctly the transit of Mercury on Nov. 7, 1631 (observed by Gassendi), and announced a transit of Venus in the same year, which was not observed, as it occurred during the night. (Sir David Brewster is mistaken in asserting that "the transit did not take place.") The transit of Venus in 1639 Kepler failed to announce, but that of 1761 he predicted. It is a sufficient evidence of his industry as an author that between 1594 and 1630 he published 33 works, besides leaving 22 volumes of manuscripts, 7 of which contain his epistolary correspondence. The latter was published in 1 vol. fol. in 1718, by Gottlieb Hansch; but the enterprise proving unsuccessful, he was obliged to part with the remaining volumes, which are now in the possession of the imperial

library of sciences in St. Petersburg. A complete edition of the works of Kepler, including all his unedited manuscripts, was published at Frankfort (8 vols., 1858-'70.)

KEPPEL. I. Augustus, viscount, an English admiral, son of the second earl of Albemarle (a title conferred in 1695 on Arnold Joost van Keppel, lord of Voorst, a Dutch general who accompanied William of Orange to England in 1688), born April 2, 1725, died in Suffolk, Oct. 2, 1786. He entered the navy in 1740 under the auspices of Lord Anson, with whom he circumnavigated the globe. In 1744 he became a post captain, and for many years rendered important services as commander of single ships or of squadrons, being almost uniformly successful in the expeditions he undertook. In 1762 he was made rear admiral of the blue; and in July, 1778, being then admiral of the red, and in command of a large fleet of ships of the line, he had an indecisive conflict with the French squadron under D'Orvilliers off Ushant. The British fleet having hauled off to repair damages, a signal was given by the admiral to renew the battle; but the failure of Sir Hugh Palliser, who commanded the rear, to obey it, enabled the French to escape. Palliser subsequently brought articles of accusation against Keppel, which upon investigation by a court martial were declared unfounded, while the conduct of Keppel was approved. He was subsequently at different times first lord of the admiralty, and in April, 1782, was created Viscount Keppel of Elvedon in Suffolk, having for many years previous been a member of the house of commons. **II. George Thomas**, sixth earl of Albemarle, born June 13, 1799, succeeding his brother, the fifth earl, in 1851. He entered the army, and was at the battle of Waterloo. In 1846 he became one of the secretaries of Lord John Russell, and sat in the house of commons, in the interest of the liberal party, from 1832 to 1835, and again from 1847 to 1851. He has written "Journey from India to England" (2 vols., 1827), "Journey across the Balkan" (2 vols., 1831), and "Memoirs of the Marquess of Rockingham" (1852). **III. Sir Henry**, an admiral, brother of the preceding, born June 14, 1809. He entered the navy at an early age, and was made lieutenant in 1829 and commander in 1833. He commanded one of the vessels of the expedition against China in 1842, and assisted Sir James Brooke in Borneo. He commanded a division of boats at the destruction of the Chinese war fleet in the Fatshan creek, June 1, 1857, for which service he was made a K. C. B. In May, 1860, he was appointed to the Cape of Good Hope as naval commander-in-chief, and was subsequently transferred to the Brazilian station. In 1867 he went to the China and Japan station as vice admiral and commander-in-chief. In 1869 he returned to England on attaining the rank of full admiral, and in the following year he was made D. C. L. of Oxford. He has written "The Expedition to Borneo of H. M. S. Dido"

(2 vols., 1847), and "A Visit to the Indian Archipelago in H. M. S. Mæander" (2 vols., 1853), both of which contain extracts from Brooke's diary.—His brother, the Rev. THOMAS ROBERT KEPPEL (born 1817, died 1863), wrote the "Life of Admiral Keppel" (2 vols., 1842).

KÉRATRY. I. Auguste Hilarion de, a French statesman and author, born in Rennes, Oct. 28, 1769, died in November, 1859. He inherited the title of count, but never used it, and though sympathizing with the revolution was twice arrested. He became a deputy in 1818, and again in 1822 and 1827, and warmly supported liberal measures, publishing vigorous pamphlets against the restoration of the censorship; and he was one of the principal promoters of the overthrow of Charles X. and of the accession of Louis Philippe, who made him a peer in 1837. In 1849 he was once more chosen to the legislative assembly, where he exasperated the radicals by his opening address as the oldest member. He strenuously opposed Louis Napoleon, and was among those who were arrested Dec. 2, 1851, but was soon released. His principal works are: *Inductions morales et philosophiques* (Paris, 1817); *Du beau dans les arts d'imitation* (3 vols., 1822); *Les derniers des Beaumanoir, ou la tour d'Helwin*, a romance (4 vols., 1824); *Du culte, &c.* (1825); *Frédéric Styndall*, a novel (5 vols., 1827); *Saphira, ou Paris et Rome sous l'empire* (3 vols., 1835); and *Une fin de siècle, ou Huit ans* (2 vols., 1840). **II. Emile de**, count, a French politician, son of the preceding, born in Paris, March 20, 1832. He served in Algeria, the Crimea, and Mexico, and retired from the army in 1866. In 1869-'70 he was prominent in the corps législatif as an active opponent of Napoleon, though he approved of the war against Prussia. Subsequently he was successively prefect of police, general under Gambetta for the organization of recruits, and prefect at Toulouse and Marseilles; but his quarrelsome disposition involved him in difficulties almost everywhere. He has published plays and miscellaneous writings, several relating to the Mexican expedition, and has been often connected with periodical literature, and lately with the newspaper *Le Soir*.

KERGUÉLEN, or **Desolation Island**, an uninhabited island of the Indian ocean, in about lat. 49° S., lon. 70° E., about 100 m. long and 50 m. wide. It contains many bays and inlets, the most important being Christmas harbor, shaped like a horseshoe and with steep rocks rising in a series of terraces to a height of 1,000 ft. This harbor is at the N. extremity of the island, where the soil is entirely volcanic, and the mountains toward the N. E. and S. W. are from 500 to 2,500 ft. high. Sea fowl abound, but seals, once numerous, have disappeared, and there are no land animals. There is scarcely any vegetation. The British exploring vessel Challenger endeavored in vain to effect a landing here in 1874. Kerguelen was selected in that year as one of the Ameri-

can and British stations for the observation of the transit of Venus.

KERGUELEN-TRÉMAREC, *Yves Joseph de*, a French navigator, born in Brittany in 1745, died in March, 1797. He early entered the navy, became a lieutenant in 1767, and received command of a frigate sent to protect the fisheries on the coasts of Iceland. Going to Norway for provisions, he sailed N., crossing the parallel of 69° on Aug. 17. In 1769 he had a like commission, and on his return related his adventures to Louis XV. In 1771 he was sent on a southern exploring expedition, and the following year discovered an antarctic territory which he called Kerguelen land. He revisited it in 1774, but was unable because of storms to explore it thoroughly, and on his return home he was accused of misconduct and imprisoned. He was soon released, and afterward served against England. He published accounts of his voyages.

KERMAN, or **Kirman**. **I.** A province of Persia, the ancient Carmania, bounded N. by Khorasan, E. and S. E. by Afghanistan and Beloochistan, S. by the Persian gulf, and S. W. and W. by Laristan and Farsistan; area, 75,730 sq. m.; pop. about 300,000. It is intersected from E. to W. by a mountain chain called Jebel Abad. N. of this chain the country, with the exception of the district of Nurmanshir, is a barren wilderness; S. of it, generally an alpine region of alternate hill and vale. The valleys and some of the plains are fertile, and yield crops of oats, maize, and barley. The white rose is extensively cultivated for its attar, and the mulberry tree for the breeding of silkworms. The chief manufactures are woollen cloths, carpets, goats' and camels' hair shawls, coarse linens, and matchlocks. The most important minerals are iron, copper, and sulphur. The inhabitants of the coast are mostly engaged in fishing, but the pearl fishery, which once employed a considerable portion of them, is no longer prosecuted. **II.** A city, capital of the province, 345 m. S. E. of Ispahan; pop. about 30,000. It is surrounded by a wall of earth, and has a citadel in which the governor of the province resides. Its bazaars are large and well furnished. It was once the great centre of trade between the Persian gulf and the inland regions; but since the rise of Bushire it has declined. In 1794 it was taken and pillaged by Asa Mohammed Khan, great numbers of its inhabitants being massacred, and 30,000 enslaved by the captors.

KERMANSHAH, a town of Persia, capital of a district of the same name in the province of Irak-Ajemi, on the S. W. declivity of a mountain range, 80 m. W. S. W. of Hamadan; pop. about 25,000. It is situated at the edge of a fine plain watered by three considerable streams, which on their junction further south take the name of Kerkha or Kara-su, and discharge into the Shat-el-Arab, N. of Bassorah. It is surrounded by an earthen wall nearly 3 m. in circumference, and is said to be a flourishing

town. In the neighborhood are the rock inscriptions of Behistun. (See **CUNEIFORM INSCRIPTIONS**.) The celebrated Persian carpets are manufactured here.

KERMES INSECT. See **COCHINEAL**.

KERMES MINERAL, a compound of the tersulphide with the teroxide of antimony. The secret of its preparation was purchased in 1720 by the French government and made public. It is prepared either in the dry or wet way by treating the tersulphuret of antimony with carbonated soda or potash. The official process is to boil 1 oz. troy of the pulverized sulphuret of antimony with 23 oz. troy of carbonate of sodium in 16 pints of water for an hour, and after filtering to allow the liquor to cool slowly in an earthen vessel. The kermes subsides in 24 hours. It is then collected on a filter, washed with boiled water, and dried without heat. It is a purplish brown, tasteless powder. Kermes mineral, as containing more oxide, is a more active drug than the precipitated sulphuret. It has been used to produce the depressing action of antimony upon the heart, and has consequently been considered antiphlogistic. It is the active ingredient in what is known as James's powder, the *pulvis antimonialis* of the pharmacopœia. Of late years it has been much less employed than formerly.

KERN, a S. county of California; area, 8,000 sq. m.; pop. in 1870, 2,925, including 143 Chinese. It is mostly devoted to grazing. The agricultural and mineral resources are little developed. Some parts are very fertile, but the greater portion is dry and unproductive. It contains the S. terminus of the great valley of California, the junction of the Coast range and Sierra Nevada mountains, and a portion of the desert region E. of the latter. It is watered by several streams, and Kern lake is in the W. part. The chief productions in 1870 were 13,700 bushels of wheat, 3,575 of Indian corn, 26,270 of barley, 6,050 of potatoes, 1,643 tons of hay, and 281,100 lbs. of wool. There were 1,685 horses, 6,373 cattle, 90,200 sheep, and 753 swine; 2 flour mills, 4 saw mills, and 3 quartz mills. Capital, Havilah.

KERNER, *Andreas Justinus*, a German physician, born in Ludwigsburg, Würtemberg, Sept. 18, 1786, died at Weinsberg, Feb. 21, 1862. After completing his school education he served an apprenticeship in a cloth factory. In 1804 he went to the university of Tübingen, where he studied medicine and formed an intimacy with the poet Uhland. After some years of preliminary practice he settled in 1818 in the little village of Weinsberg. Some of his lyrics, for which Schumann has written melodies, have attained a popularity scarcely inferior to those of Uhland. The first volumes of his poems were published in 1826 and 1848; another collection at Stuttgart in 1853, entitled *Der letzte Blütenstrauß*; and another in 1859, entitled *Winterblüthen*. He was a close investigator of the phenomena of animal magnetism and somnambulism, and among

the results of his observations is a remarkable book, *Die Seherin von Prevorst* ("The Seeress of Prevorst," Stuttgart, 1829), translated into English by Catharine Crowe, which produced an immense sensation. He wrote a number of other books on the same subject. His novel *Reiseschatten* is considered his best work in prose. Having been obliged in 1851 to resign his profession from a total loss of sight, he received a pension from the king of Württemberg, and also one from the ex-king Louis I. of Bavaria.

KEROSENE (from Gr. κηρός, wax), a term originally employed as a trade mark for a mixture of certain liquid hydrocarbons used for purposes of illumination. It has been prepared from bituminous coal, bituminous shales, asphaltums, malthas, wood, rosin, fish oil, and candle tar; but it is now almost exclusively obtained from petroleum. It is produced in greater or less quantity during the destructive distillation, at moderate temperatures, of nearly all organic and mineral substances containing carbon and hydrogen. It has been obtained for commercial purposes in enormous quantities from the petroleum of Pennsylvania, Ohio, West Virginia, Rangoon in India, the Caucasus, and other localities, and in less quantities from the cannel coals of England and the United States, the Boghead shale of Scotland, the albertite of New Brunswick, the asphaltum of Trinidad, and common rosin. It has been prepared in small quantities from the malthas of southern California, and from menhaden oil. For the details respecting its preparation from petroleum, see **PETROLEUM PRODUCTS**.—Kerosene consists of a mixture of many hydrocarbons, the whole having the consistence of the essential oils, a burning taste, and aromatic odor. When properly prepared it is nearly colorless by transmitted light, but is slightly opalescent by reflected light. Its density as compared with water should be about .810, or 43° of Baumé's hydrometer. When heated it should not yield inflammable vapors below 110° or 120° F., and should extinguish a lighted match as readily as water at the ordinary temperature of our apartments. As the temperature of this oil in a burning lamp seldom or never exceeds 100° F., it is obvious that such an oil is perfectly safe, as it would never yield any vapor below 110° which, by mingling with the air above the oil in the lamp, could form with it an explosive mixture. Chemically considered, kerosene is a mixture of the less volatile members of the marsh gas series of the hydrides of the alcohol radicals (C_nH_{2n+2}), of a second homologous series isomeric with the first, having higher boiling points, together with members of the ethylene or olefant gas series (C_nH_{2n}).—The manufacture of this product as an article of commerce has developed into enormous proportions. Its unsurpassed qualities as an illuminating agent, together with its cheapness when compared with other substances used for that purpose,

has caused it to penetrate to every region whither its transportation is possible. Like many other of the great industries of the world, it has arisen from repeated and very small beginnings. The extraction of oil from bituminous substances, as shales, coals, asphaltum, &c., is no new discovery. The first announcement that oil might be thus procured is contained in the specification of a patent granted in England in 1694 to Martin Eele, Thomas Hancock, and William Portlock, for "a way to extract and make great quantities of pitch, tar, and oyle out of a sort of stone, of which there is a sufficient found within our dominions of England and Wales." The stone proved to be a bituminous shale; but no practical results appear to have followed the discovery and the patent. In 1716 the Messrs. Betton of Shrewsbury patented a process for extracting oil from the black, pitchy, flinty rock commonly found overlying the coal beds. This must have been the bituminous shales; and their method was to grind them to powder and subject the material to destructive distillation. The product was used only as a medicine, and was noticed as such in 1761 in Lewis's "Materia Medica," under the name of British or petroleum oil, "extracted by distillation from a hard bitumen or a kind of stone coal found in Shropshire and other parts of England." The substance and the method of procuring it received occasional notice in the scientific journals; the earliest paper of much interest containing an account of Dr. Clayton's experiments was published in the "Philosophical Transactions" of January, 1739. But it was about 90 years after this before any decided advance was made in adding to our knowledge of the products of the slow distillation of organic bodies. Those products, however, were known only as oily fluids, possessing no interest except as empirical medicines, when Reichenbach of Moravia undertook to investigate their properties, and extended his researches to the great variety of products of the destructive distillation at both high and low temperatures of organic bodies, of animal as well as vegetable origin. The mixture of the several hydrocarbons, such as constitute the purified coal oils, he called eupione (Gr. εἶ, very, and πῶν, fat). He recognized the superior illuminating quality of these oils, and observed that a cheap method of separating them from the tarry residues was alone required to bring them into extensive use for domestic purposes. The great number of new substances which he thus discovered, together with the promise that several among them might be applied to useful purposes, gave great interest to the accounts of his investigations which appeared in the *Journal für Chemie und Physik* of Schweigger-Seidel, the *Neues Jahrbuch der Chemie und Physik*, and Erdmann's *Journal für praktische Chemie*, for 1830-'31. They attracted the attention of scientific and practical chemists in other parts of Europe, some of whom, in France particu-

larly, were already engaged in the extraction of the oils from bituminous substances, a patent for which had been granted in 1824 to the MM. Chervau. In 1832 Blum and Moneuse patented the application of these oils to illuminating purposes. The latter had a factory near Autun in the department of Saône-et-Loire for treating the bituminous shales of that district; the chemist Laurent was at this time engaged in conducting the operations, and a year or two afterward was succeeded by Selligie. The papers published by these chemists, and especially the specifications of the patents taken out by the latter from 1834 to 1845, published in the *Brevets d'invention*, present full details of the operations, which they had already brought to such a state of perfection that the subsequent improvements introduced consisted merely in comparatively unimportant modifications of the apparatus employed. Up to the year 1861 no treatise upon the subject had appeared at all comparable to that in the specification of the patent of March 19, 1845 (*Brevets d'invention*, new series, iv. 30). Of this an English translation is recorded in the specification of the patent of Du Buisson, No. 10,726 of the English patent office. (See also a paper on the history of this manufacture by F. H. Storer, in the "American Journal of Science," vol. xxx., pp. 121 and 254, 1860.) In this specification Selligie describes first the apparatus employed in the distillation, in one form of which he makes use of superheated steam. The products of the distillation are then enumerated, which were as follows: 1, a very limpid whitish volatile oil, almost without odor, useful as a solvent or for illumination in suitable lamps, and sometimes known as naphtha; 2, a straw-colored oil, somewhat volatile, of specific gravity 0.84 to 0.87, almost odorless, and suitable for burning in lamps in which the oil is kept at the same level, and which are provided with a double current of air, with a chimney, and proper burner; 3, a heavier oil adapted for lubricating machinery; 4, a red coloring matter extracted from the different varieties of the oils; 5, paraffine; 6, a grease for lubricating machinery, being evidently a mixture of paraffine in little oil; 7, a black pitch, the residue of the distillation, suitable for coating wood, metals, &c., for their preservation; 8, an alkaline soap prepared by treating the oil with alkalies; 9, sulphate of ammonia; 10, fertilizing mixtures prepared with the ammoniacal liquors; 11, sulphate of alumina. The crude oil obtained from his retorts, which were like those of the gas works, he treated either before or after its being redistilled with a quantity of acid (sulphuric, muriatic, or nitric), and caused the mixture to be thoroughly agitated. This operation being continued for some time, the tarry matters were partially freed from the oil, and on the mixture being left to repose they subsided with the acid, so that the purified oil could be drawn off from the top, bringing with it but little of the acid.

This was neutralized by addition of an alkali, as the lye of soap boilers, and after the mixture had been well agitated again, more tar and coloring matter subsided, from which the oils were separated by decanting again and redistilling. By a series of fractional distillations the several sorts of light oils were obtained in a pure state.—In 1846 Abraham Gesner made oil from coal in Prince Edward island, and was the first to give it the name kerosene. In England the establishment of the coal-oil manufacture was due to the enterprise of James Young of Glasgow. In 1847 his attention was directed to the extraction of a lubricating oil from petroleum, which exuded from a coal mine in Derbyshire; and having exhausted the supply of this, he next applied to the same purpose the Torbanchill mineral or Boghead cannel, a material which was first ascertained in 1850 to possess an unusual proportion of bitumen, and to be capable of affording large quantities of gas. Mr. Young found it still better adapted for the manufacture of oil, and succeeded so well that in 1854, as he testified in a lawsuit for establishing his patent, his production of oil amounted to about 8,000 gallons a week, which sold for 5s. a gallon. For the year the sales reached about £100,000, a large proportion of which was profit. Such success soon led others to undertake the manufacture, and coal-oil works rapidly increased in England, and were introduced into the United States. The first factory of the kind in this country was that of the kerosene oil company, on Newtown creek, Long Island, opposite the upper part of New York city, which went into operation in June, 1854. It was designed to work the Boghead cannel or other materials of similar character that might be brought to New York from New Brunswick or Nova Scotia, or from the western coal mines; and the operations were to be conducted under the patent of Mr. Young, granted to him in this country as well as in England, for the exclusive use of coal for this manufacture. His claim, however, was not recognized at other works of later date in the United States, and was never enforced. In 1856 the Breckenridge coal-oil works at Cloverport, Ky., on the Ohio river, were producing oil from the cannel coal of the vicinity, which somewhat resembled the Boghead cannel in appearance and in its rich bituminous character; and the same year a factory was built in Perry co., Ohio. The cannel coals of this region proving to be well adapted for this application, several other factories were soon constructed, particularly in the vicinity of Newark, Licking co., Canfield, Mahoning co., and in Coshocton co.; and at the close of the year 1860 the total number in Ohio was probably not less than 25, and there were also many in other states. The processes pursued in the different works were essentially the same. The only distinctions of importance were in the forms of the apparatus, and particularly in the retorts. The common form in

use for some time was that of the gas retort, long cast-iron boxes, with an opening at the end that projected from the furnace in which they were set, and shaped in their section like the letter Ω . Others were made of cylindrical form, were set upright in the furnace, made to be charged at the top and discharged at the bottom, and furnished with exit pipes for the volatile products either at the top or at different heights. Earthenware retorts were substituted in some works for those of cast iron, as in the manufacture of gas. In the use of all of them a loss resulted from the unequal degree in which portions of the charge were heated, a part being rapidly overheated so as to produce gaseous matters, while other parts were acquiring the heat necessary for the generation of the oily products. This defect was however corrected by means of a revolving retort which was invented in France, and which produced a more uniform distribution of heat. Methods of distillation were also in use by which an external fire was dispensed with, and the heat required for the expulsion of the volatile matters was produced by the combustion of a portion of the material, as in the process of making charcoal. Near Wheeling, Va., this plan was in operation, the coal being collected in pits of 100 tons' charge, and covered with earth. Other forms of kiln were in use, but as the process of obtaining kerosene from coal is abandoned, more than the above notice is superfluous. In 1860 the establishments on the Atlantic coast alone produced about 200,000 barrels. At that date, according to the census returns, the total value of all the kerosene produced in the country was estimated at \$2,142,693. The marvellous production of petroleum during the years immediately following led to the abandonment of coal as a crude material. Those establishments then using coal rapidly changed to petroleum refineries, and many new refineries were erected at different points. (See PETROLEUM PRODUCTS.)

KERR, a S. W. county of Texas, watered by Guadalupe and Medina rivers; area, 818 sq. m.; pop. in 1870, 1,042, of whom 90 were colored. The surface is diversified, and much of the soil of superior quality. The chief productions in 1870 were 45,781 bushels of Indian corn, 10,963 lbs. of wool, 19,095 of butter, and 236 tons of hay. There were 486 horses, 2,511 milch cows, 10,128 other cattle, 4,848 sheep, and 2,620 swine. Capital, Kerrville.

KERRY, a S. W. county of Ireland, in the province of Munster, bordering on the Atlantic, the estuary of the Shannon, and the counties Limerick and Cork; area, 1,811 sq. m.; pop. in 1871, 196,014, of whom a considerable proportion speak only the Irish tongue. The coast is much indented with bays and inlets, the principal being Brandon, Valentia, Kenmare, Dingle, Tarbert, and Tralee bays. Numerous small islands lie off the coast. The chief rivers are the Feale, Maine, Laune, and Roughty. Many beautiful lakes are hid-

den among the hills, including the famous lakes of Killarney, the two lakes of Carra, Currane, Derryana, and Lanan, and the Devil's Punch Bowl, near the summit of Mangerton. The surface in the north is open and undulating, in the southwest wild and mountainous. Carn Tual, the highest mountain in Ireland, is 3,414 ft., and several others are 2,000 and 6,000 ft. Minerals have been but partially explored, yet copper, marble, and roofing slate are worked, and lead and iron are known to exist. Agriculture is in a backward condition. The soil is inferior, except in the central lowlands, where it is a rich loam, resting on limestone. The climate is the mildest in Ireland. The fisheries of the Kerry coast are important. The chief towns are Tralee, Killarney, Dingle, Listowel, Caherciveen, and Kenmare.

KERSHAW, a N. county of South Carolina, drained by Wateree river; area, 776 sq. m.; pop. in 1870, 11,754, of whom 7,945 were colored. It has a hilly surface. The soil of the uplands is sandy, but susceptible of profitable cultivation, and the river bottoms are remarkably fertile. The Camden branch of the South Carolina railroad terminates at the county seat. The chief productions in 1870 were 6,389 bushels of wheat, 108,420 of Indian corn, 11,161 of peas and beans, 16,595 of sweet potatoes, 4,161 bales of cotton, and 30,530 lbs. of rice. There were 501 horses, 651 mules and asses, 1,432 milch cows, 2,214 other cattle, 1,247 sheep, and 4,224 swine. Capital, Camden.

KERTCH (anc. *Panticapæum* or *Bosporus*), a city of Russia, in the Crimea, on the strait of its name or of Yenikale, commanding the entrance to the sea of Azov, lat. 45° 20' N., lon. 36° 28' E., 112 m. E. N. E. of Simferopol; pop. in 1867, 19,616. The place as it now stands is of recent date. It is handsomely built of stone, with wide and regular streets. It has been a free port since 1822, and is rapidly growing. The inhabitants are mostly engaged in commerce. The exports are building stone, soap, candles, salt in large quantities, and herring and sturgeon, the produce of the coast fisheries. The government has a foundry and ship yard here. The harbor is good, and is fortified.—*Panticapæum*, the capital of the ancient kingdom of *Bosporus*, was founded by Milesians in the 6th century B. C., and was annexed to Rome by Pompey, 63 B. C. The Huns seized it about 375, and the Genoese in 1280. They were compelled to abandon it by the Turks in 1475. These were displaced by the Russians in 1771, to whom the place was formally ceded in 1792. It surrendered to the allied forces of France and England May 25, 1855, and was restored to Russia by the treaty of Paris, March 30, 1856. Kertch is still called *Bospor* (*Vosfor*) by the inhabitants of the Crimea. In the Italian charts of the middle ages it is called *Pandico* or *Pondico*, as well as *Bospro* or *Vospro*. Foundations of ancient buildings and heaps of brick and pottery are still scattered over the hill of Mithridates, on

which Panticapæum was situated, and at the foot of which Kertch now stands. Among the

the falcons proper, except that the tarsi are longer and the toes less stout. The length is

Kertch.

numerous tumuli in the vicinity, the most extraordinary are those situated at the mountain called by the Tartars Altun-Obo. One of these is 165 ft. in diameter; a vestibule 6 ft. square leads into a tomb 15 ft. long and 14 ft. broad, which formerly contained the bones of a king and queen, golden and silver vases, and other ornaments. Below this tomb is another, and from the two 120 lbs. of gold ornaments are said to have been carried away at the conquest of the place by the allies in 1855. It is supposed that it was erected not later than the 4th century B. C.

KESTREL, a European falcon, of the genus *tinnunculus* (Vieill.), much resembling the

about 14 in., and the extent of wings 28, the female being a little larger than this; the closed wings are about 2 in. shorter than the tail. In the male, the general color above is light grayish blue, the back and wing coverts pale red with triangular dark spots; the tail with a subterminal broad black bar; the lower parts light yellowish red, with long longitudinal dark lines and spots. In the female, the upper parts are light red, with transverse dark bars and spots; the young resemble the female. The kestrel hovers in search of prey at a height of 30 or 40 ft., from which it pounces upon small birds, mice,

moles, reptiles, and sometimes worms and beetles, which it finds in the open fields; from its peculiar manner of hovering, it has received the popular name of wind-hover; it occasionally pursues birds in open flight. When not in search of food, the flight is high, with rapid flaps and occasional sailings. Silent when hovering after prey, it is very noisy in the breeding season; it breeds on cliffs near the sea, in trees in the woods, in ruined buildings or high towers in towns, and in the deserted nests of the crow family; the eggs, three to five, are reddish white, with irregular dots and patches of dull brownish red. This is one of the most common birds of prey in Great Britain, in almost all districts except the interior heaths. When taken from the nest, kestrels may be trained to pursue quails, snipes, larks, and birds of similar size. Their numbers are greatly diminished during winter, and they are said to migrate to northern Africa. Though persecuted by gamekeepers often for the sins of the sparrow hawk, it is of positive benefit to man by destroying great numbers of mice. It is found throughout Europe. There is a smaller kestrel (*T. cenchrus*, Naum.), with longer wings and fewer spots, in eastern and southern Europe. The kestrel swallows small mammals whole, but removes the feathers from its bird prey. There is considerable variation in the plumage.

KESWICK, a market town of Cumberland, England, on the S. bank of the Greta, 22 m. S. S. W. of Carlisle; pop. in 1871, 2,777. It is well built, contains two museums, chiefly of minerals, and has manufactures of linsey-woolsey stuffs, cutlery, and black-lead pencils. Lying within one mile of the foot of Skiddaw and half a mile from Derwentwater, it is much resorted to by tourists, for whose accom-

Kestrel (*Tinnunculus alaudarius*).

American sparrow hawk. This bird (*T. alaudarius*, Briss.) has the form and proportions of

modation there are several hotels. The vale of Keswick is renowned for its picturesque scenery, in respect to which it is surpassed by few spots in England. Greta Hall, formerly the residence of Southey, is near the town.

KETONES, or **Acetones**, a class of bodies composed of an acid radical united with an alcohol radical. Nearly all the ketones now known consist of the radical of a fatty acid combined with one of the corresponding alcohol radicals, their general formula being $C_mH_{2m}+1$ and $C_nH_{2n-1}O$, where m may be either greater or less than n . When $m=0$, the ketone becomes an aldehyde, $H.C_nH_{2n-1}O=C_nH_{2n}O$; the ketones may be therefore regarded as aldehydes in which one atom of hydrogen is replaced by an alcohol radical. Ketones are either simple or compound. In the simple, $m=n-1$, so that their general formula is $C_{n-1}H_{2n-1}O$, $C_nH_{2n-1}O=C_{n-1}H_{2n-2}O$. Acetic or common acetone, or methyle acetyle, where $n=2$, is $CH_3C_2H_3O$. Both the simple ketones are produced by heating the barium or calcium salts of the fatty acids, whereby two atoms of the salt are decomposed in such a manner that the acid radical of one of them is resolved into the next lowest alcohol radical and carbonyle.

KETTLER, Wilhelm Emanuel von, baron, a German prelate, born in Münster, Westphalia, Dec. 25, 1811. After studying law and being engaged in the civil service at Münster for several years, he qualified himself for the priesthood, was ordained June 1, 1844, and became chaplain at Bockum, and in 1846 curate at Hopsten. In 1848, as a member of the Frankfort parliament, he delivered a remarkable speech at the funeral of Lichnowsky and Auerswald, who had been murdered by the mob, Sept. 18, and advocated during the debates on the constitution the independence of the church from the state. In 1849 he was made provost of the Berlin Hedwigskirche, and next year bishop of Mentz. He became known as a most enterprising ultramontanist, founded various institutions and religious orders and communities with the view of controlling education and charitable works, and exerted himself for the protection of Roman Catholic interests in the ecclesiastical province of the Upper Rhine and in Germany generally. With the support of the Roman Catholic grand duchess of Hesse-Darmstadt and the prime minister Dalwigk, he secured, in virtue of a secret convention of Aug. 23, 1854, special prerogatives for his diocese; and although this conven-

tion was subsequently abrogated, he retained these privileges, even after the overthrow of the Dalwigk cabinet in 1871. After having opened an asylum for the Jesuits, and identified himself with the most extreme ultramontane measures, he surprised the world by questioning the expediency of the declaration of papal infallibility, though he sympathized with the principle of the dogma; but as soon as the decrees of the Vatican were passed, he united with other bishops in submitting to them. He was elected in 1871 to the first German Reichstag, and became the ablest ultramontane leader in that assembly. His principal works are: *Das Recht und der Rechtsschutz der Katholischen Kirche in Deutschland* (5th ed., 1854); *Freiheit, Autorität und Kirche* (7th ed., 1862); *Die Arbeiterfrage und das Christenthum* (3d ed., 1864); *Deutschland nach dem Kriege von 1866* (6th ed., 1867); *Die wahren Grundlagen des religiösen Friedens* (3d ed., 1868); *Das allgemeine Concil und seine Bedeutung für unsere Zeit* (5th ed., 1869); and *Die Anschauungen des Cultusministers Herrn Dr. Falk über die Katholische Kirche, nach dessen Rede vom 10. December, 1873* (1874).

KEW, a village and parish of Surrey, England, on the S. bank of the Thames, 7 m. S. W. of St. Paul's, London, famous for the royal botanic gardens, the richest in the world, comprising 75 acres, and open gratuitously to the public daily, including Sunday. They contain a palm house 362 ft. long, 100 ft. wide, and

The Museum at Kew.

64 ft. high, houses for cacti, tanks for the *Victoria regia* water lily, and a most extensive collection of Australian trees and plants. The old palace of Kew was the residence of George III. and his family. The surrounding pleasure grounds cover an extent of 245 acres, tastefully laid out. The observatory is chiefly used as a meteorological station.

KEWAUNEE, an E. county of Wisconsin, bordering on Lake Michigan and drained by Kewaunee and Red rivers; area, 360 sq. m.; pop. in 1870, 10,128. It has a rolling surface and a fertile soil, and is well wooded. The chief productions in 1870 were 120,065 bushels of wheat, 21,123 of rye, 73,554 of oats, 58,866 of potatoes, 20,636 of peas and beans, 124,091 lbs. of butter, and 5,110 tons of hay. There were 842 horses, 2,407 milch cows, 1,940 working oxen, 2,582 other cattle, 1,546 sheep, and 3,865 swine; 3 breweries, 5 flour mills, and 10 saw mills. Capital, Kewaunee.

KEWEENAW, a N. W. county of the upper peninsula of Michigan, occupying the extremity of Keweenaw point, which is surrounded by Lake Superior on all sides except the S. W., and including Isle Royale; area, about 575 sq. m.; pop. in 1870, 4,205. The surface is hilly, and near the centre mountainous. Sandstone underlies a portion of it. It is productive of copper, and mining is the principal occupation of the people. In 1870 there were 6 mines, producing to the value of \$823,447, 6 quartz mills, and a manufactory of explosives and fire-works. In 1872 the yield was 1,836 tons of ore. Capital, Eagle River.

KEWKIANG, or **Kinkiang**, a town of China, in the province of Kiangsi, on the Yangtse, near the N. end of Lake Poyang, 227 m. S. W. of Nanking. It takes its name from the nine rivers which flow from the adjacent mountains. This situation, commanding the trade of Lake Poyang, induced Lord Elgin in 1860 to propose the place as an open port, it being the nearest outlet of the green tea district, of which the export rose in 1868 to 9,000,000 lbs., and of black tea to nearly twice as much. The shipments subsequently declined considerably, and the total exports in 1871 did not exceed the value of \$4,000,000, the imports, however, reaching \$12,000,000. The town suffered greatly from the Taeping rebellion, and was almost entirely destroyed when it was recaptured by the imperial troops; but it soon recovered. The overflow of the Yangtse in several consecutive seasons had filled the place in 1870 with fugitives from inundated districts, and with vagabonds and Mohammedan fanatics, who destroyed missionary chapels, but were put down with the aid of war vessels. The British settlement fronts the river, and the remains of the Chinese town are back of it, with a new temple built by the emperor, containing a memorial of a general who fell in the siege. The American house of Russell and co. maintains here a fine fleet of river steamers, and controls the carrying trade on the Yangtse and on Lake Poyang. The shipping in 1871 comprised 320 American and 92 English steamers, and 23 American and 65 English sailing vessels. Kewkiang is only a subsidiary port of Shanghai, and the navigation is liable to be impeded by low water and sand bars, requiring the transshipment of cargoes at Hukow, 16 m. below Kewkiang, at the mouth of Lake Poyang.

KEY, **Francis Scott**, an American poet, born in Frederick co., Md., Aug. 1, 1779, died in Baltimore, Jan. 11, 1843. He was educated at St. John's college, Annapolis, and commenced the practice of the law in Frederick City. Subsequently he removed to Washington, where he was for many years district attorney of the District of Columbia. As a song writer he is chiefly known by "The Star-Spangled Banner," a popular national lyric, suggested and partially written while the author was detained in the British fleet during the bombardment of Fort McHenry, near Baltimore, of which he was an anxious and interested witness. A collection of his poems was published in New York in 1857. In 1874 James Lick of San Francisco gave \$150,000 for a monument to Key in that city.

KEY, **Thomas Hewitt**, an English scholar and educator, born in Southwark, March 20, 1799. He graduated at Trinity college, Cambridge, in 1821, and for two or three years was engaged in studying medicine in Guy's hospital, London. In 1824 he accepted the professorship of mathematics in the university of Virginia, but, the climate not agreeing with his health, he returned to England in 1827. The next year, on the founding of the university of London, he was elected to the chair of Latin, and held the post for 13 years. He then became head master of the school in the university, and professor of comparative grammar, which positions he still occupies (1874). He has contributed largely to philological literature in the way of reviews, pamphlets, essays, &c.; he had a spicy controversy with Donaldson in regard to the latter's "Varronianus;" and he was engaged for many years on a new and full "Latin-English Lexicon." He has also published a "Latin Grammar" (1843-'6), "Philological Essays" (1868), and "Language, its Origin and Development" (1874).

KEY ISLANDS, or **Ki**, a group of islands in the Indian archipelago, 50 m. W. of the Arroo islands, in lat. 6° S., lon. 133° E. The largest are the Great Keys, with mountains 3,000 ft. high, which are supposed to contain gold. Little Key and other smaller islands are level and fertile. Along the coast is a mixture of races, the Malays predominating. The interior is inhabited by the Haraforas, who are laborious agriculturists. The islands are annually visited by coasting vessels from the Moluccas and other islands for the shipment of tortoise shell, birds' nests, and other products. The Dutch resident at Amboyna occasionally superintends the affairs of the islands, though they are virtually independent. They were explored in 1870 by the Italian navigator Cerrute.

KEYSER, **Nicaise de**, a Belgian painter, born in Sandvliet, province of Antwerp, in 1813. He is the son of a peasant, and was enabled by the generosity of a lady who recognized his talents to pursue his studies at the academy in Antwerp. His first picture was a "Christ on the Cross," painted in 1834, for a Roman

Catholic church in Manchester, England. His works consist chiefly of battle pieces and historical subjects.

KEYS OF FLORIDA. See FLORIDA KEYS.

KEY WEST (Sp. *Cayo Hueso*, Bone Key). **I.** An island forming part of Monroe co., Florida, one of the Florida Keys, 60 m. S. W. of Cape Sable, the S. point of the state; pop. in 1850, 2,367; in 1860, 2,832; in 1870, 5,016, of whom 989 were colored and 2,233 foreigners; in 1874, about 7,000. It is 7 m. long by from 1 to 2 m. wide, and is 11 ft. above the sea. On the S. W. point there is a lighthouse with a fixed light 72 ft. above the water, guiding vessels to the city, and another on the N. W. passage, showing a fixed light, 40 ft. above the water. The island is of coral formation, and has a shallow soil, consisting of disintegrated coral with a slight admixture of decayed vegetable matter. There

are no springs, and the inhabitants are dependent on rain or distillation for water. Adjacent to the city is a salt pond, where the greater part of the salt used on the island is manufactured, and considerable quantities are shipped to neighboring keys and the mainland. The natural growth is a dense but stunted chaparral, in which various species of cactus are a prominent feature. Tropical fruits are cultivated to some extent, the chief varieties being coconuts, bananas, pineapples, guavas, saponillas, and a few oranges. The air is pure and the climate healthy. The thermometer seldom rises above 90°, and never falls to freezing point, rarely standing as low as 50°. The island has suffered repeatedly from violent hurricanes. Excepting the Cubans, a large proportion of the population of Key West consists of natives or descendants of natives of the Bahama islands.

Key West.

They are a hardy and adventurous race, remarkable for their skill in diving. The language commonly spoken is Spanish or a patois of that tongue. **II.** A city, port of entry, and United States naval station, occupying about three eighths of the island, capital of Monroe co., Florida, and the southernmost town of the United States, 430 m. S. by E. of Tallahassee, and 110 m. N. by E. of Havana; lat. 24° 32' N., lon. 81° 48' W.; pop. about 5,000. The streets are broad, and for the most part are laid out at right angles with each other. The residences are shaded with tropical trees, and embowered in perennial flowers and shrubbery, giving the city a very picturesque appearance. The buildings, however, are mostly small, and are constructed of wood, except the Western Union telegraph office, those belonging to the United States government, and one other, which are

of brick. The public buildings are the custom house, naval storehouse, marine hospital, county court house, county jail, a masonic hall, an opera house, and a hotel capable of accommodating from 50 to 75 guests. Another hotel, to accommodate 200, is about to be erected. The United States court house, the post office, and the city hall occupy leased buildings. Near the naval storehouse is a monument of dark gray granite, erected in 1866 to the memory of the sailors and soldiers who died in the service on this station during the civil war. Key West has a fine harbor, accessible through several channels by vessels drawing 22 ft. of water. Being the key to the best entrance to the gulf of Mexico, it is strongly fortified. The principal work of defence is Fort Taylor, built on an artificial island within the main entrance to the harbor. It has 120 guns mounted and

40 more ready for mounting; but work upon the brick and stone batteries or forts that were projected has been suspended, and sand batteries are in process of construction. The barracks are large and commodious, and are garrisoned by 60 men. There is a United States dock, with cisterns to catch rain water, a condensing and distilling apparatus, and a machine shop and foundry. Key West is connected with New York and New Orleans by weekly lines of steamers, and with Baltimore by a semi-monthly line. The New Orleans line also connects the city with Cedar Keys, the gulf terminus of the Florida railroad, and with Havana. There are telegraph cables to Cuba and to the mainland. The value of the imports from foreign countries for the year ending June 30, 1873, was \$389,054; exports to foreign ports, \$939,880; the number of vessels entered was 384, with an aggregate tonnage of 68,828; cleared, 383, of 58,661 tons. In the coastwise trade the entrances were 337, of 201,942 tons; clearances, 278, of 198,517 tons; belonging to the port, 103 vessels, with an aggregate tonnage of 3,374. Among the principal industries are turtling, sponging, and the catching of mullet and other fish for the Cuban market. The value of sponges annually obtained is about \$100,000. About 30 vessels with an aggregate of 250 men are engaged in wrecking on the Florida reef. The manufacture of cigars employs about 775 hands, chiefly Cubans. About 25,000,000 cigars are manufactured annually. An establishment for canning pineapples is in successful operation. The value of real estate and improvements on the island in 1874 was \$2,600,000. The city is governed by a mayor and a board of nine aldermen elected annually. The United States courts for the S. district of Florida are held here. There are two public schools for white children, with 500 pupils, and one for colored children, with 198 pupils. The Catholic convent has a school connected with it, and there are eight private schools, containing in all 225 pupils. Two weekly newspapers (one Spanish) are published. The city has Baptist, Episcopal, Methodist, and Roman Catholic churches.—Key West was settled about 1822, but it long remained a mere village. During the civil war the attention of the government was more particularly directed to it.

KHAN, a Tartar word, signifying sovereign or chief. It is used by sovereign princes in all the Tartar countries, and is one of the titles of the Turkish sultan. The title khan is given in Persia to officers of various grades, but is generally expressive of high rank, and is especially applied to the chiefs of the nomad tribes of that country.—Khan is also the Turkish word for caravansary or hotel. These edifices are very numerous in Constantinople. They are commonly in the form of a square, with an interior court surrounded by three ranges of galleries, one above another, from which open small unfurnished chambers which travellers occupy without charge. Some have been

founded by private individuals, but they have mostly been built at the expense of the sultans.

KHANDEISH. See CANDEISH.

KHANIA. See CANEA.

KHANPOOR, or **Khaunpoor**, a town of N. W. Hindostan, in the native state and 89 m. S. S. W. of the city of Bhawalpoor; pop. about 10,000. It is connected with the Indus, about 30 m. distant, by a navigable canal, and though once of considerable importance, it contains only a few houses of brick, a spacious bazaar, and a slightly mosque. There is also a ruinous mud fort. Between the town and the Indus the land is fertile, and the district very populous, but to the east and south lies a desert.

KHARESM, or **Khovaresm**, in the middle ages, a designation of the khanate of Khiva, and in more recent times of the central portion of it. According to eastern legends, Kai Khosru in pursuit of the army of Turan, crossing the Oxus and beholding the field of battle, exclaimed, *Kharesmibud*, "I have my desire," and the plain has ever since been called Kharesm. The name of its inhabitants seems, however, to be identical with that of the ancient Chorasmii or Chorasmusini mentioned by Herodotus, Strabo, Pliny, and others. During the middle ages Kharesm was for a time subject to the Seljuks, and subsequently formed an independent kingdom, and the Kharesmians were formidable enemies to the Persians until both peoples were conquered by Genghis Khan. An invasion of Syria by a horde of Kharesmians (Carizmians, or Corasmians), flying from the Mongols, about 1243, is related by the chroniclers of the crusades, and also by the Arabian historians.

KHARKOV. **I.** A S. government of European Russia, in the province of Ukraine, bordering on Kursk, Voronezh, the land of the Don Cossacks, Yekaterinoslav, and Poltava; area, 21,016 sq. m.; pop. in 1867, 1,681,486. It has an elevated but flat and monotonous surface, partly covered with forests, and a fertile soil, which is generally loamy and here and there sandy. It is traversed by the Donetz, the Oskol, its chief tributary from the north, and tributaries of the Dnieper. None of these are navigable for any considerable distance. The chief vegetable productions are the various species of grain, flax, hemp, tobacco, hops, and potatoes. Besides agriculture, the rearing of cattle (which are excellent), horses, and bees forms the principal occupation of the inhabitants, who are for the most part Little-Russians and Cossacks. The principal towns are Kharkov, Akhtyrka, and Bogodukhov. **II.** A city, capital of the government, situated at the confluence of two small affluents of the Donetz, and at the junction of railway lines to Moscow, Odessa, and Taganrog, 400 m. S. by W. of Moscow; pop. in 1867, 59,968. It is mostly built of wood, but contains a cathedral, many churches, two convents, and a theatre; a university founded in 1804, with a botanical garden, museum, and a library of 20,000 volumes;

and numerous other educational institutions. The manufactures of Kharkov consist chiefly in felt hats, carpets, soap, brandy, and leather. The winter fairs are numerous, attended by traders from all parts of the empire. It is the see of an archbishop.

KHARTOOM, a town of Sennaar, Africa, the centre of government of Egyptian Soudan, situated on the banks of the Bahr el-Azrek or Blue Nile, nearly at its junction with the White Nile; lat. $15^{\circ} 36' N.$, lon. $32^{\circ} 38' E.$; pop. about 20,000. It is about 1,450 ft. above the sea, but the inundations of the White Nile frequently reach the earthen wall by which it is surrounded. The houses are mostly constructed of millet stalks, and scattered over a wide area; but the town has recently been much altered. Dr. Schweinfurth, on his return from his expedition into the heart of Africa in 1871, saw in it "a large number of

portioned the surrounding territory among themselves, and have brought the natives to a condition of vassalage. They are represented by agents who command the armed men of the country, determine what products the natives shall pay as tribute, appoint and displace the local managers, carry on war or make alliances with the chiefs, and once a year remit the collected stores to Khartoom. Vessels are built of *Sunt acacia*, a wood harder and heavier than oak, but from want of skill and proper tools they are exceedingly clumsy.

KHEMNITZER. See CHEMNITZER.

KHERASKOFF, Mikhail, a Russian poet, born Oct. 25, 1733, died in Moscow, Sept. 27, 1807. He served in the army, and was at one time director of the Moscow university. He was a copious writer in prose and poetry; but he is now remembered only as the author of the "Rossiad" (Moscow, 1785), an epic in 12 cantos on the conquest of Kazan by Ivan the Terrible; and of the "Vladimir" (Moscow, 1786), in 18 cantos, on the conversion to Christianity of the czar of that name.

KHERSON, or Cherson. I.

A S. government of European Russia, bordering on the governments of Kiev, Poltava, Yekaterinoslav, and Taurida, the Black sea, and Bessarabia; area, 27,475 sq. m.; pop. in 1867, 1,497,995, consisting of Russians, Cossacks, Poles, Bulgarians, Tartars, Greeks, Armenians, Jews, gypsies, and many foreign settlers, mainly Germans, who form a large number of colonies. With the exception of the N. W. and N. E. borders, where there

Khartoom.

new brick buildings, a spacious quay on the banks of the Blue Nile, and some still more imposing erections on the other side of the river." There are extensive gardens and rows of date palms planted nearly half a century ago. The defective drainage of the portion of the town built below high-water level renders it very unhealthy. The inhabitants are a mixture of Egyptians, Berbers, Arabs, Turks, Jews, Europeans, and negroes. They have a Coptic church, and a Catholic mission. Khartoom carries on an extensive ivory trade, mostly in the hands of six of the larger merchants, which facilitates also the operations of the regular slave traders, who pour into the negro countries annually by thousands, on the roads over Kordofan and Darfoor. The merchants of Khartoom maintain a great number of settlements in districts as near as possible to the present ivory countries, and among peaceful races devoted to agriculture. They have ap-

is some wood, and some extensive forests in the neighborhood of Elisabethgrad, the whole country consists of an immense plain with but few trees. The soil, however, is covered with grasses and other plants, and produces in the interior rich pastures. The principal rivers are the Dnieper, the Bog, and the Dniester. Wild animals are very numerous, especially wolves and wild cats. The most common tame animal is the sheep. Oxen and buffaloes are numerous and used for draught; the horses (of which many are wild) are spirited and noted for their swiftness. The fisheries are important, especially in the Dniester. The minerals are freestone, slate, chalk, talc, saltpetre, agates, and garnets. The northern part of the government possesses many distilleries and tallow manufactories; rope walks and tile works are scattered all over the country, and much linen is manufactured. The products are wheat, hemp, flax, tobacco, mustard, saffron, and wine.

The chief seat of manufacture as well as of trade is Odessa. **II.** A city, capital of the government, situated at the head of the embouchure of the Dnieper, 50 m. E. of the Black

hardest of plants can flourish, and which is relieved in spots by low, barren, slaty mountains. In the middle of this desert is the oasis of Khiva, which has a length of about 200 m.,

Kherson.

sea, and 90 m. E. by N. of Odessa; pop. in 1867, 45,926. It is divided into four quarters, and is the seat of the provincial government and of several learned institutions. Kherson was founded in 1778 by Potemkin, whose tomb is in the cathedral, and was destined by Catharine II. to become the southern St. Petersburg of the empire. But the bad climate of the town has proved unfavorable to its growth, and the vicinity of Odessa has still more contributed to reduce its importance. The imperial dockyards have been removed to Nikolayev. The small amount of trade of the town is almost entirely in the hands of the Greeks. John Howard the philanthropist died in Kherson, and a monument was dedicated to his honor by Alexander I.

KHIVA. I. A khanate of Independent Turkistan, central Asia, between lat. 36° and 44° N., and lon. 51° and 62° 30' E., bounded N. W. and N. by Russia, N. E. and E. by Bokhara, S. by Afghanistan and Persia, and W. by the Caspian sea; area, about 30,000 sq. m.; pop. estimated at 1,500,000. The Bokharian-Russian boundary under the recent treaty (the czar having ceded the territories occupied E. of the river to the khan of Bokhara) follows the Amoo Darya (Oxus) from Kukertli to the junction of the westernmost branch, which it follows to the Aral sea; and from Cape Urgan, on the latter, the line continues along the E. slope of the Ust-Urt plateau and the so-called old bed of the Oxus to the Caspian. The whole of Khiva is supposed to have been at some time the bed of an immense shallow inland sea, of which only the Caspian and Aral remain. It is now a level expanse of plain alternating between sand and gravel, in which only the

with an average width of 75 m., and contains a population of nearly 1,000,000. The Amoo Darya is connected with this oasis by a large number of canals, partly formed by the river itself, and partly artificial, and covering the whole land under cultivation as with a net. The climate of the oasis of Khiva is variable. The greatest cold is in December, when the Amoo and the sea of Aral are usually covered with ice. Frosts continue till April, and then the heat increases so rapidly as to become insupportable in June. In October night frosts set in again. Vámbéry speaks in the most enthusiastic terms of the

fertility of the abundantly watered soil, and of the admirable quality of its fruits and vegetables, especially apples, peaches, pomegranates, and the incomparable melons. The other principal products are corn, rice, cotton, and *ruyan*, a kind of root prized for the red dye extracted from it. The finest silk comes from Shah-Abat and Yeni Urganj. Sheep, goats, horses, asses, and camels are raised in large numbers. The principal manufactures are articles in brass, earthenware, woollen goods, silk, and linen. Trade is chiefly carried on with Russia. Caravans consisting of nearly 2,000 camels go to Orenburg in the spring and to Astrakhan in the fall, and bring back cast-iron vessels, chintz (a favorite ornament of the women), fine muslin, calico, sugar, guns, and fancy goods. There is a great export trade in fish, but the Russians have their own fisheries on the sea of Aral. With Persia and Afghanistan the trade is small, as the routes are occupied by the Turkomans. With Bokhara they exchange woollen gowns and linen for teas, spices, paper, and fancy goods. From Astrabad they obtain boxwood and naphtha.—The khanate is peopled by Uzbecks, Turkomans, Kirghiz, Sarts (or Tajiks), and Persians. The Uzbecks, the predominant race, live in settled villages and towns, and are mostly engaged in agriculture. They are fond of music and poetry, mimic battles, wrestling, and horse races. The Turkomans are represented mainly by the Yomuts, who inhabit the borders of the desert from Kunya Urganj to Gazavat. There are now very few Kirghiz. The Sarts are the ancient Persian population of Khiva, and though they have lived five centuries together, very few marriages have taken

place between them and the Uzbecks. Before the recent war there were 40,000 Persians, many of them slaves. The Khivan constitution is of Mongol origin. At the side of the khan stand a number of dignitaries whom he cannot remove from office. Other officials serve only in time of war. Justice is administered by *karsis* and *muftis*, either in their own houses or in the mosques. The political divisions of the khanate correspond to the number of large cities, which have their own beys or governors. The most interesting cities are Khiva, the capital, Yeni (New) Urgenj, and Kunya (Old) Urgenj, famous for having long been the capital of the khanate. Other towns of importance are Hazar-asp, Kungrad, Tash-hauz, Gurlen, Khoja Ili, Shah-Abat, Kiliĵ-bay, Mangit, and Kiptchak, mostly within a short distance from the banks of the Amoo Darya.—The khanate of Khiva anciently formed part of the Persian empire, and included the provinces of Chorasmia, Sogdiana, and Bactria. The shores of the sea of Aral were at that time inhabited by the Massagetæ, who, it is said, slew Cyrus, 529 B. C. North of the old course of the Oxus, which united the Caspian and Aral seas, lived the Asparsiacæ, a Scythian tribe. Khiva probably formed part of the Parthian empire at the time of Arsaces VI. (or Mithridates I.), about 150 B. C. The tribes succeeded in throwing off the Parthian yoke between A. D. 50 and 100. From the 3d to the 10th century it was connected with Persia. It became afterward an independent kingdom under the name of Khovaresm or Kharesm, until conquered by Genghis Khan early in the 13th century. At the end of the 14th it was taken by Tamerlane, and remained part of the kingdom of Samarcand until the beginning of the 16th century. Eventually it came under the rule of the Uzbecks, a Turkish tribe, who founded the khanate or kingdom of Khiva. Peter the Great sent an army under Gen. Bekevitch against the Khivans in 1717, which was defeated. Since that time the khans have taken every opportunity to display hostile feelings against Russians. Prominent among the recent khans, for his military skill and wise administration, was Rahim (1802–26). Allah Kuli (1826–41) toward the end of his reign successfully resisted a large Russian expedition under the command of Gen. Perovsky. He subdued also the tribe of the Goklens, whom he transferred into his territory. His son Rahim Kuli (1841–3) settled 10,000 tents of Jemshidi, a Persian tribe, on the bank of the Amoo, near Kiliĵ. His brother defeated the emir of Bokhara, and usurped the throne at his death. Mohammed Emin (1843–55) extended his territory by conquering the land of the Sariks and the Tekkes, who dwelt near Merv and Akhal. In a subsequent expedition some daring enemies entered his tent, struck off his head, and sent it to the shah of Persia. His troops called to the throne one Abdullah, who was slain in a rebellion

of the Yomuts (1856). He was succeeded by his younger brother Kutlug-Murad, who reigned only three months. His successor, Seid Mohammed, allowed the Yomuts to devastate the land, and the colonies founded by the previous khan became depopulated. Then a pretender to the throne, Mohammed Penah, instigated a rebellion, and implored the protection of Russia, for which he was finally murdered by his own partisans. The expedition undertaken by the Russian government against Khiva toward the close of 1872, under pretext of repressing brigandage and securing redress of grievances, met at first with a serious reverse. A body of Khivans surprised the advancing Russians, and compelled them to retreat. The Khivan success, however, roused the Russians to new efforts. An army was sent out in two main divisions, one advancing against Khiva from Turkistan on the east, and another from Orenburg and the Caucasus on the west. The principal column was under the orders of Gen. Kaufmann, the commander-in-chief of the whole expedition. On May 20, 1873, Kungrad was attacked and captured, and on June 10 the Russians entered the capital of Khiva. The khan had fled, but a few days afterward he returned, signified his submission, and signed a treaty of peace, which compelled him to pay an indemnity of 2,000,000 rubles by instalments extending over seven years, the Russian troops in the mean time occupying Shurakhan and Kungrad. The independence of the khan was to be recognized, but the E. boundary of the territory was reduced to the river Amoo Darya. Slavery and the slave trade were prohibited in the khanate. Subsequently it was added that the khan should have no right to make treaties with foreign powers without Russian sanction. The population of the ceded territory may be roughly estimated at 6,000 houses of settled inhabitants, and 37,000 kubitkas of nomads and semi-nomads; and taking the usual estimate of five persons to a house, with about 5,000 Persians previously slaves, the ceded population probably amounts to about 220,000. II. A city, capital of the khanate, situated in the most fertile portion of the valley of the Amoo Darya, about 30 m. from its W. shore; lat. 41° 22' N., lon. 60° 24' E.; pop. about 6,000. The environs of Khiva are beautifully cultivated, but the city itself is declared to be inferior to a Persian city of the lowest rank. The houses are built of mud, and stand in the most irregular manner. The city is divided into Khiva proper and the citadel, which can be shut off from the outer city by four gates. The palace of the khan is an inferior building, and the bazaars are not equal to those of other oriental cities. Tim is the principal bazaar, where the articles imported from Russia, Bokhara, and Persia are exposed for sale. There are few mosques of much antiquity or artistic construction. The Polvan-Ata is an edifice about four centuries old, consisting of one large and two small.

domes, and contains the tomb of Polvan, the patron saint of the city. The mosque attached to the khan's palace has a high round tower ornamented with arabesques. Among the *medreses* (colleges), that of Mohammed Emin Khan is probably the largest. It was built in

The Mosque of the Palace of Khiva.

1843 by a Persian architect after the model of a Persian caravansary. It has accommodation for 300 students.—See Stumm, *Aus Chiwa* (Berlin, 1874); Veniukoff, *Die Russisch-Asiatischen Grenzlande* (translated from the Russian by Kramer, Leipsic, 1874 *et seq.*); Vámbéry, "Central Asia and the Anglo-Russian Frontier Question" (London, 1874); Spalding, "Khiva and Turkestan" (London, 1874); and MacGahan, "Campaigning on the Oxus, and the Fall of Khiva" (London, 1874).

KHODAVENDIGHIAR, a vilayet of Asiatic Turkey, bounded N. by the sea of Marmora; pop. about 1,100,000. It is traversed by lofty mountains, including the Keshish Dagh (anc. *Olympus*), and by tributaries of the Sakaria river, and has numerous lakes, that of Abullonia being the most remarkable. It abounds in grain and fruit, and produces cotton and silk. It comprises the S. part of ancient Bithynia, Mysia, and the western portions of Phrygia. Capital, Brusa.

KHOL, a town of Persia, in the province of Azerbijan, situated in a fertile valley watered by the Kotura, an affluent of the Aras, N. of Lake Urumiah, 70 m. N. W. of Tabriz; pop. about 20,000. It is strongly fortified and one of the most attractive Persian towns, with many mosques, a fine caravansary, and a khan's palace. There is a considerable caravan trade to Erzerum. Woollen and cotton goods are manufactured, and the principal products are grain, cotton, and fruits. The Persians, numbering 30,000, were overwhelmed here by a Turkish army of 180,000 men in 1514.

KHOKAN, or **Kokand**. **I**. A country of central Asia, one of the three great khanates of

West Turkistan or Independent Tartary, lying between lat. 39° and 43° N., and lon. 69° and 75° E.; bounded S. W., W., N., and N. E. by the new Russian province of Sir Darya, E. and S. E. by East Turkistan, and S. by the Pamir plateau and Karateghin. It is enclosed by lofty snow-covered mountain ranges on the south and southeast, dividing the basin of the Amoo Darya or Oxus from that of the Sir Darya (the ancient Jaxartes), which is the principal river of Khokan, receiving all its streams. The precise area of the khanate is unknown, but it is largely comprised in an almond-shaped valley about 165 m. long and with an extreme width of 65 m. Prior to the Russian advance in 1864, the fertile valley of the Sir Darya as far N. W. as Tashkend was included within its boundaries, but at present the western frontier of Khokan crosses the river between the capital and the city of Khojend. The general elevation of the country exceeds 1,500 ft. above the sea level. The winter is severe in the mountainous tracts, but a milder climate prevails in the main valley, where but little snow falls. In summer the heat is excessive during the day, but the nights are cool. The most fertile portion of the khanate is the rich territory about the city of Andijan, near the centre of the country, formerly known as the province of Ferghana; but irrigation is extensively practised, and the soil throughout the country is extremely productive. The cereals are wheat, barley, and rice; there is a large cotton crop; and hemp, flax, sorghum, peas, beans, madder, and tobacco are also cultivated. Khokan is noted for the excellence and variety of its fruits. The manufacture of a fine quality of silk is a leading branch of industry. In 1872 the chief articles of export were cotton, of which about 8,000,000 lbs. were sent to Russia, and silk, of which the same country received about 200,000 lbs. Many districts afford pasturage for large and thriving herds of horses, asses, horned cattle, sheep, and camels. Coal, iron, naphtha, and petroleum are known to exist in the mountains; turquoises of an inferior quality and greenish hue are also found. The population is estimated at 3,000,000, and includes Uzbecks, who are the military and dominant class, Tajiks, Kirghiz, and Kiptchaks. A commercial treaty between Khokan and Russia was negotiated in 1868, and the khanate is virtually under Russian protection and control. (See **TURKISTAN**.) **II**. A city, capital of the khanate, situated in a beautiful valley a short distance S. of the Sir Darya, about 220 m. E. N. E. of Samarcand, 1,540 ft. above the level of the sea. According to Vámbéry, it is three times as large as Bokhara and six times as large as Khiva. Estimates of the population vary from 30,000 to 60,000. There are four stone mosques in the city, and numerous bazaars in which Russian goods are sold, as well as native silks and woollens, and handsome leather equipments for riding.

KHORASAN, or *Khorassan*, a N. E. province of Persia, between lat. 31° 30' and 38° 40' N., and lon. 52° 40' and 61° 20' E., bounded N. by Khiva, E. by Afghanistan, S. and W. by the Persian provinces of Kerman, Fars, Luristan, and Irak-Ajemi; area, 124,400 sq. m.; pop. estimated at 850,000. A large portion of the surface is covered by the great salt desert, called by the natives Kubir. The N. W. and N. E. districts are fertile, with numerous oases, mostly of small extent, but containing several populous towns. The Elburz mountains stretch along the north of the province, and throw off ramifications to the southward. The products of the cultivated districts are grain, cotton, hemp, tobacco, aromatic plants, and drugs, including asafœtida, manna, and gum tragacanth. The manufactures are silk, woollen, and goats' hair stuffs, carpets, muskets, and sword blades. Meshed is the capital of the province, and the other chief towns are Yezd, Tabas or Tubus, and Nishapur. About 40 m. N. W. of Nishapur are famous turquoise mines. Two thirds of the inhabitants are Persians, resident in towns, the remainder being nomadic Turkomans and Kurds. The prevalent religion is Mohammedanism of the sect of Ali.—The province comprises the ancient territories of Parthia, Margiana, and Aria. After its having formed part of the empire of Alexander the Great and of the Seleucidæ, a portion of it was incorporated with Bactria. The Arsacides of Parthia, the Sassanides of Persia, and the caliphs ruled over the entire province. Its governor Taher revolted in 813, and he and his successors continued independent. The Suffarides regained possession of it, but lost it to the Samanides and their successors in power, the Ghuznevides. The Seljuks also occupied it for a while, losing it periodically to the people of Kharesm and Ghore, and finally Genghis Khan conquered it. About 1383 it fell into the hands of Tamerlane, and in the reign of his son it enjoyed great prosperity. After much suffering from the inroads of the Uzbecks, it was seized by Ismael, and has formed since 1510, with the exception of Herat, a province of Persia.

KHOTIN, or *Chocim*, a fortified town of Russia, in Bessarabia, on the right bank of the Dniester, nearly opposite Kamenetz, near the frontier of Galicia; pop. in 1867, 20,917. It is surrounded by hills, which lessen the strategical value of the fortifications. It is the seat of an archbishop of the Greek church. The industry consists chiefly in furnishing supplies for the army. It was anciently a Moldavian city, and became afterward an important stronghold of the Turks against the Poles. The latter, however, achieved here two celebrated victories. In 1621 Gen. Chodkiewicz repulsed here vigorous Turkish assaults on his fortified camp; and in 1673 John Sobieski routed an army of Mohammed IV. in a battle of scarcely two hours. Strengthened by new fortifications since 1718, the place was taken by the Russians in 1739, but restored to the Turks; taken again in

1769, and restored in 1774; taken by the Austrians in 1788, but not held; and finally ceded by the peace of Bucharest to Russia in 1812.

KHUZISTAN (anc. *Susiana*), a province of Persia, bounded N. and N. E. by Luristan, S. E. by Fars, S. by the Persian gulf, and W. by the Turkish vilayet of Bagdad; area estimated at 39,000 sq. m.; pop. about 400,000. Its surface is hilly, the Bakhtiyari mountains rising on its N. E. frontier, and lesser eminences being scattered over the N. part of the province. In the south it is more level. The Shat-el-Arab (the united stream of the Tigris and Euphrates) forms part of its W. boundary. Several of the branches which form its delta empty into the Persian gulf through this province. The principal rivers which traverse the interior are the Kerka (anc. *Choaspes*) and the Karun (anc. *Eulæus*). Khuzistan contains extensive grazing lands on which vast herds are pastured, and produces rice, maize, barley, cotton, sugar cane, dates, and indigo. The silkworm is reared, and trade is carried on with Bagdad, Bassorah, and other places. Its principal towns are Shuster, Dizful, Ahwaz, and Mohammerah. The inhabitants are Tajiks, Sabian Christians, Lurs, Erdelans, and Arabs, all of whom except the Sabians are Mohammedans. The province contains the ruins of Susa, one of the ancient capitals of Persia. (See *ELAM*, and *SUSIANA*.)

KIAKHTA, or *Kiachta*, a town of Siberia, near the Chinese frontier, in the Russian province of Transbaikalia, lat. 50° 20' N., lon. 106° 30' E., about 100 m. S. of Lake Baikal, on a small stream of its own name, 2,500 ft. above the sea; pop. in 1867, 4,286. It consists of the fortress, where the custom house and the government buildings are established, and of the lower town or town proper, where the merchants live, many of them in elegant houses. Kiakhta is a great emporium of trade between Russia and China, the Chinese settlement Maimachin being less than half a mile from the lower town. In 1727 a free commercial intercourse was established between China and Russia, to be carried on at the common boundary on the Kiakhta. Fairs were formerly held annually, at which Russian productions were bartered for Chinese, especially tea, a great amount of which was forwarded to the fair of Nizhni-Novgorod. The trade of Kiakhta, formerly estimated at \$8,000,000 a year, has decreased since the treaty of Peking, Nov. 14, 1860, which opened for traffic the whole line of the Russian-Chinese frontier.

KIANGSI, a S. E. province of China, bordering on Hupeh, Nganhwui, Chihkiang, Fokien, Kwangtung, and Hunan; area, 72,176 sq. m.; pop. about 23,000,000. It is watered chiefly by the Kan-kiang, which flows into Lake Poyang, and its numerous affluents. East of the lake are large coal mines. Green tea is produced chiefly in the E. and black in the W. part of the province. The other products include cereals, rice, cotton, sugar, indigo, and

silk. Excellent porcelain and nankeen cloth, besides other articles, are manufactured. A large portion of Kiangsi was flooded in 1870-'71 by the Yangtse, more than 300,000 persons taking refuge on the high ground near Kewkiang. This created poverty and disturbances, resulting in movements against missionaries and foreigners generally. Capital, Nanchang.

KIANGSU, a province of China, on the N. E. coast, bordering on Shantung, Honan, Nganhwui, Chihkiang, and the Yellow sea; area, 44,500 sq. m.; pop. about 38,000,000. It is generally level, and abounds in marshes, but is one of the most fertile regions of China, owing to its many lakes, rivers, and canals. The principal lake is the Hungtsih, about 200 m. in circumference, which is connected with the Hoang-ho. It exports more rice than any other Chinese province, and cereals, cotton, tea, and silk are produced. Fisheries thrive on Lake Taihu and other waters. The people are among the most intelligent in China, and the province contains many fine towns. Capital, Nanking.

KICKAPOOS, a tribe of the great Algonquin family, first found by the French missionaries toward the close of the 17th century on the Wisconsin, not far from the Maskoutens, a kindred tribe, who seem to have ultimately merged in the Kickapoos. They probably lived previously on the Mississippi, above the Wisconsin. They were closely allied to the Miamis, but roved in bands over a large territory. Though professing friendship to the French, they killed a Franciscan, Father Gabriel de la Ribourde, who was attached to La Salle's party. They took part in the general peace of 1700, but in 1712 joined the Foxes to attack Detroit, and were their allies in the long series of hostilities that ensued. By 1718 they were chiefly on the Rock river, Illinois. In 1728 they captured the Jesuit Father Guignas, and held him captive for several months. Peace was finally restored about 1747, when the Kickapoos are said to have been reduced to 80 warriors; but they were still hostile to the Illinois. When the English conquered Canada, in 1763, they found 180 Kickapoos on the Wabash. The tribe joined Pontiac, and in 1765 attacked Croghan on the Ohio, killing and wounding several of his men; but they made peace at Detroit in October. They were soon hostile again to the English, and in 1779 readily supported Col. Clark in his operations against the English. They soon, however, partook of the general hostile feeling against the new government, besides warring on the Chickasaws. In June, 1791, Gen. Scott carried the Kickapoo town on the Wabash, and in August Wilkinson burned another of their villages. Peace was nominally made in 1792, but they did not really yield till the treaty of Greenville, Aug. 3, 1795, after Wayne's great victory. They then ceded part of the land they claimed for \$500 a year in useful goods; and they made further cessions in 1802, 1803, and 1809. Though warned by Gov. Harrison, they joined Tecumseh, and

fought at Tippecanoe in 1811. After that they sought to treat, but Harrison declined. The war with England gave them hopes, and the Kickapoos with others attacked Fort Harrison, where Zachary Taylor defeated them. In October, 1812, Russell surprised a Kickapoo town on the Illinois, killing many; and in November Hopkins destroyed another town on Wildcat creek. They then sued for peace, and Little Otter met Harrison. The treaties of Portage des Sioux (Sept. 2, 1815), Fort Harrison (June 4, 1816), and Edwardsville (July 30, 1819), ceded a large part of the lands which they claimed by descent from their ancestors, by conquest from the Illinois, and by 60 years' possession. Many of the tribe had already gone beyond the Mississippi, and the United States agreed to pay them \$2,000 a year for 15 years, and assigned them a large tract on the Osage. In 1822, 1,800 had removed, only 400 remaining in Illinois. About 1830 Kennekuk, or the prophet, a leading chief, set himself up as a teacher, preached with eloquence, and taught the people to pray morning and evening, the form being symbolically cut on maple sticks. Provision was made for schools by the treaty of Castor Hill, Oct. 24, 1832; but the labors of the Jesuits, followed by the Methodists, Presbyterians, and Friends, failed to convert the tribe or establish education among them. Some few settled down to cultivate; more rambled off to hunt on the grounds of southern tribes, entering even Texas and other Mexican states. This band was very troublesome, plundering on all sides. They were sent out of the Chickasaw country in 1841, but were allowed on the Creek territory for a time. They made constant inroads into Texas, killing and horse stealing. In 1854 they killed an Indian agent of the United States. In 1838 the agency band numbered 725; the next year only 419. In 1845 this band had increased to 516, and they were then in a thriving condition, raising enough vegetables and grain to support themselves, and supply Fort Leavenworth. In 1854 they were removed to a reservation in Atchison co., Kansas, part of their large tract being ceded for \$300,000. Soon after the tribe lost greatly by smallpox, Kennekuk the prophet being one of the victims. Though unaffected by the civil war, they steadily declined in numbers, and in 1863 there were only 343 on the reservation, the southern or wild band appearing only when the annuities were to be paid. At this time the Atchison and Pike's Peak railroad obtained the right to purchase their lands at \$1 25 an acre, and steps were taken to give individual members of the tribe separate lands, and make them citizens. Great discontent arose, and Nokohwart led 100 to Santa Rosa, Mexico, where a large number of Kickapoos had settled and were protected by the Mexicans. In 1865, under a new treaty, 30 families took lands in severalty, 160 acres being allotted to each head of a family; 79 families, form-

ing the Prairie band, preferred to have lands in common. The sale of the remaining lands gave a fund of which the United States was to pay \$10,000 in 1873 and a similar amount yearly till the whole is accounted for. The tribe has also \$5,000 a year for schools. The roving part has given much trouble to the more civilized and to government. They have gathered mainly at Santa Rosa and its vicinity, and, as they defend the Mexicans against the Apaches, and bring in considerable by their raids, are encouraged in their roving habits. In 1871 Miles, the agent of the Kickapoos, went to Mexico to endeavor to induce the whole body there to return to the United States and settle on a reservation. The Mexican government thwarted his plans, and at once spent \$10,000, long previously appropriated, for agricultural implements and other valuable articles for the Kickapoos. The depredations of these Indians across the frontier led to a dash into Mexico by Gen. Mackenzie, in which the Indians were severely punished. These Mexican Kickapoos numbered fully 1,000; but in 1873 300 or 400 returned, and were placed in the Indian territory, west of Arkansas river. In 1873 the Kickapoos on the reservation in N. E. Kansas numbered 274. There were 46 children in their school, and a boarding school was in progress. These Indians have ceased to be or consider themselves warriors. Their annual produce was valued at \$12,000, and their stock was worth about \$18,000.

KIDD, William, a pirate, born in Scotland (probably in Greenock), executed in London, May 24, 1701. He is said to have been the son of John Kidd, a nonconformist minister. He followed the sea from his youth, and toward the end of the 17th century was a bold and skilful shipmaster from New York. He distinguished himself as a privateersman against the French in the West Indies, and in 1691 received £150 from New York for protecting the colony against pirates. In 1695 a company for the suppression of piracy was organized in England, by the earl of Bellamont and others, who hoped to derive a profit from recaptures. The *Adventure Galley*, a new ship of 287 tons and 34 guns, was bought, and at the suggestion of Robert Livingston of New York, one of the shareholders, her command was given to Kidd, who received two commissions, one dated Dec. 10, 1695, from the commissioners of the admiralty, empowering him to act against the French, the other dated Jan. 26, 1696, under the great seal, authorizing him to cruise against pirates. One tenth part of all booty was to be set aside for the king, and the remainder was to be divided between the shareholders and Kidd in certain specified proportions. A share was also appropriated to the crew, who were to receive no regular pay. Kidd sailed from Plymouth on April 23, 1696, captured a French fishing vessel off Newfoundland, and arrived in New York with his prize about July 4. He remained there until Sept. 6, when he sailed

with a crew of 154 men for Madagascar, then the chief rendezvous for pirates, and arrived there in January, 1697. In 1698 rumors became prevalent in England that Kidd himself had turned pirate, and on Nov. 23 of that year orders were sent to the governors of all the English colonies to apprehend him if he came within their jurisdiction. In April, 1699, he arrived in the West Indies, in a ship named the *Quidah Merchant*, secured her in a lagoon in the island of Saona, at the S. E. end of Hayti, and set sail northward with about 40 men, in the *San Antonio*, a sloop of 55 tons. He made a landing in Delaware bay, sailed up the coast to Long Island sound, and went into Oyster bay. Here he took on board James Emott, a New York lawyer, and running across to the Rhode Island coast set him ashore and sent him to Boston to Bellamont, who had become governor of the colonies, to ascertain how the latter would receive him. During his absence Kidd buried some bales of goods and some treasure on Gardiner's island. Bellamont answered evasively, and after some correspondence persuaded Kidd to go to Boston, where he landed on July 1, 1699. He was examined before the council, and, according to Bellamont, gave trifling answers to interrogatories, and on July 6 the governor ordered his arrest. He was sent to England, and after a grossly unfair trial, in which he was allowed no counsel, and was not permitted to send for papers and witnesses, he was found guilty of piracy and of the murder of William Moore, one of his crew, whom he struck on the head with a bucket during an altercation, and was hanged at Execution dock, with nine of his associates. Kidd asserted his innocence to the last; averred that Moore was mutinous when he struck him; and claimed that his men forced him to take the *Quidah Merchant* against his will. Bellamont equipped a ship to go in search of that vessel, but heard before she sailed that the latter had been stripped and burned by the men left with it. He secured the treasure buried on Gardiner's island, which, together with that found in Kidd's possession and on the *San Antonio*, amounted to 1,111 oz. troy of gold, 2,353 oz. of silver, 17 oz. of jewels (69 stones), 57 bags of sugar, 41 bales of merchandise, and 67 pieces of canvas, of the total value of about £14,000. There are no grounds for the popular belief that he buried other treasures, although frequent search has been made for them along the N. E. coast, in the lower part of the Hudson, and elsewhere, till a very recent period.

KIDDER, a N. county of Dakota, recently formed, and not included in the census of 1870; area, about 1,700 sq. m. It is occupied by the "Plateau du Coteau du Missouri," and contains several alkaline lakes. The Northern Pacific railroad crosses it.

KIDDER, Daniel Parish, an American clergyman, born at Darien, N. Y., Oct. 18, 1815. He graduated at Wesleyan university, Middletown,

in 1836, entered the Genesee conference, and was stationed at Rochester, N. Y. In 1837 he went as missionary to Brazil, and during 1839 traversed the whole eastern coast from San Paolo to Pará. He introduced and circulated the Scriptures in the Portuguese in all the principal cities of the empire, and preached the first Protestant sermon on the waters of the Amazon. He returned to the United States in 1840, and in 1844 was appointed official editor of the Sunday school publications and tracts, and corresponding secretary of the Sunday school union of the Methodist Episcopal church, a post he held for 12 years. Besides editing the "Sunday School Advocate," he compiled and edited more than 800 volumes of books for Sunday school libraries. He was likewise the organizer of the conference Sunday school unions, and one of the originators of Sunday school conventions and institutes. In 1856 he was appointed professor of practical theology in the Garrett Biblical institute at Evanston, Ill., where he remained till 1871, when he was called to a like chair in Drew theological seminary at Madison, N. J., where he still remains (1874). His publications include a translation from the Portuguese of the work of Feijo entitled "Demonstration of the Necessity of abolishing a constrained Clerical Celibacy" (Philadelphia, 1844); "Mormonism and the Mormons" (1844); "Sketches of a Residence and Travels in Brazil" (2 vols., 1845); conjointly with the Rev. J. C. Fletcher, "Brazil and the Brazilians" (1857); "Homiletics" (New York, 1868); and "The Christian Pastorate" (1871).

KIDDERMINSTER, a municipal and parliamentary borough of Worcestershire, England, situated on the Stour, 13 m. N. of Worcester; pop. of the municipal borough in 1871, 19,463; of the parliamentary borough, 31,747. The streets are irregularly built and the houses are generally small. The most important manufacture is of carpets, for which Kidderminster has long been famous; but worsted and other woollen goods, damask silks, leather, &c., are made. The Stafford and Worcester canal, and the Oxford, Worcester, and Wolverhampton railway, pass through the town. The manor of Kidderminster was once the property of the poet Waller. Here for many years Richard Baxter officiated as pastor.

KIDNAPPING, the stealing and carrying away or secreting of any person. It is regarded by the law as an aggravated species of false imprisonment, and includes the legal elements of that offence. At the common law kidnapping is a misdemeanor, and punishable by fine and imprisonment. The same punishment is adopted by the state statutes in this country.

KIDNEY, a special organ in vertebrated animals, whose office is to separate from the blood certain effete substances, to be thrown out of the system in the urine; it has no direct connection with any of the nutritive operations concerned in digestion. Taking these organs

in man as typical, the kidneys are situated in the lumbar region, one on each side of the spine, on a level with the last two dorsal and the first two lumbar vertebræ; they are of a brownish red color, bean-shaped, flattened from before backward, and grooved on the interior border for the great vessels; the anterior surface is in relation on the right with the duodenum and the ascending colon, and on the left with the descending colon, the posterior surface is imbedded in fat, resting against the muscles; the upper extremity is embraced by the supra-renal capsules; the lower extremity, which is somewhat smaller than the upper, projects a little further downward upon the right side than the left. The kidneys are well supplied with blood, in accordance with the importance of their function; the renal arteries come directly from the aorta, and the large veins terminate in the vena cava; the nerves

come from the renal plexus of the sympathetic system. They are covered by a thin, firm, transparent cellular envelope; internally they are composed of two substances, an exterior or cortical and an interior or medullary. From the researches of Bowman, Gerlach, Kölliker, and others, it is ascertained that the cortical substance, the seat of the greater part of the secretory process, is made up of a great number of uriniferous tubes, much convoluted and inosculating with each other, and lined with epithelial cells of a spheroidal and projecting form; scattered through the plexus formed by these tubes and the blood vessels are dark points which have been called *corpora Malpighiana* from their discoverer; these last are convoluted masses of minute blood vessels included in flask-like dilatations of the uriniferous tubes, forming a close relation between the circulating and the secreting systems.

The medullary substance is composed principally of tubes passing nearly straight inward to the central receptacle of the secretion. Both these substances are imbedded in interlacing

kidney. The uriniferous tubes end in from 12 to 18 conical bundles, pointing toward the interior, and there embraced by 6 or 12 membranous ducts received into the central reservoir or pelvis of the kidney, from which arises the ureter, the membranous tube which conducts the renal secretion to the bladder. Without entering upon physiological questions which will be more properly treated under URINE, it

Vertical Section through a portion of the Medullary and Cortical Portions of the Rabbit's Kidney.

a. Small arteries of the cortical portion. b. Corpora Malpighiana. d. Capillary blood vessels of the cortical portion. e, n, p. External surface of the kidney. g, h, i. Blood vessels of the medullary portion. l. Straight uriniferous tubes of the medullary portion, becoming convoluted in the cortical portion.

fibres, most abundant in the medullary. In mammals the kidneys are supplied with blood directly from the arterial system, but the renal artery divides very soon after entering the organs into minute twigs which pierce the capsule of the Malpighian tufts; from the convolutions of these tufts arise the efferent vessels which surround the uriniferous tubes, and from which the renal veins are formed; thus the urinary secretion is produced from blood which has passed through the Malpighian capillaries, the efferent trunks from which have been compared to a portal system within the

Malpighian Tuft from near the base of one of the Medullary Cones. a. Arterial branch. af. Afferent vessel. m. Malpighian tuft. ef. Efferent vessel; b, its branches, entering the medullary cone. (Magnified 70 diameters.)

will be sufficient to state that the kidneys serve to regulate the quantity of water in the system, a large amount of which may be got rid of through their agency. As the skin and lungs, the other channels through which superfluous water is removed from the blood, are liable to be greatly affected by external circumstances, the kidneys perform a very important office in relation to that fluid. Hence the quantity of the renal secretion will depend on the amount of fluid passed off by the skin, being greatest when the cutaneous secretion is least, and *vice versa*; the amount of solid ingredients being dependent on the amount of waste and the excess of nitrogen in the system. The kidneys serve to free the blood from highly nitrogenized compounds formed from the decomposition of the albuminous and gelatinous tissues and from some portions of the food; they also remove certain excrementitious compounds, of which carbon is a principal ingredient, abnormally increased when the liver and the lungs do not act freely; by them the superfluous water and various saline matters in excess, and foreign substances introduced into the blood as medicines or otherwise, which would be injurious if retained, are carried off. The kidneys are subject to many painful and dangerous diseases, which can only be alluded to here; among these are vascular congestion, inflammation, fatty and waxy degeneration, and diseased states produced by retention of urine, by calculi, external violence, and extension from other organs. Bright's disease is one of their most common and fatal affections, the so-called granular degeneration, consisting in the distention of the tubules, the surrounding tissue, and the Malpighian capsules, with exudation matter, and the subsequent atrophy of portions or even the whole of the cortical substance. Invertebrates have special organs for the secretion of urine, opening into the intestines or into the branchial cavity. In fishes

the kidneys are very long, extending the whole length of the spine, even to the head, formed of a mass of simple globules, the ureter opening into the cloaca or a urinary bladder; in reptiles they are generally situated within the pelvis, but in serpents they come further forward and are made up of numerous lobes of a compressed reniform shape. In birds they are elongated, commencing immediately below the lungs, extending on each side of the spine to the rectum, and variously divided into lobes. In mammals they resemble those of man, except that in cetaceans and some other lower families they are more or less subdivided into lobes, as in the human foetus; in mammals only is there the marked distinction into cortical and tubular

substance. In the foetus at an early period, while the kidneys are very small and imperfect, their office is performed by the "Wolffian bodies," two organs analogous to them in structure, which afterward become atrophied and disappear. The two kidneys, which first make their appearance just behind the Wolffian bodies, grow rapidly as the latter diminish in size, and in the human subject have fully taken their place by the end of the second month of foetal life. In fishes, on the other hand, the Wolffian bodies remain as permanent organs, no true kidneys being developed.

KIEL, a seaport of Prussia, in Holstein, capital of the province of Schleswig-Holstein, and of a district of its own name (embracing Hol-

Kiel.

stein), situated on the Kieler Hafen, a fine harbor of the Baltic, 52 m. N. by E. of Hamburg; pop. in 1871, 31,747. It is walled, well built, contains the Glücksburg palace, four churches, and a university founded in 1665, with an observatory, a library of 140,000 volumes, a botanic garden, and 250 students. Kiel is important as the great harbor of the fleet of the German empire. The harbor is about 10 m. long and 1 m. wide, and is defended by several forts. The government is building extensive wharves and arsenals, which are to be completed in 1878. The naval academy of Berlin was transferred in 1868 to Kiel, and a special school for deck officers and sub-engineers was connected with it. An academy for the instruction of naval officers is in the course of erection. It is proposed to connect the Baltic with the North sea by a new canal terminating in the harbor of Kiel. The Eider canal, which forms that connection at present, is not considered wide and deep enough for the purposes of the German navy, and is for technical reasons not fit to be enlarged. There are numerous sugar, soap, and woollen factories, large iron founderies, machine shops, and ship yards. An extensive trade is carried on with all the important towns on the Baltic. There are railways to Hamburg and Neustadt. —Kiel was a town in the 11th century, and sub-

sequently belonged to the Hanseatic league. A treaty of peace between Denmark and Sweden was concluded here in 1814. An insurrection in favor of the independence of Schleswig-Holstein took place, and a provisional government was formed, March 24, 1848. By the convention of Gastein, Aug. 14, 1865, Kiel, unlike the rest of Holstein, was to be held by Prussia as a German federal harbor.

KIELCE. **I.** A government of European Russia, in the kingdom of Poland, bordering on the governments of Piotrków and Radom, and on Austrian Galicia; area, 3,623 sq. m.; pop. in 1867, 470,300. It is slightly mountainous in the north, where it is traversed by offshoots of the Lysa Góra, and hilly in the east and south. It has mines of iron and other metals, and produces rye, wheat, and fruits. It is watered by the Vistula, which separates it from Galicia, by its affluent the Nida, and by the Pilica, which partly separates it from Piotrków.

II. A city, capital of the government, 96 m. S. W. of Warsaw; pop. in 1867, 7,295. It is the seat of a Catholic bishop, has several churches, a monastery, an episcopal seminary, a gymnasium, a mining school, and in its environs iron, copper, lead, and coal mines.

KIENCHOW, or **Klungchow**, a city of China, capital of the island of Hainan, off the S. coast of the province of Kwangtung, on a narrow

spit of land between a river and a bay; pop. about 200,000. There is a considerable coasting trade with Canton and Macao. Kienchow is one of the ports open to foreigners, though there is not as yet any English settlement. The rocky coast is infested by pirates and wreckers, in consequence of the numerous casualties, but the inhabitants generally treat the shipwrecked people with kindness.

KIEPERT, Heinrich, a German geographer, born in Berlin, July 31, 1818. He studied under Ritter, explored Asia Minor in 1841-'2, and was director of the geographical institute at Weimar from 1845 till the end of 1852, when he returned to Berlin, and became a member of the academy of sciences and a lecturer, and in 1859 a professor in the university. In 1865 he joined the statistical bureau. He published, with the assistance of Ritter, the *Atlas von Hellas und den hellenischen Colonien* (Berlin, 1840-'46; revised ed., 1866). His other works include maps for Robinson's "Biblical Researches in Palestine" (Halle, 1843); a celebrated map of Asia Minor (1843-'5); *Historisch-geographische Erläuterung der Kriege zwischen dem oströmischen Reiche und den persischen Königen der Sassaniden-Dynastie*, which won a prize from the French institute in 1844, though not yet published; eight maps to Lepsius's "Monuments of Egypt and Ethiopia" (Berlin, 1849-'59); *Historisch-geographischer Atlas der alten Welt* (16 maps, Weimar, 1848; 15th ed., 1864); *Neuer Handatlas der Erde* (40 maps, Berlin, 1857-'61; enlarged ed., 1866 *et seq.*); *Grosser Handatlas des Himmels und der Erde*,

with C. F. Weiland and others (43d ed., 72 sheets, Weimar, 1871); and a large number of minor publications.

KIESEWETTER, Rafael Georg, a German author, born at Holleschau, Moravia, Aug. 29, 1773, died near Vienna, Jan. 1, 1850. He was for many years referendary of the aulic military council at Vienna. His works include *Geschichte der europäisch-abendländischen, das heisst unserer heutigen Musik* (Leipsic, 1834; 2d ed., 1846), which has been translated into English. He also wrote works on Dutch, modern Greek, and Arabic music. He published a catalogue (2 vols., Vienna, 1847) of his collection of ancient music, which latter he bequeathed to the imperial library at Vienna.

KIEV, Kieff, or Kiow. I. A S. government of European Russia, bordering on Minsk, Tchernigov, Poltava, Kherson, Podolia, and Volhynia; area, 19,682 sq. m.; pop. in 1867, 2,144,276. Kiev is the most fertile part of the Ukraine or Little Russia. Its surface is a plain, here and there undulating, and near the river courses intersected by low ranges. It is watered by the Dnieper, which forms its boundary on the side of Tchernigov and Poltava, and its western affluents, the Pripet, Ros, and others, the streams which take their course to the Bog or southern Bug being unimportant. There is abundance of grain of all kinds, of hemp, flax, honey, wax, and tobacco, excellent timber, and cattle of very good breed, the latter forming a principal article of export. The climate is generally very mild and dry; excessive heat prevails in summer. Agriculture and cat-

Kiev—the Petcherskoi Monastery.

tle breeding are the chief occupations of the inhabitants, who consist mainly of Little-Russians. The manufactures are unimportant. Trade is in part carried on by Jews, who are

numerous in the adjoining western governments. **II.** A city, capital of the government, on the right bank of the Dnieper, 270 m. N. of Odessa; pop. in 1867, 70,591. It consists of

four parts, the old town, the Petcherskoi or new fort, both on steep hills, the Podol or low town, between the hills and the river, and the Vladimir town, which was added to the former by the empress Catharine II. The old town, which in the times preceding the conversion of the Russians to Christianity, under Vladimir the Great, was the principal seat of Sarmatian and Russian heathen worship, now contains, besides several other churches, the cathedral of St. Sophia, a magnificent structure of the 11th century, and the palace of the Greek metropolitan. The fort contains the great Petcherskoi monastery from which it received its name, and which, together with the bastions and walls of the place, and the glittering gilt and colored cupolas of the churches on the neighboring eminences, makes a strong impression upon the traveller who approaches the city from the other side of the Dnieper. This division embraces the barracks of the garrison, the arsenals and magazines, the houses of the officers, the palace of the governor, numerous churches, and the renowned catacombs of St. Anthony, consisting of excavations in a precipitous cliff on the banks of the river, which attract numberless pilgrims from all parts of Russia through veneration for the saints whose bodies are there preserved. Adjoining are the catacombs of St. Theodosius, which contain a smaller number of saints. The Podol, which is the commercial part of the city, is regularly laid out, and embellished with gardens. Kiev has a large university, founded in 1834, to which are attached a library and cabinets of medals, zoology, mineralogy, and botany. There are also various other institutions of learning, of which the Greek theological academy in the Petcherskoi monastery is the best endowed and most frequented. The manufactures and trade of the city are not important. Railways connect it with Moscow and St. Petersburg, Odessa, and Lemberg. A magnificent bridge, recently constructed, spans the Dnieper.—The earliest history of Kiev is traced by some to the time of the Greek colonies near the N. coast of the Black sea; others place its foundation in the 5th century. In the last quarter of the 9th century it became the residence of the princes of Novgorod. As the capital of Christianized Russia, it was adorned in the 11th century with a great number of churches. After the middle of the 12th, however, it was deprived of its rank, and subsequently suffered by the devastations of the Tartars, the Lithuanian and Polish wars, the plague, and fires. After having been for about three centuries in the hands of the Poles, it was reannexed to Russia by the peace of 1667.

KILAUEA, a volcano in the E. part of the island of Hawaii, in lat. $19^{\circ} 25' N.$, lon. $155^{\circ} 20' W.$ It is a pit or sunken plain 8 m. in circumference, bounded by steep or perpendicular walls, and varying from 800 to 1,500 ft. in depth as the floor of the crater is raised or lowered by volcanic action; eruptions drawing

off the accumulated lavas from beneath and causing it to sink. Near the S. W. extremity of the pit is a lake of melted lava in a state of constant ebullition, called by the Hawaiians the Hale-mau-mau, or "house of everlasting fire," and formerly regarded as the residence of their principal divinity, the goddess Pele. From this caldron, which is not infrequently a third or a half mile in diameter, the fusion overflows in times of special volcanic activity, spreading out upon the cooled lava which forms the bottom of the crater; or it bursts out at new points of this nearly level tract. The crater presents in consequence quite different appearances at different times, being especially changed by the occurrence of eruptions. These are generally preceded by a rise in the floor of the crater. When the lateral pressure of the accumulating lava becomes sufficiently great, it forces its way through the side of the mountain, often accompanied by violent earthquakes, and breaks to the surface at a distance of 5, 10, or 20 m. from the great crater, which is usually emptied to a depth of 400 ft. The lava continues to flow seaward incessantly for several days, weeks, or months. These eruptions are generally independent of those which take place from the crater upon the summit of Mauna Loa, 10,000 ft. higher than Kilauea, though the two craters are but 16 m. distant from each other. The lavas are very fluid, and contain much iron and augite. The greatest recorded eruption of Kilauea took place in June, 1840. The lava forced its way for 27 m. mostly underground, marking its course by rending the rocks above it, and sometimes splitting the trunks of large trees so as to leave them standing astride of the crevices. The lava stream showed itself occasionally upon the surface of the ground, or in the pits of old craters; and finally it broke from the ground in a resistless flood, at the distance of 12 m. from the coast, and rolled shoreward, sweeping forests, hamlets, and plantations before it, until, leaping a precipice of 40 or 50 ft., it plunged with loud detonations into the sea. Its entire course was 40 m. in length; its depth, owing to the extreme roughness of the country over which it flowed, varied from 12 to 200 ft., and its width from 500 ft. to 3 m. The flow continued for three weeks, and for a fortnight the light of it was so brilliant that at Hilo, 40 m. distant, fine print could be read at midnight. The coast was extended into the sea a quarter of a mile; hills of scoria and sand were formed, one 300 ft. high; the sea was heated for 20 m. along the coast, and multitudes of fishes were killed. This eruption poured out 15,400,000 cubic feet of lava, which is probably about the average amount of the eruptions of Kilauea. Eruptions occurred in 1789, 1823, 1832, 1840, and 1866. The crater is not difficult of access, and is generally visited from Hilo.

KILBOURNE, James, an American pioneer, born in New Britain, Conn., Oct. 19, 1770, died in Worthington, O., April 9, 1850. He

was successively employed as an apprentice, clerk, merchant, and manufacturer. Having secured a competence, he became a priest in the Protestant Episcopal church, declined several advantageous calls to vacant parishes, and, for the purpose of promoting western emigration, in 1801-'2 organized the Scioto company, under whose auspices a colony of about 100 persons, under his lead, was in 1803 established in what is now the township of Worthington in Ohio. He retired from the ministry in 1804, and was appointed a civil magistrate, an officer of militia on the N. W. frontier, and surveyor of a large portion of the public lands. In 1812 he was one of the commissioners to settle the boundary between the public lands and the great Virginia reservation, and also commissioned as a colonel in the frontier regiment; and in 1813 he entered congress, of which he remained a member till 1817. He was for 35 years president of the board of trustees of Worthington college.

KILDARE, an inland county of Ireland, in the province of Leinster, bordering on Meath, Dublin, Wicklow, Carlow, Queen's, and King's counties; area, 654 sq. m.; pop. in 1871, 84,198. The surface is flat or undulating, and, with the exception of the bogs, has a fertile clayey soil. Farms are less subdivided in this county than in most others. Kildare has a considerable export of grain and flour by means of the river Barrow and the Royal and Grand canals and their branches. The rivers Liffey and Boyne also traverse a portion of the county, and two railways intersect it. Cotton and woollen fabrics and paper are manufactured to a limited extent. Near the centre of the county is a plain of 4,858 acres, the property of the government, and called the Curragh of Kildare, used for military camps of exercise, and having on it one of the best race courses in the kingdom. The principal towns are Naas, the capital, Athy, and Kildare.

KILDEER, an American plover, so called from its notes, which resemble the sounds "kildee, kildee, dee, dee, dee;" it is the *charadrius vo-*

Kildeer (*Ægialitis vociferus*).

ciferus (Linn.) or the genus *ægialitis* (Boie). The kildeer is about 10 in. long, with an extent of wings of 20, the bill 1 in., and the weight 6 oz. The head is small, the neck short, body rather slender, wings reaching to the end of the long tail, feet long and slender, hind tibia bare con-

siderably above the joint, and toe wanting. The bill is black, the edges of the lids bright red, the iris dark brown, and the feet grayish blue; the head above and upper parts of the body light brown with a greenish tinge; rump and upper tail coverts rufous; lower parts white; ring on neck and wide band on breast black; quills brownish black, with about half their inner webs white; white spots on the shorter primaries, and the secondaries edged with the same; the four middle tail feathers white tipped, with a wide subterminal black band, and the lateral ones widely tipped with white; the whole upper plumage is sometimes edged with rufous. The bird is common throughout North America, most abundant inland, going to the south in winter, and to the islands of the Atlantic and Pacific. It is very wary, the small flocks when feeding posting a sentinel to warn them of danger; when alarmed it is very noisy, uttering rapidly the notes which have given it its name. Its chief resorts are newly ploughed fields, the banks of clear rivers, and elevated worn-out grounds, where it feeds on worms, grasshoppers, beetles, small crustaceans, and snails; toward winter it approaches the seashore, and at the south is fond of the sugar, cotton, and rice fields, and of marshes, mud flats, and oyster beds. The flight is strong and rapid, whether at high or low elevations, and the speed in running is such as to have become proverbial; the large eyes indicate its habit of feeding by night as well as by day. It breeds in the southern states about the beginning of April, and a month later in the middle states; the nest is either a hollow in the earth or is made of grass on the ground; the eggs, usually four, are 1½ by 1¼ in., cream-colored with irregular purplish brown and black blotches; the parents adopt various devices to divert attention from their nest. The flesh, unless of the young in early autumn, is indifferent, though it is eaten at all seasons of the year.

KILIMANJARO (properly *Kilima Njaro*, snow mountain), the highest known mountain in Africa, situated in the Jagg country, on the border of Zanguebar, about 180 m. from the coast, in lat. 3° 40' S., lon. 36° E. It is crowned with perpetual snow, and its summit is 20,065 ft. above the level of the sea. It was discovered in 1848 by Rebmman.

KILKENNY. I. An inland county of Ireland, in the province of Leinster, bordering on Queen's, Carlow, Wexford, Waterford, and Tipperary counties; area, 796 sq. m.; pop. in 1871, 109,302. The surface is generally level, but diversified with some hills, which rise to the altitude of 1,000 ft. The county is intersected by the river Nore, and bounded respectively E. and S. by the rivers Barrow and Suir. The soil is mostly a light fertile loam. Anthracite coal of inferior quality abounds. Fine black marble is quarried near the town of Kilkenny. Various stone piles of the pagan era, cromlechs, and cairns are found in this county,

chiefly on the summits of hills. It is divided into ten baronies. **II.** A city, capital of the county, and a county in itself, situated on the

St. Canice's Cathedral, Kilkenny.

river Nore, 63 m. S. W. of Dublin, and 30 m. N. by W. of Waterford; pop. in 1871, 15,609. It is well built, paved, lighted, and supplied with water. The principal buildings are the cathedral of St. Canice or Kenny, erected in the 12th century, and having a round tower 100 ft. high adjoining its S. transept; a Roman Catholic cathedral, two Episcopal parish churches, six Catholic chapels, two monasteries, a convent, several Presbyterian and Methodist places of worship, the ruins of a Franciscan monastery, prisons, workhouse, barracks, and a castle built by Strongbow. Its educational institutions include the Kilkenny college or grammar school, where Swift, Congreve, Farquhar, Bishop Berkeley, and other distinguished persons studied; and St. Kyran's Roman Catholic seminary for the education of young men destined for the priesthood.

KILLARNEY, a market town and parish of Ireland, county Kerry, 44 m. N. N. W. of Cork; pop. of the town (which lies partly in the parish of Aghadoe) in 1871, 5,187. It is an unattractive place, containing several hotels, a nunnery, a dispensary, a fever hospital, an almshouse, and several churches and chapels, including a handsome Roman Catholic cathedral.

It is situated about $1\frac{1}{2}$ m. E. of a chain of three lakes famous for their picturesque beau-

ty, and much resorted to by tourists. The upper or southernmost lake is $2\frac{1}{2}$ m. long and $\frac{3}{4}$ m. wide. It contains 12 islets, and is connected by a circuitous stream with the middle, Muckcross, or Tore lake, $1\frac{1}{2}$ m. long. The latter communicates by three passages with the lower lake, called also Lough Leane, which is 4 m. long and 2 m. broad, and contains 30 islands. On the peninsula between the middle and lower lakes are the picturesque ruins of Ross castle, a fortress of the 15th century, and the remains of Muckcross abbey. On the W., S., and S. E. shores rise high mountains, separated by wild ravines, through which flow several beautiful springs. O'Sullivan's cascade, near the W. shore of Lough Leane, consists of three distinct falls between high overhanging rocks.

KILLIGREW. I. Sir William, an English poet, born at Hanworth, Middlesex, in 1605, died in London in 1693. He was educated at St. John's college, Cambridge, and became governor of Pendennis castle in Cornwall, and afterward gentleman usher to Charles I. When the civil war broke out he was made a captain in the royal horse guards, and at the restoration gentleman usher to Charles II., and subsequently first vice chamberlain, which office he held for 22 years. He was buried in Westminster abbey. He wrote "The Siege of Urban," "Selindra," "Ormasdes, or Love and Friendship," and "Pandora," dramas published at Oxford in 1666, and much praised by Waller. In his old age he wrote "Artless Midnight Thoughts," &c., and "Midnight and Daily Thoughts." **II. Thomas**, an English dramatist, brother of the preceding, born at Hanworth in 1611, died in London in 1682. After visiting France, Spain, and Italy, he be-

Ruins of Ross Castle, Killarney.

came page of honor to Charles I., and at the restoration groom of the bedchamber to Charles II., whose exile and privations he had shared,

and over whom, by his coarse licentious wit, he had acquired great influence. He was the author of 11 plays, a complete edition of which appeared in 1664. **III. Henry**, an English divine, brother of the preceding, born at Hanworth in 1612; the date of his death is uncertain. He was educated at Christchurch, Oxford. When only 17 years old he wrote a tragedy called "The Conspiracy" (reprinted in 1653 under the title of "Pallantus and Eudora"). After the restoration he became almoner and chaplain to the duke of York. **IV. Anne**, daughter of the preceding, born in London in 1660, died in June, 1685. She was noted for her virtues, beauty, and accomplishments, but is still better known by the ode which Dryden wrote to her memory. She was "excellent in the sister arts of poesy and painting," and painted a portrait of the duke of York (afterward James II.) and his duchess, to whom she was a maid of honor. A volume of her poems was published in 1686.

KILMARNOCK, a parliamentary and municipal borough of Ayrshire, Scotland, 12 m. N. N. E. of Ayr, 20 m. S. W. of Glasgow, and 8 m. from the seaport of Troon, with all of which it is connected by railway; pop. in 1871, 22,952. The town possesses some handsome public buildings, 18 churches, an academy, several public libraries, a picture gallery, a mechanics' institute, &c. It is famed for the manufacture of woollen shawls, carpets, worsted goods, gauzes, muslins, hosiery, and shoes.

KILOGRAMME. See **GRAMME**.

KILWA, or **Qilwa**, a town of E. Africa, on an island off the coast of Zanguebar, in lat. 8° 57' S., lon. 39° 37' E.; pop. about 7,000. It is tributary to the sultan of Zanzibar, and has much declined in importance and population since its devastation by the Portuguese early in the 16th century. It is now chiefly known as one of the principal ports for the exportation of slaves; nearly 100,000 were sent in the five years 1862-'7 to Zanzibar and other places, and about 15,000 were exported in the year ending August, 1869. These statistics were submitted at a public meeting held in London, June 5, 1874, for the suppression of the slave trade in accordance with Sir Bartle Frere's negotiations in 1873 with the sultan of Zanzibar. The name Kilwa is also applied to the island and to other adjacent localities, and the surrounding region is watered by many important rivers and noted for its unhealthy character.

KIMBALL, **Richard Burleigh**, an American author, born at Plainfield, N. H., Oct. 11, 1816. He graduated at Dartmouth college in 1834, studied law, and after visiting Europe, and spending some time at the continental universities, he entered upon the practice of law, first at Waterford, N. Y., and then in New York city. His works, besides lectures, pamphlets, and contributions to periodicals, are: "St. Leger, or the Threads of Life" (New York and London, 1849); "Letters from England;" "Letters from Cuba" (New York, 1850);

"Cuba and the Cubans" (1850); "Romance of Student Life abroad" (1853); "Under-currents of Wall Street" (1862); "Was He Successful?" (1863); "In the Tropics" (1863); "The Prince of Vashna" (1865); "Henry Powers, Banker" (1868); and "To-day" (1869).

KIMBLE, a W. county of Texas, drained by the head waters of Llano river; area, about 1,400 sq. m.; pop. in 1870, 72. It has a rugged surface, with an alternation of narrow valleys and rocky highlands, and abounds in limestone and other building materials. The soil is of good quality, but better adapted to grazing than tillage. Good timber is abundant.

KIMHI, or **Kimchi**, **David**, a Hebrew scholar of southern France, born probably at Narbonne, flourished in that city in the earlier part of the 13th century. He was the son of Rabbi Joseph Kimhi, a distinguished Biblical commentator, and the younger brother of Moses Kimhi, an eminent grammarian. Both of them were eclipsed by David, whose exegetical and linguistic writings are to this day considered standard works by Hebrew students. They include a Hebrew grammar (*Sepher mikholol*, Constantinople, 1532; Venice, 1545, &c.), a Hebrew dictionary (*Sepher hashshorashim*, Naples, 1491; Venice, 1529, &c.), a defence of Maimonides, and commentaries on the prophets, the Psalms, and some other portions of the Scriptures, which have appeared in various Bible editions.

KINCARDINESHIRE, or **The Mearns**, a maritime county of Scotland, bordering on Aberdeenshire, Forfarshire, and the North sea; area, 394 sq. m.; pop. in 1871, 34,651. Geographically the county is divided into the Grampians or hill district, Deeside, the valley or "howe" of the Mearns, and the coast side. Mount Battock, the highest point of the Grampians in Kincardineshire, is 2,500 ft. high. The principal rivers are the Dee, North Esk, Bervie, and Dye. The county is mainly agricultural. There are manufactures of linen and of a peculiar kind of woollen tartan wares of beautiful workmanship. On the coast there are about a dozen fishing villages. Capital, Stonehaven.

KINDERGARTEN. See **INFANT SCHOOLS**.

KINESIPATHY. See **LING**, **PETER HENRIK**.

KING (Ger. *König*; A. S. *cynig* or *cynig*), a title of dignity designating the supreme ruler of a nation or country. The etymology of the word is far from being settled, some deriving it from the old Gothic *kunī*, family or (noble) race; others from roots like *know*, *can*, *ken*, denoting ability; while others compare it with *khan* and other eastern terms of similar meaning. The Romance languages all use words little altered from the Latin *rex* (ruler), which was the title of the first seven sovereigns of Rome, while those who followed the fall of the republic assumed that of *imperator* (commander), now altered into our emperor. The difference between king and emperor, and between kingdom and empire, is not always one

of power or extent, but is sometimes the result of historical developments. Thus Louis XIV. and Louis Philippe were satisfied with the title of king, while the sovereign successor to the unaltered dominions of the latter, Napoleon III., assumed that worn by the conqueror from whom he derived his historical claims to power. Soulouque of Hayti, who like both Napoleons paved his way to the throne by a *coup d'état*, also chose the title of emperor. In Europe there were 12 kingdoms in 1874: Great Britain and Ireland, Italy, Sweden and Norway, Belgium, Portugal, Holland, Denmark, Greece, Prussia, Bavaria, Saxony, and Würtemberg; the last four, however, being included in the German empire. Besides these there are other kingdoms in Europe which, having in various degrees lost their independence, have maintained their title, adding it to those of the other possessions of their rulers. Thus the emperor of Russia is king of Poland, and the emperor of Austria king of Bohemia, while Hungary forms as a kingdom a constituent half of the latter empire. There are also some titles preserved by houses who have lost the possessions to which they were attached. The emperor of Austria styles himself king of Jerusalem, and the king of Sweden also king of the Vandals. The royal dignity in Europe is now everywhere hereditary. Formerly there were elective kings of Poland, Hungary, and other countries; those of Poland were little more than presidents for life of a republic. The successor elect of the German emperors was called king of Rome; the same title was bestowed by Napoleon I. on his son. The period of Napoleon was productive of new kingdoms, of which some, as Westphalia and Etruria, were short-lived.

KING, a N. W. county of Washington territory, bounded E. by the Cascade mountains, and W. by Admiralty inlet; area, 1,800 sq. m.; pop. in 1870, 2,120. It has numerous harbors. The principal rivers are the White, Snoqualmie, Dwamish, and Green, which are bordered by good agricultural land. Lake Washington is a large body of fresh water, bordered by lands rich in coal, which is mined. The W. part is interspersed with prairies, forests, and lakes. The Snoqualmie pass, 3,700 ft. high, crosses the Cascade range in this county. The falls of Snoqualmie attract many tourists. The chief productions in 1870 were 3,872 bushels of wheat, 14,135 of oats, 2,817 of barley, 42,981 of potatoes, 34,755 lbs. of butter, and 1,884 tons of hay. There were 305 horses, 628 milch cows, 947 other cattle, and 891 swine; 1 brewery, 1 planing mill, 1 flour mill, and 2 saw mills. Capital, Seattle.

KING, John Crookshanks, an American sculptor, born at Kilwinning, Ayrshire, Scotland, Oct. 11, 1806. He was educated as a practical machinist, emigrated to the United States in 1829, and was employed for several years in Cincinnati and Louisville as superintendent of a factory. In 1834, at the suggestion of Hiram

Powers, he made a model in clay of the head of his wife, and the success with which the work was accomplished encouraged him to adopt the profession of a sculptor. From 1837 to 1840 he resided in New Orleans, and modelled a number of busts of public men and made cameo likenesses. Subsequently he removed to Boston, where he now lives. He has executed several busts of Daniel Webster, also those of John Quincy Adams, Dr. Samuel Woodward, Professor Agassiz, Ralph Waldo Emerson, and other men prominent in public life or literature. Since 1860 he has executed for the city of Boston a bust of Chief Justice Shaw; but with the exception of a few busts of private individuals, he has mainly been engaged on cameos of Webster, Franklin, Grier-son, Audubon, Com. Morris, J. Q. Adams, Horace Greeley, Sumner, Lincoln, Washington, and others, and is now (June, 1874) executing a cameo of Agassiz.

KING, Peter, lord, an English chancellor, born in Exeter in 1669, died at Ockham, Surrey, July 22, 1734. His mother was a sister of the philosopher Locke. He studied at Leyden, was called to the bar, was elected to parliament in 1699 for Beer-Alston, Devonshire, was appointed in 1709 one of the managers to conduct the impeachment of Sacheverell, and a few years later acted as counsel in defence of Whiston. Soon after the accession of George I. he was made chief justice of the common pleas, and a privy councillor; and in June, 1725, on the removal of the earl of Macclesfield, he became lord chancellor, with the title of Baron King of Ockham. He held office till November, 1733, when ill health compelled him to resign. More of his decrees are said to have been set aside than of any former chancellor. He wrote "Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church" (London, 1691), and "Critical History of the Apostles' Creed" (1702).

KING, Philip Parker, a British admiral, born on Norfolk island, Dec. 13, 1793, died at Grantham, near Sydney, Australia, in February, 1855. He was the son of a naval officer, and entered the navy in 1807. In 1817 he was intrusted with the conduct of an expedition to Australia, returning to Europe in 1823, when he published the results of his survey of the inter-tropical and western coasts; the atlas to this work was issued by the hydrographical office at the admiralty. In 1825 he was appointed to survey the S. coast of America, from the entrance of the Rio de la Plata round to Chiloe, and of Tierra del Fuego, and published in 1832 "Sailing Directions to the Coasts of Eastern and Western Patagonia, including the Straits of Magelhaen and the Sea Coast of Terra del Fuego." Afterward he returned to Australia, where he was elected to the legislature in 1851. Shortly before his death he was appointed rear admiral of the blue, being the first instance of a native of Australasia rising to so high a rank in the navy.

KING, Rufus, an American statesman, born in Scarborough, Me., in 1755, died in Jamaica, L. I., April 29, 1827. His father, Richard King, a successful merchant, gave him the best education then attainable. He was admitted to Harvard college in 1773, graduated in 1777, and went to Newburyport to study law under the direction of Theophilus Parsons. In 1778 he served as aide-de-camp to Gen. Glover in the brief and fruitless campaign in Rhode Island. He was admitted to the bar in 1780, and at once entered upon a successful practice in Newburyport. He was an ardent patriot, and in 1782 was chosen a member of the general court or legislature. In that body, to which he was repeatedly reelected, he took a leading part, and successfully advocated, against a powerful opposition, the granting of a 5 per cent. impost to the congress, as indispensable to the common safety and the efficiency of the confederation. In 1784 he was chosen by the legislature a delegate to the continental congress, then sitting at Trenton. He took his seat in December, and in March, 1785, moved a resolution: "That there be neither slavery nor involuntary servitude in any of the states described in the resolution of congress of April, 1784, otherwise than in punishment of crime whereof the party shall have been personally guilty; and that this regulation shall be made an article of compact and remain a fundamental principle of the constitution between the original states and each of the states named in said resolves." This resolution was, by the vote of seven states (New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, and Maryland) against four (Virginia, North Carolina, South Carolina, and Georgia), referred to a committee of the whole, where for the time it slept. The ordinance offered by Thomas Jefferson in the previous year (April, 1784) proposed the prospective prohibition of slavery in the territories of the United States after the year 1800; Mr. King's proposition was for its immediate, absolute, and irrevocable prohibition. When, two years afterward, the famous ordinance of freedom and government for the N. W. territory was reported by Nathan Dane of Massachusetts (July 11, 1787), Mr. King, who was a member of that congress (then sitting in New York), had gone to Philadelphia to take the seat to which he had been elected by Massachusetts as a member of the convention for framing a constitution for the United States; but his colleague embodied in the draft of his ordinance the provision, almost word for word, which Mr. King had laid before congress in March, 1785. While occupied with his duties as a member of congress, he was designated by his state as one of the commissioners to determine the boundary between New York and Massachusetts, and was empowered with his colleague to convey to the United States the large tract of lands beyond the Alleghanies belonging to his state. On Aug. 14, 1786, Rufus King and James Monroe

were appointed a committee on behalf of the congress to wait upon the legislature of Pennsylvania and explain to them the embarrassments of the finances of the United States, and to urge the prompt repeal by that state of the embarrassing condition upon which it had voted its contingent of the 5 per cent. impost levied by the congress on all the states. The speech of Mr. King on this occasion, though no notes of it remain, is commemorated as most effective and brilliant. On May 25, 1787, he took his seat in the federal convention. The journals of the convention and the fragments of its debates which have come down to us attest the active participation of Mr. King in the important business before them; and, although one of the youngest members of that body, he was selected as one of the committee of five to which it was finally referred to "revise the style of, and arrange the articles" agreed on for the new constitution. Having signed the constitution as finally adopted, Mr. King went back to Massachusetts, and was immediately chosen a delegate to the state convention which was to pass upon its acceptance or rejection. Fierce opposition was made in that convention to this instrument, Mr. King successfully leading the array in defence. In 1788 he took up his permanent residence in New York, where in 1786 he had married Mary, daughter of John Alsop; and in the following year he was elected a representative of that city in the assembly of the state. In the summer of the same year he was chosen by the legislature the first senator from the state of New York under the new constitution, having for his colleague Gen. Schuyler. In this body he took rank among the leaders of the federal party. In the bitter conflict aroused by Jay's treaty he was conspicuous in its defence, both in the senate and as the joint author with Alexander Hamilton of a series of newspaper essays, under the signature of Camillus. In 1795 he was reelected to the senate, and while serving his second term was nominated by Washington minister plenipotentiary to Great Britain, having previously declined the office of secretary of state, made vacant by the resignation of Edmund Randolph. He embarked with his family at New York in July, 1796, and for eight years ably fulfilled the duties of the office. No foreign minister was probably more sagacious in ascertaining or divining the views and policy of nations, or more careful in keeping his own government well informed on all the public questions of the day. His diplomatic correspondence is a model both in style and in topics. The federal party having lost its ascendancy in the public councils, Mr. King, shortly after Mr. Jefferson's accession, asked to be recalled. He was however urged by the president to remain, as he had in hand important negotiations. The recurrence of war in Europe, consequent upon the rupture of the peace of Amiens, leaving little hope of success on the point to which his efforts had been chiefly directed, that of se-

curing our seamen against impressment, he renewed his request to be relieved; and accordingly a successor was appointed, and Mr. King returned to his country in 1804, and withdrew to a farm at Jamaica, L. I. In 1813, during the war with Great Britain, he took his seat for the third time as United States senator. Yielding no blind support to the administration, and offering to it no partisan opposition, he yet was ever ready to strengthen its hands against the common enemy. When the capitol at Washington was burned by the British forces, he resisted the proposal to remove the seat of government to the interior, and rallied the nation to defend the country and avenge the outrage. His speech on this occasion in the senate was one of those that marked him as a great orator. At the close of the war he applied himself to maturing the policy which should efface its evils as speedily as possible, and build up permanent prosperity. To a bill, however, for a United States bank with a capital of \$50,000,000, he made earnest opposition. He resisted the claim of Great Britain to exclude us from the commerce of the West India islands; and to his intelligent exposition of the laws of navigation and of the mercantile interests and rights of the United States we are indebted for the law of 1818. He likewise early discerned the danger of the sales on credit of the public lands, and by his bill substituting cash payments and a fixed but reduced price for these lands, and stipulating a remission of interest and of a portion of the principal of the debt then due therefor, he averted a great political peril, and gave order and security to the receipts from the sale of those lands. In 1819 he was reëlected to the senate, as in the previous instance by a legislature of adverse politics to his own. In 1816 he had been, without his knowledge, named as the candidate of the federal party for governor of New York. He reluctantly accepted the nomination, but was not elected. Shortly afterward the so-called Missouri question began to agitate the nation. Mr. King was pledged against the extension of slavery; and when therefore Missouri presented herself for admission as a state with a constitution authorizing the holding of slaves, he was inexorably opposed to it. The state of New York, by an almost unanimous vote of its legislature, instructed him to resist the admission of Missouri as a slave state; and the argument made by Mr. King in the senate, though but partially reported, has been the repertory for almost all subsequent arguments against the extension of slavery. He also opposed the compromise introduced by Mr. Clay, which partially yielded the principle, and voted to the last against it. His fourth term in the senate expired in March, 1825, when he took leave of that body, and as he hoped of public life, in which for 40 years he had been engaged. One of his latest acts was to present a resolution, Feb. 16, 1825: "That as soon as the portion of the existing

funded debt of the United States for the payment of which the public land of the United States is pledged shall have been paid off, then and thenceforth the whole of the public land of the United States, with the net proceeds of all future sales thereof, shall constitute and form a fund which is hereby appropriated, and the faith of the United States is pledged that the said fund shall be inviolably applied, to aid the emancipation of such slaves within any of the United States, and to aid the removal of such slaves and the removal of such free persons of color in any of the said states, as by the laws of the states respectively may be allowed to be emancipated or removed to any territory or country without the limits of the United States of America." The resolution was read, and, on motion of Mr. Benton of Missouri, ordered to be printed. John Q. Adams, now become president, urged Mr. King to accept the embassy to England, with which country unadjusted questions of moment were pending, and which the president believed Mr. King was specially qualified to manage. He reluctantly accepted the mission; but his health gave way, and after a few months spent in England, where he was warmly welcomed, he resigned and came home.—His son JOHN ALSOP, born in New York, Jan. 3, 1788, was several times elected to the state legislature, was a member of congress in 1849-'51, and governor of the state in 1857-'9. He was for many years president of the state agricultural society, and died in Jamaica, Long Island, July 8, 1867.—His second son, CHARLES, born in March, 1789, was for some time a merchant, member of the legislature in 1813, from 1823 to 1845 editor of the "New York American," afterward associate editor of the "Courier and Enquirer," and from 1849 to 1864 president of Columbia college. He died in Frascati, Italy, Sept. 27, 1867. He was the author of a "Memoir of the Croton Aqueduct" (1843), "History of the New York Chamber of Commerce," "New York Fifty Years Ago," and other historical pamphlets.

KING, Thomas Starr, an American clergyman, born in New York, Dec. 16, 1824, died in San Francisco, March 4, 1864. He was preparing to enter Harvard college when the sudden death of his father left the family in a measure dependent upon him, and from the age of 12 to 20 he was employed either as a clerk or schoolmaster, devoting his leisure hours to theological studies. In September, 1845, he preached for the first time in the town of Woburn, and in 1846 he was settled over his father's former parish in Charlestown, whence he was called in 1848 to the Unitarian church in Hollis street, Boston, with which he remained connected until the early part of 1860. In April of the latter year he sailed for San Francisco, to take charge of the Unitarian congregation in that city. Apart from his labors in the pulpit, he acquired an extended reputation as a lecturer, and for 15 years addressed large audiences every

winter in nearly all the northern states. When California seemed in danger of seceding, he travelled over the state, speaking enthusiastically in favor of the Union; and her loyalty is largely attributed to his eloquence. He also labored earnestly and effectively in behalf of the sanitary commission. He published "The White Hills, their Legends, Landscape, and Poetry" (4to, illustrated, 1859), and a number of articles in reviews, pamphlets, and sermons. A volume of his writings, entitled "Patriotism and other Papers," was published in 1864, and Richard Frothingham wrote "A Tribute to Thomas Starr King" (Boston, 1864).

KING, William, an Irish bishop, born in Antrim in 1650, died in Dublin, May 8, 1729. He was educated at Trinity college, and ordained in 1674. In 1688 he became dean of St. Patrick's, but having taken a prominent part in the controversies of the time, and in opposition to the policy of the government, he was, after the revolution and the landing of James II. in Ireland in 1689, imprisoned in Dublin castle. On the departure of James he was liberated and restored to his deanery. In 1691 he was promoted to the see of Derry, and in 1702 became archbishop of Dublin. He was the author of many theological and controversial works, the most important of which is his treatise *De Origine Mali* (1702), which provoked attacks from several formidable antagonists, among whom were Leibnitz and Bayle.

KING, William Rufus, an American statesman, 13th vice president of the United States, born in Sampson co., N. C., April 6, 1786, died in Dallas co., Ala., April 17, 1853. He entered the university of North Carolina at the age of 12, graduated in 1803, and was admitted to the bar in 1806. He was elected to the legislature in 1806, and was reelected in 1807; but at the meeting of the legislature he was appointed state solicitor for the Wilmington circuit, which office he held for two years, when he resigned. In 1809 he was again elected to the legislature. In 1810 he was elected to congress, and was twice reelected. In congress he united himself with Clay, Calhoun, and others, who advocated the war policy of Mr. Madison's administration, and voted for the declaration of war in June, 1812. In the spring of 1816 he resigned his seat to become secretary of legation to Naples under William Pinckney, whom he accompanied in the same capacity to St. Petersburg. In the autumn of 1818 he returned home, and removed to Dallas co., Ala., where he continued to reside until his death. In 1819 he was elected to the convention to form a constitution and a state government for Alabama, and was chosen one of the United States senators from the new state, drawing the short term of four years. He was successively reelected in 1823, 1828, 1834, and 1840. During all this time he acted uniformly with the democratic party. In April, 1844, he was appointed by President Tyler minister to France. The proposition for

the annexation of Texas was then pending, and Mr. King successfully exerted himself to prevent a joint protest of France and England against it. He returned to the United States in November, 1846. In 1848 he was again elected United States senator to fill a vacancy, and in 1849 for a full term. In 1850, on the accession of Vice President Fillmore to the presidency after the death of Gen. Taylor, Mr. King was unanimously elected president of the senate. In 1852 he was elected vice president of the United States, at the time Franklin Pierce was elected president. In January, 1853, he went to Cuba for the benefit of his health, and by a special act of congress the oath of office as vice president was administered to him by the American consul general at Havana. In April he returned home.

KING AND QUEEN, an E. county of Virginia, bounded S. W. by Mattapony and York rivers, and E. by the Piankatank; area, 335 sq. m.; pop. in 1870, 9,709, of whom 5,488 were colored. The surface is moderately uneven. The soil is not very fertile, but may be improved by the application of marl, of which the county contains large quantities. The chief productions in 1870 were 28,172 bushels of wheat, 204,906 of Indian corn, 19,771 of oats, and 30,733 lbs. of butter. There were 770 horses, 1,600 milch cows, 1,289 working oxen, 1,830 other cattle, 2,036 sheep, and 5,754 swine. Capital, King and Queen Court House.

KING AT ARMS. See **HERALDRY.**

KING BIRD, an American flycatcher of the genus *tyrannus* (Cuv.), and species *T. Carolinensis* (Baird) or *T. intrepidus* (Vieill.); other names given to it are tyrant flycatcher and bee martin. This bird is 8½ in. long, with an extent of wings of 14½; the bill is stout, shorter than the head; the wings long and pointed,

King Bird (*Tyrannus Carolinensis*).

the outer primaries abruptly attenuated near the end; tail shorter than the wings, slightly rounded; on the crown a concealed patch of vermilion feathers edged with white and orange, capable of erection as a crest. The color above is dark bluish ash; below white, tinged

with bluish ash on the sides of the throat and across the breast; the wings dark brown, the greater coverts and quills edged with white; tail broadly margined and tipped with white. It is found throughout eastern North America to the Rocky mountains, and in Washington territory. According to Audubon, the king bird arrives in Louisiana from the south about the middle of March; it proceeds gradually to the north, going back about the last of August. It prefers orchards, fields of clover, and the vicinity of houses, being seldom found in woods; the flight is rapid, performed by alternate flappings and sailings, much in the manner of our robin. The intrepidity of the king bird is remarkable, as it does not hesitate to attack the crow, vultures, hawks, eagles, and even cats and other animals approaching the nest, plunging upon their backs and striking with the bill; it is the farmer's friend in protecting eggs from the crow and chickens from the hawk, and in devouring noxious insects; and yet on account of its eating a few bees, raspberries, and figs, it is very generally persecuted. The nest is made in trees, and the eggs, four to six, are reddish white with irregular spots of brown. The notes are tremulous and sharp, and uttered continuously during flight. Many are shot in the southern states, where their flesh is considered a delicacy.

KING CRAB, or Horse-shoe Crab, a common name for the limuloid group of the entomostracan order of crustaceans, from their large size and peculiar form. This order is the lowest of the class, as the segments and feet are fewer than in the other orders. In the genus *limulus* (*xiphosura*, Milne-Edwards), the tail is reduced to a mere spine, and the bases of the first six pairs of legs, being rough with points, perform

King Crab.—1. Lower surface. 2. Upper surface.

the functions of jaws, their free extremities ending in nipping claws. The whole upper surface is protected by a kind of buckler, made up of an anterior semicircular shield, and a posterior hexagonal plate, to the hinder margin of which is jointed the long sharp spine of the

tail; the branchial appendages are on the under surface of the posterior plate. The Molucca king crab attains a size of 2 to 3 ft., and both eggs and flesh are eaten by the Malays; the spine attached to a spear makes a formidable weapon. Our common species (*limulus polyphemus*) also grows very large on the Atlantic coast of the middle states, and is of a blackish brown color; its flesh is sometimes given to pigs and poultry, but, while it fattens them, imparts a bad flavor to their meat; on the New England coast the size is small, and their delicate yellowish cast-off shells are frequently thrown upon the beaches. The legs are feeble, and the use of the tail seems to be to enable it to turn over by a kind of spring, should its wide flat body be thrown by the waves upon its back; the anterior limbs in the male are short, stout, and swelled, with nippers for holding the female. The eggs, fertilized in summer as they are extruded, are placed in a hole excavated in the sand on the edge of high tide, the sand at once covering them; their hatching is thus aided by the heat of the sun until the tide rises again. The eggs of the king crabs are very tenacious of life. The extinct *eurypteridæ* are closely allied, and some, as *pterygotus*, attained a length of 6 ft. Dr. Packard, in the "Memoirs and Proceedings of the Boston Society of Natural History," 1870-'72, and "Proceedings of the American Association for the Advancement of Science," 1870, has shown that the larva, which hatches in about six weeks, bears a striking resemblance to the trilobites; he therefore regards the *paciloptera*, or the king crab and its allies, as a subdivision of the branchiopods. Prof. Van Beneden, on the contrary (1872), thinks that the king crabs are not crustaceans, having none of their characteristic phases of development, but show the closest resemblance to scorpions and other arachnids; and that trilobites, *eurypteridæ* and *pacilopoda*, must form with the arachnids a distinct division. Considering the palæozoic trilobites as the lowest, the next series in time and in rank would be such forms as *eurypterus* and *pterygotus*, the *limulus* or king crab being the highest, and beginning to appear as the trilobites were dying out; some forms of trilobites had a spiny tail like *limulus*.

KING FISH, the common name of the perch-like, scianoid fishes of the genus *umbrina*, especially the *U. nebulosa* (Storer) or *U. alburnus* (De Kay), the former being regarded by Storer as the northern and the latter as the southern species. It is of a dull gray color, with silvery reflections on the sides and irregular dark bars, one broad one extending straight backward from the end of the pectorals to the tail; beneath, yellowish; extremities of first dorsal, pectorals, and ventrals white, rays black, second dorsal and base of pectorals and ventrals yellowish. Body elongated, snout blunt, lips fleshy, jaws with numerous small card-like teeth; small fleshy cirrus under chin; length 16 to 17 in.; weight 1 to 2 lbs. It is a deep

swimmer and a good table fish, and is often called whiting. It is rare on the New Eng-

King Fish (*Umbina nebulosa*).

land coast, but common in the waters of the middle states.

KINGFISHER, an extensive family of birds, with a lengthened, generally straight bill, broad at the base with acute tip, rounded wings, short tail, strong and short tarsi. The family includes, according to Gray, the subfamilies *bucconinae* or puff birds of tropical America; the *galbulinae* or jacamars, also South American, already treated; *halcyoninae* or kinghunters, belonging to the old world; and the *alcedininae* or kingfishers, distributed the world over. The subfamily of kingfishers contains the genera *alcedo* (Linn.), *alcyon* (Swains.), and *ceryle* (Boie), with a long, straight, and slender bill, with the culmen sloping to the acute tip. In *alcedo* the wings are short, with the first quill nearly as long as the second and third, which are equal and longest; tail short, broad, and rounded; tarsi very short and robust; toes unequal, the middle one longest, and the inner one short; the claws short and curved. The species of this genus are found in most parts of the old world, where they frequent freshwater rivers and lakes, perching solitary on an overhanging branch, or skimming near the surface in pursuit of their fish prey; they

European Kingfisher (*Alcedo ispida*).

sometimes plunge from a branch, and at others flutter over a spot, suddenly pouncing on a fish

as it rises to the surface; they catch the fish with the bill, and swallow it whole, head foremost, unless it be too large, in which case they beat it to pieces and swallow the separate fragments. The nest is made at the end of a long gallery which they excavate in the sandy or clayey banks of rivers by their bill and feet, and the eggs, six or seven in number, are placed on ejected pellets of fish bones. The common kingfisher of Europe (*A. ispida*, Linn.) is about 7 in. long, with a long sharp bill, stout body, and short wings; it possesses many of the brilliant colors of tropical birds, the upper back being dark green, the lower back and rump bright blue; the upper part of the head, wing coverts, and stripe on each side of neck, green with numerous light blue spots; throat and neck stripe yellowish white, and lower parts pale chestnut. The eggs are pinkish white, and are placed in holes in river banks. The bird is the halcyon of the ancients, from whose period and habits of incubation arose the term "halcyon days."

Belted Kingfisher (*Ceryle alcyon*).

Some of the older writers even attributed to the kingfisher the power of arresting the violence of the waves. In some parts of Europe it is still believed that the breast of a kingfisher suspended by the bill will always be turned to the north, that when accurately balanced the bill will point in the direction of the wind even within doors, and that its head and feathers protect against witches and storms at sea, and are a sure means of securing the affections of a loved object. The flight is direct and rapid, and its note sharp and piercing and emitted on the wing. The genus *alcyon* (Swains.) has no inner toe; its few species are found in Australia and the Indian archipelago; their habits are the same as in the preceding.—The common kingfisher of this country belongs to the genus *ceryle* (Boie); this comprises several species, many of which are found in Africa and India; the tail is long and rounded, the tarsi uncommonly short and stout, and the inner toe much longer than the hinder. The belted kingfisher (*C. alcyon*, Boie) is found

throughout North America; the length is about 13 in. and the extent of wings 22; the head has a long crest; the color is blue above, without metallic lustre; a concealed band across the back of the head, a spot before the eye, and the lower parts white; a band across the breast, and the sides under the wings, blue like the back; primaries white on the basal half; tail transversely banded and spotted with white. In the young birds there is a light chestnut band on the breast below the blue one, which last is more or less tinged with chestnut. Specimens from the Pacific coast are considerably the largest. It is a constant resident in the southern states; its flight is rapid, and it often suddenly stops like a sparrow hawk and hovers over the water, dashing headlong after its prey, which it carries to the nearest stump or tree and swallows instantly. It follows the course of rivers even to the cascades of their sources, and its presence near a stream is good evidence to the angler that fish are there abundant; it is fond of resorting to mill ponds, where the stillness of the water enables it easily to detect its prey. Its notes are very sharp, rapid, and rattling. The nests are made in holes dug to the horizontal depth of from 4 to 6 ft. in a bank, the entrance being just large enough to admit a bird, and the end rounded like an oven; the eggs are generally six, and pure white, and incubation lasts about 16 days, being performed by both parents; the eggs are considered good eating, though the flesh of the bird is fishy and tough. According to Audubon, this bird occasionally plunges into the sea after small fry.—The subfamily of *halcyoninae* or kinghunters have the aspect and general habits of kingfishers, from which they differ principally in the broader and stouter bill. The genus *dacelo* (Leach) is found in Australia and Papua; the species are not shy, and one, the *D. gigas* (Bodd.), is 18 in. long; they go into the woods, and feed indiscriminately on any animals of suitable size, whether quadruped, bird, reptile, fish, insect, or crustacean; the colors are handsome, and the flight quick and noiseless; their powerful bills render them formidable, and they can successfully resist the smaller birds of prey; some of the species have a peculiar screaming laugh at sunrise and sunset, which has caused the name of "laughing jackass" to be given to them in Australia. The genus *halcyon* (Swains.), with about 50 species, inhabits Africa, Australia, India and its archipelago, and the South sea islands; some of these birds are very handsome, green and blue predominating; they build their nest in the hollow trunks of trees.

KING GEORGE, an E. county of Virginia, bounded N. and E. by the Potomac river and S. by the Rappahannock; area, 176 sq. m.; pop. in 1870, 5,472, of whom 2,812 were colored. The surface and soil are both diversified. The chief productions in 1870 were 34,463 bushels of wheat, 144,807 of Indian corn, 11,652 of oats, and 29,322 lbs. of butter. There were 848 horses, 2,706 cattle, and 2,440 swine. Capital, King George Court House.

KINGLAKE. I. Alexander William, an English author, born in Taunton in 1802. He was educated at Eton and at Trinity college, Cambridge, was called to the bar in 1837, and in a few years acquired an extensive chancery practice in London. Not long after his admission to the bar he made an extensive tour in the East, of which he wrote home many graphic descriptions. Upon his return to England he was induced to revise his letters for publication; but having attempted in vain to find a publisher, he threw the manuscript aside, and for some years thought no more upon the subject. Happening one day to be conversing with a publisher on the recent appearance of a book of travels, he offered to give him his manuscript if he would print it. The offer was accepted, and the work, published under the title of "Eöthen" (1844), was universally pronounced one of the freshest and most entertaining books of travel of the day. In 1857 he was returned to parliament for the borough of Bridgewater, and in 1860 took an active part in denouncing the annexation of Nice to the French empire. In 1868 he was again returned for Bridgewater, but was unseated on petition. After "Eöthen" he published nothing, except an article in the "Quarterly Review" on the political uses of the Mediterranean, till 1863, when the first two volumes of his history of "The Invasion of the Crimea" appeared; two more volumes were published in 1868, and a fifth in 1874, bringing the history down to and including the battle of Inkerman, the work being still unfinished. **II. John Alexander**, an English lawyer, cousin of the preceding; born in Taunton in 1805, died in London, July 11, 1870. He was educated at Eton and Cambridge, was called to the bar in 1830, made a sergeant at law in 1844, and appointed recorder of Exeter, and in 1856 of Bristol. For many years he was a member of parliament for Rochester, and an extreme liberal in politics, being in favor of the vote by ballot, the abolition of church rates, and other popular measures. He contributed articles to the reviews, and the authorship of "Eöthen" has frequently been erroneously attributed to him.
